

# HIV in the South HHSA Region

San Diego County

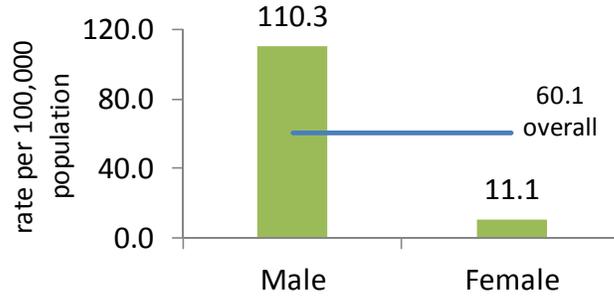

## 2007–2011

Total cases: 300

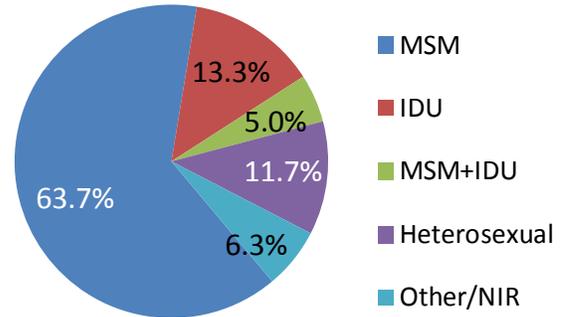

### GENDER

Between the years 2007 and 2011, 300 individuals were diagnosed with HIV while living in the South Region. The overall rate of HIV for the South Region was 60.1 per 100,000 population. The rate of HIV for men was higher than the rate for women. Of the 300 cases, 91% were male and 9% were female.

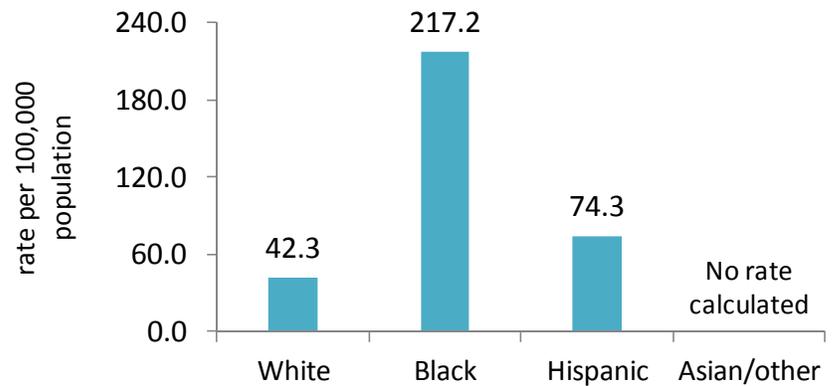

### MODE OF TRANSMISSION

Rates cannot be calculated for mode of transmission due to a lack of population data. The majority of reported cases in the South Region were MSM; however, the proportion was lower than the county overall with a higher proportion of IDU and heterosexual. Heterosexual contact accounted for 79% of female cases, but only 5% of male cases.

### RACIAL/ETHNIC GROUP

As in the county overall, the rate of HIV in the South Region was highest among blacks, followed by Hispanics and whites. Rates were not calculated for groups with fewer than 25 cases in the five-year period (fewer than five cases per year). Of the 300 cases, 20% were white, 14% black, 64% Hispanic and 2% Asian/other (includes Asian, Native American, and Pacific Islander).

### AGE AT DIAGNOSIS

Unlike the county overall, the 30-39 age group in the South Region had the highest rate of HIV, followed by the 20-29 age group. Of the 300 total cases, 5% were under 20, 35% were 20-29, 29% were 30-39, 20% were 40-49 and 10% were 50+.
