
Internet Connection. Leveraged Internet Service (LIS) provides shared Internet connections in a multi-tenant data center. HPES obtains and manages the Internet connectivity to the data-center itself, and then extends that connectivity to applications in the data-center. Each LIS core router is each connected (using link-aggregation) to both of the two WAN connectivity Layer-Aggregation Switches (WCL-AS) for the data center. Each LIS core router also terminates a connection from an Internet Service Provider (ISP). The WCL-AS connections will provide the path to the downstream LIS customer environment.

WAN Connectivity. The HPES data center will be connected to the DR site using Ethernet MPLS WAN connectivity to provide high-speed data transmission, connecting back into the County's Points of Presence (POP). Connectivity will be sized to 250Mbps of bandwidth with the capability to increase up to 1Gbps. We will have the capability of meeting any annual bandwidth increases should the County require. Within the HPES data center, our support team will manage the dedicated WAN devices. Within the County POPs, AT&T will manage the dedicated WAN devices. All network traffic between the data center and the POPs will be encrypted.

With a focus on steady, progressive change, the County has increased network reliability and reduced single points of failure. This resilient architecture will serve as the foundation for the County's future network. The network design associated with the consolidated data center addresses some limitations associated with the current network architecture to facilitate rapidly growing bandwidth and storage needs, reducing the complexity of the infrastructure, delivering high availability (HA), redundancy. This will reduce the manually intensive processes and provide the convergence of networking and storage

fabrics. It also contains standard 10Gbps and 1Gbps capabilities for attached devices, including servers, firewalls, and IPS devices. It is designed with virtualization and automation in mind and provides a foundation for a converged infrastructure.

The network will provide a redundant topology to eliminate network downtime by a single point of failure. Our network design will provide redundancy for enhanced reliability with multiple connections to network devices. Network reliability is achieved through reliable equipment and network designs that are tolerant to failures and faults by reconverging rapidly to bypass faults when these occur. On a redundantly connected network, if a router fails, connectivity is preserved by routing traffic through a redundant connection. Furthermore, each router has two or more points, or "legs," to provide additional redundancy.

Our design within the data center will flatten the layer 2 architecture and provide a low cost capacity switching fabric. This is done through the adoption of a spine and leaf topology (2-tier) network design. The L2Spine is a high speed connection between any devices attached to the leaf nodes. It eliminates unused network links and introduces full throughput on all connections between network devices using HPES networking technology known as Intelligent Resilient Framework (IRF). Using IRF, multiple switches are grouped and appear as a single logical device that allows all links connected to these devices to forward traffic in a loop-free topology. Each device is fully redundant. IRF provides a non-blocking architecture within the layer 2 network fabric. It enables highly efficient high-bandwidth connectivity and N +1 redundancy. It provides up to 40Gbps of server connectivity to the access layer as the standard.

The data center network is sized to support the existing applications currently in Tulsa plus the applications that will migrate from Plano. We shall provide the bandwidth required for each migration wave to ensure success.. HPES shall provide the bandwidth required for the Data Center consolidation, using diverse channels on the HPES Global Services Network (GSN) Transport. This is separate from the existing Plano/Tulsa replication circuits, and will therefore have no impact on production replication traffic.

Disaster Recovery. The Tulsa data center will be connected to the Colorado Springs DR site using a dedicated 10GB circuit, providing data replication for DR and off-site backup redundancy.

Once we have tested the new network, we cut over all the current connected equipment, as depicted by the dotted lines in Figure 153. This will be done in a planned change window, but will be transparent to the County because all components are redundant.

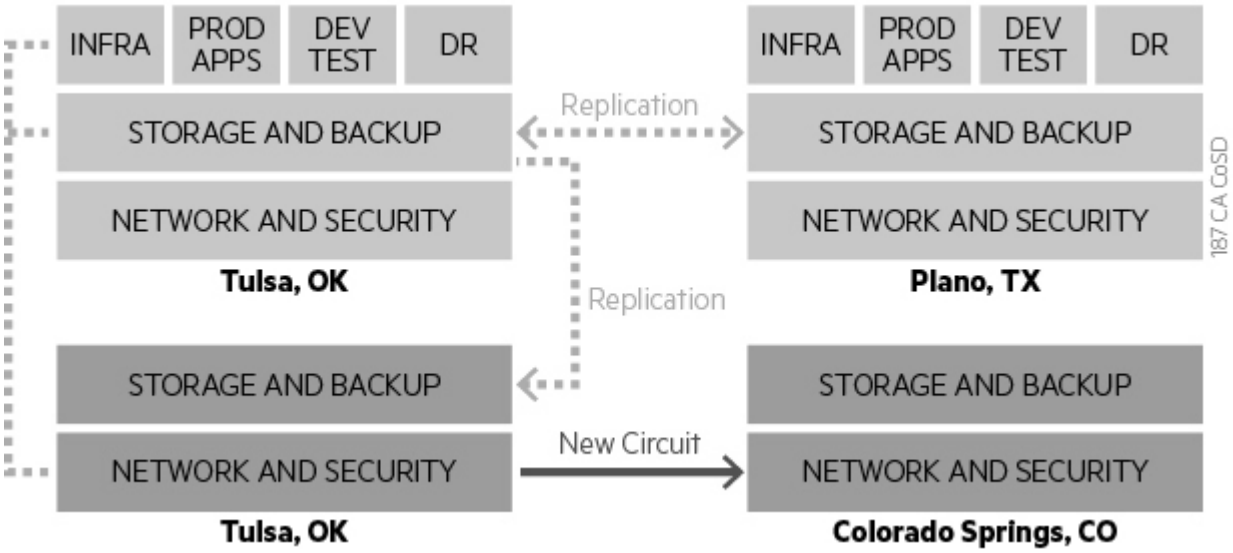
Storage Architecture.

Figure 153below provides a view of the refresh of storage requirements:

Site	Refresh point
Tulsa (SAN, Immutable, VTL)	Transition
Colorado Springs (SAN, Immutable, VTL)	Transition
View Ridge & Lemon Grove (SAN)	Storage Refresh Schedule
AT&T POP (SAN)	Storage Refresh Schedule
DR POP (direct-attached only)	Server Refresh schedule
Rancho Bernardo (SAN, VTL)	Storage Refresh Schedule

The next step is to build out the new storage and backup equipment in both sites, and start synchronizing the data between the current storage array and the new one, as shown in Figure 154. The upgraded storage architecture is fully described in the Storage Architecture Project section, as noted above, which includes a description of the detailed transition activities.

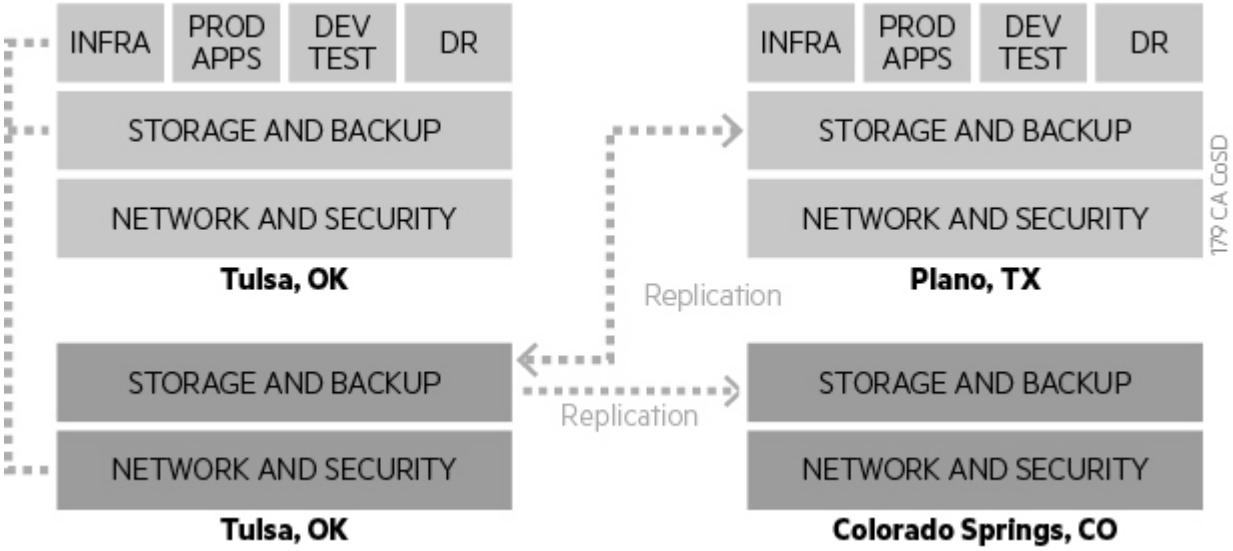
Figure 153. Deploying New Storage, Migrating Data



Once the new storage is fully synchronized with the current production array, we cut over the SAN connectivity (similar approach to the network cutover above, in a planned change window), re-initiate the replication between Tulsa and Plano, and start replicating the DR data to Colorado Springs, as shown in Figure 154

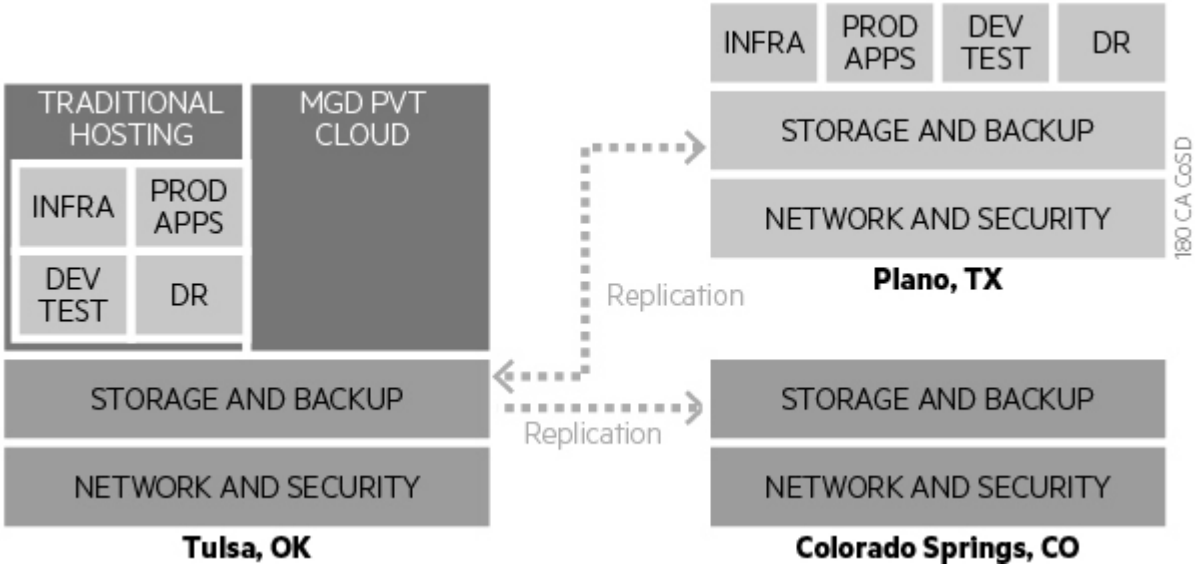
In order to avoid migrating End-Users' Home drive storage twice, the County may wish to migrate this data to OneDrive for Business (ODfB) as defined in the User Data Services Transformation Project prior to the storage migration. HPES shall accommodate this request, provided that the County can commit to supporting HPES in achieving the ODfB migration in 4 months or less from CED (the currently planned schedule calls for 7 months), with larger move groups. If the project cannot be completed in that timeframe, HPES and the County will permit the Data Center consolidation to proceed on schedule anyway (i.e., do not create a dependency between the two projects) in order to avoid the risk that the Data Center Framework Transition will exceed its allowable timeline due to delays in the OneDrive migration.

Figure 154. Cutover to New Storage Arrays



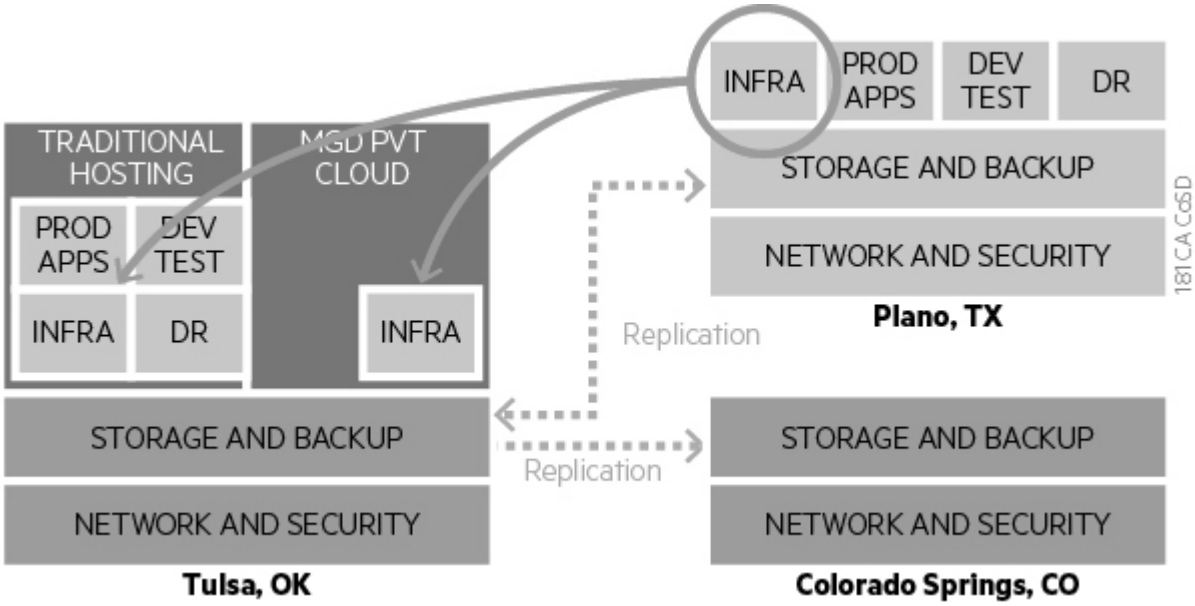
Then we can decommission the old storage and network environments Figure 155. At this point, no migrations have taken place: we have built out the new capacity to support the migration and the hybrid cloud architecture.

Figure 155. Decommission Legacy Network and Storage Hardware in Tulsa



We build out the MPC—your pre-configured cloud resources—while the migration planning and detailed scheduling is taking place Figure 156.

Figure 156. Migration from Plano to Tulsa



HPES – The Expert in Data Center Consolidation

- Unmatched public sector and data center consolidation experience
- Over 150 site consolidations/year using an automated factory approach

Data Center Hybrid Architecture. HPES will deploy hardware and software for a hybrid computing solution that supports applications and infrastructure services for the production and Dev/Test environments. The hybrid architecture combines a HPE Helion Managed Private Cloud (MPC) for cloud-compatible applications and traditional hosting for business applications that are not cloud-compatible, resulting in a hybrid environment. The MPC and the traditional hosted infrastructure are sized to accommodate the combined workloads from Plano and Tulsa, and can scale as needed to support the County's needs.

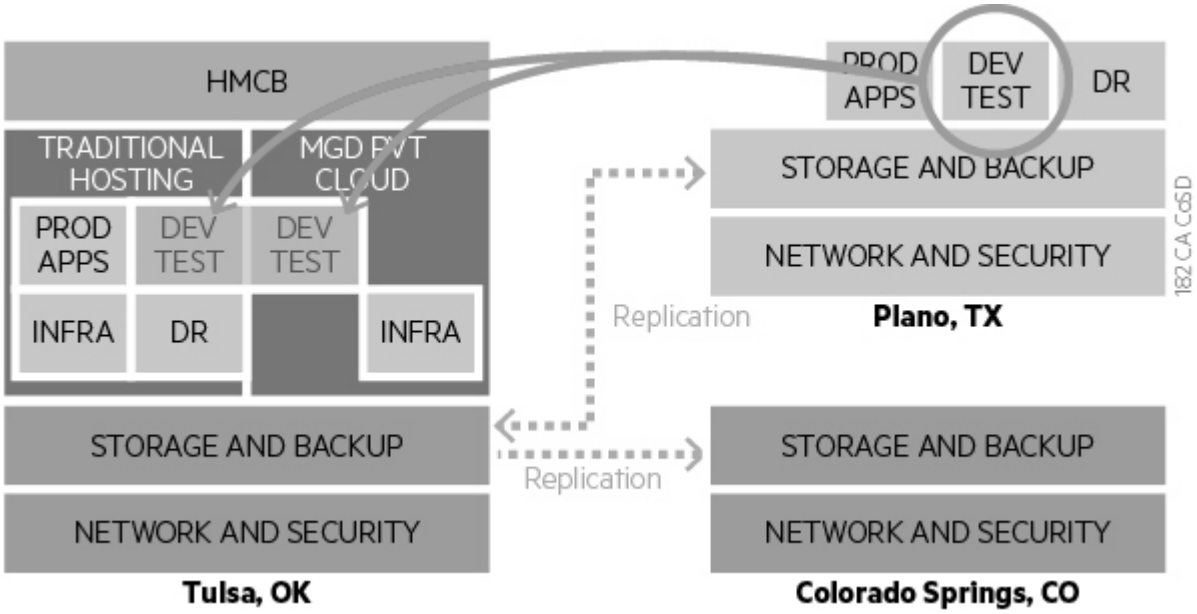
Application servers eligible to be hosted in the MPC include virtual servers that fall into a specific range of sizes, described in detail in Section 2.9,and will run current County approved versions of Windows and Linux.

Servers with resource needs higher than the predefined sizes can be migrated into the largest size, then scaled up to meet their resource needs. Sixty percent of the servers in the data center environment are already located in Tulsa and technically do not have to move to achieve the County's consolidation goal; however, to gain the benefits of automated provisioning and the ability to turn servers up and down for Dev/Test and Applications M&O environments, we have included the cost of moving those that are eligible to be hosted in MPC during the Data Center Transition, to include application regression testing. Sixty-seven percent of the servers in both Plano and Tulsa are eligible to migrate into MPC however, per the County's request, we will not migrate the Tulsa production servers during Transition.

We will work with the application stakeholders' users to identify the best migration windows and methods for each application or related group of applications, and, depending on the platform, we will either migrate them into the Traditional hosting environment or into the MPC, as depicted in Figure 157.

Building out the Cloud Broker will take place in parallel. As we create the pool view of the Dev/Test environment, we will migrate servers from Plano into it, and either keep them live if they are P1/P2 applications or traditional infrastructure, or turn them down if they are P3-P5 in MPC and are not currently being used for a project or active M&O work. See Figure 158.

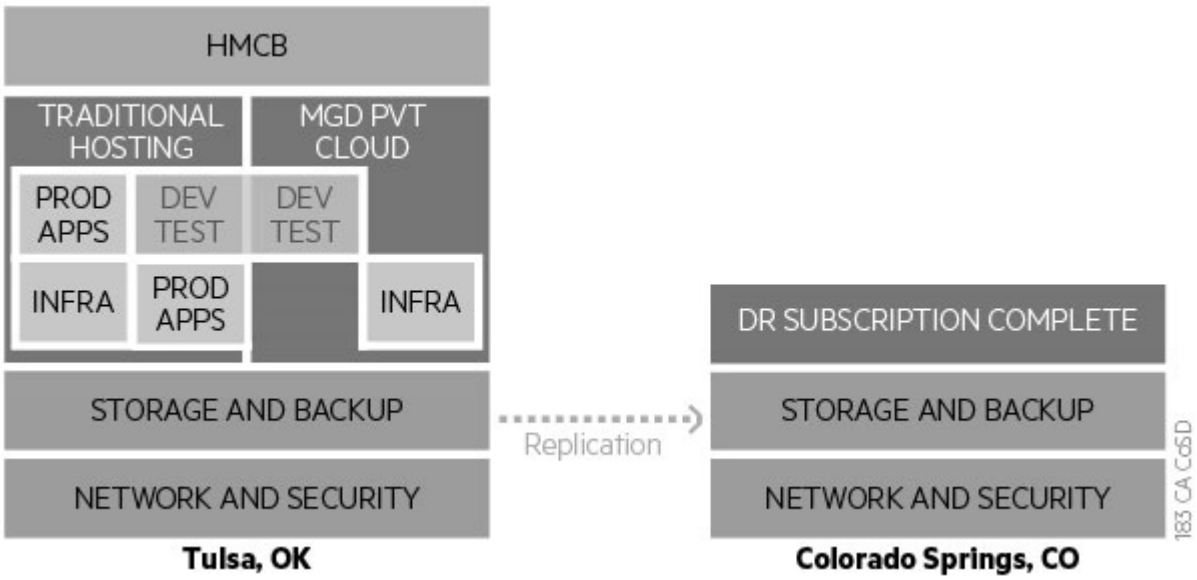
Figure 157. HMCB Deployment, Establishment and Migration into Resource Pools



As we move the production servers, we will make sure that their corresponding DR subscriptions are in place before the migration move group executes. Note that there will be minimal changes to applications—only what is needed to facilitate the migration and redirect any Internet access from using the County's Internet POP to the Leveraged Internet Service.

Once the migration from Plano is complete (or in parallel, as schedules permit), we will move any eligible Test and Development environments in Tulsa into the MPC. As shown in the project schedule, we can complete the build and the migration in as little as 7 months or we can move at a longer cadence if the business dictates. The County's required Transition period allows for two additional months to complete the project. The migration plan and pricing include moving any eligible Tulsa server environments into the MPC; however, these moves can be deferred to the refresh timeframe, if this is the County's preference.

Figure 158. Future Mode of Operations



Note that the mainframe and AS400 environments will need to remain intact beyond the end of the Transition period. The infrastructure required to support those environments will remain in Plano for as long as those systems are needed.

E-mail. The E-Mail transition is fully described in the Email Transition Project section and includes a description of the detailed transition activities.

Rationale

The hybrid environment designed for the Tulsa data center brings to the County key application infrastructure improvements throughout the life cycle of an application, whether it is in MPC or the traditional environment, and whether it resides on a physical server or a virtual host. Our complete hybrid cloud solution will bring to bear streamlined service creation, deployment, and monitoring for application workloads throughout the data center. We will enable multivendor support across hypervisors, OS instances, and infrastructure. The private cloud environment we propose consists of server, storage, and networking built for the cloud. It also consists of security, automation, and management software designed for hybrid delivery. The standardization, automation, and converged building blocks of our solution will allow the County to respond to changing business needs faster by deploying timely resources

where needed most, and in the most cost-efficient manner. Our solution is designed to enable the County to meet performance, availability, security and compliance requirements.

Based on the single data center requirement in the RFP, we have proposed consolidating the data center workload that is currently hosted in the HPES Plano, Texas data center facility into our Tulsa, Oklahoma facility.

The inclusion of the Cloud Broker solution in our proposal is based on the County's desire to have hybrid cloud capabilities in the future. Our Cloud Broker solution will provide the County with an enterprise view of all data center platforms, including private cloud, public cloud, and traditional hosting environments. The cloud broker will give the County the ability to have an enterprise view of system performance as well as financial management across each of the hybrid platform through one pane of glass. It also will provide a single console for provisioning compute resources across the County's hybrid estate.

We are proposing a MPC solution for part of the workload that can be easily ported to a cloud to provide a highly virtualized environment with automation that will reduce costs to the County.

The following Table **73** lists all requirements defined in RFP Exhibit H, Schedule 4.3 that helped us craft the solutions that best met the requirements as we understood them.

Table 73**. Exhibit H, Schedule 4.3**

RFP EXHIBIT	PAGE	HPES SOLUTION	REQUIREMENT
Exhibit H, 4.3 Operations Services	p215	Cloud Broker	The data center must be capable of providing hybrid services to County approved cloud based applications and services
Exhibit H, 4.3 Operations Services	p215	Managed Private Cloud	The data center must be capable of providing hybrid services to County approved cloud based applications and services, be a highly virtualized environment with respect to network, storage and servers and must maintain its own installed and secure Internet connection.
Exhibit H, 4.3 Operations Services	p219, Item 29	Data Center Consolidation	Develop a single data center operations.
Exhibit H, 4.3 Operations Services	P216, section 6.2.1.2	Cloud Broker	Contractor shall perform centralized management and performance monitoring of Data Center Services.
Exhibit H, 4.3 Operations Services	P220, Item 31	Managed Private Cloud	Develop a secure flexible Services model when and where appropriate so that the County shall have the flexibility to quickly grow or reduce consumption.
Exhibit H, 4.3	P230, Section 6.7.2.14	Managed Private Cloud	Contractor shall continuously improve and reduce costs with integrated tools that provide better security and control of the Application infrastructure.

RFP EXHIBIT	PAGE	HPES SOLUTION	REQUIREMENT
Operations Services			
Exhibit H, 4.3 Operations Services	P230, Section 6.7.2.16	Managed Private Cloud	Contractor shall continuously improve speed of delivery for new Applications and Services in Application infrastructure.
Exhibit H, 4.3 Operations Services	P230, Section 6.7.2.21	Managed Private Cloud	Contractor shall maintain Application Infrastructure Services so there is not a single point failure thereby assuring County business applications continue to operate during any unplanned event.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

HPES will assign a data center consolidation transition project manager (TPM) that will report to the Transition Services Manager. The TPM will have overall responsibility for this project and will be the primary point of contact for the County in support of all data center consolidation activities. This TPM will be responsible for maintaining the HPES Move Group Plan and collaborating with the County's designated project leader, as well as coordinating activities with the other TPMs and the HPES Project Management Office. Knowing the importance of this initiative to the County, we have also identified an HPES account executive sponsor to provide executive visibility throughout the project.

The data center consolidation TPM will be directly responsible for all activities associated with the DR and storage architecture subproject activities and provide oversight of the team. The TPM will be assisted by:

- Another TPM that will be responsible for the buildout and testing of the cloud components
- A TPM whose focus is applications readiness, and will work closely with the County and the HPES team to closely manage application testing, remediation (if necessary), and scheduling priorities of the County stakeholders.

Our virtual support includes architects, engineers, and migration specialists with specialized expertise in each of the disciplines required to deliver the various components of the plan. Additional details on overall transition staffing are provided in Section 2.11, Requirements, in response to Schedule 2.1, Section 2.

The data center facilities at Tulsa, Plano, and Colorado Springs are required to support transition. The transition project management teams will be headquartered at our Rancho Bernardo facility.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

Transition Schedule and Tasks

As described above, HPES will use a phased transition approach to accomplish the data center transition. For each phase, we will follow a standard process that includes an assessment of the existing environment to adjust for any changes that have occurred between the time we developed the solution and the effective date, and the status of any in-flight projects. This information will help us finalize our transition plan activities, timing, and dependencies. As we begin the design process, we seek to optimize network connections, server configurations, and storage platforms to improve speed, and take advantage of higher

capacity hardware that is faster and more efficient to deliver a lower cost solution. Each phase of the plan includes submission of project deliverables to the County for review, response, and subsequent approval, and all approved project deliverables will be made available to authorized users via the Service Portal.

The high-level planning activities for the data center consolidation are summarized in Figure 159**.** Because the data center transition has a number of interdependencies and subprojects, we will first initiate a planning and governance phase, as part of the overall transition high-level planning sessions, which will kick off this set of projects.

Consolidation Assessment. In preparation for the migration of the applications from Plano, we will assess the current Dev/Test and production environments to classify servers in terms of their migration targets and analyze server mapping. The results of the assessment will help us to develop the plan for migrating the applications, data, and infrastructure. This process is described further below.

Following the high-level planning activity, we will move directly into the detailed design and build phases. The first part of the implementation is the data center network. The draft data center network transition plan is depicted in Figure 160. An early output from the assessment will be identification/verification of additional network bandwidth needed in the Tulsa data center. We use this information to engineer the new network design and identify the specific network devices and configurations to be ordered and installed in Tulsa. We will submit this plan to the County for approval prior to placing equipment orders. Once approved, we will develop the final Bill of Materials and order the equipment.

With receipt of the equipment, HPES will begin installation of the data center network compartments in both Tulsa and Colorado Springs. In the Tulsa environment, we will create interconnects between the existing and new network infrastructure, then reroute traffic to the new or upgraded circuits. An integral part of the new network architecture is the establishment of the firewalls/IPS' and security zones needed to support traffic segregation and authorized third-party access. As part of the overall testing process, we will validate and test third-party access to the new network environment. Once testing is successful, we will move the network design deliverables to "as-built" documents, update all process documentation based on the new technologies, and submit all required deliverables to the County for review and approval.

As the network design and buildout is taking place, we will also be analyzing the DR requirements. The draft DR transition plan activities are shown in Figure 161.

As part of the Data Center Consolidation transition design process, HPES will seek to optimize County software licensing costs. Existing County software has a variety of licensing models such as site/enterprise, concurrent user, named user, module, managed budget, server, CPU, and core. Licenses based on server, CPU, and core present an opportunity for consolidation and license cost savings. Examples of County vendors that use these types of licensing models for enterprise server software include Adobe, EMC, Microsoft, Oracle, Symantec, IBM, and VMware.

Methodologies to reduce license obligations for server/CPU/core based licenses include switching licensing models between host-based and guest-based metrics (when offered by vendor), eliminating redundant licensed passive environments, restricting guest resources, and reduction of capacity dedicated to headroom at each site versus single site's shared environment.

MPC policy and architecture permits creating clusters similar to the production environment to mitigate potential license cost increases.

Data Center Services DR Plan and DR Architecture Implementation. As part of the consolidation analysis, we will review the applications' DR requirements to adjust the current solution for any changes to applications' configuration or DR requirements, and provide updated specifications to the HPES continuity team. Any buildout of the subscription-based service environment that might be needed is triggered by our internal notification and agreements for the DR relationship, and does not require transition resources assigned to this project to coordinate or procure equipment, beyond the dedicated network elements. The HPES continuity team is aware of the County's requirements, based on the solution we are proposing, and will be updated upon notification of award so that any prework needed to prepare the DR environment will be completed in time for the new contract. The other dedicated component of the DR environment, the refreshed Centera, is discussed in the Storage Architecture project (response to Schedule 2.1, Section 3.5).

