

AIDS in San Diego County

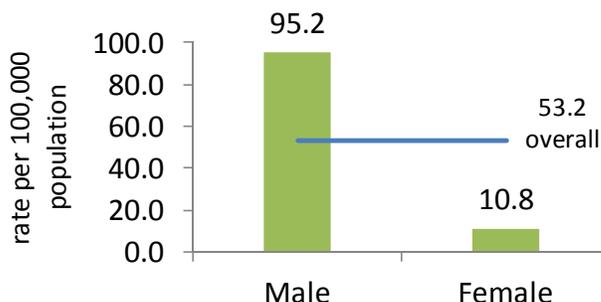

2007–2011

Total cases: 1631

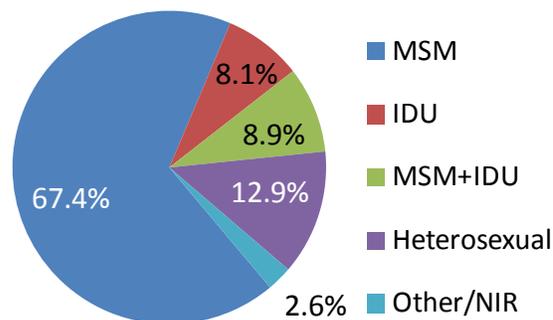

GENDER

Between the years 2007 and 2011, 1631 individuals were diagnosed with AIDS in San Diego county. The overall rate of AIDS for the county was 53.2 per 100,000 population. The rate of AIDS for men was higher than the rate for women. Of the 1631 cases, 90% were male and 10% were female.

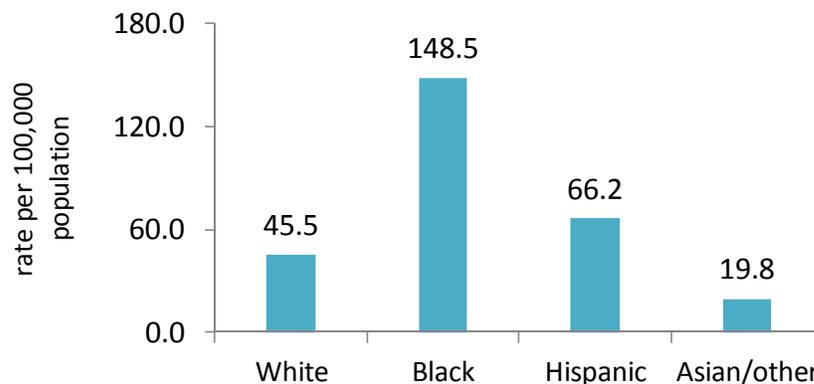

MODE OF TRANSMISSION

Rates cannot be calculated for mode of transmission due to a lack of population data. The predominant mode of transmission in San Diego county was among men with male sexual partners (MSM), followed by heterosexual, MSM+IDU and IDU. Heterosexual contact accounted for 67% of female cases, but only 7% of male cases.

RACIAL/ETHNIC GROUP

The rate of AIDS was highest among blacks followed by Hispanics and whites in San Diego county. Of the 1631 cases, 42% were white, 13% black, 39% Hispanic and 6% Asian/other (includes Asian, Native American, and Pacific Islander).

AGE AT DIAGNOSIS

In the county overall, the rate of AIDS was highest among 40-49 year olds, followed by 30-39, 20-29, 50+, and <20, respectively. Of the 1631 total cases, 1% were under 20, 15% were 20-29, 29% were 30-39, 36% were 40-49 and 20% were 50+. Rates were not calculated for groups with fewer than 25 cases in the five-year period (fewer than five cases per year).
