

# HIV in

# San Diego County

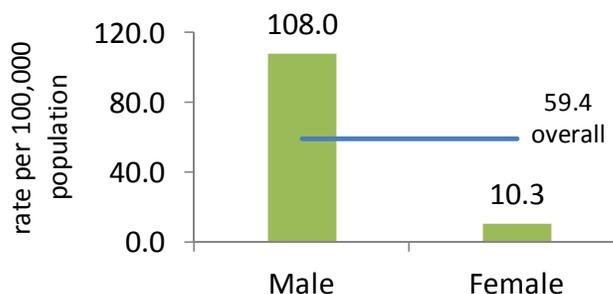

## 2007–2011

Total cases: 1819

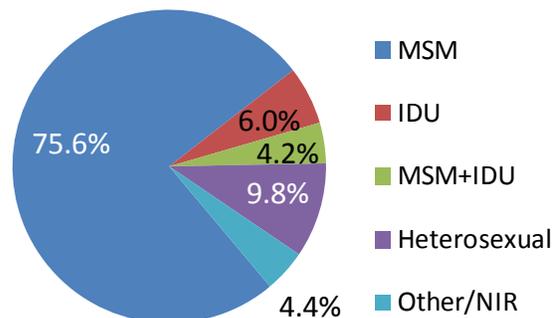

### GENDER

Between the years 2007 and 2011, 1819 individuals were diagnosed with HIV in San Diego county. The overall rate of HIV for the county was 59.4 per 100,000 population. The rate of HIV for men was higher than the rate for women. Of the 1819 cases, 91% were male and 9% were female.

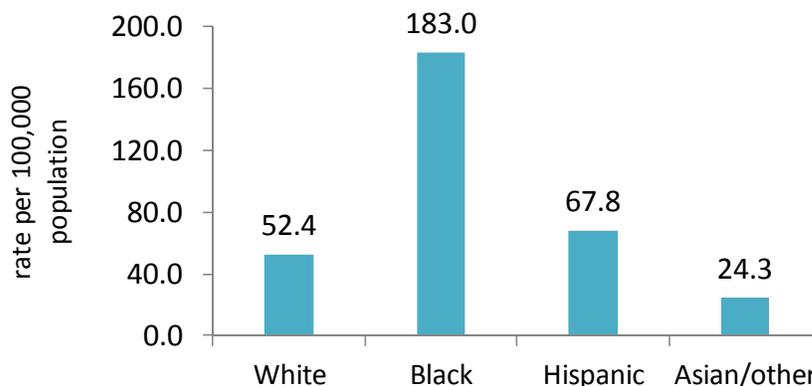

### MODE OF TRANSMISSION

Rates cannot be calculated for mode of transmission due to a lack of population data. The predominant mode of transmission in San Diego county was men with male sexual partners (MSM). Heterosexual contact accounted for 73% of female cases, but only 4% of male cases.

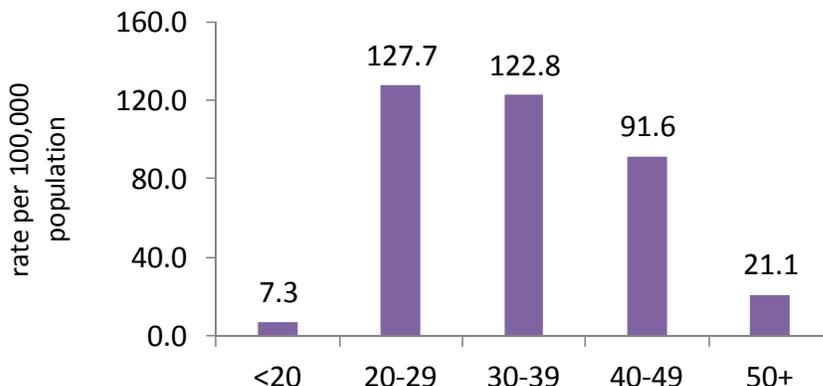

### RACIAL/ETHNIC GROUP

The rate of HIV was highest among blacks, followed by Hispanics and whites in San Diego county. Of the 1819 cases, 43% were white, 15% black, 36% Hispanic and 6% Asian/other (includes Asian, Native American, and Pacific Islander).

### AGE AT DIAGNOSIS

In the county overall, the rate of HIV was highest among 20-29 year olds, followed by 30-39, 40-49, 50+, and <20, respectively. Of the 1819 total cases, 3% were under 20, 36% were 20-29, 29% were 30-39, 21% were 40-49 and 10% were 50+.