Once the network connectivity between the Tulsa and Colorado Springs is established, we will begin replicating both live data and virtual tape library (VTL) data and verify that data replication is occurring accurately and as planned. At the end of the phase, HPES will perform three tabletop exercises of the DR plan to validate its functionality and address any deficiencies found during the exercise. Following successful completion of these exercises, at least 90 days prior to the cutover date for the data center framework, HPES will submit the draft DR plan for framework to the County for review and comment. Once we have at least a few applications running in the Tulsa environment, we will schedule an actual failover test. Note that using the HPE Helion team's established DR testing methods, a failover test can be accomplished without forcing an actual outage to the production applications.

Figure 162 provides a summary of activities in our draft transition plan for building out the Tulsa data center target environment.

Data Center Hybrid Architecture and Consolidation to Tulsa

Consolidation Assessment. As described above, we will assess the Plano application and infrastructure environment to identify the migration approach for each. We will prepare a source-to-target mapping that documents each of the servers that will be migrated along with the target server characteristics during this stage. We will also do an assessment of application requirements to the services provided by the MPC to determine compatibility. If there is a match, the application's Dev/Test and/or Break/Fix servers will be moved into MPC. HPES will work collaboratively with the County's business users to determine the most appropriate solution for each application. Our applications team will review the applications targeted to migrate to verify if they have any common issues that need to be mitigated prior to migration, such as hard-coded IP addresses. If we discover any issues, we will mitigate them prior to migration, using established change control procedures. From this process, we will have a clear picture of where we will need new equipment and where we will have opportunities for reuse and for migration using a pack-and-ship approach, and can refine and adjust the target server environment solution (developed for this proposal) into a design that reflects the detailed configurations including any changes that have occurred since submission.

Design and Procure Target Server Environment. We will design the hybrid environment in Tulsa to include:

- MPC and Cloud Broker (HMCB)
- Expansion of the capacity of the existing traditional infrastructure in Tulsa to accommodate workloads from Plano that require traditional hosting.

From the completed design documents, we will develop Bills of Materials and engineering documents, and submit internal purchase orders for any new hardware and software required. There is no additional cost beyond the Transition price for this activity.

444	8	Final Transition Milestones	7 days	Fri 9/29/17	Tue 10/10/17	

Design Migration Plan. During the design phase we also identify move groups that will organize the servers according to application dependencies, and incorporate other critical factors such as the change "freeze" periods, allowable maintenance windows, and other business priorities. The intent is to migrate all applications supporting a business process together when possible rather than migrating individual applications, reducing risk to the County business processes. In addition, this will assist in the County's understanding of the order in which the detailed design and migrations should take place and enable the project to complete in the proposed time frame. We will assign a work packet for each server group supporting the same application, which are combined into move groups based on the critical factors identified above and application resource availability. We will create a consolidated move group plan that we will present to the County for approval.

Build-Out Hybrid Environment. The build-out of the hybrid environment includes installing new racks, power and cabling, installing, and configuring the MPC and traditional hardware and software. We will also install and configure the HMCB. We will perform tests on the newly built servers to verify that automation processes as well as traditional connectivity and configurations to existing back-end management and reporting systems are in place, then create or update documentation for the target systems. Note that the storage architecture will have been built out under a separate but integrated plan: at this point in time, the two schedules converge. Once the build is complete and tested, we are ready to begin migrating move groups over the network. Tasks to build out the Dev/Test environment capabilities will also commence during this phase. These activities are described in the response to Development and Test Environment, Schedule 2.1, Section 3.3.

During this time, HPES will work with County application stakeholders to create the detailed Migration Runbook and other subdeliverables, such as the Back Out plan, and determine the change window to execute the go-live. During this phase, we will work with and provide guidance to the County to plan the tasks and secure required resources to successfully execute the Migration Runbook Plan. We will also begin the necessary change management steps and communications processes in conjunction with the County.

Figure 163 shows the types of migrations we may perform, for illustration only. The actual number, types, and scheduling of move groups will be established in coordination with County stakeholders. In the illustration, weekend dates are used, to illustrate off-hours activity, such as for pack-and-ship migrations; however actual scheduling and the full set of tasks will be solidified during the migration planning.

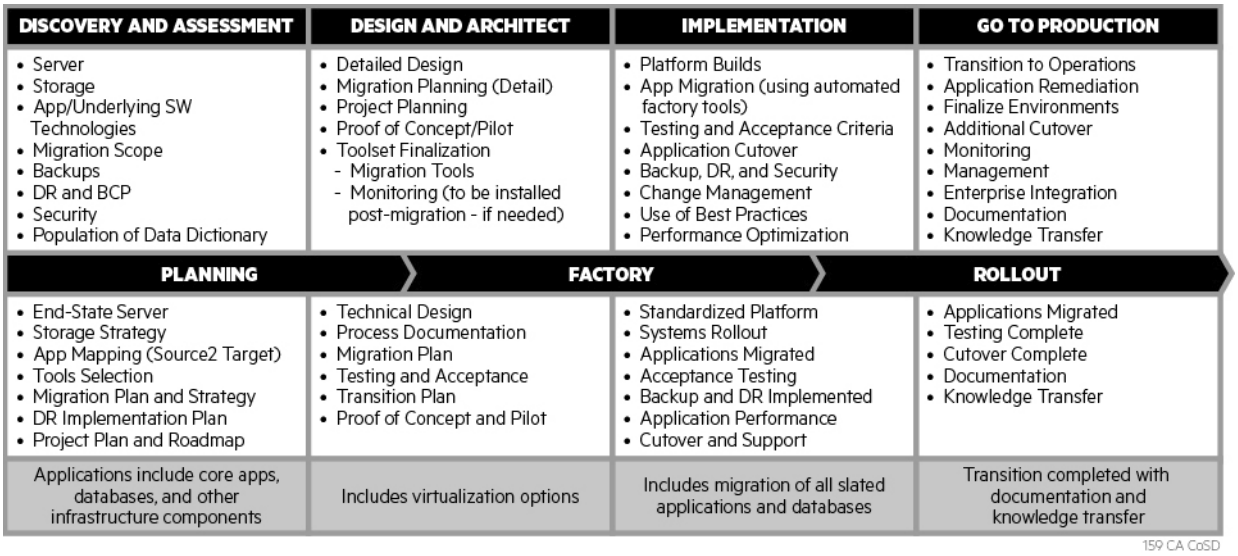
Execute Migration Move Groups. The HPES Migration Factory embodies a proven methodology and phases as well as best practices that HPES uses on all of our data center consolidation projects. An overview of the phases is provided in Figure 164.

Figure 164. Migration Factory Methodology



Adherence to this methodology enables HPES to deliver a flawless data center consolidation.

During the assessment and design phases of the project, we will build a migration roadmap detailing the placement, design, and execution of workload migration of all workload residing in Plano and Tulsa to achieve the consolidation. We will prioritize workload migrations, with Plano workloads into Tulsa taking the highest priority. This will allow the County to consolidate into Tulsa as quickly as possible to reduce the cost and complexity of operating in two data centers.

The HPES quality framework is wrapped around our Migration Factory. Using industry-recognized models, such as Software Engineering Institute's (SEI) Capability Maturity Model (CMM), International Organization for Standardization (ISO), Information Technology Infrastructure Library (ITIL), and Six Sigma, we continually focus on process and quality improvement. Our strong focus on quality and process excellence enables us to provide the high-quality, consistent migration services that the County requires.

Through quality assurance, we validate that data center migration processes are operating in "control." We monitor key process indicators, internal controls, and processes. Also, to verify the suitability and effectiveness of the quality management systems in satisfying customer quality objectives, our leadership reviews reports from internal, risk-based audits conducted throughout the year.

Note that pack-and-ship migrations may begin before the hybrid environment buildout is complete, if otherwise permitted by the County, since they do not require the hybrid environment to be in place in order to move. If we are able to ship servers before the Broker is in place, we will simply import those systems to the governance facility once the Broker is live to make them part of the hybrid environment at that time.

Migration activities follow step-by-step processes for the Dev/Test and production environments. During this phase, HPES will work with the County, our technical resources, and our application SMEs to execute the migrations from the source to the target environment. The migrations will be in accordance with the approved Migration Runbook Plan and approved detailed design documentation according to the

migration schedule for each move group. The contents will be captured in the Migration Runbook developed for each application. Tasks performed as part of the Go-To-Production process, such as executing hardening scripts, loading software agents for antivirus and adding the devices to the central repository, are incorporated into the project plan to make sure that the approved Go-To-Production process is followed for all migrations. Note that in the MPC environment, many of these tasks are automated, which will make the migration process more efficient.

During the migration, as assets migrate, their Resource Units will be recast from the current contract billing structure to the new contract billing structure. The County will not be billed for both in the same month.

We expect to employ multiple migration methods. Typical criteria to determine the proper migration method are the application downtime restrictions, amount of data to be migrated, network bandwidth, and any special security procedures that need to be followed. Our migration engineers, with the support of the County-designated project manager and application and infrastructure SMEs, will execute the Migration Runbook Plan according to the project schedule. The business owner of the application will provide the final approval during the cutover and is responsible for coordinating user acceptance testing and declaring the migration a success.

All migrations will have contingency plans to invoke a back-out or other service restoration procedure in the event of a failure, or a scenario where the migration is at risk of exceeding its allotted window. The TPM and the County business owner will mutually agree on the criteria for invoking the contingency plan.

The migration plan will include County freeze periods and adjust migration move groups accordingly, and will consider migration alignment with maintenance windows to minimize downtime. Migration of applications impacting critical services will be reviewed; we may invoke the contingency plan to mitigate impact on critical service supporting County business. Each move group plan will require County approval and participation by the application stakeholders in acceptance testing.

Automated tools like DoubleTake and PlateSpin will help mitigate or lower the downtime considerably, as migration can be performed while source servers are live: stakeholders can test on the target servers at a time convenient for them in most cases.

- Automated Tools – Automated systems and tools involved in proposed solution

We will provide the migration tool licenses, such as DoubleTake and PlateSpin. Some applications may be manually installed into the target data center for a number of reasons, including ease of configuration, the need to upgrade the version of the application, or the desire to have a clean install of the application in the target environment. The engineering and application teams will collaborate to make the decision for each application. Following the initial seeding, the County application team will test the application in the target data center. HPES recommends that the County participate in the performance of a full system and integration test to validate that the application is working as expected.

Our Migration Factory uses a tool from Binary Tree Company. HPES can provide large-scale migration support by planning and executing multiple move groups concurrently, consisting of multiple applications and associated components and using software products such as those described in Table 74.

Table 74. Automated Tools

TOOL NAME AND VENDOR	DESCRIPTION
DoubleTake	DoubleTake v7 is a migration tool that will be used for migration from Plano to Tulsa. DoubleTake performs a complete server copy from the source server onto the target server. It also has an advantage of having an asynchronous replication feature, significantly simplifying the data synchronization effort required during the final go-live process. Data synchronization can be set to certain files, directories, or file systems, optimizing the amount of data being transmitted on the network.
PlateSpin	PlateSpin v11 is a migration tool similar to DoubleTake and will be used for migrations into the County managed private cloud. PlateSpin performs a complete server copy from the source server to the target server, if needed. It allows source servers to be copied as an image that can be transported using an approved portable storage device and then restored to either a physical or virtual server on arrival at the Tulsa data center.

- Qualifications and Experience – Background and experience in comparable environments

HPES has more 40+ years of experience in data center transition and consolidation with a special emphasis on collaboration to add value. We will leverage our industry best practices, deep IT expertise, and our trusted, reliable, and repeatable services on behalf of the County. HPES delivers solutions that we know will work, are time-tested, and produce expected results.

Centers for Medicare and Medicaid Services (CMS) Enterprise Data Center (EDC) Contract: Using TTM, we executed a comprehensive transition in three parts.

- During the first year of our CMS EDC contract, we transitioned workloads from six different CMS data centers into our data center. Our transition team developed the plans and led the transition activities.
- We worked closely with all CMS business owners and the incumbent application hosting services provider to schedule migrations during times, and in a manner, acceptable to the legacy production data centers.
- We deployed start-up teams of experienced specialists, including design engineering, system administration, network engineering, security, backup and restore, and storage and monitoring experts.
- During the transitions, we implemented the move of a large number of workloads into our center. Concurrently, we supported overlapping workload transitions for Medicare Administrative Contractors (MACs), Durable Medical Equipment (DME) MACs, as well as workloads that previously completed the transition. To reduce risk, we used proven, repeatable processes and refined them from transition to transition.

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

- Alternative Approaches (*optional*) – Submit a description of an alternative approach if you believe it is worth consideration by the County, including rationale, trade-offs and potential benefits.

None.

Storage Architecture (Schedule 2.1, Section 3.5)

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

Solution Summary

The core of our primary Data Center Storage Architecture includes the latest innovation of HPE 3PAR enterprise storage, which is designed for both cloud and traditional environments. The storage hosts operating system images, virtual snapshots, and application data. Our architecture enables the server image to be disassociated from the physical hardware, allowing the image to move from one physical server to another as needed for greater flexibility, better resource utilization, and built-in failover. Our managed Storage Architecture supports the applications that enable a more mobile workforce and citizen access to County services.

The Storage Architecture Transition project is a specialized and integrated component of the Data Center Consolidation, and our team will provide tight coordination with that project and its execution as well as with the implementation of the Colorado Springs Disaster Recovery (DR) implementation. Table 75 summarizes the types of storage in place in the County, the current and post-migration technologies in use for each, and the Transition strategy for each.

Table 75. Storage Transition Summary

TIER	CURRENT	FUTURE	TRANSITION APPROACH
1 (Data Center)	3PAR P10000 thick provisioned 15,000 RPM drives (Plano and Tulsa)	3PAR P20000 thick provisioned 10,000 RPM drives (Tulsa)	Replication, Peer Motion
1 (AT&T POP)	3PAR StoreServ 8400 2N Solid State drives	3PAR StoreServ 8400 2N Solid State drives	No change in Transition. We will review and re-address the architecture when this storage comes due for refresh.
2	3PAR P10000 thinly provisioned 15,000 RPM drives (Plano and Tulsa)	3PAR P20000 thinly provisioned 10,000 RPM drives (Tulsa)	Replication, Peer Motion
Archive	3PAR P10000 thinly provisioned 7,200 RPM drives (Tulsa)	3PAR P20000 thinly provisioned 7,200 RPM drives (Tulsa)	Replication, Peer Motion
DPC	3PAR 7200 with 10,000 RPM drives	3PAR 7200 with 10,000 RPM drives	No change in Transition. We will review and re-address the architecture when this storage comes due for refresh.

Mainframe	HPE P9500 or equivalent in Plano (leveraged)	HPE P9500 or equivalent in Plano (leveraged)	None. Mainframe storage remains intact until the mainframe is decommissioned. At that time, the new midrange solution for those applications will have been

TIER	CURRENT	FUTURE	TRANSITION APPROACH
			deployed (under a separate project) using the appropriate tiers of SAN storage.
Direct-Attached	Disk drives installed on and dedicated to a physical server (types may vary)	Disk drives installed on and dedicated to a physical server (types may vary)	None specific to the storage environment. Direct attached storage will be replaced, and its data migrated to new storage at the time its associated server is refreshed.
Backups (Data Center)	HPE StoreOnce B6200 Virtual Tape Library (VTL)	HPE StoreOnce B6600 Virtual Tape Library (VTL)	Replication
Backups (DPC)	HPE StoreOnce D4212 at Rancho Bernardo MSL 4048 Tape Library	HPE StoreOnce D4212 at Rancho Bernardo Replicating to DR site in lieu of tape creation, for offsite storage	No Transition of VTL environment; only need to start replication to Colorado Springs Tape Libraries will remain intact until all tapes are expired.

For Storage Area Network (SAN) storage, we are currently providing a 3PAR P10000 in both Tulsa and Plano, with 15,000 RPM drives for tier 1 and 2 storage and 7,200 RPM drives for the archive tier. Tiers 1 and 2 of storage are redefined to reduce cost without sacrificing performance. The primary immutable storage (EMC Centera) is in Plano and is replicated to an EMC Centera in Tulsa. Document Processing Center 3PAR storage is available in the Viewridge and Lemon Grove San Diego sites. Our current backup solution provides a StoreOnce VTL in the data centers at Tulsa and Plano replicating to each other for offsite backup set protection and a combination of a smaller VTL in Rancho Bernardo with tape copies for offsite storage of backup sets. Our Transition solution addresses each of these types of storage.

The 3PAR 20000 is the latest innovation in enterprise storage from HPE. Primary data (all 3PAR-based tiers) for applications with a 48-hour Recovery Time Objective (RTO) is replicated to the DR site. The primary immutable storage will be located in the new production data center in Tulsa on refreshed EMC Centera storage and will be replicated to a refreshed Centera at the DR site. We are refreshing the 3PAR storage at the County's San Diego sites with like 3PAR storage to reduce the impact on operational processes and maintain the same level of performance. The backup solution also meets the requirements by providing a refreshed StoreOnce VTL in Tulsa and a smaller refreshed StoreOnce in Rancho Bernardo, both replicating to the DR site for remote storage of backup data. The backup solution changes from the current solution by replicating all data center backup data to the DR site and by eliminating remote offsite storage of backup data on tapes for the Rancho Bernardo site in favor off replicating that data to the DR site as well.

Rationale

To meet the increased capacity and transaction requirement of the consolidated data center environment and improve the storage architecture for primary SAN storage, we will transition to a refreshed, dedicated SAN with a 3PAR 20000 storage array. The 3PAR 20000 was selected to provide better performance than the current environment, with lower-cost disk drives. The current Tulsa and Plano storage environments typically reach a peak of approximately 2,450 KB per second, while the new design is capable of 2,438 MB per second—three orders of magnitude increase in performance headroom.

Our approach for all storage migrations taking place, both during and after Transition, is to provide improved storage performance and capacity at the point of refresh, without disruption to County business applications. Our Transition approach also makes sure that during the Transition period, data redundancy currently in place between Plano and Tulsa is re-established in the Colorado Springs DR site prior to removal of the Plano environment.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

Depending on the type of storage and stage of the Transition, we will execute this project at the Tulsa and Plano data centers and our Rancho Bernardo site.

Our storage Transition engineers will come from HPES' US Public Sector delivery organization, a virtual team composed of U.S. citizens based in the Continental United States, working in close coordination with the local San Diego teams.

We will engage EMC Professional Services to install, configure, and migrate the existing immutable storage environment to the refreshed environment.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

Overall, we use a combination of host-based and storage-based replication to migrate data to the new storage and backup infrastructure without interruption to business processes and without data loss. Please refer to Section 2.9, Storage Services (response to Schedule 4.3, Section 6.12), Methodology and Key Processes, for additional information.

Transition Schedule and Tasks

As shown in Figure 165, HPES presents a notional transition schedule and Gantt chart, with high-level tasks, milestones based on a January 2, 2017 Contract Effective Date (CED). As previously noted, we will adjust the schedule based on the actual CED and final detailed plan. Task descriptions and key deliverables on the schedule are explained at a high level following the chart.

Plan, Procure, and Engineer (Design). HPES will create a detailed plan and design for the new storage architecture and provide engineering documents to migrate data from the original storage solution in Plano and Tulsa to the new storage solution in Tulsa and Colorado Springs (DR). We will submit the design and plan deliverables and review them with the County. The County will review and respond based on the agreed schedule. We will make any final revisions and create the detailed Bill of Materials from which we will procure the needed hardware, software, and services. All design deliverables will be posted to the Service Portal as required.

Build New Storage and Backup Architecture, Enable Remote Replication. Once hardware is received, we will begin the build process. We will install the new SAN switches, storage, and VTL in Tulsa, configure and test the environment, and begin the process of replicating data from the current Plano array and VTL to the new Tulsa array and VTL. Replication from Plano to Tulsa is continuous throughout the Data Center Consolidation project, and is turned down for each application at the point during the consolidation when all application data has been verified and accepted on its Tulsa system.

Preparation of the DR environment will also be occurring in parallel with the buildout at Tulsa. Once the DR environment is available, we will begin replication of SAN storage for applications that require DR with a 48-hour Recovery Time Objective (RTO), from the new Tulsa array to the DR site. We will replicate VTL data to the DR site for applications that require DR with a 72-hour RTO. We will begin replication of VTL data from Rancho Bernardo to the DR site for offsite storage.

We will engage EMC Professional Services to perform the Transition activities for Immutable Storage; this includes refreshing both Centera units. The new units will be located in Tulsa and in the Colorado Springs DR site. The new Tulsa Centera will be configured to take over as the primary, and will replicate to the Centera at the DR site. All existing Centera data will be replicated to the new Tulsa Centera. The Centera refresh/migration will not require downtime. However, to make sure there are no configuration problems after this refresh process, it is good practice and required by EMC that we reboot the Centeras shortly after refresh/migration. The reboot process will cause about one hour of downtime for the immutable storage service environment. We will coordinate this activity, like all Transition tasks, with the County via the Change Management process.

The rest of the Document Processing Center (DPC) storage and backup architecture will be refreshed at the appropriate time post-Transition—there are no tasks required during the Transition period.

Figure 165. Storage Transition Activities

Migrate Local Data – SAN. Once the new SAN and Backup environment are fully configured and ready to support live servers, the various migrations described in the Consolidated and Single Data Center section can begin. In addition to supporting these migrations, servers that are not migrating (that sit in Tulsa currently) must also have their storage migrated to the new environment. Note that there are no dependencies between the Data Center Consolidation and migration of the current Tulsa servers to the new storage—these two activities can occur in tandem.

To migrate the Tulsa environment from the current to the new storage, we will first verify that all data is fully synchronized from the existing array. The SAN has redundant connectivity, and we will take advantage of this redundancy to move the environment from the current to the new SAN without requiring an outage to the systems or applications. We will move one set of connections from the current fabric to the new fabric, switch data access to the new fabric, then move the second set of connections to the new fabric. We will then enable replication of these volumes to the DR site.

In the current storage architecture, end-user data storage is available primarily through network attached storage (NAS) shares that are mapped to workstations as the end users' H: drives for their personal shares and S: drives for their group shares. In the current architecture, NAS appliances using 3PAR storage arrays for end-user data storage are located in Tulsa and are also available in Plano. In some special circumstances, end-user data storage is also available through server shares using 3PAR storage to access AutoCAD drawings and mapping data for example.

As previously noted, HPES and the County will strive to migrate End-User data to OneDrive for Business in order to avoid having to migrate it to the new array as well. If the End-Users cannot commit to the four-month timeframe required, and the County does not wish to elongate the timeframe for the Data Center Framework Transition, we will build out the End-User NAS shares by providing End-User data storage directly from the new NAS-capable 3PAR, eliminating the need for NAS appliances. This change will be transparent to the users.

Following successful completion of the Storage Architecture Transition, HPES will securely destroy all data on the retired storage and backup systems and provide disposal of those items.

- Automated Tools – Automated systems and tools involved in proposed solution

Both the backup storage (VTL) and 3PAR have native replication capabilities built into and enabled by the storage array software. When host/system-based replication is used, DoubleTake V7 will be the tool that migrates the data along with the server image. This is described in the Consolidated and Single Data Center section. Table 76 lists storage-based tools and utilities.

Table 76. Storage-Based Tools and Utilities

TOOL	DESCRIPTION AND USAGE
VTL Utilities	StoreOnce replication using Catalyst Replication of deduplicated backup data reduces time and bandwidth on the dedicated replication link between Tulsa and the DR site. Backup data is available for DR more quickly, to reduce the chance of missing backup data in case of a DR event.
3PAR System Utilities	• 3PAR array-based replication allows background replication of storage from one array to another and will aid the migration of service data from Plano to Tulsa. • 3PAR Storage Peer Motion allows us to migrate storage data volumes off the old Tulsa 3PAR onto the new Tulsa 3PAR without any interruption in accessing the data.

- Qualifications and Experience – Background and experience in comparable environments

Table 77. Relevant Experience

QUALIFICATIONS AND EXPERIENCE CITATION	WHAT WE DO AND HOW IT IS RELEVANT TO THE COUNTY
County of San Diego	Upgraded storage architecture in 2012 using a similar process and methodology.
NGEN	• On the Department of Navy (DON) Next Generation Network (NGEN) contract, which includes support for the Navy Marine Corps Intranet (NMCI): • From 2005 until early-2014, our team managed and monitored a diverse SAN environment that consisted of two different vendors. • In mid-2014, the team designed, engineered, and implemented a one-platform SAN storage environment to standardize NMCI on the more flexible, easier to use and support NetApp SAN. This single-SAN approach enabled us to capitalize on native capabilities to provide site-to-site resiliency and reduce backup overhead through a storage hub and tapeless backup. Our single-SAN design is reducing complexity and Total Operating Cost (TOC) while increasing operating efficiencies and effectiveness.

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

- Alternative Approaches (*optional*) – Submit a description of an alternative approach if you believe it is worth consideration by the County, including rationale, trade-offs and potential benefits.

None.

Service Portal (Schedule 2.1, Section 3.6)

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

Solution Summary

HPES' End User Access (EUA) solution, integrated closely with our Service Management systems (Service Manager), will provide a centralized Service Portal for all County users. Our Service Portal provides access to self-service assistance options and multiple dashboards easily accessible by County users, Service Desk agents and HPES support teams. It is mobile-enabled and easy to use. Additional information regarding the Service Portal design and functionality is found in Section 2.6

During the Service Desk Transition, which occurs during the first 90 days from CED, we will set up the core Service Portal functionality, including single sign-on, and link it to current data sources and source systems to integrate with the current repositories.

Rationale

Our Portal implementation approach is one that has been used at other accounts with a high degree of success. We have a repeatable process for the base Portal setup, which is being proposed here. We limited the initial deployment to the base set of configuration elements to minimize risk and to give both the County leadership and HPES a chance to solicit user feedback and suggestions to feed a continual improvement plan for the Portal's ongoing evolution.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

HPES will work with the County Technology Office (CTO) and its designees to assist in the design and testing and governance of the Service Portal. Our Global Engineering and Technical Consulting (GETC) organization, which has experience implementing similar projects for other customers' portal requirements, will provide the engineering and customization work, in collaboration with the County's local engineering and support team, which manages the current portals. We will hold design sessions with the County at HPES's Rancho Bernardo facility or at a designated County location.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

HPES will use infrastructure project management processes in delivery of the project, as described in Section 2.5.7 of this proposal.

Transition Schedule and Tasks

Figure 166, on the following page, provides a notional view of the activities associated with the Service Portal Transition.

Design Customizations. The Portal configuration process is an Agile-style iterative process providing rapid feedback throughout. At the start of the project, we will collaborate with the County in several iterative workshops to design the Portal "look and feel" and to review initial functionality. The configuration process that takes place during the Transition period will include items such as the following:

- County branding and "look-and-feel" elements on the front page (tiles, menus, links)
- Use of banners and splash pages
- Identification of user roles to be configured, to determine which groups have access to the various types of information
- Integration with Active Directory for Single Sign-on and configuration of user roles
- Integration with Service Manager and other tools
- How existing portals and data sources (ITSC, Doc Vault, and so forth) will be presented—as links or tiles from the main page to the existing functioning applications.

Service Portal Implementation. During transition, Portal implementation has two parts: (1) the "look and feel" of the Portal and (2) integrating HPE Service Manager (SM) and other applications and data sources. We begin with a sample portal, such as the one shown in Section 2.6, and gather feedback from the County to determine their preferences. This is an iterative process, and once finalized and approved by the County it becomes the Transition release design version.

With Portal design in hand, the next task is to connect the functionality of the document repositories and portal systems in use today to the appropriate tiles or links in the new Portal design. The integration of Service Manager with the Service Portal is part of HPES's product integration; that is already complete. The functionality in the Portal that is embedded in Service Manager will require minimal configuration. For Transition, there will be no change in the application functionality of existing source applications that

sit behind the Portal (those reached by pass-through links and that are not part of the Service Manager suite).

Figure 166. Draft Service Portal Transition Activities

267	6.4	Email Services	83 days	Mon 1/2/17	Wed 4/26/17	
296	6.5	Data Center Services Framework Complete	0 days	Fri 9/29/17	Fri 9/29/17	202,251,235
297	7	Cross Functional Framework	195 days	Mon 1/2/17	Fri 9/29/17	
444	8	Final Transition Milestones	7 days	Fri 9/29/17	Tue 10/10/17	

Testing. With the design complete and built, the Portal and attached functionality can be tested. We use the testing methods used for other infrastructure and applications releases, progressing from Systems Integration Test (SIT) through User Acceptance Test (UAT). These test steps are described in more detail in Sections 2.7 and 2.10.

Content Development, Content Migration, and Training. In the same timeframe as the testing phases, we will create Service Desk related content, such as self-help content (videos, tip sheets, and so forth) and cross-functional content associated with the Service Desk (refer to Section 2.11, Cross Functional Framework Transition, in response to Schedule 2.1, Section 3.1), available on the Portal. We will create Service Desk scripts and conduct training for the Service Desk agents to support the Service Portal, and work with the County to develop training and communications materials to introduce users to the new capabilities.

At the end of the process, we will present final documentation and the Portal itself for County review and response. Approval and successful completion of the activities above will mark the end of the 90-day Service Desk Framework Transition. During the rest of the framework transitions, reports, updated process documentation, design documents, and other deliverables will be posted to the Service Portal as these deliverables are completed.

- Automated Tools – Automated systems and tools involved in proposed solution

The Service Portal is customized using EUA and other web development tools.

HPES will use Project and Portfolio Management Center (PPMC) as our Primary Project and Portfolio Management (PPM) tool suite. We use PPMC for the development and ongoing management of project schedules.

