

**C02 - CREMATORY, NATURAL GAS FIRED, ANIMAL REMAINS, CONTROLLED AIR**

**CALCULATION METHODS**

$E_a = U_a \times EF$  (lbs/ton charged or lbs/mmscf natural gas)

$E_h = U_h \times EF$  (lbs/ton charged or lbs/mmscf natural gas)

**NOTES:**

- Control efficiencies must be included in emission factors since the calculation procedure will not refer to this data.
- Trace toxic emission factors for crematories are based on test results from an AB2588 study performed on UCSD equipment (1990).
- Emission factors for NOx, CO, SOx, TOG, and ROG are based on fuel usage and assumed to be equivalent to a small, uncontrolled, commercial boiler (AP-42 Section 1.4).
- ROG emissions are assumed to be 52% of the TOG emissions per AP-42 Section 1.4, Table 1.4-3.
- NOx, CO, TOG, and ROG factors have been adjusted for fuel BTU content per AP-42 Section 1.4.
- Use site specific particulate emissions testing if available. The default value (6.5 lbs PM10/ton charged) is based on the emission limit of 0.3 grains/dscf exhaust.