- Qualifications and Experience – Background and experience in comparable environments

HPES has deployed thousands of client portals across the globe. We will apply our expertise in portals and collaboration, application transformation, and technology innovation to support the County's mission of providing a centralized and continuously managed focal point for all communications and information. Some examples include the following:

County of San Diego: HPES performed a successful transition from Northrop Grumman in 2011, including support for the existing myRequests portal. We subsequently established the ITSC portal, MASL Dashboard, and several SharePoint-based portals for both the County's and our own internal use.

Worldwide Power and Gas Company: HPES helped this company improve efficiency and customer satisfaction by integrating multiple supplier catalogs into a single integrated portal, with a friendly consumer-like experience for their employees. The number of service desk activities declined by about 15%, thanks to workflow enhancements that eliminated some manual activities and the generalization of dynamic forms so users no longer need to call for additional information.

Federal Healthcare Agency: HPES developed and integrated a medical portal for a client supporting a major hospital facility with full Health Information Privacy and Accountability Act (HIPAA) compliance.

Procter and Gamble: HPES implemented the EUA Portal for P&G users.

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

- Alternative Approaches (*optional*) – Submit a description of an alternative approach if you believe it is worth consideration by the County, including rationale, trade-offs and potential benefits.

None.

High Level Transition Milestones and Tasks (Schedule 2.1, Section 4)

Estimated timeframes for each task are shown in Table 78 through Table 84. Timeframes are shown as "CED + x" where "x" is a number of calendar days from the Contract Effective Date. As previously noted, actual timelines will be adjusted based on detailed planning and mutual agreement with the County. Tasks that do not have to be performed by HPES are shown as "N/A".

Table 78. Transition Start-up and Organization

TASK	DUE DATE	TRANSITION MILESTONE
1. Each party shall assemble and name a transition management team for each Service Framework, including overall transition managers responsible for oversight of the entire transition process for each party.	CED	
2. Deliver to the County a detailed process and communications strategy for soliciting, making offers to, and hiring personnel used to perform the services.	N/A	
3. Propose, finalize and implement the communications and governance plan for the County and the County's Legacy Provider.	CED+10	
4. Conduct kick-off meetings with the Legacy Provider's disentanglement teams and the County's transition teams.	CED+17	

Table 79. Service Desk Framework

TASK	DUE DATE	TRANSITION MILESTONE
1. Identify the current projects pertaining to this Service Framework (including current projects for Cross-Functional Services applicable to this Service Framework) that will be the responsibility of the Contractor as of the Cutover Date for this Service Framework.	N/A	
2. Provide the County with a detailed disaster recovery plan for this Service Framework (as well as the Cross-Functional Services applicable to this Service Framework) for its review, comment and approval.	CED +30	
3. Shadow the Legacy Provider and implement knowledge transfer processes for this Service Framework and the Cross-Functional Services applicable to this Service Framework.	N/A	
4. Complete interviews of personnel providing services to the County under this Service Framework (including any personnel providing Cross-Functional Services to the County under this Service Framework, as applicable) and make offers to same.	N/A	
5. Complete the assignment to the Contractor of third party contracts, licenses and leases that are currently used to provide the services	N/A	

TASK	DUE DATE	TRANSITION MILESTONE
(including any applicable Cross-Functional Services) to the County under this Service Framework.		
6. Complete the assignment to the Contractor of assets that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
7. Hire personnel providing services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
8. Deliver a reasonable and appropriate draft Standards and Procedures Manual sections to the County pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework) for the County's review, comment and approval.	CED+20	
9. Finalize and deliver to the County the Standards and Procedures Manual sections pertaining to this Service Framework (including any Cross- Functional Services applicable to this Service Framework), incorporating all of the County's suggestions and comments.	CED+30	
10. Submit for County approval the design document for the Service Portal	CED+50	
11. Finalize and deliver the Service Portal. Add Service Desk related content to the Service Portal	CED+85	
12. Cutover Date for this Service Framework (including any Cross-Functional Services applicable to this Service Framework), effective date of the Service Levels applicable to this Service Framework, implementation date for the final approved Disaster Recovery Plan for this Service Framework.	Effective Date+ 90 days	Yes

Table 80. Application Services Framework

TASK	DUE DATE	TRANSITION MILESTONE
1. Identify the current projects pertaining to this Service Framework (including current projects for Cross-Functional Services applicable to this Service Framework) that will be the responsibility of the Contractor as of the Cutover Date for this Service Framework.	N/A	
2. Provide the County with a detailed disaster recovery plan for this Service Framework (as well as the Cross-Functional Services applicable to this Service Framework) for its review, comment and approval.	Cutover Date minus 90 days	
3. Shadow the Legacy Provider and implement knowledge transfer processes for this Service Framework and the Cross-Functional Services applicable to this Service Framework.	N/A	
4. Complete interviews of personnel providing services to the County under this Service Framework (including any personnel providing Cross-	N/A

1. Identify the current projects pertaining to this Service Framework (including current projects for Cross-Functional Services applicable to this Service Framework) that will be the responsibility of the Contractor as of the Cutover Date for this Service Framework.	N/A	
2. Provide the County with a detailed disaster recovery plan for this Service Framework (as well as the Cross-Functional Services applicable to this Service Framework) for its review, comment and approval.	Cutover Date minus 90 days	
3. Shadow the Legacy Provider and implement knowledge transfer processes for this Service Framework and the Cross-Functional Services applicable to this Service Framework.	N/A	
4. Complete interviews of personnel providing services to the County under this Service Framework (including any personnel providing Cross-Functional Services to the County under this Service Framework, as applicable) and make offers to same.	N/A	
5. Complete the assignment to the Contractor of third party contracts, licenses and leases that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
6. Complete the assignment to the Contractor of assets that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	

TASK	DUE DATE	TRANSITION MILESTONE
7. Complete the assignment to the Contractor of assets that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
8. Hire personnel providing services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
9. Deliver a reasonable and appropriate draft Standards and Procedures Manual sections to the County pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework) for the County's review, comment and approval.	CED+180	
10. Finalize and deliver to the County the Standards and Procedures Manual sections pertaining to this Service Framework (including any Cross- Functional Services applicable to this Service Framework), incorporating all of the County's suggestions and comments.	CED+210	
11. Develop and deliver to the County for approval a completed Management Plan for each Cross Functional Component	CED+210	
12. Add all Cross Functional Services content to the Service Portal	CED+240	
13. Add all Cross Functional Management Plans to the Service Portal	CED+240	
14. Implement and deliver each Cross Functional Management Plan	CED+240	
15. Cutover Date for this Service Framework (including any Cross-Functional Services applicable to this Service Framework), effective date of the Service Levels applicable to this Service Framework, implementation date for the final approved Disaster Recovery Plan for this Service Framework.	Effective Date+ 270 days.	Yes

Executive Summary

Including Cross-framework/component integration, Competitive Differentiators and County Benefits

As your partner in delivery of IT Services for more than 10 years, HPES offers the County the lowest risk transition:

- We will not have to perform knowledge transfer, asset transfer, people transfer or spend time on these activities: our Transition period is fully dedicated to the success of your projects.
- Normal operations and your current projects will continue during the Transition period with no disruption or handoff required.
- Sixty percent of the Data Center Framework is already located in our target site for the Data Center Consolidation and will not have to move.
- There is a high degree of interdependency between the various Data Center projects. Only HPES has the depth of knowledge to fully comprehend these complexities from the start, and make sure that they are all accounted for, so that all of your projects execute flawlessly, on time and within budget.

Starting with Cathy Varner and throughout the organization, we are committed to sustaining excellence in support of, and in cooperation with the County. We will use our TTM and dedicated Transition Management team to complete the details behind the high-level Transition Plan used for illustration in

this section, and to provide the County with the governance, communications and documentation required to keep all stakeholders informed and confident of success. Both our local team and our teams of technical subject matter experts are ready to transition and deliver the County's next generation of IT services.

"Transition [from NG to HP as a prime] was a non-event. It was managed very well by HPES. There was zero impact to the County. There wasn't a whole lot to do from a project management perspective on the County side. HPES took on all the heavy lifting and they made everything transparent. It was a magnificently successful transition for the County."

County of San Diego Executive

The HPES plan meets all of the transition requirements as demonstrated in our response to Schedule 2.1, Section 2. We look forward to continuing our relationship with the County and are excited about the transition to the new Contract.

2.12 Transformation Services

Executive Overview

The County has achieved great success with numerous transformational activities, from DEH's Hazardous Material Division (HMD) receiving an outstanding innovation award for their e-Forms solution, to modernizing the annual enrolment process for employees, and the PUMA Mobile Probation Officer app which has received national recognition and awards. HPES is privileged to be your partner in these achievements and looks forward to partnering with you to transform the County to the next level of technology and services.

Continual improvement in the delivery of County services to its customers, which include residents, businesses, and visitors, requires the right balance among financial, social, environmental, and technology implementation objectives and a culture that is progressive and adaptive. We recognize that transformation is broader than technology identification and integration – it requires foresight, planning, and alignment with the business strategy to help the County continue to move forward.

We follow a bi-modal approach to proactively assess, deliver and sustain transformational IT initiatives, with one mode focused on stability and the other on agility. Mode 1 is planning and adhering to disciplined processes to ensure that business technology functions appropriately and securely. Mode 2 focuses on innovation, looking at new IT trends and early adoption of innovation that can be evolved and rolled-out quickly to manage cost and improve County effectiveness.

HPES will control transformational projects through Enterprise Architecture (EA) governance processes that incorporate CTO Architecture Principles, Bricks, reference patterns, technology assessments, regular meetings and roadmaps to identify and align solutions suitable with County business and IT strategic direction. HPES' CTA and our EA team will continue to champion innovation days and technology seminars, focusing on improvements to keep the County moving forward. Establishing actionable roadmaps with measurable objectives enables us to forecast and accommodate business changes in an agile orientation through effective governance and processes that:

- Use EA tools such as MEGA to create artifacts to identify, allocate, and measure transformational initiatives from an end-to-end perspective
- Establish a Transformational Maturity Model (TxMM) and analytical algorithms to analyze, predict, and recommend architectural and transformational initiatives
- Establish a Model Driven Enterprise in which service models are used to simulate and test emerging value chains and alternatives and accomplish prototyping and testing without impacting operational baselines
- Incorporate recommendations based on bi-modal organizational thinking.
- Blend bi-modal approaches to build County services from an "Outside-In" perspective.

Our approach to long-term transformation goes beyond those projects identified in Exhibit KK. We will leverage our knowledge of the County environment, business processes, and strategic objectives, with the foresight necessary to adapt to changes in the environment and foster citizen engagement. We propose two additional transformational projects for consideration: 1) Enterprise Information Management (EIM) to enable the County to take full advantage of the information it has to improve decision-making and make richer programs available to the public; and 2) Comprehensive Applications Threat Analysis (CATA) services to build security into applications from the start to minimize risk.

Transformational changes present challenges and opportunities to improve business execution, service quality, and innovations, with the right mix of current, emerging, and disruptive initiatives. We respect the past, understand the current environment, and have the vision to identify additional transformation initiatives taking advantage of flexible interfaces and extensible platforms to bridge transformational

gaps, eliminating barriers to change. HPES will partner with the County to continually transform, proactively and collaboratively, to improve the experience of County employees, taxpayers, and residents.

2.12.1 Transformation Services (Exhibit KK, Section 2.4, 2.5, 2.6)

- Key Considerations and Potential Alternative Approaches

HPES has worked diligently with CTO staff under the current contract to introduce positive changes in the environment through both new business processes and new technology. Some examples include:

- Technology Innovation Workshops, hosted by HPES to collaborate with and inform the County on key technologies. These include an Identity Workshop, which resulted in establishing the PKI vision, and Active Directory Workshop that resulted in Active Directory, Active Directory Federation Services and SCCM upgrades, as well as the DNS Re-Architecture using Akamai.
- Developed HP Cloud Strategy Roadmap detailing the vision to move from the current Tulsa/Plano state, to the mid-term state with HP Helion Cloud, and Goal state in a hybrid/broker environment. This initiative resulted in implementation and adoption by county for PaaS infrastructure hosted in the Rancho Bernardo Lab and HP Helion Cloud, and serves as the foundation to further support the County's move to hybrid and broker environments.
- Upgraded network perimeter security to provide secure, redundant firewall, SSL offloading, and load-balancing, which enabled the County to simplify and better secure its network landscape by retiring redundant and aging infrastructure in Microsoft ISA and Universal Access Gateways (UAGs).
- HPES provides the County a full range of mobile delivery capabilities to empower County field workers with native Android/iOS developed apps, to engaging citizens through mobile-friendly responsive web sites (Beach & Water, County Web Portal, Live Well Portal) to create a positive customer experience.
- Standardized the County architecture methodology using HPE's RightStep/TOGAF to provide a consistent framework to organize and define solution architectures, which has improved the overall quality and consistency of project deliverable. Institutionalization of standardized architecture Solution Design Documents (SDD) has improved speed to delivery by enabling quicker County approval, project start, and solution execution by downstream delivery teams.
- *Standardized solution assessment approach to quickly provide architecture direction* taking into consideration five categories: Cost, Business Fit, Architecture Fit, Quality, and Risk, to recommend the best solution to the County. This approach directly aligns with the County's focus on fiscal stability, operational excellence, and commitment to service improvement.

We will build upon these achievements to identify additional transformational initiatives and work collaboratively with County leadership and stakeholders to determine the feasibility of these initiatives. We do not anticipate potential impacts to the agreement to move forward with these types of initiatives.

In the following section, we describe our approach for driving Transformation as a program; then address specific transformational initiatives.

- Solution Summary and Rationale

Our transformational program will be based on the following tenets:

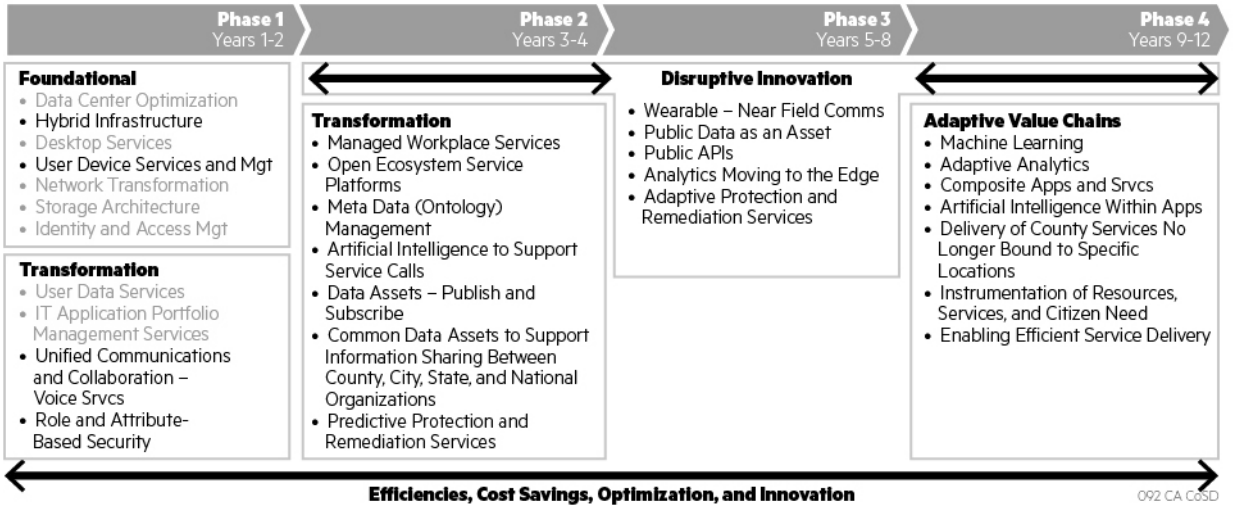
- **Enable citizen engagement (digital first) –** The County has recognized a growing preference among citizens to interact with the government online, at a time and place that is convenient for them, and they expect their experience to mirror that of the private sector. Tools, functions, capabilities, and services produced by transformational activities will allow the County to expand the current "digital first" initiative.

HPE's hybrid foundational platforms and services will enable the County to deliver additional services that align with citizen expectations. Embedding knowledge-based tools into existing systems and websites

enables citizens and employees to conduct transactions quickly and accurately. Whether in one-on-one scenarios or via social communities, County departments can learn from each interaction and tailor content to maximize effectiveness. This will improve citizen satisfaction, while minimizing the inconvenience of making a phone call or visiting an office.

- **Provide Secured Information Sharing and Enrichment (Open Data Platforms) –** Open Data Platforms (published APIs and consumable data marts) provide a secured and authoritative means to share and enrich information among County departments to proactively deliver services. Seamless interoperability drives mobility capabilities and a digital environment, increases the ability to share, reuse and analyze data, leading to creation of information and knowledge. An example of a use case enabled by these core capabilities would be to provide the County with means to dynamically identify, track, and interact with homeless veterans in the field. Or, instead of simply reacting to a distressed parent calling to report health symptoms, a predictive model could alert health officials based on the means to collect, correlate, and analyze data from health providers, pharmacies, and geospatial indications to notify citizens proactively with information and access to services. Treating data as an asset requires actively taking initiatives to improve both the quality and the usefulness of the data.
- **Adaptive Enterprise –**HPES offers a comprehensive Adaptive Enterprise strategy that we designed to strengthen every link in the County's value chain. Together, the components of our multifaceted Transformational Agenda fully address the County's business objectives. The County can achieve enterprise agility and growth while improving its overall return on IT investment (RoIT).

Figure 167. Transformational Agenda for the County



HPES' transformational agenda supports achieving the Future of the County

We will make sure that each transformational activity produces qualitative and quantifiable returns to the County. The following are complementary Transformational Categories:

- **Managed Workplace Services**– Provides services, platforms, and support that enable workers and citizens to interact in an effective way to create, manipulate, and access desired services from an authorized device or location – accommodating new value chains. [Tools and Devices]
  - User Device Services and Management
  - Desktop Services (Windows10, other mobile OSs)
  - User's operational device/environment is contextually aware
  - Unified Communication and Collaboration
  - Internet of Things (Wearable – Near Field Comms)

  - Artificial Intelligence to support Service Calls

- **Enterprise Information and Knowledge Management (EIKM) –** New capabilities and services oriented around the use of proactive analytics and public data as an asset. [APIs, consumable data assets]
  - Public Data as an Asset
  - Metadata (ontology) Management
  - User Data Services
  - IT Application Portfolio Management Services
  - Publish and subscribe data assets that support information sharing (contextual and semantic apps and services)
  - Analytics moving to the edge
  - Machine learning

We address the following considerations to effectively deliver the business value derived from transformational activities:

- **Strong focus on architecture foundation:** Rigor across the architecture-analysis-design-construction phase. This methodology advocates the establishment and evolution of reference architecture and applies a solution architecture for improved system-wide integration.
- **Importance of metadata:** A specialized metadata work stream manages metadata as a critical County asset. The common aspect associated with the digital workplace and the County's transformational initiatives is the maturity of data – information – knowledge – intelligence that directly enhances the County worker's ability to create and deliver services.
- **Not limited to a predetermined technical platform:** Use best-fit technologies to implement transformational solutions, including a technology-neutral approach independent of vendor solutions. Tool-specific best practices are introduced through technology extensions.
- **Modular and flexible to meet various size and complexity needs**: This approach adapts to projects of various sizes and complexities, customized to meet specific needs. Related subsets of activities are independently executed along phases or activity work streams, depending on project scope.

- Resources and Facility Approach Summary

HPES team members in Rancho Bernardo, including our CTA, and AT&T staff at Trade Street are dedicated to supporting the County, will have the lead to identify potential transformational projects because of their first-hand knowledge of the environment, culture, and strategic objectives. This team has reachback to corporate HPES and corporate AT&T resources with extensive expertise across services. This is not to say that *only* HPES CTA and AT&T can identify transformational projects—any and all members of the HPES and AT&T team can do so.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

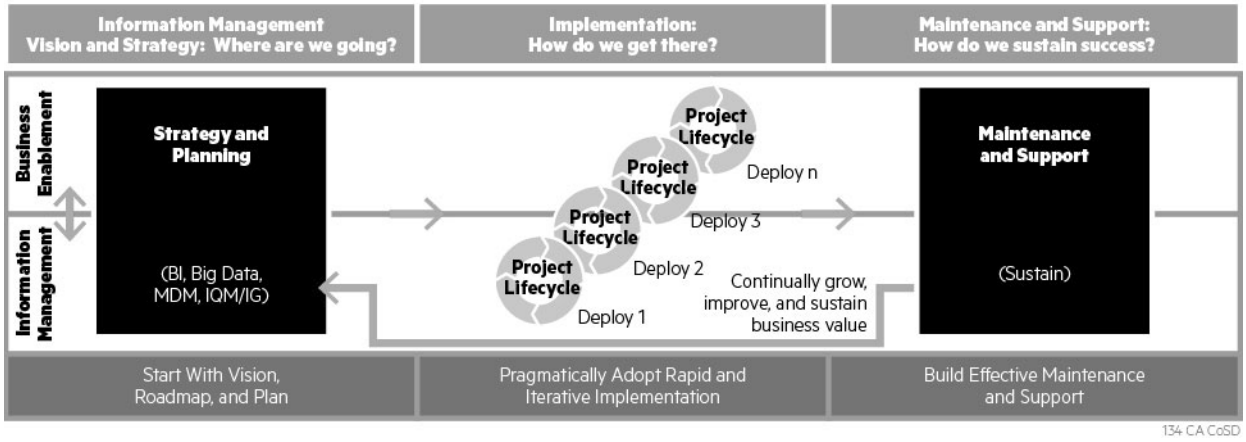
We are committed to making certain that transformation continues in the future, after successful completion of the identified transition and transformation projects. We will provide leadership and oversight for transformational projects through an Enterprise Architecture (EA) governance process that focuses on regular technology assessment, new ways to do business through online services and automation, and briefings for the County on new and evolving technologies and business processes. As part of our support of EA through our architecture team, we will present innovation days and technology seminars to keep a focus on improvements and new technologies to keep the County moving forward.

The HPES IT Solution Architecture (ITSA) applies industry-recognized reference architectures and patterns, described in Section 2.5.6 of this proposal, to the management of the transformational life cycle to provide successful and sustainable delivery and the highest value for the County. Consistent and

repeatable processes set clear expectations, simplify implementation, accelerate development, minimize errors, lower costs, reduce risk, and encourage strategic alignment between IT and the business.

The HPE Transformational Implementation Methodology (TIM) is an Agile methodology that facilitates discovery and prototyping for early insight into proposed transformational initiatives and solutions Figure 168. We use this tool-driven approach to rapidly perform transformational implementation activities in a highly productive, coherent, repeatable, and accountable manner.

Figure 168. HPES Transformational Implementation Methodology



This structured approach helps to continually grow and sustain business value.

The project lifecycle circles highlight the incremental release aspect of the business transformational life cycle. Each circle represents an incremental build and deployment, and the progression from the circle on the bottom (Deploy 1) to the circle at the top (Deploy n) represents the increasing complexity and scope involved, building on what was completed before, and the passage of time.

This methodology is composed of a rich array of features that support successful business intelligence (BI) implementation:

- **Iterative development support:** TIM leverages iterations on program, project, and activity levels, controlling progress via activity entrance and exit criteria.
- **Agile development from conceptual through logical and physical design:** TIM creates a conceptual and logical solution through the business requirements, architecture, and analysis phases. Agile development continues with a high-level physical design through the design, construction, testing, and deployment phases.
- **Reinforcement for business value:** The methodology uses project charter, interactive requirements gathering, and prototyping. Business objectives and ongoing business involvement are clarified throughout the systems development life cycle for transformational activities and systems.
- **Well-structured and content-rich:** The implementation framework includes methodology phases, activities, tasks; artifact/working document templates and samples; and clearly defined roles and responsibilities with supporting Responsible, Accountable, Support, Consulted, and Informed (RASCI) assignments.
- **Built-in support for critical information quality and information governance:** TIM embeds information quality and governance into implementation activities and tasks, and addresses organizational elements supporting governance.

TIM is technology independent, so professionals can identify business goals and develop the appropriate architecture for the optimal delivery of data to meet those goals. It uses techniques and terminology that

are largely compatible with current organizational structures and cultures. This highly modular and flexible methodology may be used for projects of varying sizes, scopes, and platforms, especially those involving complex or voluminous enterprise data.

Methodology Phases

HPES supports Agile, iterative, waterfall, and transformational development. TIM is an Agile methodology. Execution of the methodology phases is not sequential; they overlap. Each phase is part of each iteration and increment.

Table 85 highlights the purpose and key benefits of each TIM phase.

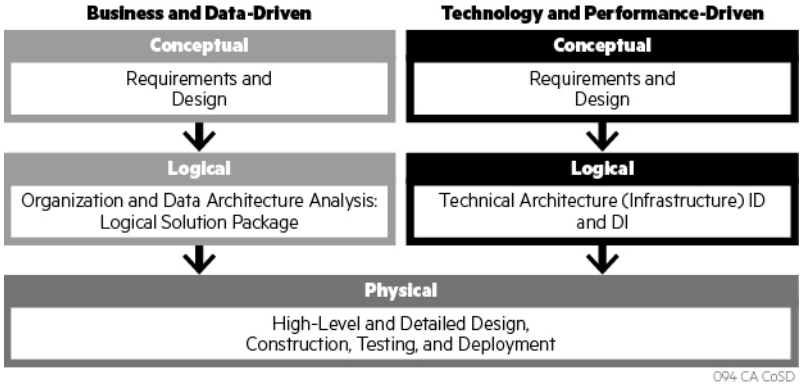
Table 85. Purpose and Key Benefits of each TIM Phase

TIM PHASE	PURPOSE	KEY BENEFITS
Definition	• Clearly define project/program scope. • Complete preparation and planning activities.	Stakeholders' expectations are met.
Requirements	• Elicit, synthesize, and analyze requirements from business stakeholders, data analysis, and information. • Produce clearly articulated, detailed requirements, and business dimensional models aligned to business goals. • Leverage prototypes and perform high-level source data validation.	Requirements are accurate and achievable.
Architecture	• Produce a conceptual-level solution. • Focus on infrastructure architectures. • Apply solution architecture for improved system-wide integration.	Solution architecture integrates all dimensions of the solution.
Analysis	• Establish a vision of work from a data movement perspective. • Define goals in business terms, regardless of technology deployed.	Data movement decisions are made prior to beginning technical design. Implementation is streamlined and resources used efficiently.
Design	• Translate a logical solution into a physical solution. • Focus on high-level/ detailed specifications. • Create detailed design documents.	Solution is project-specific.

We will begin designing the County's transformational solutions at the highest conceptual levels, separating the business solution from the technical solution Figure 169. In this way, the business and data-driven requirements ("what" should be built) are initially separated from technology and performance-driven requirements ("how" it should be built). Separating the "what" from the "how" preempts technologies unnecessarily or prematurely constraining the proposed business solution.

As we progress through increasingly detailed logical levels, we will begin integrating the technical requirements with the business requirements. We will bring in vendor-independent architectural elements, for example, information delivery (ID) and data integration (DI). We will capture the final logical design of the business solution in a Logical Solution Package (LSP), which is the de facto design specification for the physical solution.

Figure 169. Designing Solutions at the Conceptual, Logical, and Physical Levels



TIM minimizes surprises and maximizes business value by delivering high-quality results

- Automated Tools – Automated systems and tools involved in proposed solution

In addition to the tools described above, HPES uses the following tools to support transformational initiatives:

- HPE's Transformational Roadmap (TxRM) - Provides executives with an actionable guide that defines the transformational journey, linking incremental and measurable results to business objectives, priorities, and desired outcomes. It brings clarity to the complexity of transformation.
- HPE's Helion Development Platform - An open, scalable, flexible cloud application platform and ecosystem supporting a variety of runtimes, frameworks, and services. HPE Helion Stack is based on Cloud Foundry® technology, uses Docker containers to launch applications deployed, and offers additional enterprise capabilities for developers and IT operators. HPE's Helion Development Platform is designed to run on many leading Infrastructure-as-a-Service (IaaS) platforms, including AWS, VMware, Azure, and OpenStack.
- This tool supports continuous integration and deployment and helps operations teams deliver cloud-native applications. HPE's Platform-as-a-Service (PaaS) solution enables customers to:
  - Accelerate development of cloud-native applications
  - Reduce cost using a common platform across development and operations.

We are aware that the County needs a full solution to realize the true potential of cloud computing that encompasses both infrastructure services and a robust development platform for developers and applications. Infrastructure-as-a-service is important, but developers also need a fast, easy, and open platform from which to build and deploy applications suitable for the cloud.

- Qualifications and Experience

We have produced TxRMs for many Government clients, including the Department of Homeland Security (DHS), the Internal Revenue Service (IRS), the United States Marine Corps (USMC), the Department of Housing and Urban Development (HUD), and the United Nations (UN). For IRS, we used the TxRM to showcase the dependencies of three domains regarding the future of IT within the IRS enterprise (Infrastructure, Workload, and Data). In doing so, the team was able to expose risks, redundancies, and costs that could greatly limit future success if the requirements were not altered to address ways to mitigate those issues. We obtained agreement across all the IRS' IT lines of business on shared constraints, synergies, and transformational journey.

- Assumptions

None.

- Answers to Specific Questions – Listed below are questions relating to topics of particular interest – if answers are provided already in the context of responses to these Service Framework Components, note in your response with specific cross-references to the questions.

Describe your solution approach to the proposed Transformation requirements.

In the following section, HPES describes our approach to addressing the individual Transformation Projects, as summarized in Table 86.

Table 86. HPES Summary of Answers to Specific Questions (12.1.1 and 12.1.2)

INITIATIVE	PAGE #
Desktop Services (Exhibit KK, Section 3.1)	566
User Data Services (Exhibit KK, Section 3.2)	572
IT Application Portfolio Management Services (Exhibit KK, Section 3.3)	574
Network Transformation (Exhibit KK, Section 3.4)	578
Voice Services Transformation (Exhibit KK, Section 3.5)	585
Storage Architecture (Exhibit KK, Section 3.6)	594
E911 (Exhibit KK, Section 3.7)	608
Identity Federated Services (Exhibit KK, Section 3.8)	610
Other Proposed Initiative (Exhibit KK, Section 4): Enterprise Information Management (EIM)	617
Other Proposed Initiative (Exhibit KK, Section 4): Comprehensive Applications Threat Analysis (CATA) Service	622

Initiatives: Desktop Services (Exhibit KK, Section 3.1)

From our experience working with the County over the past ten years, HPES understands that one of the most pressing IT challenges is meeting existing legacy application requirements. This is in the light of the requirement to transition the County's desktop environment to newer operating systems (e.g. Windows 10) and optimization for current and future technology requirements. It has been a challenge to move to newer operating systems, such as Windows 10, when there are business critical applications which have dependencies on a specific OS, or even a specific browser version and plug-ins.

- Key Considerations and Potential Alternative Approaches

In determining our approach to transform Desktop Services, we considered the following:

- The need to provide the County with innovative methods to more rapidly enable workforce mobility and new styles of IT for their users.
- Decoupling the application from the device, allowing secure legacy application access from anywhere, at any time and from any device
- Decreasing management and support costs by reducing the number of traditional applications on PCs (desktops and laptops)
- Providing the ability to rapidly integrate, provision and leverage new/updated operating systems for end user PCs (desktops and laptops)
- Improving user's productivity and satisfaction by providing improved contextual awareness that is consistent from device to device and compute styles
- Enable a more flexible mobile first, cloud first strategy

We evaluated various approaches that include:

- Desktop rebuild from the ground up
- Desktop Virtualization ("VDI")
- Presentation Virtualization (Application Virtualization)
- Technologies for virtualization from VMware and Citrix

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

HPES proposes implementation of Presentation Virtualization (also known as Application Virtualization) driven by Citrix XenApp. Presentation Virtualization helps address the need by decoupling the legacy applications from the device in such a way that it minimizes the infrastructure and overall costs when compared to other virtualization approaches. In doing this, legacy applications will no longer dictate the upgrade path for the rest of the County's environment and this will minimize the potential for impact if a particular application such as Kronos, Acclaim, or Accela will cause problems with the latest O/S upgrade, or browser version. This, and all of the other virtualized apps, can remain for as long as the County continues to use the apps. Transformation of legacy apps can then proceed on their own timeline, rather than being tied to the remainder of the IT environment.

Each virtualization option, illustrated in the Compute Style section of Figure 170 is generally related to a specific type of user's digital profile, and is typically based on their overall work related IT requirements (e.g. Device(s), Applications, Data, and Support). As the need for more computing power increases (i.e. CPU, Memory, graphics) at the user level, the more complex and costly the virtualization solution becomes.

Project Deliverables:

- Virtualization of up to 200 County applications
  - For up to 15,000 County Users

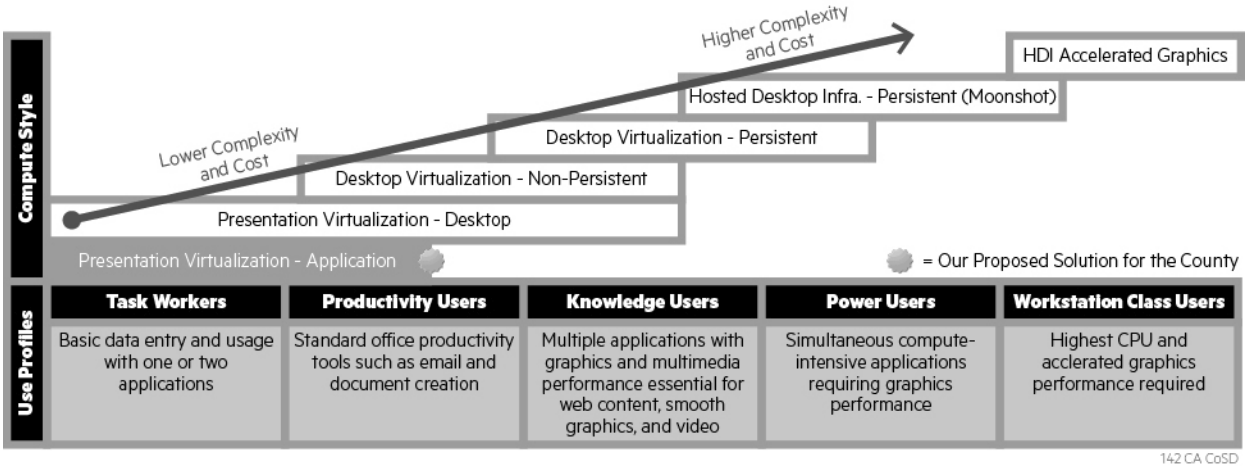
We assume High Concurrency of end users, meaning that for the most part, multiple users will be accessing the application(s) at the same time.

Client virtualization processing load is not only determined by the number of concurrent users, but by the complexity of their applications. The greater the application complexity, the lower the user density per server. As a result, application complexity is an important determinant of the number of concurrent users that can be supported on a given Client Virtualization Service (CVS) solution. HPES classifies application complexity into three groups: light, medium, and complex and has assumed an application profile of medium complexity for the County. Medium Complexity is a standalone application that has minor dependencies on the OS, a prerequisite application, or large/complex data feeds. Most business-related common off-the-shelf applications are considered medium complexity. One notable exception is Microsoft Excel workbooks with embedded macros that can be considered complex in nature.

Specific deliverables include:

- CVS design assessment
- Detailed Presentation Virtualization solution design
- Implementation of the approved solution
- Standardized HPES CVS Presentation Virtualization monthly reports.

Figure 170. Presentation Virtualization



The approach decouples the legacy applications from the device in a way which minimizes the infrastructure and overall costs compared to other virtualization approaches.

Rationale: Presentation Virtualization, provides all the required functionality and is significantly more cost-effective than other solutions, such as VDI (i.e.. Desktop Virtualization, both non-persistent and persistent). We recommend a periodic re-evaluation of Client Virtualization after a number of years, perhaps making the next step to VDI if the requirements change, and if it makes sense financially for the County. This would also be a time to review the current desktop build from the ground up, since VDI would require a much thinner client.

HPES designed the solution for the County to use the same software stack and versions to deploy and to manage it throughout the life of the contract. The solution includes:

- Lakeside Software's SysTrack (for Assessment)
- Citrix: XenApp, XenServer, NetScaler
- Microsoft Server, SQL
- AppSense DesktopNOW Environment Manager.
- Liquidware Labs 'Stratusphere™ UX', Profile Unity and FlexApp
- HPE's Standard Reference Architecture
- Automated Tools – Automated systems and tools involved in proposed solution

Our analysis shows that typically 80 to 90 percent of the use cases can be met by presentation virtualization (typically Citrix XenApp). Presentation virtualization is the most cost effective way to deliver legacy applications when compared to other desktop virtualization technologies, including VMware solutions.

The RFP states that desktop product upgrades or changes to the Applications Portfolio require significant time and engineering efforts to deploy. Presentation virtualization addresses this issue in that upgrade engineering and testing need only focus on one image: that of the server in the data center running the application that is being presented to the user. Virtualizing desktop applications removes a dependency on various desktop client hardware.

This helps prevent deployment delays and post-deployment problems while improving the ability to rapidly maintain desktop currency, at least for the many desktop applications that are virtualized.

Presentation virtualization will also help maximize the performance of all the applications on the end user device, whether virtualized or local.

Timing: The Presentation Virtualization project would follow Transition completion.

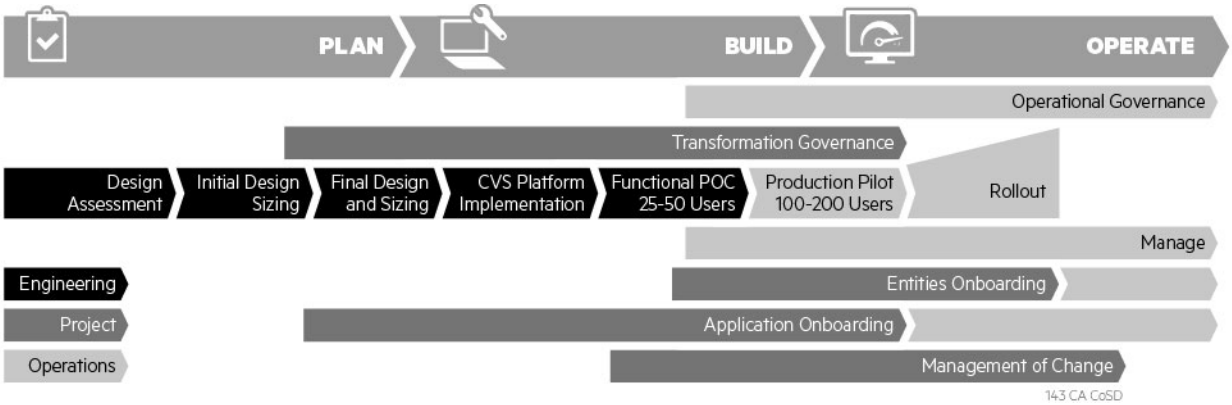
Risk Considerations: The introduction of client virtualization changes the way users perform their work and is therefore considered disruptive. Failed first attempts to introduce users to client virtualization result in roll-out delays, onboarding program rework and reintroduction to users which is costly, time consuming and can significantly erode the expected ROI. For a high degree of success, consider the following:

- **Entity onboarding** - Depending on the structure of the customer and according to the priorities defined during the assessment/analysis/design phase, we recommend ramping up users by personas (groups of users). User personas could be a business unit, a department, a typical group of user profiles based on common desktop or application requirements. This will involve identifying people, managing the persona grouping, desktop and application group entitlements and orchestrating this by means of Active Directory.
- **User onboarding** - Onboarding management and Client Virtualization Service (CVS) Management links the two onboarding subphases (Entity and User onboarding). We propose to migrate a category of virtualized users either by a specific persona and/or with relatively similar desktop/application requirements, and begin with less complex use cases then progress to the more complex. Subsequently, the scope will be increased until all users have been on boarded successfully.

All onboarding activities are managed and controlled by an onboarding manager. Once users are successfully onboard in the production environment, they are managed like any other user with a CVS Service Manager. The CVS Service Manager monitors the overall performance of the virtualization service, coordinating performance review meetings and reports with both the customer and CVS operations.

Key dependencies and Milestones: Our proposed deployment is comprised of two discrete parts, with the second part dependent upon completion of the first. These are CVS design assessment and implementation.

Figure 171**. Representative Key Milestones for a Presentation Virtualization Deployment**



Please note that the durations and dates of the major tasks are dependent upon the data gathered from the first step, the Design Assessment. After the Design Assessment, HPES develops the final implementation timeline. Typical Presentation Virtualization projects of similar complexity to the County's take approximately five months.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

The following HPES resources will support this transformation project:

- The HPES Workplace Transformation Consulting Team will perform the CV Assessment
- The HPES implementation team consists of
  - An overall Program Lead that is a subject matter expert (SME) in End-User Compute solutions.
  - Additional SMEs based on the overall solution scope and may include but is not limited to: project management, deployment and implementation planning, infrastructure specialists, user onboarding, training, Image Creation / Mgmt., application packaging and testing.
- A senior Transformation Manager who is responsible for the end-to-end project scope and stays in place until acceptance criteria have been met.
- Ongoing support for the Presentation Virtualization service will be delivered by US-based delivery resources in line with the County's requirements.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

We follow a proven methodology for CVS implementation that begins with the CVS Design Assessment, and continues through implementation and ongoing management as described below.

CVS Design Assessment: HPES will assess a sample of existing County users, looking at how they interact with their apps and analyze how the apps interact with users' devices. This helps the appropriate applications for each user type to be identified and drive the transition plan from the current mode of operation (CMO) to the desired future mode of operation (FMO). This assessment will take into consideration the following items:

- The desktops included will be a sample of end-user desktops for each type of user and IT usage
- A "Type of user" categorization, which refers to the type of applications users work with the intensity with which they use them as measured by CPU, RAM, disk IO, and network traffic
- A "Type of usage" categorization, which includes not only the PC, laptop, tablet, smartphone, or engineering workstation each user needs to do his/her job, but also any requirements for peripherals such as USB connected security dongles, portable data storage, cameras, meters, and other specialized devices. The goal is to identify the subset of IT usage that provides the majority of business value, identify a solution that meets the core requirements for providing that business value, and, after the core requirements are met, identify how to support all other candidates for virtualization for the optimum incremental cost.

There are three steps to the Design Assessment:

- Startup
  - Developing a statement of requirements to confirm that the engagement team understands the purpose of this engagement from the County's point-of-view
  - Developing a data collection plan that details how the engagement will collect the data needed for this assessment: The purpose of this plan is to enable County personnel responsible for change management and information security to approve the data collection.
- Execution
  - Meeting notes from a discussion of the County's intended future mode of operation (FMO) to confirm that engagement team understands the desired outcome
  - An assessment report that summarizes and analyzes the collected data: The engagement team will review this assessment with County stakeholders
- Closedown
  - A solution document that identifies the next steps that the County and engagement team have jointly recommended as a result of reviewing the assessment report.

This assessment validates the initial assumptions or identifies necessary modifications of the initial assumptions related to the original scope for this effort. This revised scope, based on the data that was

gathered and analyzed, can affect the original solution and can have an impact on the overall solution components including; infrastructure, labor and software that is required for the solution.

CVS Implementation: At the start of the implementation phase of the project, we hold a workshop to begin the planning process. We will work collaboratively with the County to identify and agree upon key milestones and objectives, and we will report status on these throughout the implementation.

We have an established and proven transformation methodology that follows an industrialized "factory" approach. This methodology is organized in phases, as described in the following overview, with clear milestones that are established by HPES and the County after the Design Assessment. We then create a mutually agreed to transition plan with a detailed work breakdown structure, milestones and owners for execution.

The activities executed during the Implementation Phase of the project are:

- Design Sizing (Initial, Final)
  - Review of assessment data (user usage, application usage, network, user data, security)
  - Architecture Design and Infrastructure Implementation Plan established
- Infrastructure Set-up
  - Site preparation in the Tulsa data center and equipment provisioning. This environment can be implemented as an expansion to your MPC environment, or as a standalone virtual infrastructure under the HMCB, in order to integrate it with your hybrid cloud.
  - Server installation (HW and operating system)
  - Server integration in the County's Active Directory Domain
  - Server integration in the Tulsa data center and linkage to other infrastructure service (DNS, Storage, proxy, AV system, etc.)
  - Software implementation and configuration
- Functional Testing
  - Functional pilot or Proof of Concept (POC), is performed by a small group of IT users to verify compliance (to functional and technical requirements) and performance of the solution, and tune the configuration if necessary.
- Production Pilot
  - While the functional testing above is focused on IT users with client virtualization familiarity, this testing phase focuses on the general user population with the goal of testing both the technical solution and the roll-out plans and materials.
  - The Production pilot is performed with 100 to 200 selected users operating in the production environment. This pilot is for a fixed, short period of time. Test scripts are supplied to pilot users that identify the specific activities a participant should perform. We then examine the results for faults and provide feedback to the delivery team. We correct any faults, either by correcting the script, user performance of the script or infrastructure/software correction. Once corrections are in place, we re-run the script will be re-run until all test scripts are successfully completed with no issues.
- Onboarding
  - During this phase, we manage two kinds of onboarding (Entity and User, as mentioned above), each of which potentially influence the other. Workgroup/departmental similarity in application use, security, and the County's implementation priorities are the main factors in identifying a roll-out plan.
- Management of Change
  - Throughout the entire pilot and rollout period, the Transformation Manager will work with the implementation team and the operational support team to verify that the rollout plans are communicated, support is in place and end user issues are addressed.

- Qualifications and Experience – Background and experience in comparable environments

HPES has demonstrated extensive industry knowledge and experience managing virtualized computing environments, with more than 725,000 seats deployed. Based on the most recent version of The Forrester Wave™ for Global Workplace Services HPES is positioned as a Leader.

We leverage our relationships with market leaders—Microsoft, Citrix, and Liquidware Labs—to create a fully integrated client virtualization solution that provides better security, greater flexibility, and lower costs than locally installed applications or desktops on traditional PCs.

> "A client virtualization implementation requires software, hardware, and services and a proven methodology to enable faster installation of the right solution the first time. HPES is one of the few companies that can offer all of these components."
>
> *IDC white paper; Driving business Value With Virtualization*

Our experience and expertise includes:

- Reachback to highly qualified delivery personnel in Centers of Excellence around the world to take advantage of the knowledge gained from previous client engagements. With more than 300 Citrix Certified professionals, HPES has the experience to deliver even the most complex solutions. We are currently managing 725,000 virtualization seats and 100,000 virtual applications in almost every industry.
- Serving more than 570 clients in 135 countries
- More than 15 years of experience providing Client Virtualization Services
- Recognition as a VDI market leader and innovator with over 650K (and growing) seats deployed in in multiple industries and countries - Nelson-Hall
- Using market-leading technology from Citrix, Liquidware, and Microsoft delivered through a global center of expertise and four global delivery locations

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

Initiatives: User Data Services (Exhibit KK, Section 3.2)

- Key Considerations and Potential Alternative Approaches

One of the steps to achieving a truly mobile workforce is to separate the data from the device. By doing so, County employees will be able to access the data necessary for their job from any number of devices, whether County-owned or through Bring Your Own Device (BYOD), or even via the Web. Knowing this, we have formulated a number of key considerations. The solution must have the following characteristics:

- Be secure
- Allow user data to be decoupled from the user's device
- Take advantage of existing licensed solutions, tools, and services
- Allow various levels of access.
- Support collaboration both within the organization and external to it.
- Finally, County users span many different types of work, and they are multi-generational as well. Because of this, our solution balances a new way of interacting with one's data along with the need to maintain some form of familiarity.

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

HPES recommends taking full advantage of the technology the County already has using your Office 365 subscription and OneDrive for Business. This solution satisfies the specific requirements of the County identified in Schedule KK, Section 3.2, and it addresses a multitude of possible Use Cases.

OneDrive for Business includes apps for smartphones, and allows mobile access through the mobile device management (MDM) solution.

As subscribers to the G3 level of Office 365, each user has 1TB of space on their OneDrive for Business account. Microsoft research shows that the vast majority of business users consume much less than 1TB our research on the County's historical use of file shares supports this. The entire size of County network shares is 78TB for all 15,000 users. HPES will continue to work with Microsoft to facilitate optimal configurations.

End users can collaborate in several ways. Using OneDrive for Business, a user can share a document or series of documents from their own OneDrive for Business data space. The documents themselves are not delivered to the other user. Rather, a link to that document allows the designated user (and no one else, besides the owner) access to only the documents the owner wants to share.

Departments or divisions that want to have a shared space for their exclusive use can create "groups." Access to these groups is initially fully locked down. The owner of the group would have to explicitly invite members to use the shared space.

To fully realize the benefits of Office 365, users must make the move from using network file shares to storing their data on OneDrive for Business. We propose a project to migrate data on user network file shares to their OneDrive for Business location. The project steps at a high-level are:

- **Group Policies / Powershell Scripting.** The moves will be automated via Powershell scripts and actioned via group policies.
- **Search for invalid files/folders and cleanup.** OneDrive for Business has different requirements for filenames and folder structures than Windows. We will need to locate the files that will not move in their original states.
- **Pilot.** We will migrate a test group of users via automated processes.
- **Scheduling.** The migration will need to occur in waves. The project plan assumes a conservatively low size of 300 users per wave. As the waves progress, the size of subsequent waves might grow, thereby shortening the project.
- **Communication / Training.** OneDrive for Business is a paradigm shift from the traditional way of interacting with data files. We will develop and deliver a communication plan as well as training for users who migrate to OneDrive .
- **Migration (waves).** The migration will occur in waves, with support throughout the entire project. At the end of the project, all County users will have completed a migration from a network share data to their OneDrive for Business account.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

For OneDrive for Business, all data is stored in Microsoft's Government Community Cloud.

Support for OneDrive for Business will come from the Service Desk. OneDrive for Business issues will take advantage of our enhanced support for Office 365 service, which uses HPES support resources working on-site with Microsoft Office 365 support engineers.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

We support OneDrive for Business, using time-tested infrastructure processes of both HPE and Microsoft, which emphasize delivering measurable, repeatable, and efficient services to the end user.

- Automated Tools – Automated systems and tools involved in proposed solution

For the rollout and subsequent maintenance of the end-user device connectivity to OneDrive for Business, we will use Group Policy through Microsoft System Center Configuration Manager (SCCM). This will allow a smooth rollout of the solution and will make subsequent revisions for new requirements easier as well.

- Qualifications and Experience – Background and experience in comparable environments

Internally, HPES has transitioned ~300,000 users (HPE/HPI combined) to OneDrive for Business, using it for individual storage, collaboration, sharing, and device backup. HPES will follow a similar process to successfully migrate the County to the OneDrive for Business solution.

This solution takes advantage of our 30-year history of partnership and collaboration where HPES is the only Microsoft partner to have co-located shared support resources for Office 365 for the exclusive use of our customers.

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

Initiatives: IT Application Portfolio Management Services (Exhibit KK, Section 3.3)

- Key Considerations and Potential Alternative Approaches

Over the past 10 years, the HPES account team has developed a proven practice to manage the County's IT application portfolio. The foundation of this approach is close collaboration with County stakeholders, GITMs and department leads, plus incorporating numerous tools to gain access and visibility into applications usage, usefulness and life. Ongoing application rationalization has helped facilitate this decision making by looking at gaps, and reducing complexities surrounding the application portfolio. It has also helped to support new business initiatives by providing information that links strategy to intelligent investments. Our application rationalization project in 2012 led to a number of major projects that have benefitted the County, such as

- Replacement of a third party eBenefits system by incorporating its capabilities into a Peoplesoft upgrade
- Implementation of iTrack as collection point and system of record for Information Technology Outsourcing (ITO) expenditures
- Deployment of the new Electronic Document Processing Platform (EDPP)

IT Application Portfolio Management supports the continuous assessment of IT application portfolios to:

- Standardize portfolio management
- Align the IT application portfolio with business strategies
- Reduce deployment time
- Improve operational efficiencies
- Reduce costs and optimize value
- Increase visibility and understanding of the application portfolio

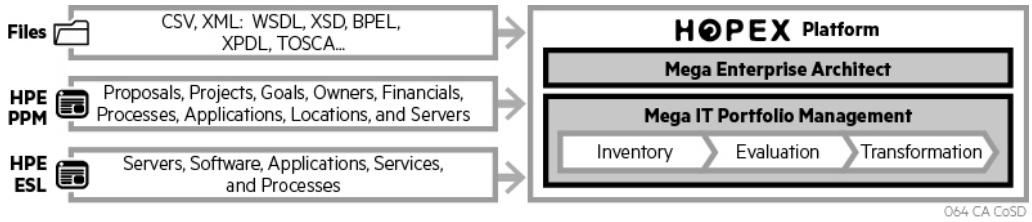
Key considerations for this transformation project require selecting a tool suitable for meeting the criteria listed below. These criteria are based on the initial list of items contained in Exhibit KK, and derived from the requirements.

- Highly configurable
- Integrated environment
- Integration with source systems
- Speed of implementation
- Develop architecture disciplines to maximize in-place tools
- Business capability mapping
- Incorporation of application portfolio inventory
- Define cost elements
- Project-related information
- Rationalization alternatives/recommendations

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

Solution: MEGA's HOPEX platform offers a comprehensive, well-rounded, feature-rich platform that provides an out-of-the-box metamodel that is highly configurable and has strong modeling capabilities. It also supports a wide range of industry frameworks. HOPEX combines industry-leading practices in enterprise architecture (EA), IT portfolio management (ITPM), business process analysis (BPA), and governance, risk, and compliance (GRC) into a single platform. This integrated solution gives an interactive view of all business and IT components to help drive business and IT transformation as shown in Figure 172.

Figure 172. MEGA IT Portfolio Management



This fully integrated solution gives an interactive view of all business and IT components to help drive business and IT transformation.

Use of this tool facilitates creation of a complete inventory of IT assets, including applications, underlying technologies, and servers. Both out-of-the-box and custom reports provide information that makes it easy to evaluate IT assets using multi-criteria analysis such as costs, risks, technical efficiency, and business value, bringing visibility to the County's IT portfolio. This information also provides insight about dependencies and helps to identify redundancies of IT systems while reducing costs and complexity by eliminating systems with the same functionality. MEGA also provides the ability to create and compare multiple transformation scenarios that take into account various criteria to select the most relevant scenario for their business needs and constraints.

Upon approval from the County to proceed with this transformation project, HPES and MEGA consultants will schedule a project planning and kickoff meeting. A topic of discussion for this meeting will be identification of County stakeholders that requested to participate in requirements gathering sessions to make certain the MEGA ITPM is configured correctly to meet the requirements.

Once in place, MEGA ITPM provides a three-step approach to managing IT assets:

1. **Inventory**: ITPM automates the collection of IT assets through a web-based interface. It provides metadata that can describe IT assets through various parameters such as functional scope, lifecycle, costs, and risks, providing a comprehensive view of the existing IT portfolio.

The inventory creation will use MEGA's APIs to interface with the ESL, partner systems, and other feeder systems (i.e., AppsManager) to make certain accurate data is in place. Once the inventory data is populated, IT assets can be viewed by business lines, business processes, business capabilities, organizational units, and technology vendors.

2. **Evaluation**: This step assesses IT assets through either out-of-the-box or custom criteria such as costs, risks, business value, and functional support. It provides detailed analysis through cost, dependency, and impact reports (i.e., Brick's compliance). To rationalize the portfolio, it provides insight into which IT assets need to be removed, replaced, or maintained. Using business capability maps, IT assets are organized by functional areas, and changes are displayed over time, helping to make better-informed decisions.

Also during this step, costs and other project-related information are associated with the assets. The IT assets are evaluated by business value, functional support, and technical efficiency through the use of IT portfolio evaluation campaigns.

3. **Transformation**: In this step, the County can define a mix of initiatives or assumptions such as extending, replacing, or phasing out applications and technologies and compile them into different scenarios. The County can then assess and compare these scenarios through various criteria such as risk to quality, risk to feasibility, and costs and then identify the best transformation scenario to implement.

Rationale: The County has stated a clear preference for the MEGA ITPM tool. We have designed this project based on the recommendations of the product supplier, with the following characteristics and caveats:

- As requirements evolve, additional MEGA modules, such as Enterprise Architecture and Governance, may be required.
- Information from the HPES ESL, PPM, and AppsManager will be maintained by the source systems and will be updated by MEGA at scheduled times.
- MEGA out-of-the box functionality will be used for this effort.
- HPES will install, configure, and manage MEGA modules.
- Licenses are included for MEGA HOPEX WorkBench and ITPM module for 30 contributors, 10 Portfolio Managers (GITMs) and 5 Advanced Users (CTO).

Timing: HPES proposes to use the MEGA Quick Start program for implementation of MEGA ITPM. In the MEGA Quick Start program, HPES will collaborate with MEGA consultants to conduct a project kickoff that includes the definition of project scope and schedule. Typical installation and configuration of a MEGA project takes about 45 days, including installing and configuring MEGA ITPM, conducting functional/deployment specifications workshops, designing supporting MEGA metamodels, testing the changes, reviewing and mapping the artifacts, uploading the artifacts, establishing portfolios and hierarchies, and training supervisors and users.

Risk considerations: Potential risks that could affect the project include the following:

- Automating APIs and metamodels will require configuration and potential connector development to accommodate integration with external systems of record: AppsManager, PPM, and HPE's ESL.

Key Dependencies and Milestones: Following are the key milestones and dependencies for the project:

- Kickoff: Receipt of County approval to begin will initiate kickoff of the engagement. After the kickoff session, we will define the project scope and develop the schedule.
- Installation: The next milestone is installation of MEGA on the established infrastructure. This is dependent on the availability of SQL Server licenses and availability of the infrastructure.
- Specification: The next milestone is conducting and delivering the functional/deployment specifications workshop. Part of this deliverable will be demonstration of MEGA ITPM capabilities. HPES will prepare an ITPM customer guide. The deliverable will include the functional/deployment specifications and customer guide. This task is dependent on availability of the designated County users who will provide the requirements for use of the MEGA system.
- Configuration: The next milestone is reached when the configuration and customization of MEGA is completed using the functional/deployment specification as defined above. During this step, the supporting MEGA metamodels will be designed, built, tested, and implemented.
- Artifacts: The next milestone is reached when all artifacts are uploaded in MEGA after reviewing and mapping the ITPM specific artifacts. The portfolios and hierarchies will also be established during this cycle. At this time we perform acceptance testing to verify that it is set up correctly.
- Training: This milestone will be followed by a training session for users.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

Resources: For implementation of the MEGA ITPM toolset, HPES will use MEGA's Quick Start program. MEGA's experienced consultants will work with us to install, configure, and set up the MEGA environment. MEGA consultants and HPES staff will work with County staff to demonstrate MEGA HOPEX functionality, determine functional and deployment needs, and document the supporting requirements. To minimize the County's time investment while maximizing impact, we will conduct information gathering workshops through a series of focused discussions with stakeholders to make certain that we have an accurate understanding of the County's needs. At the end of this effort, we will deliver a functional deployment specification and a user guide. We will then help design MEGA metamodels and make the configuration changes to interface with PPM, ESL and AppsManager systems. We will then upload the artifacts and establish portfolios and hierarchies in accordance with the County's needs. Our team will also provide training for the user groups who will use MEGA ITPM toolset.

The HPES team supporting the MEGA toolset will work closely with CTO, and supporting staff to provide a collaborative working environment. This will enable direct communication and provide the County with the ability to reach out directly to HPES personnel for quick resolution of any issues.

Facility: HPES will locate the MEGA infrastructure in the Tulsa data center.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

We will perform the installation, configuration, and management of the MEGA ITPM toolset using ITIL v3 processes, consistent with the established processes for managing County assets. We will use our system development life cycle (SDLC) processes in collaboration with the County staff to configure and make necessary updates to MEGA application programming interfaces (APIs) to align with automated systems and tools involved in proposed solution

The MEGA ITPM tool provides all required functionality to meet the County's requirements, and it will integrate with AppsManager, PPM and the ESL solution.

- Qualifications and Experience – Background and experience in comparable environments

HPES manages COTS product implementations across many Federal and state agencies and uses the MEGA toolset at Procter & Gamble (P&G). At P&G, we deployed and configured the MEGA Suite as the company's system of record for business, information, application, and technology architectures. The suite was designed to let P&G map out and understand processes and how they relate to the services that it delivers. The suite is integrated with the P&G service management stack to integrate portfolio artifacts. HPES provides advisory services to help P&G identify and eliminate redundancies and gaps. Through this process, P&G expects to be able to develop and deliver these shared services at lower cost, resulting in financial savings for the company. The MEGA Suite has become the system of record for all architectures: business, information, application, and technology. It is one of the core systems for the IT landscape on which P&G runs shared services for the company. The MEGA Suite allows information to be changed once in the repository; the updated data flows across the IT landscape.

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

- None.

Initiative: Network Transformation (Exhibit KK, Section 3.4)

- Key Considerations and Potential Alternative Approaches

The HPES network team has implemented a unique approach to transformation that has set a new standard in its effectiveness and ability to align with County strategy while delivering vision and perspective that enable the evaluation of near-term and long-term opportunities. The foundation of this approach is close collaboration with the County Technology Office (CTO), the HPES Chief Technical Architect, and the HPES Enterprise Architecture team. Technical leadership meet weekly to discuss strategic objectives and the technology and industry influences that provide the impetus for new solution development.

Our team has adopted a "start fast" approach that enables experimental and rapid evaluation of technology—many times in the production environment—that helps our teams understand not just the viability of a potential solution but the integration challenges associated with it, including those that could impact adjacent frameworks. This bi-modal "mode 2" approach has proven extremely effective in driving continual improvement across the entire enterprise. As new solutions to business problems are evaluated, this iterative practice makes certain that our roadmaps remain agile—not bogged down with dependencies—with traditional planning efforts saved for solutions already confirmed as viable.

We save time, drive change rapidly, and identify fatal flaws before solutions are brought into the environment, in turn avoiding costly overruns and business impacts. We are proud of this approach and believe that ultimately it will continue to position the County as a leader in its utilization of IT as an enabler to the enterprise.

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

The HPES approach to network transformation leverages the existing investment that the County has made in its infrastructure, building on the robust, geo-redundant network core to enable new service adoption while we migrate from legacy technology. This foundation positions the County to make smart, progressive choices in the way services are delivered to its employees and constituents, regardless of their location or access device. As the County network continues to evolve, our ability to provide ubiquitous connectivity with seamless accessibility, security, and performance will provide the benchmark of our framework.

The solutions highlighted in this section include transformation initiatives planned for implementation early in the term as well evolutionary technologies that may arise later in the contract life cycle. In the near term, all defined solutions represent planned implementations inherent to the services described in Section 4.3 of the RFP and are priced in Schedule 16.1-1 accordingly. Relative to statements focused on technology not yet available for deployment, AT&T will evaluate the feasibility of these solutions and provide roadmaps over the contract life cycle. If identified as a viable replacement to existing services, AT&T will make recommendations for upgrades in line with refresh obligations or as otherwise agreed to with the County.

Cloud Enablement via NetBond

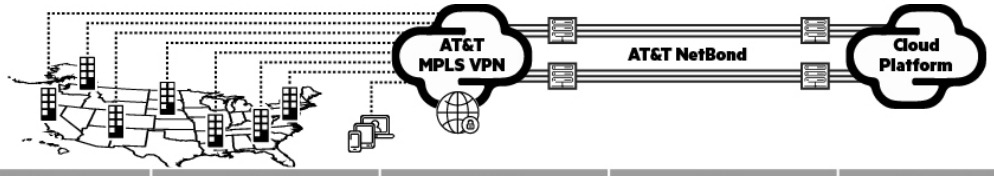
As cloud-based services mature and become more viable for Government use, we are positioning the County's network perimeter to enable seamless, secure, and performance-assured integration for cloud providers. AT&T will build a geo-redundant core network foundation to enable this shift in services, leveraging AT&T's virtual private network (AVPN) MPLS-based transport. This foundation will be deployed as a transformation activity in preparation for future services early in the contract term and is priced in Schedule 16.1.1.

Building on our AVPN transport, AT&T's optional NetBond service will be made available on a per cloud provider basis, enabling secure, performance-assured cloud-to-enterprise peering, in turn isolating these important services away from the unsecure and potentially congestion-prone Internet Service Provider (ISP) links. The NetBond service is represented in Exhibit 16.1.2 as a proposed new RU, where the County can select peering relationships with designated cloud providers on a bandwidth scaling basis. Cloud provider side costs may apply and will be priced as new RUs when establishing a new cloud provider contract, as requested by the County.

In support of the transition of Exchange to the O365 cloud, AT&T offers the optional service that will enable Netbond functionality in a peering arrangement with Microsoft's ExpressRoute product. This option will be designed and implemented in line with the specified transition plan and is priced as a separate resource unit that combines the NetBond RU (highlighted in Exhibit 16.1.2) with the ExpressRoute costs to complete the connectivity model for the service.

Figure 173 illustrates NetBond benefits; Figure 174 represents some of the well-known cloud services partners to which AT&T currently supports connectivity via NetBond; Figure 175 depicts security benefits of AT&T NetBond; and Figure 176 shows the performance benefits of NetBond.

Figure 173. AT&T NetBond Benefits



Performance	Security	Simple	Agile	Cost Effective
Direct on-net routing; reliable redundancy	Separates customer data; flows to the cloud	Easy to add and change cloud access in near-real time with API	Built-in "burstability" that scales in tandem with cloud	Cloud-like pricing with no long-term commitments

025 CA CoSD

Figure 174. Well-known cloud services partners that AT&T currently supports via NetBond.

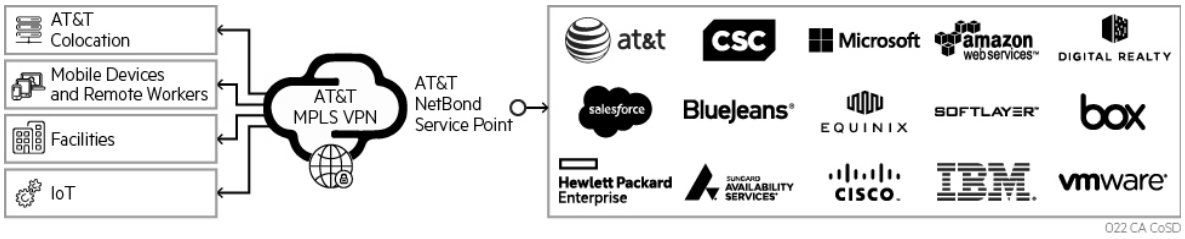


Figure 175. Security Benefits of AT&T NetBond

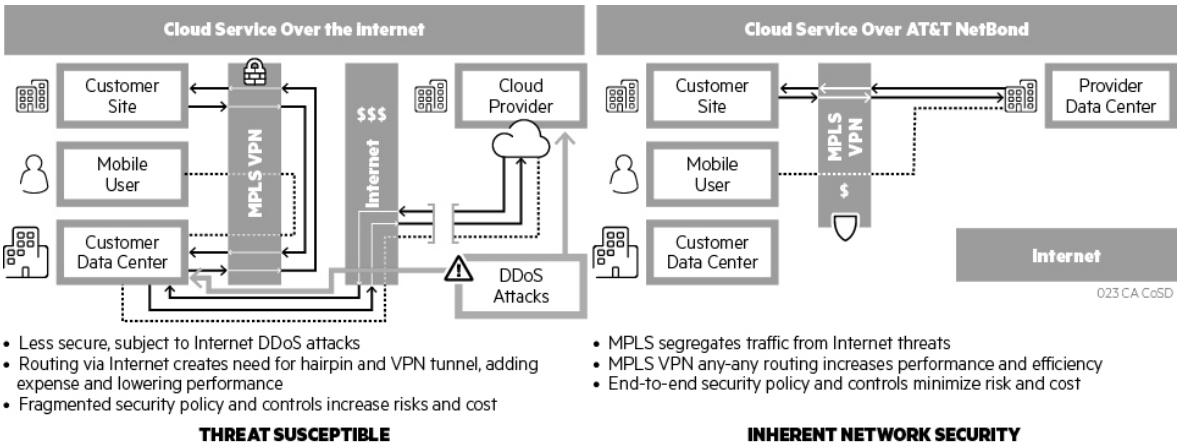

Figure 176. Performance Benefits of AT&T NetBond

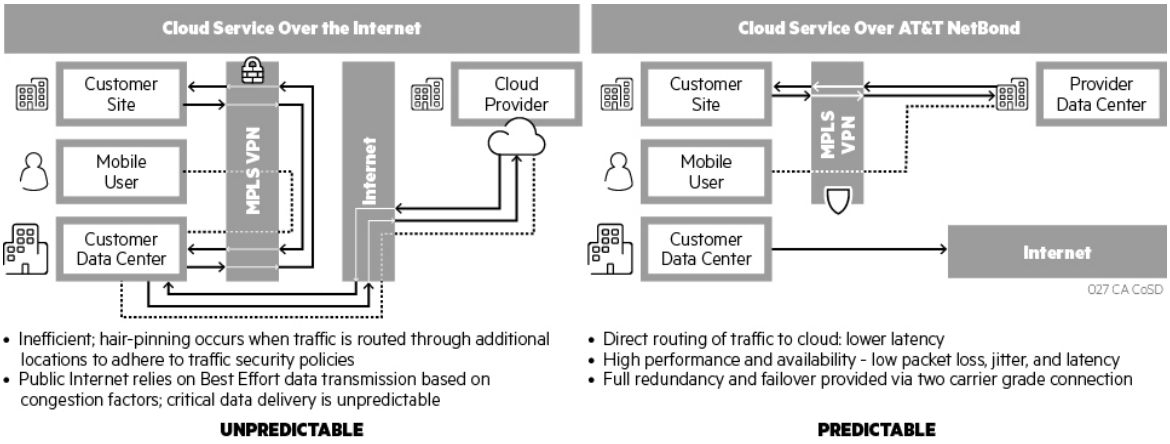


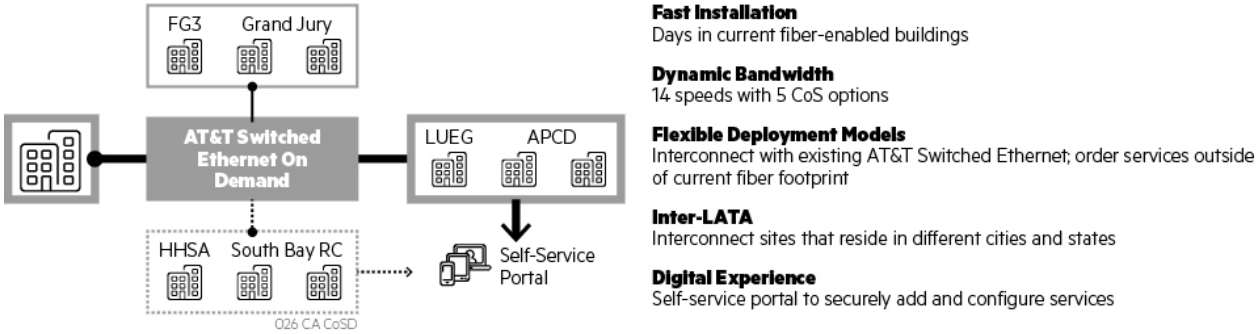
Migration to AT&T Switched Ethernet with Network on Demand

HPES' transformation plan for the County's wide area network (WAN) includes migration of all 115 OPT-E-MAN Metro Ethernet connected sites to the AT&T Switched Ethernet with Network on Demand (ASE w/NOD). Additionally, all data T1 sites will be evaluated for migration and where available without significant special construction costs, sites will be migrated to this new service. Special construction costs apply when fiber based transport is unavailable in the "last mile" from an underground or above ground exchange nearby a given site. The fiber install from these local exchanges is included in normal construction, but installing extended runs to new areas with no local exchange would be grounds for special construction. During the design and provisioning process, HPES will provide a list of T1 sites to

the County with special construction costs for consideration. At the time of this proposal, it is believed that 80-90% of the existing T1 sites are eligible for migration to this new service.

Using software defined networking (SDN) capabilities inherent to ASE w/NOD, bandwidth can be adjusted within 15 minutes from as low as 2 MB to as high as 1 GB. Coupled with real-time capacity management capabilities, this new service will allow rapid response to County bandwidth needs as well as enable the planning of additional throughput for scheduled events. Additionally, the deployment of fiber-based services will further improve consistency, availability, and performance of the remote sites across the network. Figure 177 lists benefits of AT&T Switched Ethernet On-Demand Service.

Figure 177. AT&T Switched Ethernet On-Demand Service Benefits



ASE w/ NoD Site Redundancy

HPES has evaluated enabling additional remote site redundancy at key County facilities. The facilities listed below are historically some of the most important to County business functions and are the recommended sites for this enhanced service. It's important to note that the site list includes two sites that are currently on the Gigabit backbone (Sites 18 & 33), but are planned for migration to ASE w/ Network on Demand as a part of the Network Transformation, Backbone Consolidation project (see next section).

Site #	Site Name	Street Address	City	Zip Code
13	Children's Service Center (Adoptions Center)	6950 Levant St.	San Diego	92111
18	MTS Trolley Tower (Mills Building)	1255 Imperial Ave.	San Diego	92113
19	Lemon Grove District Office / FRC	7065 Broadway	Lemon Grove	91945
33	Health Services Complex	3851 Rosecrans St.	San Diego	92110
35	Animal Control-Central Shelter	5480 Gaines St.	San Diego	92110
55	Oceanside Service Center	1315 Union Plaza Ct.	Oceanside	92054
56	A. B & Jessie Polinsky Children's Center	9400 Ruffin Ct.	San Diego	92123
57	Child Welfare Services - Central	4990 Viewridge Ave.	San Diego	92123
80	Assessor/Recorder/Clerk Kearny Mesa	9225 Clairemont Mesa Blvd.	San Diego	92123
81	Assessor/Recorder/Clerk San Marcos	141 E. Carmel St., Bldg. 1	San Marcos	92078
95	HHSA FRC Center South Bay	401 Mile of Cars	National City	91950
190	HHSA FRC Center Escondido	649 W. Mission Ave.	Escondido	92025
205	Edgemoor Geriatric Hospital	655 Park Center Dr.	Santee	92071
260	Assessor's Revenue and Recovery	590 3rd Ave.	Chula Vista	91910
290	Access 211	8765 Fletcher Pkwy.	La Mesa	91942

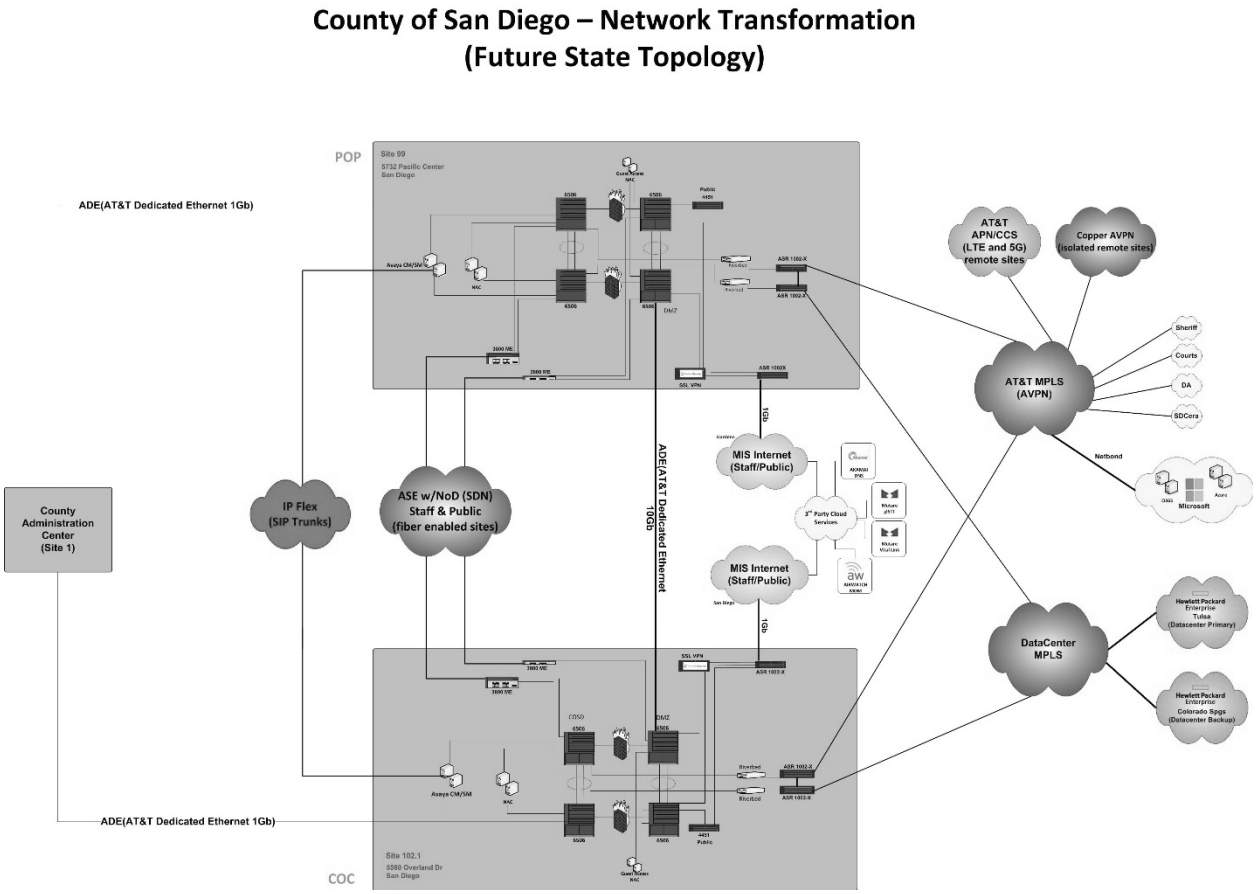
The standard Network on Demand design provides geo-redundant host circuits, however from the last Central Office, this diversity is reduced to a single fiber pathway to the remote site. The redundancy design will involve provisioning a redundant circuit with diverse fiber path and infrastructure from an alternate central office. This secondary pathway will extend to the remote site, entering via redundant entrance facilities. The circuits will be ordered and built as stand-alone circuits and configured with minimal bandwidth, which will leverage the Network on Demand near real time bandwidth provisioning capability to provide fully functional bandwidth in the event of a failure on the primary path.

HPES proposes the completion of requisite core transport design work which will result in a per site construction cost for County consideration. This process will also allow the County to evaluate cost of diverse entrance facilities. These one-time costs would be the responsibility of the County. The County may evaluate these costs and select sites that have the greatest benefit without being cost prohibitive. As these sites are selected, and one-time costs agreed, HPES will execute an order for the service. This offer will remain valid over the first four (4) years of the contract term. County requests to add sites not listed in this proposal will be handled on a case by case basis.

Backbone Consolidation

AT&T also adheres to the concept of keeping it simple where possible. While some network solutions can be incredibly complex, the core architecture does not have to be. By reducing the number of core backbone sites (GigaMAN Connected), AT&T can simplify the network architecture while providing redundancy, sufficient bandwidth, and throughput for County business. This allows us to right-size and tailor services in accordance with the needs of a location without the costs, equipment, and infrastructure inefficiencies that come with unnecessary capacity. The net result is standardization of transport connectivity across all County sites, providing the shortest path to services, in turn leading to predictable performance, improved security, reduced maintenance cost, and lower mean time to recovery (MTTR) in the event of an incident. Figure 178 illustrates the future-state network topology.

Figure 178. County of San Diego Network Transformation (Future State Topology)



Session Initiation Protocol (SIP) Core Expansion

Our network team has already begun the process of transformation within the County to phase out Time Division Multiplexing (TDMbased voice connectivity in favor of Session Initiation Protocol (SIP)-based solutions. Our SIP infrastructure is provided via two AT&T IP flex trunks, provisioned over the geo-redundant AVPN core network, that are dynamically available and sized to take a full production load of traffic in the event of a circuit failure. Currently, the SIP trunks are configured to support local outbound calling. Expanding on this foundation, we plan to increase the capacity of these trunks to enable support of all Avaya core network controlled outbound calls, including local, long distance, and toll services. This expansion will eliminate outbound usage-based costs for these legacy resources units. Inbound calls will be migrated to SIP including Toll Free 800 services, which will substantially reduce the usage charges associated with Toll Free 800 services. Over the life of the proposed contract, we will continually evaluate the capabilities of these trunks to support additional voice and unified communication services.

Future T1 Migration for Non-ASE with Network on Demand Sites

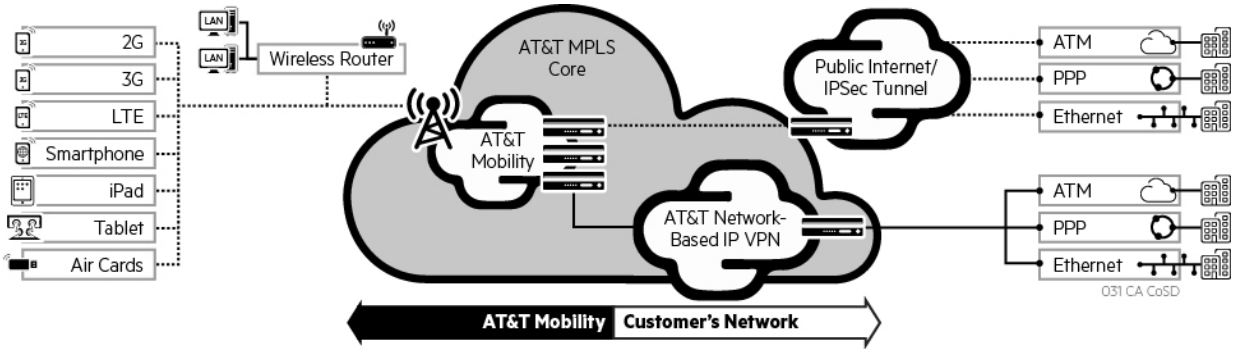
As identified earlier, T1 transport utilizing legacy TDM based connectivity, will be targeted for migration to ASE with NOD where possible. However, where fiber is not available without prohibitive construction cost, AT&T will evaluate products such as copper-based AVPN that provides transport redundancy to the geo-redundant core. This service layers an AVPN service over a T1 copper circuit, providing AVPN cloud connectivity from a central office, creating pathway redundancy across the LAN. This solution continues to leverage the copper based wireline infrastructure that supports the site today, with a single

point of failure still remaining on the "last mile" of transport to the remote site. As we evaluate our options for eliminating T1 sites these factors may drive us to pursue other alternatives.

Such an alternative could leverage the AT&T mobility network infrastructure using Commercial Connectivity Services (CCS) over a private Access Point Network (APN) service. Using LTE/4G (or potentially even 5G connectivity as it is brought to market), this service allows for secure connectivity through our mobility infrastructure, to connect back into the County network's AVPN edge at the County Operations Center and AT&T POP. While this solution eliminates the "last mile" single point of failure, early deployments using the LTE network will need testing to fully assess the impact of potential latency issues. As we look further down the industry roadmap, advancements promised in 5G connectivity have the potential of providing a high speed, low latency service that could meet enterprise requirements.

Through a collaborative evaluation of these options, HPES, in conjunction with the County, will develop a roadmap to migrate all T1 based technology to connectivity options which are in line with our geo-redundant core infrastructure. Figure 179 illustrates this concept.

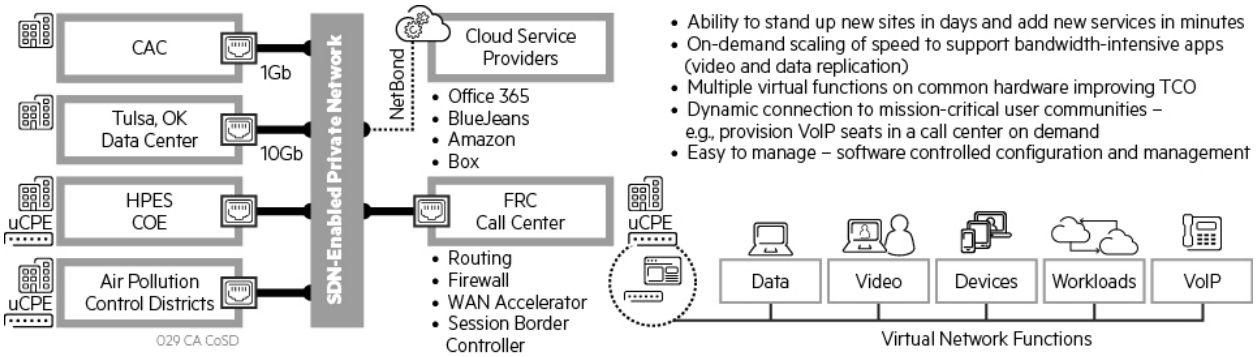
Figure 179. Commercial Connectivity Service – Enterprise Secure Connectivity using AT&T's LTE Mobile Network



Future Evolution of Software-Defined Networking-Based Services

During the life of the contract, AT&T will continually expand and improve its software-defined network (SDN) capabilities, where the local AT&T County network team will evaluate and recommend upgrades as they become viable and align with existing services. Midway through the next contract term, we anticipate key technical advances that could fundamentally affect the topology of the County network and the capital investment strategy. Building on the SDN foundation, new universal devices (Universal Customer Premises Equipment, or uCPE) could potentially represent a paradigm shift in how networks are provisioned and managed. Shifting capital cost to the provider, the County can take advantage of Network Function Virtualization, which provides services such as integrated LTE broadband backup, firewall, WAN optimization, and voice gateway functionality all on the same carrier managed device. Using our collaborative approach, we will conduct production pilots, evaluate feasibility, determine business value, and make recommendations through the established Enterprise Architecture review process. Figure 180 illustrates the AT&T SDN enabled enterprise of the future.

Figure 180. AT&T SDN-Enabled Enterprise of the Future



As the needs of the County continue to evolve, we will continue to collaborate with business unit and CTO staff and our cross-framework partners to understand the challenges and develop best-in-class solutions. We believe that transformation is an iterative process, requiring strategic planning and vision coupled with practical approaches that ultimately make certain that functionality is provided to the customer in the most expedient way possible. Technologies identified in this solution are just the beginning of a contract lifecycle of change, but will provide a foundation for growth as we move forward as a trusted advisor to the County.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

The local, dedicated AT&T team—fully embedded in the solution lifecycle—provides all design, implementation, support, and monitoring of transformation activities. Technical personnel assigned to the County of San Diego and dedicated to the program are located at our Trade Street facility to maintain a fairly central base from which to service the County. All solutions leverage the AT&T Internet Data Center (IDC) in San Diego County as well as the County's Operations Center to hold the core hardware components and facilitate circuit terminations. Working from the local Trade Street facility, our SMEs will monitor, support, and maintain the remote services.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

The local, dedicated AT&T team views transformation as an ongoing activity. By constantly monitoring what is currently available technology as well as keeping abreast emerging technology, we are able to deliver concepts and ideas for consideration by the CTO. We have already begun the task of installing ASE w/NOD at all new County sites; this task was preceded by the installation of two new host circuits, one each at the point of presence (POP) and County Operations Center (COC). We will leverage this existing infrastructure as we begin migration to ASE from the existing OPT-E-MAN connected county sites, with our project management staff coordinating the implementation(s). Work is also currently underway to consolidate the core GigaMAN backbone sites, with high-level architecture design already underway. The expectation is that the first two sites will be transitioned by approximately the end of the year.

Discussions with the County have already begun and are continuing related to cloud providers and the benefits that NetBond can provide. AT&T remains dedicated, so when and if the County decides this service is necessary—based on migration of various components to cloud providers and infrastructure—the local, dedicated AT&T team will bring in any resources needed to facilitate the entire process. This process will span final design and associated documentation, ordering of infrastructure components like circuits, and coordination with AT&T core services as well as cloud providers to provide a seamless transition. The local, dedicated AT&T team will continue to leverage all resources available within our

local organizations (Engineering, Project Management, and Architecture) to provide all aspects of transition and transformation activities.

- Automated Tools – Automated systems and tools involved in proposed solution

The local, dedicated AT&T team uses a myriad of tools and automated systems to perform implementations and support operations and performance. These tools include Cisco Prime Infrastructure, the CA Spectrum suite, SNTC (Smart Net Total Care), Riverbed Cascade, and Panorama. Cisco Prime Infrastructure is used to centrally manage configuration as well as gather data related to changes, performance, inventory, and licensing. The CA Spectrum suite—which includes Spectrum and E-health—is used to monitor availability, performance, and inventory management; it also provides trending and analysis for traffic utilization. SNTC is a Cisco product used to manage support services as well as automate the process of gathering data for direct vendor support in the event of a problem. Riverbed Cascade is a deep packet analysis tool that uses NetFlow data, which is gathered passively and , directed to it in an automated manner as well as active packet capture and analysis. Finally, Panorama is a Palo Alto Networks product that provides a central repository for logging, inventory of the Palo Alto components, licensing management, software image management, and analysis capability for the County security infrastructure.

- Qualifications and Experience – Background and experience in comparable environments

The AT&T team dedicated to the County program consists of network and network security engineers as well as project management and support staff with decades of combined experience in supporting these specific solutions along with 12 years of direct support to the County. The team's knowledge of both the solution and the County maximizes the County's return on investment while minimizing transition risk.

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

- Alternative Approaches (optional) – Submit a description of an alternative approach if you believe it is worth consideration by the County, including rationale, trade-offs and potential benefits.

None.

Initiative: Voice Services Transformation (Exhibit KK, Section 3.5)

- Key Considerations and Potential Alternative Approaches

Early in the existing IT Outsourcing contract, as part of the committed transformation of the voice environment, the network team executed a flattening and consolidation of the Avaya infrastructure. As a result of this migration, the core of the voice network was VoIP-enabled across the County WAN. Over the 5-year data network switching refresh, executed from 2007 through 2011, all LAN switching infrastructure was upgraded to Power over Ethernet (PoE)-capable devices. In 2010, the voice network team proposed a complete VoIP solution as a new site standard, extending the technology to either endpoint or telephone set. Since then, our team has deployed more than 6,000 VoIP telephone sets to nearly 20 county facilities.

Over the life of the current agreement, the County's voice strategy has been continually evaluated and adjusted, with a focus on enhanced real-time communication capabilities that eventually became defined by the industry as a convergence of voice, presence, video, and conferencing capabilities into a Unified Communications (UC) solution. Our team has focused on enabling features and functionality across the enterprise, which allowed early adopters to take advantage of these capabilities, recognizing that the foundation of our service is the basic functionality of the telephone used by more than 18,000 end users

on a daily basis. Some of these deployed capabilities include speech to text (voicemail to email), IP soft phone (for daily users as well as contact center agents), extension to cellular and Session Initiation Protocol (SIP) integration.

Maintaining a Voice Services and UC strategy in a dynamic, industry-influenced environment has created challenges that the network team has continually evaluated, adjusting roadmaps accordingly. The long-term objective has been, and continues to be, the ability to provide a single UC client, capable of integrating with or even potentially controlling voice services functionality while providing pervasive and integrated real-time communication capabilities that increase business productivity. The pursuit of this objective requires careful consideration of industry advancements, business requirements, technology adoption rates, user experience, disruption potential, solution integration requirements, and investment timing.

With this background, the AT&T team has defined a transformative and achievable Voice and UC strategy that brings valuable functionality and productivity to end users in a cost-effective manner, while allowing continued strategic planning and evaluation of new industry solutions as they mature. Our transformation approach will focus on eliminating legacy technology, bringing the enterprise to VoIP and removing aging infrastructure. This first step is an important one, as it will standardize the end-user voice experience, enabling the AT&T team to focus on providing an integrated UC capability. By integrating the Avaya enterprise voice infrastructure with the Microsoft Lync (Skype for Business) desktop client, HPES will unlock functionality that will allow the County to take full advantage of new features including telephone presence and click-to-call functionality (through the desktop, extended to the enterprise phone set or even to a mobile device) while presenting the voice call using the enterprise designated phone number (Direct Inward Dialing–DID). Our team believes that these additional capabilities, combined with a fully supported Lync client, will enable a new wave of UC feature adoption as users begin to take advantage of these extensive real-time communications capabilities.

Successful transformation of any kind requires the ability to identify opportunities for change and measure the value of the result against the cost of implementation—be it financial or in disruption to the norm—while also supporting foundational requirements such as allowing all County telephone numbers to stay the same. Over the lifecycle of the proposed solution, AT&T will continually evaluate these opportunities, establishing milestones for key decision points that could bring forward new approaches, consolidate functionality, or represent cost savings to the County. These options may include a natural migration path of localized premises-based services to a cloud-based, fully hosted off-premises architecture. Through ongoing roadmap planning and collaboration with the County Technology Office, we will advance the Voice Services and UC transformation strategy throughout the contract lifecycle.

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

The solutions highlighted in this section include transformation initiatives planned for implementation early in the term as well evolutionary technologies that may arise later in the contract life cycle. In the near term, all defined solutions represent planned implementations that are inherent to the services described in Section 4.3 of the RFP and are priced in Exhibit 16.1-1 accordingly. Relative to statements focused on technology not yet available for deployment, AT&T will roadmap and evaluate the feasibility of these solutions during the contract life cycle. If identified as a viable replacement to existing services, AT&T will make recommendations for upgrades in line with refresh obligations or as otherwise agreed with the County.

AT&T's approach to transforming voice services focuses on enabling new features and capabilities used by both the end users and County constituents built on a foundation that is redundant, resilient, and highly available. The ultimate goal in developing the next architecture for voice services is to harden the core

and edge locations and to offer robust and feature-rich UC for each and every user of enterprise voice services.

Core Network Transformation

Transformation activities at the Avaya Voice Core will migrate from any remaining traditional PBX architecture and provide an infrastructure reduction resulting in lower power consumption and reduced trouble tickets while minimizing disruption to users. This approach provides migration from the existing G650 Port carriers or other gateways, and upgrades them to G450 or G430 gateways. This transition will eliminate legacy IP Server Interface (IPSI) boards, mitigating risk by replacing end-of-life equipment and reducing the physical footprint in the data centers. This transition will take place at the Point of Presence POP as well as the County Operations Center (COC). In addition, the "TN" modules will be replaced with Media Modules in the G450s or G430s, and the digital signal processor (DSP) resources will be replaced with local media resources at the gateway as well as in the Avaya media servers.

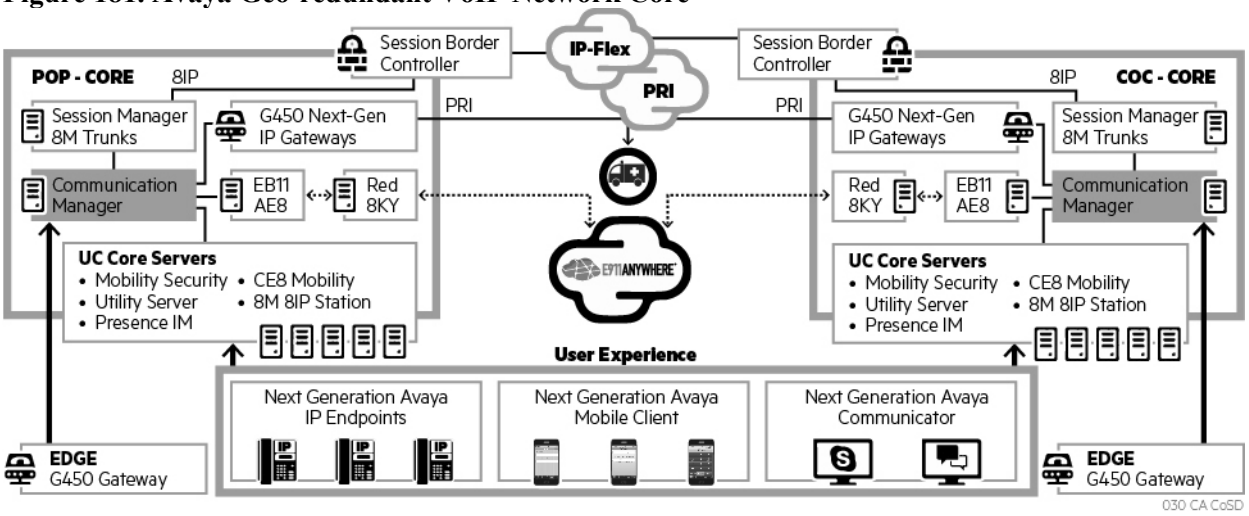
This highly available architecture will provide seamless failover between the COC and POP, with no single point of failure of the Core VoIP gateways. The proposed architecture not only will provide centralized management between the two "Core" locations—POP and COC—but will also provide access to the remote locations, or locally survivable processor (LSP) sites.

Additional implementations will take place at the Core that will serve as the foundation for offering new and enhanced UC capabilities for end users, such as external mobile SIP endpoints on County- managed devices. This will be made possible by the Avaya Client Enablement Server as well as the Avaya Presence service for telephony presence on a mobile device.

Geo-redundant Voicemail

Our proposed solution includes the advancement and transformation of enterprise voicemail services, which replace the current, single-site-based voice messaging platform located at the AT&T POP, with a fault-tolerant, geo-redundant voice messaging platform located at the AT&T POP and COC. The new platform provides the ability for a standardized voicemail experience across all of the County's Avaya enterprise voice locations. This geo-redundant design incorporates live replication of the voicemail database, messages, and greetings between the AVST Call Servers at the AT&T POP and County Operations Center using AVST's never fail technology. Figure 181 illustrates the Avaya Geo-redundant VoIP Network Core. This solution is expected to be in place as the next agreement is signed. Using a roadmap strategy, AT&T Centrex users will be migrated over time to this platform, as specified below in the paragraph highlighting AT&T's Centrex migration roadmap.

Figure 181. Avaya Geo-redundant VoIP Network Core



The new platform provides the ability for a standardized voicemail experience across all of the County's Avaya enterprise voice locations.

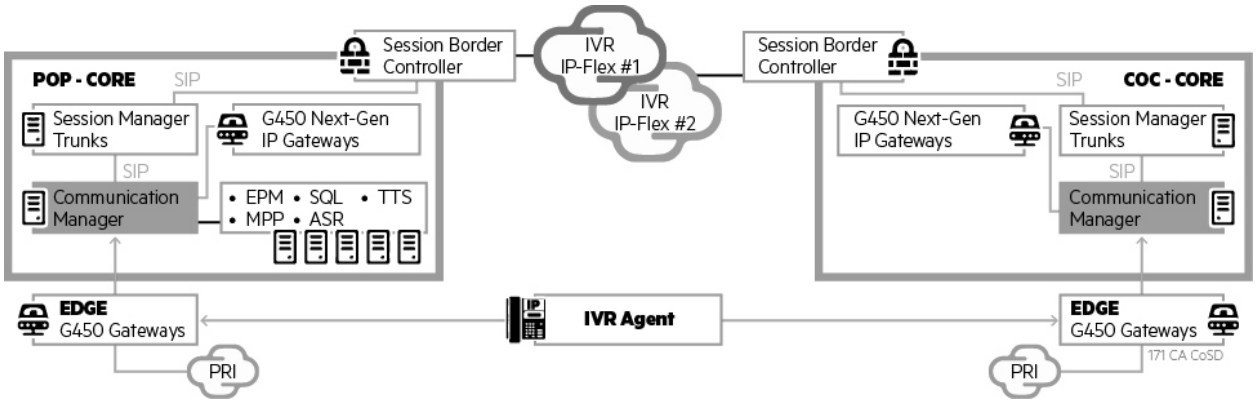
Interactive Voice Response (IVR) Transformation

Lastly, AT&T's transformation plan for Voice Services extends to Core adjunct services, such as its Interactive Voice Response (IVR) solution. The County's IVR infrastructure is built around the Avaya experience portal, which is a high availability contact center solution located at the AT&T POP. This platform provides access for external constituent service to County departments (such as Animal Services, Land Use Environmental Group, and various departments within the Health Human Services Agency) using features such as IVR, self-service, touch-tone, and speech recognition services. This scalable, high availability infrastructure provides many options for programming and agent integration, allowing customization for any type of constituent-facing contact center service.

The platform will undergo near term changes to external telephony connectivity as AT&T initiates plans to implement dedicated, fault tolerant inbound and outbound IP flex SIP trunks for the County's IVR infrastructure at the AT&T POP and County Operation Center. This change will prevent the Core IVR solution from impacting enterprise voice traffic, allowing business units to conduct high volume contact center activities such as outbound dialing campaigns. This new capability will provide a more standardized RU that business units can use to leverage the platform in meeting their business needs.

Over the term of the contract, AT&T will focus on roadmap initiatives and develop proposals to increase redundancy and resiliency of Core IVR applications as well as provide additional feature benefits such as automated agent call back and web chat.

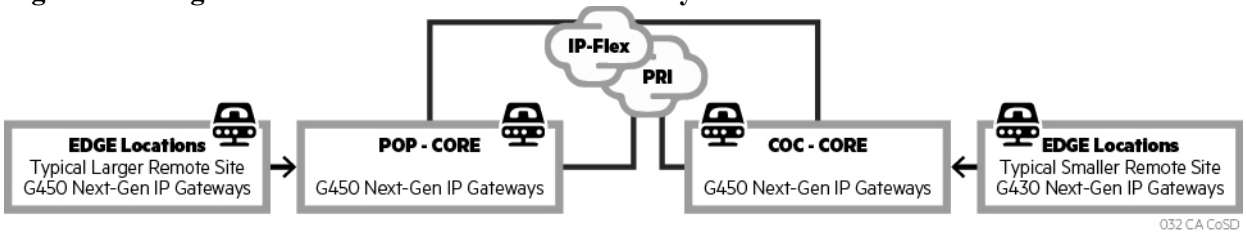
Figure 182. Avaya's Experience Portal leverages geo-redundant communication managers and redundant SIP trunking for inbound and outbound contact center traffic.



Edge Network Transformation

At the remote Edge, AT&T will replace all legacy cabinets and gateways (G650, MCC, SCC, CMC, and G700 series) with the latest generation of G450 or G430 gateways, providing LSP for resiliency. In the County, 81 sites have been identified as needing remote edge transformation to accommodate the implementation of VoIP phones. These 81 locations currently have digital telephones served from legacy cabinets and gateways. The Avaya G450 Media Gateway is a multi-purpose media gateway. Figure 183 illustrates Edge or Remote Site Network Connectivity. It works in conjunction with Avaya Communication Manager IP telephony software running on Avaya S8XXX Servers to help deliver intelligent communications to enterprises of all sizes. The G450 combines telephone exchange and data networking by providing public switched telephone network (PSTN) toll bypass and routing data and VoIP traffic over the WAN. The G450 features a VoIP engine, an optional WAN router, and Ethernet LAN connectivity. The G450 provides full support for Avaya IP and digital telephones as well as analog devices such as modems, fax machines, and telephones. Telephone services on a G450 are controlled by an Avaya S8XXX Server operating either as an External Call Controller (ECC) or as an Internal Call Controller (ICC). The G450 supports the Avaya S8300 Server as an ICC or, when the S8300 is installed in another media gateway, as an ECC. An ICC will be installed and used as a LSP. This is designed to take over call control in the event the ECC fails or the WAN link between the branch office and main location breaks. The LSP provides full-featured telephone service survivability for the branch office. The G450 itself also features Standard Local Survivability (SLS), which provides basic telephone services in the event that the connection with the primary ECC is lost.

Figure 183. Edge or Remote Site Network Connectivity



Centrex Migration

As detailed in Volume 2 – 2.08 Section 5.7 of Voice Services, the majority of voice services for the County are provided by the Avaya enterprise voice network. A small subset of the County's office sites do have voice services delivered by AT&T's Centrex business telephone service. Centrex service is typically deployed to smaller County sites that contain 1-20 users. At present, there are roughly 117 sites

with Centrex voice services. While the AT&T Centrex business telephone services provide stable telephony and voicemail services, these locations are separated from the remainder of the County's user population and are not able to take advantage of the full UC capabilities offered to Avaya enterprise users. With this in mind, the need to transform the features and capabilities for current Centrex voice services locations and to enable the users with the ability to use Avaya enterprise voice feature is a business priority. AT&T has developed a transformation approach to migrate a majority of these users' stations to a VoIP solution, while maintaining a roadmap for remote and intentionally off-net services to be executed during the term of the agreement.

The migration of Centrex users will begin with the deployment of stand-alone IP-based telephones at sites with existing data network functionality. This solution will provide services for VoIP telephone sets that is centrally managed by the Avaya geo-redundant voice cores at the AT&T POP and County Operations Center. While these sites will not have local survivable gateways, they will take advantage of the data network for their connectivity to the enterprise voice infrastructure. Of the roughly 117 Centrex sites across the County, 80 of these locations would be eligible for this service. Through this migration, over 65% of the Centrex remote sites and more than 272 individual stations will be converted to the Avaya enterprise standard. These sites/users will be provided new centralized voicemail and UC functionality as well as a new telephone set that leverages the County's investment in the data network for connectivity.

A greater challenge in the elimination of the legacy Centrex solution is associated with locations that do not have data network access. These locations are typically very small and remote locations that only require simple telephone service for communication. The migration of these services will be the topic of transformative roadmap planning during the term of the new contract. Currently, AT&T is developing a Centrex replacement technology that is expected to provide transport and service options that will be evaluated for transformation. Some additional possibilities include the use of the mobility network for connectivity to the enterprise infrastructure, using an emerging technology called voice over LTE (Long Term Evolution).

Additionally, there are some remaining Centrex stations that have been placed throughout the County in locations with data network services where off-net phones are provided as a business requirement, such as elevator phones and emergency lines (red phones). As the Centrex replacement solutions mature, these solutions will also be evaluated for migration to a similar, off-network service so as to maintain the redundancy required for the specific use case.

VoIP Telephone Standard

The End-User experience is the single greatest change that will affect the County users in the proposed voice transformation. While the voice network is continually upgraded at the core, many telephone sets across the County have remained unchanged in over 15 years. By moving to new VoIP telephone sets, the County users will enjoy the benefits of a new device, along with improved reliability and performance.

There is significant value in resiliency that IP telephones offer over legacy TDM telephones. TDM devices require a dedicated port with a dedicated wire to connect to a local gateway. There are many points of potential failure, including the wire, gateway card, gateway power supply, gateway processor, and so forth. An IP telephone connects universally to any network port to facilitate registration to one of several points of call processing. An IP telephone will primarily be registered to the Session Manager Registrar at the core; there is a Session Manager Registrar at both core sites for high availability. In the event an edge location becomes fragmented from the WAN, the IP telephone will register locally to the G450 gateway with a local survivable processor (LSP).

Avaya/Skype for Business Integration

Another important pairing with a VoIP deployment is the implementation of E911 services. E911 allows for a continually managed registry of location data for each workstation so first responders have necessary information to effectively respond to an emergency call (see Exhibit KK – Section 3.7. E911).

Another key end-user benefit associated with the Voice Transformation initiative is the integration of the Avaya enterprise voice system with Microsoft Lync (Skype for Business client). Using available licensing and open Application Programming Interfaces (API's), **Avaya Communicator** extends Avaya Aura real-time collaboration capabilities to Microsoft Lync 2010, 2013, or Skype for Business 2015, 2016 clients to provide users with a unified, consistent collaboration experience from their preferred applications and devices. The Avaya Communicator for Microsoft Lync service adds functionality to Microsoft Lync clients using only the Lync/Skype for Business standard client access license (CAL). Features include telephony presence aggregated with Lync's machine and calendar presence through Lync/Skype for Business client API and Lync/Skype for Business IM and desktop sharing, click-to-call control of PBX desk phones, voice and video, enterprise dial-plan support, toast pop-ups enabling incoming calls to be answered, and Reply with IM as well as a conversation window pop-up to access Avaya mid-call features and the ability through the Share My Bridge feature to launch a conference call and or collaboration session from within the client.

Avaya Collaboration Services

Avaya Collaboration Services interworks on the user PC with Communicator for Lync to provide UC services originated from Microsoft Office Suite, Outlook, SharePoint, and Internet Explorer as well as Mozilla Firefox and Google Chrome browsers.

When in Outlook or SharePoint, hovering over a user's name or presence indicator presents their contact details. The user now has the opportunity to IM, email, make a voice or video call, or schedule a meeting with this user. The user's presence is also displayed.

In addition, Collaboration Services will detect a number embedded in an email or a Word, Excel, PowerPoint, or SharePoint document and allow calls to be made to this number through Communicator for Lync. As with a call originated through the Lync/ Skype for Business user interface, a conversation window will be presented to provide the user with call control options for the duration of the call.

Collaboration Services automates the process of Join or Host a conference call. With this feature, the user can launch a conference call and/or a web collaboration session. The Collaboration Services will determine whether the user is the Host or a Participant to this call and uses the appropriate access passwords to access this call.

Collaboration Services, when used with Internet Explorer, Mozilla Firefox, and Google Chrome browsers, will recognize number patterns on web pages, and through the use of an intelligent algorithm applies enterprise, national, and/or international dialing rules to highlight these as phone numbers. These phone numbers can be dialed from a web site using the Avaya Communicator for Lync.

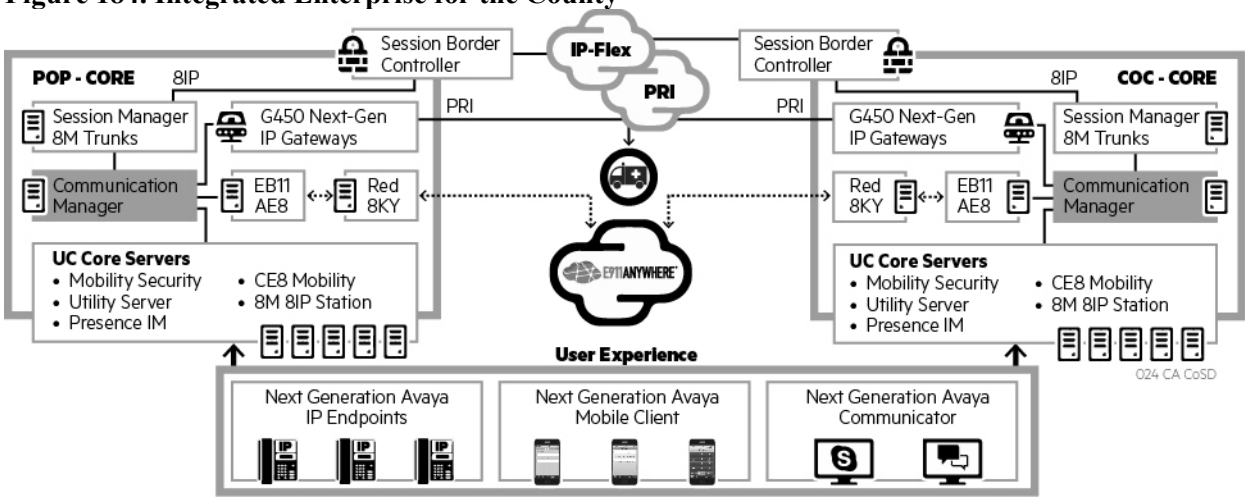
If a phone number is on an enterprise web page, Collaboration Services will take this number, access Active Directory, and pull down additional information for this user. This information is displayed on a contact card. The contact card is also populated with icons that enable the user to send an IM and see the presence of this contact, make a voice or video call to the contact, and schedule a meeting.

Integrated Enterprise Mobility

A final end-user benefit of the Voice Transformation initiative is integration of the user's voice and UC capabilities with their mobile device. Integrated Enterprise Mobility brings seamless interoperability with

the desktop and desk phone. Figure 184 illustrate components of the County Integrated Enterprise experience.

Figure 184. Integrated Enterprise for the County



Integrated Enterprise Mobility brings seamless interoperability with the desktop and desk phone.

Features that span the desktop and desk phone are extended to the mobile user and are transparent in functionality. Examples include the following:

- Start a call from your desk (either desktop client or desk phone) and, if you choose to become mobile, simply select a button on the mobile app to move the call from the original location to the mobile device.
- Call processing from a mobile device extends a robust feature set (Hold, Transfer, Conference, Speaker, Mute, etc.) to the user so that transitioning from desktop or desk phone is seamless. The user experience is the same.
- The UC features of Avaya Communicator include visual voice mail to filter and sort voice messages. Use the visual voice mail feature to respond to important messages quickly. Communication History logs help you trace the history of your enterprise calls and voice messages. Use Avaya Communicator to increase the productivity of your enterprise with tools that enhance collaboration, improve responsiveness, and lower costs for IT and end-user support.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

The local, dedicated team provides all the design, implementation, support, and monitoring of transformation activities and is fully embedded in the solution life cycle. Technical personnel assigned to the County are dedicated to the program and located at our Trade Street location, maintaining a central location from which to service the County. Additional leveraged resources may be engaged to support transformation and will operate under the direction of the local team.

All solutions use the AT&T POP as well as the County's Operations Center to hold the core hardware components and facilitate circuit terminations. All County facilities with voice network connectivity will house infrastructure and telephone sets necessary to provide service.

Methodology & Key Processes – Key methodologies and processes in proposed solution

The dedicated LCM team is embedded in the full life cycle of every enterprise voice and UC solution—from the initial gathering of requirements, through the design and implementation phases, to managing

and monitoring, and even decommissioning when requested. Through customer meetings and service reviews, the team creates the proper solution that is chosen and sized appropriately.

We will use standard Project Management methodologies in the scoping and execution of any new installation. AT&T architects and engineers will also use approved processes in their design and equipment placement activities. Enterprise voice and UC options are continually evaluated based on County business requirements in addition to current and emerging technologies.

Our technical enterprise architecture team evaluates new products and standards to make recommendations to the CTO. When a recommendation is approved, our team moves forward with implementation recommendations including refresh of existing equipment and rollout schedules. For equipment issues, our Service Desk and engineering team work to identify and remediate the problem.

- Automated Tools – Automated systems and tools involved in proposed solution

To support quality voice service within the support levels defined by the new agreement, our subject matter experts (SMEs) use numerous automated tools. These tools enable us to continuously monitor the overall health and performance of voice appliances, provide tools to assist in rapid restoration through fault isolation, and perform traffic analysis, as discussed below.

HPES delivers complete manufacturer system maintenance coverage on all County Core Voice Services assets. The Avaya maintenance services include Avaya Expert Systems and Secure Access Link. Avaya Expert Systems provides the County Core Voice Services a maintenance database of more than 30,000 Artificial Intelligence Algorithms (AIAs) with scripted automation that is able to automatically correct many known system and software-related issues. Avaya Secure Access Link (SAL) is a centralized consolidation point for all Avaya Core systems for health and alarming monitoring, secure remote access using secure outbound-only HTTPS standards, and an integration point for Avaya Expert Systems. Together, these tools provide the County's Avaya Core Voice Services complete health monitoring and rapid issue resolution. Avaya Expert Systems and Secure Access Link are online and engaged 24/7 to diagnose and attempt to resolve known system alarms, clear many service-affecting issues, and escalate to engineering resources for prompt attention when necessary to allow service restoration or outage avoidance to County users.

Our Voice Services team uses Nectar's Unified Communication Management Platform (UCMP) and leverages its complete suite of innovative features to provide the County enhanced integrated UC network services. Nectar provides multi-vendor management services including application dependency tree visual alerting and vendor knowledge modules, which assist our SMEs to proactively pinpoint and resolve cross-platform integrations issues to quickly restore services to County users. The UCMP also includes real-time network quality-of-service reporting using RTP (Real-time Transport Protocol) Control Protocol (RTCP) integration and can provide our team with the capability to create simulated traffic injection between designated network segments for analysis. This enable SMEs to monitor and report on all VoIP-related traffic transmissions. The quality-of-service reporting tool provides per-hop statistics, and in many cases assists in quickly identifying improper packet handling hop points, driving efficient resolution of network quality-of-service issues. The Nectar platform includes statistical resource utilization data gathering and storage that enables trending analysis and capacity planning so County users are not impacted by growing resource needs. Finally, all these capabilities are wrapped into an intuitive and customizable dashboard for use with visual and electronic alerting from sophisticated threshold configurations that drive the ability to acknowledge, respond to, and correct issues proactively in many cases before County users are aware of or report an issue.

E911 Manager will automate the E911 management process by connecting with the County's Geo-Redundant Avaya Communications Manager to the AT&T MPLS network to track and update VoIP, digital, and analog phone moves, adds, and changes.

E911 Anywhere is a cloud-based 911 call routing service that can connect a 911 call to more than 6,000 Public Safety Answering Points (PSAPs) in the U.S. and Canada.

- Qualifications and Experience – Background and experience in comparable environments

Our team's support specialists participate regularly in internal and manufacturer-led training programs. We hold certifications specifically related to Voice Transformation and UC systems and have been recognized by technology leaders for our support expertise. Our certifications include the following:

- Avaya Certified Expert–IP Telephony
- Avaya Certified Implementation Specialist–Unified Communications
- Avaya Certified Implementation Specialist–Contact Center
- Avaya Certified Solution Specialist
- Cisco Certified Network Associate (CCNA)
- Cisco Certified Network Professional (CCNP)
- Microsoft Certified Solutions Expert–Lync Master

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

- Alternative Approaches (*optional*) – Submit a description of an alternative approach if you believe it is worth consideration by the County, including rationale, trade-offs and potential benefits.

None.

Initiative: Storage Architecture (Exhibit KK, Section 3.6)

As the County relies more heavily on electronic transactions to streamline services to citizens, data volumes will continue to grow. Currently, the County generates and currently manages nearly 100 TB of unstructured data, and, as the volume continues to grow, storage costs grow as well. Cost effectively managing the growth requires better data management policy and procedures and better targeting data to cheaper storage aligned with County's need to access the data as well as exploring newer storage technology.

The solution to this transformation project requires a blend of process and technology, hardware and software. Section 2.9 (Schedule 4.3, Section 6.12) of this proposal describes a tiered storage approach that addresses the County's immediate needs. The Solution Summary section below describes how we will meet the County's longer-term storage needs. We also recognize that the County's needs and storage options will evolve, and, as they do, HPES will continue to identify technologies that provide the County the most value.

In Exhibit KK, Section 3.6, the County identified four specific initiatives that are tied to Storage Architecture, which we address individually in the following sections. These initiatives are as follows:

- Architect storage to embrace tiers of well-defined storage
- Classify County data and assign it to the appropriate tier
- Develop archival solutions for Portfolio applications
- Develop Hyper Converged Integrated Systems

- Key Considerations and Potential Alternative Approaches

Architect Storage to Embrace Tiers of Well-Defined Storage: The solution being implemented by HPES during the data center consolidation architects the design to embrace tiers of well-defined storage. The key considerations that went into the storage solution include cost and the ability to meet the

County's requirement to keep the storage infrastructure current by refreshing storage components every 5 years. We also considered the storage growth requirements and developed a solution with 20% year-over-year growth projected for the first 5 years.

In addition to our proposed solution, which builds on the storage that will be in place for the County on completion of the transition activities, HPES considered two alternatives:

Storage Tiering Alternative: HPES considered providing a 3PAR 20000 with 15,000 RPM drives and/or SSD as Tier 1, 10,000 RPM drives as Tier 2, and 7,200 RPM drives as the archive tier. This would provide a clearer delineation of the tiers from a performance perspective but would have resulted in a higher total storage cost than our actual solution. We will continually monitor the performance of the storage environment and offer

Shared Storage Alternative: The second alternative is to provide storage as a leveraged service. This approach is similar to cloud storage in that the storage infrastructure would be shared with other non-County of San Diego clients, but the storage volumes would be dedicated to the County of San Diego. There would be no co-mingling of data on storage volumes, but the underlying storage hardware would be shared. All storage volumes would be securely wiped after they are no longer needed by the County, to prevent any chance of the County's data being exposed to non-County of San Diego customers on the leveraged storage infrastructure. This solution provides a lower cost per GB of storage. Using leveraged storage, we could also provide the required tiers of storage using either the recommended solution or the Storing Tiering Alternative. However, with this leveraged approach, the County would not be able to specify the hardware refresh to meet their desired schedule, so we rejected this solution.

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

Solution Summary: Upon completion of the data center consolidation, the storage architecture will comprise a dedicated storage area network (SAN) with a 3PAR 20000 storage array in Tulsa providing tier 1, 2, and archive storage to all data center servers, consolidated in Tulsa. End-user data storage will be provided directly from the new network-attached storage (NAS)-capable 3PAR. Otherwise, end-user data storage will be the same. All 3PAR data will be backed up locally using HPE Data Protector with a StoreOnce Virtual Tape Library (VTL) as the backup target. All backup data and disaster recovery (DR)-required 3PAR data will be replicated to the DR site in Colorado Springs. The data center solution will include immutable storage, which will also be replicated to the DR site. For the San Diego sites, backup data will be replicated to the DR site instead of being copied to tapes, for remote offsite storage. Finally, the immutable storage refresh and reconfiguration will be a newer version of the same immutable storage.

The HPES storage architecture following transition includes updated storage equipment, which will be refreshed on a 5-year cycle. The storage array technology is flexible and efficient, designed to keep pace with the County's requirements as they evolve. Tiers 1 and 2 have been redefined to reduce cost without sacrificing performance. The backup solution will consolidate all of the County's backup needs into one capacity-driven solution that eliminates physical tapes from the environment. The location of the immutable storage solution will change with the Data Center Consolidation, and the hardware will be refreshed.

HPES will continually evaluate the various storage tiers used by the County as their storage requirements evolve, with an eye toward providing the right storage solution for each tier. However, the storage solution that will be in place following Transition provides ample opportunity for growth in terms of storage and performance, as described and illustrated in Section 2.9 in response to Schedule 4.3, Section 6.12. Tier 1, Tier 2, and achieve tier storage service is based on 3PAR 20000 storage devices—the latest innovation in 3PAR enterprise storage from HPE.

We will continually evaluate the County's storage archiving needs and consider a cloud-based archive storage solution if/when cloud-based archiving meets the County's approval.

Rationale: The solution we provide meets the County's post transition requirements and will allow the County to transform its storage architecture over time, as needed. The 3PAR is capable of supporting 15 PB of usable storage capacity. It will support a range of disk drive technologies from 7,200 RMP, 10,000 RPM, and 15,000 RPM Serial Attached SCSI (SAS) drives and solid state disk drives (SSD). The 3PAR supports storage migration without interruption via 3PAR-enabled storage peer motion (SPM). The 3PAR supports the following:

- Thin provisioning (TP), which is a method of optimizing the efficiency with which the available space is used in SANs. TP operates by allocating disk storage space in a flexible manner among multiple users, based on the minimum space required by each user at any given time.
- Auto tiering is a real-time intelligent mechanism that continuously positions data on the appropriate class of storage based on how frequently the data is accessed. This improves application performance.
- Compression, which reduces the number of bits needed to store or transmit data.
- Data deduplication, which reduces storage needs by eliminating redundant data. Only one unique instance of the data is actually retained on storage media.
- Federal Information Processing Standard (FIPS) 140-2—data at rest encryption to protect against loss or theft.
- Industry standard redundant array of independent disks (RAID) configurations to meet disk fault tolerance requirements and optimize performance.
- Remote and local replication for future refresh migrations on live data (meaning no down time required).
- Quality of Service to make certain bandwidth is available when needed.

The immutable storage solution has the capacity to support future growth in data storage requirements. The County's Document Processing Center (DPC) storage, which also uses 3PAR, will allow the DPC storage to evolve as needed. The direct attached storage will remain the same, and HPES will continually evaluate services that use direct attached storage and work with the County to determine when/if those services can be migrated to SAN and/or cloud storage.

Timing: HPES performs weekly reviews to assess capacity usage and determine whether changes are needed, taking into account any anticipated changes from the County.

Risk Considerations: This approach poses minimal risk based on continued use of the same platform. All capabilities are currently available, and the County can take advantage of this on a schedule that meets its needs.

Key Dependencies and Milestones: None.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

The HPES Storage Administration team will perform the assessments on an ongoing basis, as described above.

Storage hardware will be located in the Tulsa data center and at the San Diego sites, which include the DPCs at Lemon Grove and Viewridge. The storage will be replicated to the DR site in Colorado Springs.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

At the 5-year refresh cycle, we will continue to use replication extensively. Our storage administration staff is well versed in array-based replication capabilities and will be able to extend replication to include the new hardware with little to no disruption to the County's compute services.

- Automated Tools – Automated systems and tools involved in proposed solution

Enterprise storage (3PAR) has native replication capabilities built in and enabled by the storage array software. The primary tool used to accomplish the storage transformation will be SPM. This type of replication is automated and keeps storage in sync on both copies of the data.

- Qualifications and Experience – Background and experience in comparable environments

HPES has proven experience providing these types of services to a variety of clients with environments similar to that of the County, as described below.

County of San Diego: We have demonstrated our ability to meet these requirements under our current contract with the County. Our storage administration staff is using the tools needed to accomplish the transformation to a tiered storage architecture on a daily basis and will continue to use the tools as part of ongoing operations and maintenance (O&M).

Department of Navy (DON), Next Generation Enterprise Network (NGEN) contract, which includes support for the Navy Marine Corps Intranet (NMCI): From 2005 until early 2014, our team managed and monitored a diverse SAN environment that consisted of two different vendors' SANs. In mid-2014, the team designed, engineered, and implemented a one-platform SAN environment to standardize NMCI on the more flexible, easy-to-use and support NetApp SANs. At that time, our team replaced all non-NetApp storage to achieve a single-vendor SAN environment with a single set of tools, reports, and storage allocation techniques. This single-SAN approach has enabled us to capitalize on native capabilities to provide site-to-site resiliency and reduce backup overhead through a storage hub and tapeless backup. Our single-SAN design is reducing complexity and total operating cost while increasing operating efficiencies and effectiveness.

HPES has executed a storage architecture redesign that has moved from a standalone storage environment into a clustered virtual storage environment on NetApp Data ONTAP 8.2. This has reduced the managed storage footprint in the server farm by merging disk capacity and controller resources into a single virtual storage fabric while increasing the total capacity to 16 PB. Disk capacity and performance are metrics that can be managed across all nodes in the cluster under a single administrative interface. Compared to the previous version of Data ONTAP, this was managed on a controller-by-controller basis. Clustered Data ONTAP has enabled new efficiencies in the TOC to include labor, tooling, and infrastructure. We are able to maximize resource use by using complementary workload characteristics, dynamically identified to balance utilization. Clustered Data ONTAP facilitates shifting workloads across the nodes without impacting the solutions and users that depend on these services. Figure 185 and Figure 186 summarize the average end-user network storage requirements and minimum storage requirements, respectively.

Figure 185. Average End-User Network Storage Requirements

	Personal File Storage	Primary Mailbox Storage		Command Storage	Records Management	DV End Users Only	Public Folders
VIP	10 GB/User	10 GB/User		2 GB/User	2 GB/User	30 GB/User	1 TB / Claimant
MOC	10 GB/User	6 GB/User		2 GB/User	2 GB/User	30 GB/User	1 TB / Claimant
Business	5 GB/User	2 GB/User		2 GB/User	2 GB/User	30 GB/User	1 TB / Claimant

Figure 186. Minimum Storage Requirements

	Class I	Class II	Class III
	Enterprise Class	Mid-Tier	Economy
Drive Type	15K Revoltions per Minute (RPM) Serial Attached SCSI (SAS) or better	10K RPM SAS or better	7200 RPM SATA or better
Performance IOPS per Array [minimum 25 disk depth per Logical Unit Number (LUN) set]	Greater than or equal to 2100	Greater than or equal to 1500	Greater than or equal to 900
Performance IOPS per Disk	Greater than or equal to 175	Greater than or equal to 125	Greater than or equal to 75
Availability inside the Data Center	99.990%	99.900%	99.000%
Data Types	Virtual machine OS, SQL databases for portal environments with high access, and other high IOPS applications	Mailbox stores, organization file stores, PST, and individual file shares	Archive, deduplication repository, and records management archive
Battery Backup	Yes	Yes	Yes

- Key Considerations and Potential Alternative Approaches

Classify County data and assign it to the appropriate tier: When evaluating solutions to classify County data, we took the following items into consideration:

- The significant volume of the County's unstructured data currently stored in file shares, SharePoint, Exchange, and a range of other repositories; however, not all unstructured data should be treated the same way.
- It is important to be able to classify data based on its importance, sensitivity, and need for access.
- By classifying unstructured data, we can automatically direct it to appropriate data tiers to reduce storage costs while providing the County with the appropriate access requirements.

This initiative, is a primarily technology-driven effort coupled with consulting services to guide configuration of the solution. The alternative approaches are tied to specific implementation models for the various product suites that could be used to deliver this auto-classification.

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

Currently, a wide range of products is available to support the automatic classification of unstructured data/content. Through the application of policy enforcement, content can be targeted to different tiers of storage. The County has assessed a range of these products and has found several that appear to meet the requirements. We will work with the County to design, configure, and implement the selected product suite.

We would recommend, however, the County implement HPE's ControlPoint software. HPE is recognized by Gartner as a leader in Information Governance and Information Management (IM/IG). ControlPoint provides a robust platform for identifying, analyzing, and managing diverse types of information stored in enterprise repositories. Through continuous monitoring of enterprise repositories, ControlPoint can classify unstructured data based on a range of County identified metadata, including standard classification structure of Public, Sensitive, and Confidential documents, applying policy to facilitate optimal storage strategy.

Rationale: Applying file management tools will help the County to reduce its information footprint by identifying redundant, obsolete, and trivial (ROT) data; this can lead to reduced storage costs.

- Redundant data consists of duplicates such as unauthorized copies of documents, emails, records, or database information residing in file shares, SharePoint sites, mail systems, and databases.
- Obsolete data consists of information that is no longer in use or is out of date. Determining whether data is obsolete can be based on its creation date, last modified date, or access date; then assess this information in conjunction with an appropriate retention policy.
- Trivial data is determined by file type, where the file type has no content value, such as executables, system files, and thumbnails.

Additionally, such a solution can be used to tag and classify unstructured data, and through automatic application of policy, data can be targeted to specific tiers of storage or even deleted if appropriate. Ultimately this will lower the total cost of storage.

Timing: After completion of transition, we recommend approaching unstructured data classification on an enterprise scale. Our approach begins with an assessment and a pilot of a limited set of data/ repositories, while building out the required solution architecture to support the County's entire unstructured data environment. Our solution includes resources to manage the indexing of the remaining data, keep indexing up to date throughout the contract, and cross-train others on the support team.

Risk Considerations: Given the volume of data currently stored by the County, an enterprise-wide implementation can expose significant risk. HPES mitigates the potential risk by starting the project with an early assessment to help define and test the County's data categories. Following the Milestones presented below also mitigates this risk through careful planning and testing prior to enterprise-wide rollout.

Key Dependencies: This solution is dependent on the availability of tiered storage architecture and file management/auto-classification platform, whether ControlPoint or an alternative selected by the County.

Milestones: Key Milestones for the data classification project include the following:

- **Milestone 1 – Develop Data Categories** – Building on the County's existing set of categories such as security classifications—Public, Sensitive, or Confidential—we will use automated tools and common categories to develop a set of categories specific to the County. These categories could include County Groups, Function, and Availability. We will select a set of representative documents from the County's data repositories to use for training and benchmarking. This makes certain that the categories created are based on meaningful concepts and real business context. This capability improves the efficiency and accuracy of categories and the application of policy to content. Preparation of theses draft categories will not affect documents in production systems.
- **Milestone 2 – Refine and Test** – This step helps to determine the relevance of the categories to enterprise documents. Refining a category is done by adjusting the weighting of a term or the selection threshold, or by adding field text. These activities can be done individually or in combination. A category can be published, making it available for use in automatic policy execution against content managed by the tool suite.
- **Milestone 3 – Auto-Classification** – Once County data is categorized, we apply policies for ongoing management. Policies can be created with keywords, metadata, and/or example documents. Using the desired tool suite, we can automate policy application, governing all aspects of the information lifecycle including deletion prevention, storage management, and ultimately disposition management by applying policies at data creation. Additionally, de-duplicating data across repositories helps to minimize storage costs and reduce discovery times.
- **Milestone 4 – Knowledge Transfer** – Following the pilot effort, further described below as part of our methodology and key processes, and validation of results, HPES subject matter experts (SMEs) will conduct knowledge transfer to the support team for the County to maintain the system and to index all County unstructured data.
- **Milestone 5 – County-wide Rollout**

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

HPES will initially provide a team of SMEs to guide the planning and piloting efforts. This team will work onsite, collaborating with the County's staff and the support team to define requirements and validate the results of the project. This team will also conduct knowledge transfer to facilitate extending the implementation and support County-wide. HPES SMEs will remain available as required to provide reachback support. The infrastructure for the product of choice will be installed in the Tulsa Data Center.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

A data classification project begins by working collaboratively with the County to gain insight and understanding of the legacy data landscape. This helps us to define the benefits of a full legacy data cleanup solution, create a Solution Roadmap illustrating the go-forward plan, and implement the auto-classification solution infrastructure. We then conduct a pilot, where we will sample approximately 1 TB of data currently residing on the County's existing file share environments to determine appropriate classification structure and to demonstrate how data can be targeted automatically to different tiers of storage based on the classification. Additionally, the assessment will showcase where unstructured data exists and how frequently is it being referenced/used so that intelligent decisions can be made regarding data management, archiving, retention, and retirement. Following the pilot, HPES SMEs will perform knowledge transfer to the HPES account team to facilitate indexing of the remaining data and then applying the solution to provide ongoing auto-classification of unstructured data.

- Automated Tools – Automated systems and tools involved in proposed solution

HPES will use ControlPoint software or an alternative platform selected by the County to auto-classify unstructured data.

- Qualifications and Experience – Background and experience in comparable environments

The following example demonstrates HPES qualifications and expertise in classifying data.

Alcatel-Lucent: HP Software and HP Enterprise Services (HPES) developed a complex, groundbreaking solution that featured as-as-service pricing for capturing, retiring, storing, backing up, and analyzing data in legacy applications. The solution employs a range of software products, including ControlPoint and Structured Data Manager. Alcatel-Lucent has committed to retiring 30 applications by Q3 2016, focusing on HR applications. It has scope to retire more than 300 applications in 5 years, each with substantial related data, IT infrastructure, and human resources. The client uses centrally hosted data within HPE's Private Cloud infrastructure under the One HPE IaaS Solution deal won in 2014.

Client Business Needs/Challenge:

- To cut costs and streamline operations, the business wanted to decommission numerous IT systems, creating the need to archive the data from those systems.
- Due to its history as a merged global entity, Alcatel-Lucent had many operating and legacy systems including six different human resources (HR) systems.
- This complexity would increase as the business integrated a third major business, Nokia. In particular, Alcatel-Lucent's chief executive officer (CEO) wanted to retire the enterprise resource planning (ERP) systems.

Client Benefits:

- Lower costs as applications are retired and application data is archived
- Better visibility of its IT environment and data, and ability to search and access a wide range of data from within a single environment
- Improved management of structured and unstructured data reduced into smaller data footprint and lower storage costs

International Criminal Court: The International Criminal Court (ICC) produces and consumes vast amounts of information. Cases could not be tried without witness statements, experts' reports, maps, footage, photographs, and other evidence. Outcomes have to be recorded in judicial documents. These court records need to be stored securely—often for long periods of time—and be easily accessible to those who need and are authorized to use it. Established in 2002 and headquartered in The Hague in the Netherlands, the ICC has a judicial obligation to preserve the vast volumes of information it produces. Governed by the Rome Statute, the ICC is responsible for trying persons accused of the gravest of crimes, including genocide, crimes against humanity, and war crimes.

ICC's records and information management team is responsible for collecting the information from these various specialist areas. They bring it all together, organize it, and present it back to the many people who need to consume and learn from the intelligence it provides. To help the court respond rapidly, the team wanted to map out the diverse categories of information produced by the court. To build the maps, the team first needed to build a clear picture of all the materials produced by court. But with only manual tools available, it took 6 months to build an accurate inventory of the kinds of materials the business was creating. Manual processes were not only slow, they also consumed a lot of valuable manpower.

ICC looked for a tool to help them understand and categorize its information, and they invited HPE to demonstrate ControlPoint's ability to automatically classify data. The international legal institution worked closely with HPE to implement a proof of concept (POC) around HPE ControlPoint that would secure judicial documents, tag operational documents, and dispose of duplicates. As part of the POC, HPE technical specialists were able to demonstrate how HPE ControlPoint could automatically dispose of the outdated and unnecessary legacy content that was consuming storage capacity. The project analyzed around five gigabytes of information stored on ICC's file system, migrating sensitive court records to

their records manager and tagging or disposing of administrative documents according to predefined policies. ICC decided to acquire the HPE solution—a client spokesman commented, "HP ControlPoint helped us to gain visibility into the nature of the records we have. That helped us to speed up the proliferation of our macro retention policy."

Client Business Needs/Challenge:

- Identify and transfer critical court records that needed to be stored safely in the court's record management solution.
- Gain understanding of its information architecture, make certain that sensitive information is stored appropriately, and reduce duplication of records by implementing a system that can identify documents accurately and manage them based on policies.

Client Benefits:

- Frees up resources to focus on higher value activities
- Reduces storage capacity requirements—HPE ControlPoint found approximately 30% of documents to be redundant
- Improved access to data through improved information classification and categorization

- Key Considerations and Potential Alternative Approaches

Develop Archival Solutions for Portfolio Applications: The County has more than 400 applications currently supporting its departments and citizens. These applications rely on different types of data—some unstructured, such as document management and SharePoint oriented data—and some with structured data. It is important to consider and evaluate the full portfolio of applications to determine the appropriateness of data archiving to reduce the data footprint and storage costs. There are two potential alternative approaches:

- **Approach 1:** Conduct an enterprise-wide assessment to determine the applications that should be targeted for data archiving. Based on this assessment, develop an enterprise plan for rolling out the archiving capability.
- **Approach 2:** Start with a pilot effort to validate the cost savings that can be realized by application data archiving. Then conduct an enterprise-wide assessment and develop the roadmap for expanding data archiving.

We recommend Approach 2 because this provides the opportunity for a quick win to both measure the impact of data archiving and to demonstrate its potential to support additional applications across the County. Also, it reduces the near-term investment in hardware and software. Finally, it helps to better define the County's true requirements, which reduces the potential risk of oversizing the enterprise archiving environment.

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

HPES sees this initiative focusing primarily on applications that have structured, rather than unstructured, data sources. Recognizing that not all applications have the same potential for data archiving, we will focus on database-to-database archiving as the primary archive model.

A component of the HPES Information Management/Information Governance (IM/IG) Portfolio is the Structured Data Manager (SDM) tool. SDM automates application lifecycle management and structured data optimization by relocating inactive data from expensive production systems and legacy databases,

while preserving data integrity and access. SDM enables retiring outdated applications through an automated process of extracting, validating, and deleting data.

Rationale: This unique solution significantly reduces capital expenses and administrative costs, and helps the County to respond quickly to legal and compliance requests. This enables the County to obtain maximum value from the data.

Timing: This initiative can begin at any time after contract effective date (CED); however, we recommend beginning this initiative after completion of transition. This will make sure that all changes to the data center architecture are complete and will reduce the complexity of implementation.

Risk Considerations: Each application will have to be assessed and evaluated independently to determine the value of archiving data. There is a risk of overestimating the impact of application data archiving, leading to over-solutioning the archiving platform. We address this risk by starting with a pilot effort for a single application that meets a common profile for successful archiving. We will also assist the County to assess other applications and prioritize them for archiving based on the potential for storage or other savings.

Key Dependencies: There are no real dependencies—in fact, the County considered a pilot effort in 2015. However, as stated above, we would recommend delaying the start of this initiative until after completion of the Transition phase of the contract.

Milestones: Key milestones for this initiative include the following:

- Milestone 1 – SDM Requirements and Analysis
- Milestone 2 – Architecture and Solution Design
- Milestone 3 – Foundation Build in Development/Test Environment
- Milestone 4 – Onboarding and Archiving of the Central Reporting System (CRS) Tax Data
- Milestone 6 – Knowledge Transfer and Testing
- Milestone 7 – Foundation Build in Production Environment
- Milestone 8 – Post Production Support and Documentation

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

We will initially provide a team of SMEs to guide the planning and piloting efforts. This team will collaborative onsite with the County's staff and the local support to define requirements and to validate the results of the project. The team will also conduct knowledge transfer to facilitate extending the implementation and support County-wide. HPES SMEs will remain available as required to provide reachback support.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

The County has in excess of 400 applications. The potential value for archiving portfolio data will vary significantly from one application to another. HPES recommends conducting a pilot effort on one of the County's applications to validate the potential for reducing application data storage requirements rather than starting with a County-wide implementation of Portfolio Application Archiving.

Previously, the County, with the support of HPES, identified Treasurer-Tax Collector (TTC) CRS as a candidate for the pilot effort. Following the pilot, we would work with the County to develop a strategy and roadmap for extending application data archiving to other County applications.

- Automated Tools – Automated systems and tools involved in proposed solution

We propose using the SDM tool, described above, to reduce the data footprint of the County's structured data. SDM software comprises an integrated set of components that facilitate design, deployment, and ongoing management of archiving processes throughout the lifecycle of applications and data. In addition, they deliver capabilities that address different levels of application complexity, data volumes, and archive access requirements. The components include the following:

- Designer – Provides a visual interface to model data and create business-aligned data migration rules with ease
- Data movement – Makes sure data relocation is performed to meet volume requirements while retaining application integrity at all times
- Archive access – Provides a full range of access capabilities to meet requirements for business operations, regulatory compliance, and legal discovery
- Job engine – Automates all archiving tasks with built-in recovery and restart
- Management console – Provides system configuration, job monitoring, job launching, and complete audit trail capabilities

- Qualifications and Experience – Background and experience in comparable environments

HPES has proven experience providing these types of services to a variety of clients with environments similar to that of the County, as described below.

Leading Pharmaceutical Manufacturer: Solution Description: For the last 4 years, one of the world's leading pharmaceutical groups has been cutting costs. One of its key targets has been to reduce the number of IT applications from around 5,000 to 1,500 to lessen associated complexity, costs, and legal risks. A further issue was that the existing Information Lifecycle Management (ILM) Data Archive did not meet Government regulations, creating a high level of organizational risk. Finally, they were storing more information than required, and system interruptions were commonplace—especially if the company sought to simultaneously extract and purge data. In July 2015, the company purchased HPE Structured Data Manager (SDM) to accelerate the archiving of structured data from legacy applications. The company plans to use SDM on an enterprise-wide basis to decommission 300 applications in 2015 (66 of which require structured data archiving) and 896 in 2016 and 2017 (135 structured).

Client Challenges/Need:

- Meet Government requirements for information governance
- Reduce application and data complexity to reduce risk and lower cost

Client Benefits:

- Significant cost savings through reduction in software licensing
- Automatic migration of data with a complete and documented chain of custody
- Improved data quality during data migration, thereby reducing the risk of future litigation
- Data stored in common record formats
- Consolidation of all data in a standard archive rather than disparate locations.

- Key Considerations and Potential Alternative Approaches

Hyperconverged Integrated Systems: Hyperconverged infrastructure is designed to simplify the design and management of the computing environment by merging and pre-packaging the server, network, and storage components of infrastructure into pre-sized building blocks. To deliver the most value, hyperconverged systems would have to comprise nearly all of the infrastructure deployed in the data center; otherwise, the hyperconverged solution becomes just another platform that has to be integrated

and adapted to existing standards; this would increase rather than decrease overall complexity in the environment.

One possible application of hyperconvergence that the County could consider in the shorter term would be the implementation of hyperconverged infrastructure for servers deployed in County field sites. As systems come up for refresh, we will compare available options in the marketplace for cost, compatibility with established management tools and fielded applications, and if a hyperconverged solution would yield benefits to the County, we will recommend its implementation.

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

As described in Section 2.9, Application Infrastructure Services, in response to Schedule 4.3, Section 6.7, HPES will implement Helion MPC and Helion Managed Cloud Broker (HMCB) during the Transition as we build the County's on-demand Dev/Test and Production environments as part of the data center consolidation. These platforms start the County on a path of greater standardization in the virtual/converged infrastructure environment. By implementing a private cloud with standard-sized building blocks of virtual infrastructure, we will be able to test and validate whether a hyperconverged infrastructure will ultimately yield benefits for the County.

When the County is ready for hyperconvergence, HPES will provide the technology partnership to achieve this. If we are able to fully standardize over time on the x86 platform in the converged infrastructure, then the next logical step is to plan, design, and implement a hyperconverged infrastructure. During the planning phase we will build the business case for hyperconvergence and will provide the County with alternative solution designs built on the most suitable and current technology and vendors available. HPE offers a wide range of hyperconverged systems that we continue to advance and innovate with to suit various business cases and client needs.

To achieve the best possible outcomes from the County's investment in this technology and to meet its needs in a way that helps to better support County business, we will consider and evaluate the following features to help the County select the optimal hyperconverged solution:

- **Integration for Seamless Coexistence**. Ability of the hyperconverged solution to integrate with the legacy environment. The hyperconverged solution must enable the County to fully integrate the new solution with the legacy environment. Existing server and storage assets must be able to coexist with the new environment until the eventual collapse of multiple administrative interfaces into fewer simpler tools.
- **Scalability**. Ability to grow the environment in a nondisruptive manner and the ability to scale up or scale out without replacing the initial equipment with new equipment. The solution must offer just-in-time growth capability to avoid the need to carry expensive inventory. Additionally, granularity in scalability is important to scale only the resources required in the increments that make sense for the County.
- **Data Mobility**. Ability to move data around to accommodate individual device outages—the ability to easily move data between the hyperconverged platform and other systems, without having to rely on consultants.
- **Data Protection**. Ability to protect data in the event of hardware failures, human error, or natural and manmade disasters while meeting desired SLAs, RPOs, and RTOs without the need for an additional software or hardware layer. Features we will evaluate for the County include RAID or mirroring, fault tolerance, replication (synchronous and asynchronous) within the site and between sites as well as full disaster recovery capabilities.
- **Performance**. Ability to provide performance opportunities that are considered enterprise-class. This means that the solution should support flash and, optionally, spinning disk. Ideally, both will be

supported because they have different strengths and weaknesses. When it makes sense, the solution should be able to automatically tier storage systems to enable faster data access or, at the very least, have an accelerated method for handling data retrieval.
- **Availability**. Ability to provide availability at SLA levels that meet County requirements for all systems. To determine this, we will evaluate ease of scalability, ease of management, ability to scale out storage, tolerance for node loss, cluster resiliency, and capabilities of automated failover.

Once we have identified and received County approval of the plan, in a parallel but fully integrated mode of operation we will execute a phased migration of the County's systems to the new hyperconverged infrastructure. Our plan will also consider data center component refresh dates to maximize investments in the legacy environment prior to the migration.

Timing: Preparation for implementation of a hyperconverged infrastructure will occur during transition. HPES recommends the actual implementation to occur as data center components come up for refresh.

Risk: None at this time.

Dependencies and Milestones:

- Prior to the County investing in a hyperconverged integrated solution, standardization on the proposed Managed Private Cloud platform must be established
- To migrate to a hyperconverged infrastructure, existing legacy equipment will need to be refreshed onto the hyperconverged platform.
- Development of implementation strategy and plan.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

With the implementation of hyperconverged systems, methodologies and process for deployment become easier as a result of the pre-configuration of server, network, and storage components of infrastructure into pre-sized building blocks. These systems include easy-to-use management tools designed to streamline implementation and management and help shield the administrator from much of the underlying architectural complexity.

Our new HPES hyperconverged systems deploy VMs in just five clicks, update hardware and firmware in just three clicks, and provide instant diagnostics and analytics to enable faster response to business needs.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

HPES' facility approach is to deploy the new hyperconverged infrastructure at our primary data center in Tulsa, Oklahoma and/or in field sites as deemed appropriate.

- Automated Tools – Automated systems and tools involved in proposed solution

Our vision is to dramatically simplify and streamline IT administration and operations management. While many hyperconverged integrated system solutions are available on the market today, HPES is a market leader in hyperconverged systems. Our hyperconverged systems offer an infrastructure that provides the following features/benefits:

- Rapid provisioning of VMs
- Flexibility and speed to add capacity in as little as 15 minutes
- Simple IT operations with firmware and driver updates in just three clicks
- 99.999% continuous data availability
- Federated lifecycle management
- Data fabric with data mobility across systems, sites, and cloud

- Lower startup cost with two-node entry and linear scaling
- 62% lower cost for disaster recovery
- Pay-as-you-grow flexible capacity model

Using HPE OneView as the common software-defined convergence platform, we provide software-defined management for both our larger ConvergedSystem 700 powered by Intel models as well as the smaller CS200-HC models. The HPE OneView user experience (UX) makes managing and monitoring systems so easy, no manual is required. HPE OneView integrates with HPE Helion OpenStack and CloudSystem and has extensions to a variety of management software. With a commitment to provide clients with the most flexibility, we have been continually and significantly expanding this ecosystem since 2015.

- Qualifications and Experience – Background and experience in comparable environments

Uniting market-leading HPE Converged Infrastructure with decades of experience in solution design, HPES delivers the ConvergedSystem Portfolio—offering a purpose-built system that dramatically simplifies IT.

HPE ConvergedSystem delivers components designed from the start for convergence, coupled with integrated OneView management and workload optimization based on decades of expertise. The result—a single holistic computing ecosystem.

HPES has proven experience providing hyperconverged integrated systems and services to a variety of clients with environments similar to that of the County, as described below.

City of Los Angeles Department of Building and Safety: Solution Description: The City of Los Angeles Department of Building and Safety Technology Services Bureau supports 1,100 employees to perform permitting, inspection, and code enforcement. The Department processes an average of 120,000 permits per year and provides management for application projects. In the last 12 months leading up to the HPES Converged Systems solution, the client reported two major outages preventing hundreds of customers from doing their work, hurting their reputation as well as the construction industry and economy in general.

Client Challenges/Needs: The client reported frequent hardware failures, power failures, and struggles with keeping systems cool in the space-confined communication rooms and closets hosting equipment in their district offices. The client also struggled with high maintenance costs and frequent travel to remote sites to perform maintenance tasks. They needed to save costs and time, while improving availability.

Client Benefits: We provided a scalable hyperconverged solution within a single box in district offices to provide the services they needed. End users reported a 30% improvement in performance. Provisioning went from weeks to less than a day. They went from two full racks of equipment per site to two units of a single rack. The HPE hyperconverged system boxes, which generate no heat, reduced power consumption and cooling costs. We also reduced travel costs with remote management and low maintenance. The client had a single interface to perform remote management using HPE OneView, slashing maintenance costs. No outages were reported since we implemented our hyperconverged solution. With this scalable solution, the client can add more applications and storage as needed.

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

Initiative: E911 (Exhibit KK, Section 3.7)

- Key Considerations and Potential Alternative Approaches

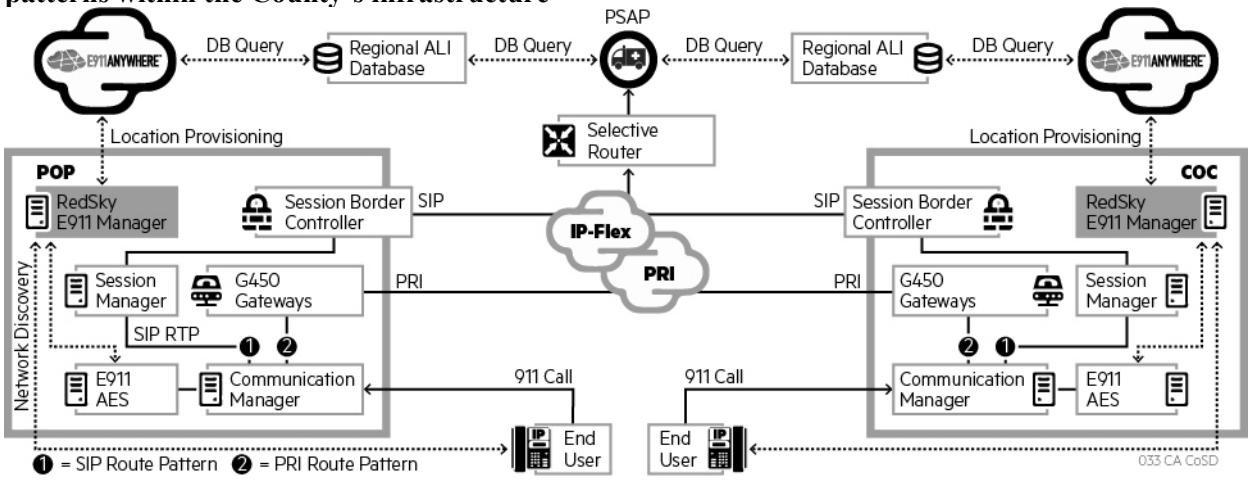
Enhanced 911 (E911) is an important complementary solution to an enterprise Voice over Internet Protocol (VoIP) deployment. As call control is converged into the geo-redundant voice core infrastructure and VoIP is enabled at the telephone set, there is an imperative to provide emergency responders with accurate and detailed information about the source and location of the caller. We propose integrating a site-by-site deployment of E911 services in conjunction with the VoIP upgrade activities proposed in the Voice Transformation response.

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

The solution highlighted in this section specifies the E-911 migration planned for implementation early in the contract at existing VoIP sites and ongoing in parallel with VoIP site upgrades. AT&T believes this implementation is crucial to the voice services described in Section 4.3 of the RFP and is priced in Exhibit 16.1-1 accordingly.

HPES recommends the adoption of the industry leading E911 Manager and E911 Anywhere by RedSky technologies. RedSky's E911 Manager® solution will be implemented in line with the County's geo-redundant network core, with infrastructure at the AT&T Point of Presence (POP) and the County Operations Center (COC). The primary application will run on an active host with a standby host that will take over in the event of failure of the primary server, enabling full redundancy.

Figure 187. Fully-integrated E911 solution will automate the E911 process by recognizing route patterns within the County's infrastructure



The E911 Manager will automate the E911 management process by connecting with the County's Geo-Redundant Avaya Communications Manager via the AT&T MPLS network to track and update phone moves, adds and changes.

To handle the growing deployment of VoIP services throughout the County, RedSky's E911 Manager will communicate with the Avaya Enterprise voice network to monitor registration events of VoIP endpoints. E911 Manager will use Layer 2 Network Discovery or Layer 3 Network Regions to determine the location of the user based on port, network device, or IP address and will update the Avaya Communication Managers with the proper Emergency Line Identification Number (ELIN) for 9-1-1 off-net calling. The E911 Manager server will create and store Automatic Location Identification (ALI)

records as necessary and submit to RedSky's E911 Anywhere® cloud service in the required format for the local Public Safety Answering Point (PSAP).

To manage ALI information centrally—for County locations or to support mobile softphone users—the proposed RedSky solution includes RedSky E911 Anywhere cloud service. E911 Anywhere is a cloud-based 9-1-1 call routing service that can connect a 9-1-1 call to more than 6,000 PSAPs in the USA and Canada. E911 Anywhere is an effective choice for the County based on its distributed locations as well as the increase in mobile and desktop IP softphone users. The recommended solution by AT&T will feature the following:

- A fully automated E911 solution that will track the location of phones as phones move within the County's enterprise voice network
- An E911 software application located at the AT&T IDC and COC that will interface with the Geo-Redundant Avaya Communication Manager voice network
- A solution that connects with all Private Switch-Automatic Location (PS-ALI) Identification databases throughout the cities within the County
- A solution that provides Emergency On-Site notification to anyone working at the County of the location of a call placed to 9-1-1
- Geo-Redundant Active / Active Server construct located at the AT&T Internet Data Center (IDC) and COC for high availability and redundancy
- Reporting and metrics for auditing of all E911 activity
- As a "cloud-based" 9-1-1 call routing service, E911 Anywhere can send a 9-1-1 call to any PSAP in the U.S. or Canada (with County approval)

E911 is a necessity for the County enterprise VoIP deployment. As stated in the introduction, this solution will be integrated into the County's enterprise-wide VoIP migration, enabling functionality on a site-by-site basis over the length of the transformation initiative.

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

For the proposed e911 solution, AT&T will leverage the local LCM (Life Cycle Management) team, in-house vendors, direct manufacturers, and carriers. AT&T personnel will provide this support from its location on Trade Street in San Diego.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

All support services—whether triage, new requests, change requests, or removals—are initiated by the County user to the HPES Service Desk. All requests within the network framework for E911services will be directed to the AT&T LCM team for assessment and completion.

AT&T will leverage the RedSky's solution for updates to the PSAP routing and PS-ALI databases as County staff request Adds, Moves or Changes to their VoIP telephone stations. The tracking of VoIP phones is made possible by enabling Layer 3 Network Regions on the County's LAN. This is the most common method of tracking IP, SIP, and IP soft phones inside an enterprise. This method, which is specific to Network Regions or subnets, establishes a dedicated block of IP addresses associated to the region at the DHCP server. Each Network Region will then have assigned to it a physical address and an ELIN. Every time a VoIP phone registers to the Avaya Call Manager at the AT&T POP or County Operations Center, E911 Manager reviews the IP address of the VoIP phone to determine if the IP address falls into one of the IP address ranges set aside for the regions. If E911 Manager determines that a VoIP phone is in a Network Region, E911 Manager will provide the ELIN to the respective Avaya Communication Manager server at the AT&T POP or County Operations Center.

- Automated Tools – Automated systems and tools involved in proposed solution

E911 Manager solution will automate the E911 management process by connecting with the County's Geo-Redundant Avaya Communications Manager to the AT&T Multiprotocol Label Switching (MPLS) network to track and update VoIP, digital, and analog phone moves, adds, and changes.

E911 Anywhere is a cloud-based 9-1-1 call routing service that can connect a 9-1-1 call to more than 6,000 Public Safety Answering Points (PSAPs) in the U.S. and Canada.

- Qualifications and Experience – Background and experience in comparable environments

RedSky is the leading provider of on premise and cloud-based E911 solutions. More than a million workers, students, guests, and visitors use RedSky for E911 protection. RedSky leverages legacy standards as well as the new National Emergency Number Association (NENA) i3 standards for Next Generation 9-1-1 (NG9-1-1) to help organizations provide effective 9-1-1 emergency response, comply with state E911 regulations, and meet business requirements for safety, risk management, and efficiency.

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None

- Alternative Approaches (*optional*) – Submit a description of an alternative approach if you believe it is worth consideration by the County, including rationale, trade-offs and potential benefits.

With our E911 solution, emergency responders will receive information for the building location including the floor of the building from which the call was placed. An alternative approach is to define the PSAP information all the way down to the office/cubicle for the caller; this is not included in the proposed solution.

Initiative: Identity Federated Services (Exhibit KK, Section 3.8)

- Key Considerations and Potential Alternative Approaches

HPES took into consideration the following items, in addition to those identified in the RFP, in making the decision to recommend retaining the current identity and access management (IDAM) platform that the County uses and expanding it to enable the Identity Federated Services through the addition of HPE Identity and Access Management as a Service (IAMaaS). We decided on this solution because it offers the following benefits:

- Low risk to the County
- Speed of implementation
- Low risk to County business partners
- Ease of use
- Leverage existing infrastructure and licenses for County's Oracle IDAM platform
- Existing knowledgebase within the County' and HPES technical and architectural teams
- Maximizes the County's current investment

Potential Alternative Approaches: HPES considered full implementation of HPE Identity and Access Management as a Service (IAMaaS), which would provide identity management of internal as well as external users such as citizens. We decided against this solution because it would require removal of the County's current Oracle IDAM solution, which does not protect the County's investment in the current platform and introduces risk.

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

HPES analyzed Okta, Oracle, and IAMaaS during the technology selection stage and recommended HPE's IAMaaS due to the maturity of the product and services, purchase and maintenance cost, and lower risk during implementation. However, if the County opts for another solution such as Okta or Oracle, HPES will work with the County to plan and execute a successful implementation of either vendor's solution.

The recommended Identity Federated Services solution includes the following components:

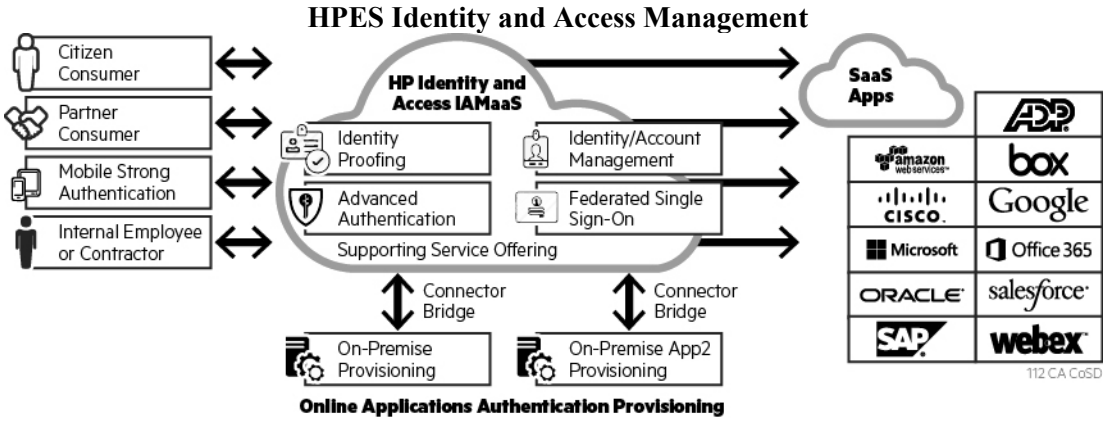
- The existing Oracle IDAM technology platform as its core
- Microsoft Active Directory Federation Services (ADFS)
- HPE's IAMaaS to enable the federation services where the County is acting as service provider and identity provider.

The first two components of the solution are discussed fully in Section 2.5.13 (response to Schedule 4.3, Section 2.18). The remainder of this section describes IAMaaS solution. HPES will use IAMaaS to integrate external constituents within the County's Identity Management Service. IAMaaS is a cloud-based IDAM) solution built using the Computer Associates (CA) secure cloud product for multi-tenancy. IAMaaS is hosted on the HPE Helion Managed Virtual Private Cloud for U.S. Public Sector. The following elements describe the main features of the IAMaaS solution and how they relate to the County:

- User life cycle management such as self-registration, password resets, and profile updates.
- Application access management to request access to applications.
- Hybrid provisioning cloud and on premise to create/update on premise identity requirements.
- Identity synchronization on premise to make certain that relevant data is updated one way or bi-directionally.
- Reporting for compliance and audit.
- Identity proofing from the solution to County data stores.
- The single sign-on (SSO) Federation Hub can act as identity provider (IDP) and service provider (SP) to County software as a service (SaaS) applications.
- IAMaaS can act as a Federation Hub. External users can be authenticated to SaaS apps using their County/IAMaaS credentials, County credentials, or social login credentials like Facebook.
- The CA Security SaaS Validation Program helps SaaS vendors increase sales and adoption by simplifying and validating their SSO interoperability. It enables smooth integration of SaaS solutions into CA SSO environments in a user-friendly and cost-effective way.
- Credentials may include Forms, Integrated Windows Authentication (IWA), multi-factor authentication (MFA), public key infrastructure (PKI), Radius, OAuth, one-time password (OTP), and Risk.

Figure 188 illustrates the main elements of the IAMaaS solution and its relationship with the County, its citizens, employees, and partners. On the left side is each type of user who will interact with the service. Within the core or "cloud" of IAMaaS are the key services provided such as identity proofing, identity and account management, federated SSO, and advanced authentication. The resources and services to access are on the right; those services are both internal and external to the County IT environment, including third-party providers. Connectivity to the resources via the IAMaaS are enabled via industry-standard IDAM protocols.

Figure 188. IAMaaS solution



Providing secure IT services operations through robust user identity authentication.

Rationale: We believe that expanding the current IDAM capability along with implementation of HPE's IAMaaS for identity management of external users provides the most cost-effective solution. This approach *provides a low risk, non-disruptive method* to expand on existing County investments and meets the County's architecture vision for identity management.

Timing: The timing for expansion of the existing County IDAM solution to include federation will coincide with the ConnectWell San Diego project or other timing as required by the County. Other elements of the solution such as federation requests to business partners will occur as the solution is deployed.

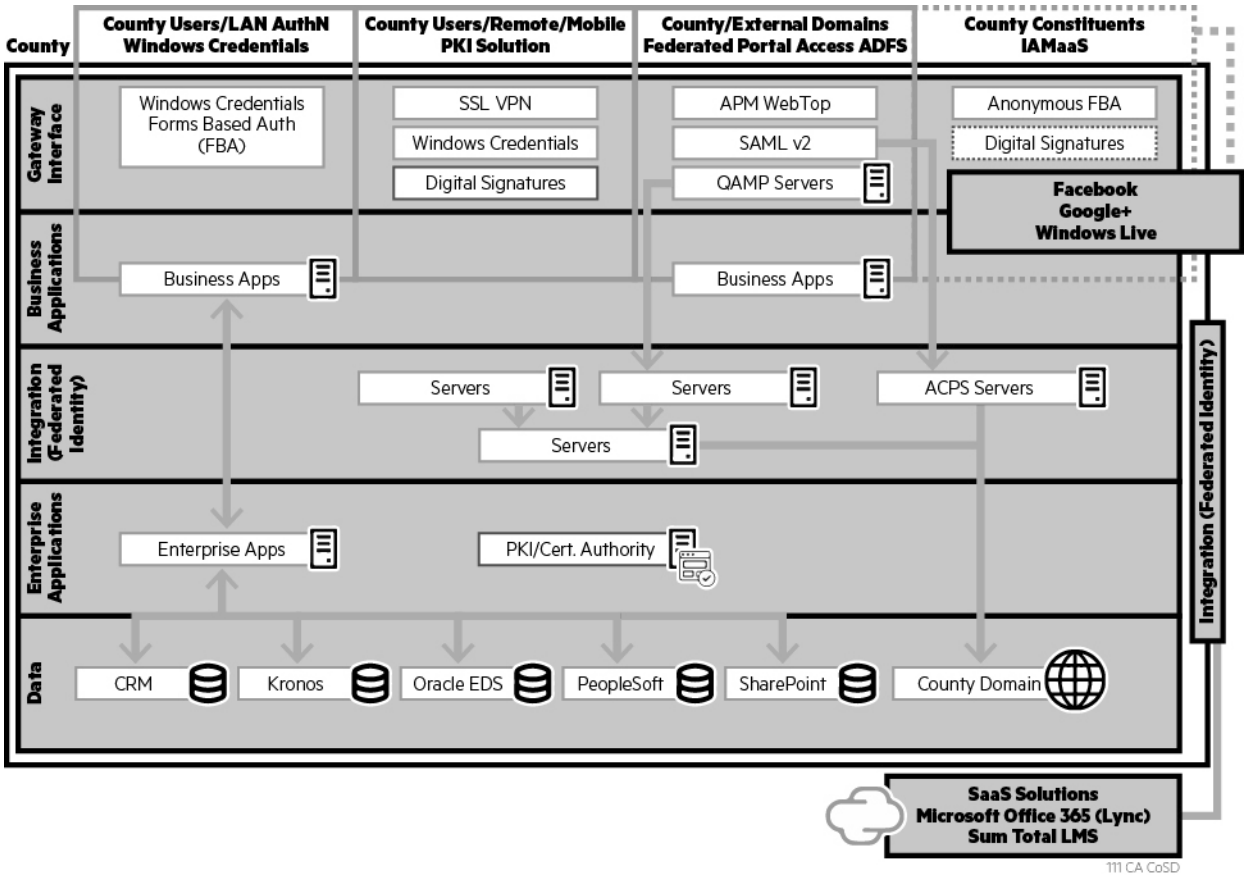
Figure 189 below depicts the overall view of the IDAM solution and how Oracle, ADFS, and the HPE's IAMaaS will work together to provide identity federation. As seen in the figure, the core elements of the IDAM solution will work together to enable seamless federation between the County and third-party providers, external State and Federal agencies, and identity management for County residents.

The County ADFS 2.0 environment—a key component of the Identity Federated Services—has been operational since 2011, providing secured identity federation and web SSO capabilities for County and external business unit end users who require access ADFS-secured applications within the County network and in the cloud.

Earlier in 2016, the ADFS environment was upgraded to v3.0 with redundancy, and included a new test environment. By adding external access to the test ADFS server, this upgrade provides expanded use of the ADFS test environment for development and testing of new ADFS-secured applications.

Upgrading the ADFS environment was part of the County's overall IT roadmap to refresh and improve key infrastructure components and expand the County's IDAM solution. The key point is that this solution is strongly tied to the Identity and Access Management Services solution; it is a continuation of that capability but expanded to enable federation—much of the approach is duplicative.

Figure 189. The proposed new IDAM solution integrates Oracle, ADFS, and the HPE's IAMaaS



This solution offers minimal risk to the County and enables seamless federation between the County and third-party providers, external State and Federal agencies, and identity management for County residents.

Key Dependencies and Milestones: As a part of the overall IDAM effort, Identity Federated Services is encapsulated in the following list, which details the progressive steps of the IDAM solution and details what is being done today and what HPES will perform in the future:

- Current/on-going effort – Oracle Federation Manager is currently deployed with Service Provider active and Identity Provider not active. Based on an existing request from the Department of Child Support Services (DCSS), we plan to implement the Federation Acting as Identity Provider upon approval. To deliver the federation capability for DCSS, IAMaaS needs to be implemented simultaneously with Federation Acting as Identity Provider.
- Future – Develop a process for auto-onboarding new employees based on the information in PeopleSoft to create the Active Directory (AD) identities
- Future – Expand use of the existing platforms into all County business units and partners as well as work with the current Knowledge Integration Project (KIP) team (IBM) to expand to partners
- Future – Use HPES IAMaaS solution to expand to County residents and to act as the identity manager for County residents
- Future – Re-architect the solution to become a zero downtime solution
- Future – Federate with County third-party vendor applications

- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

Ongoing support for the IDAM service will be delivered by continental U.S.-based delivery resources in line with the County's requirements. With more than 5,000 security professionals who have IDAM expertise, HPES has the experience to deliver even the most complex solutions.

The HPES Tulsa Data Center will be the production data center, with the IDAM solution delivered from this location. This includes almost all web, application, and database servers, data storage, and data management. The HPES disaster recovery (DR) site in Colorado Springs will provide the recovery site for the IDAM solution.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

HPES will adhere to the following key processes to deliver Identity Federated Services:

Solution Methodology: By incorporating the HPES IT Strategy & Architecture (ITSA) for Identity Federated Services, we will take the same iterative approach, addressing issues and improvements in data quality and data management—in both practice and implementation. Through this process, HPES will work closely with County data teams and other HPES Transformation, Integration, and Architecture (TIA) data architects to define and manage County IT outsourcing enterprise data semantics. ITSA for Identity Management advocates a rapid, incremental, and iterative approach that can be aligned with the County's hybrid development methodology.

In addition to the ITSA, we will use standard TOGAF (The Open Group Architecture Framework)-based architecture approach to develop the solution artifacts and produce the required documentation to make certain that the solution is documented correctly and that it also will lower the overall implementation risk to County. We will integrate these key methodologies with the County's current Architecture and Solution reviews in conjunction with the County Technology Office (CTO) and relevant County groups.

For the Oracle IDAM Suite, HPES will work with our IDAM architect to make certain that the design, development, and deployment of the Oracle suite follow standard Oracle design and deployment methods. This will facilitate operation of the Oracle platform within the design parameters. Any significant design changes to the platform or changes to the Oracle databases will follow Oracle mandated practices.

- Automated Tools– Automated systems and tools involved in proposed solution

HPES will use the Oracle and Microsoft tools identified in Table 87. in support of Identity Federated Services.

Table 87. Automated Tools for Support of Identity Federated Services

TOOL	PURPOSE
Identity Manager	• Oracle Identity Manager is designed to manage user access privileges across all of the County's resources, throughout the entire identity management lifecycle—from initial creation of access privileges to dynamically adapting to changes in business requirements. Identity Manager enables the incorporation of necessary business changes at minimal cost, while avoiding enforced customization.
Access Manager	• Oracle Access Manager provides adaptive authentication, federated single sign-on (SSO), risk analysis, and fine-grained authorization extended to mobile clients and mobile applications. Services can be licensed and enabled as required to meet the specific needs of the County.

TOOL	PURPOSE
Federation Manager	• Oracle Identity Federation (OIF) provides secure identity information exchange between external/internal partners. OIF provides account management for partner identities and integrations through support of industry federation standards. OIF protects existing IT investments by integrating with a wide variety of data stores, user directories, authentication providers, and applications.
Virtual Directory, Unified Directory	• Oracle Virtual Directory provides Internet and industry-standard Lightweight Directory Access Protocol (LDAP) and eXtensible Markup Language (XML) views of existing enterprise identity information without synchronizing or moving data from its native locations.
Microsoft tools and services also be used: • Microsoft Active Directory 2012 • Microsoft ADFS	• Microsoft Active Directory (2012) Domain Services (AD DS) provides a distributed database that stores and manages information about network resources and application-specific data from directory-enabled applications. Administrators can use AD DS to organize elements of a network—such as users, computers, and other devices—into a hierarchical containment structure. The hierarchical containment structure includes the AD forest, domains in the forest, and organizational units (OUs) in each domain. • ADFS (Active Directory Federated Services) provide County users with SSO access to systems and applications located across organizational boundaries. It uses a claims-based access control authorization model to maintain application security and to implement federated identity. (Claims-based authentication involves authenticating a user based on a set of claims about that user's identity contained in a trusted token. Such a token is often issued and signed by an entity that is able to authenticate the user by other means, and that is trusted by the entity doing the claims-based authentication.) It is part of the AD DS.

- Qualifications and Experience – Background and experience in comparable environments

HPES has experience delivering IDAM services that include the following:

- Managing 59 million usernames and passwords
- Managing and monitoring more than 6,000 firewalls
- Executing 3,000 IDs for threats and vulnerabilities
- Completing more than 250 custom security audits annually
- Providing laptop and desktop encryption in 65 countries for more than 575,000 devices

Additionally, we provide similar services to a variety of clients in an environment comparable to that of the County, as described below.

County of San Diego: HPES has successfully deployed all of the major Identity Management elements currently running within the County of San Diego including Active Directory (AD), Active Directory Federation Services (ADFS), Oracle Identity Management Suite, Public Key Infrastructure (PKI), Office 365, and Digital Signatures. This includes continuing integration and design efforts.

U.S. Navy Next Generation Enterprise Network (NGEN) Program: HPES currently manages a full-spectrum identity management and lifecycle capability for the United States Navy that encompasses the entire United States land-based Naval and Civilian services including both unclassified and classified domains. We manage more than 800,000 user identities across the two environments, which encompass

human resources (HR), support, healthcare, and third-party systems. HPES works directly with the Navy customer to institute business and process rules into the IDAM capability.

Massachusetts Executive Office of Health and Human Services (EOHHS), Massachusetts Medicaid Management Information System (MMIS): HPES designed, developed, implemented, and now maintains and enhances the MMIS system for Massachusetts. HPES replaced the previous, state-operated Medicaid system with the new Web-based, service oriented architecture (SOA) application constructed to integrate into the state's enterprise SOA infrastructure. The infrastructure includes shared services such as enterprise identity management and electronic payments. The MMIS has enabled the consolidation of health data and enabled the timely implementation of new policies and programs.

The MMIS applications are integrated via Web services with enterprise access management systems to enable user SSO. Self-service user ID management features were developed and implemented for the new Provider Online Service Center (POSC) Web site. These features allow the primary user ID for a healthcare practice or hospital to create and administer user IDs for their own staff, rather than calling a help desk. An online security administration subsystem was developed to provide EOHHS security staff the ability to administer role-based authorization for both internal and external users. The MMIS system uses digital certificates to secure service-based interfaces with internal and external systems. During implementation, HPES issued new cards to 1.1 million members and provided a self-registration feature to create new user IDs for 24,000 active providers.

Hirschvogel Automotive Group: For this client, HPES created and implemented an HPE identity management solution that integrates SAP NetWeaver Identity Management with SAP HR, SAP ERP, and Active Directory residing in various business units and locations. HPES led the company in all project phases, including project management, solution design, and implementation. HPES now supports the company in maintaining and developing the identity management solution.

The new identity management solution is designed to make available high-quality personal data in a secure central identity management (IDM) system. It minimizes manual administration and limits access to personnel information.

In workshops with HR and IT staff, HPES helped Hirschvogel analyze its identity management requirements and develop a set of specifications. Based on these, the HPES team created an HPE Identity Management System and implemented it with SAP NetWeaver Identity Management to the following requirements:

- Build a reliable identity provisioning infrastructure
- Integrate the system very tightly with the company's HR processes—partial relocation of staff workflow in the Identity Management System
- Create a central workflow engine to implement management processes
- Delegate administration of user privileges
- Establish a central review point for all activities involving managing users and permissions
- Connect SAP HR
- Connect various Active Directory domains within the company
- Connect SAP ERP

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

- Alternative Approaches (*optional*) – Submit a description of an alternative approach if you believe it is worth consideration by the County, including rationale, trade-offs and potential benefits.

HPES considered an alternative approach, as described above in the Key Considerations and Potential Alternative Approaches section.

Alternative Approaches – Other Proposed Initiatives (Exhibit KK, Section 4)

HPES proposes two additional transformation projects for consideration by the County described below.

Enterprise Information Management

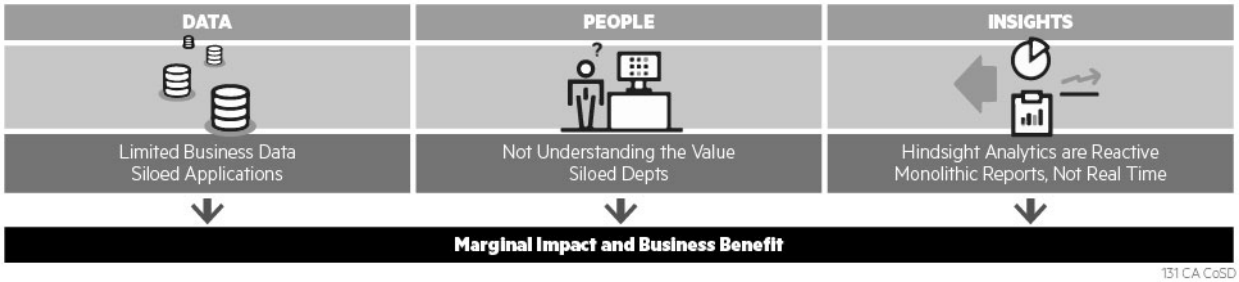
- Key Considerations and Potential Alternative Approaches

HPES recommends implementation of an Enterprise Information Management (EIM) program to capitalize on the valuable data that is available but currently not harnessed. This will provide the County with information it needs to make more informed decisions and present an enterprise view of the data that could be used to make richer programs available to the public.

The County has begun the journey to modernize the Information Architecture and Governance model a critical step as modernization and transformation of the IT infrastructure begins. The information architecture must address traditional "feeds and speeds," and include business definitions of information and the information processes to incorporate all data (structured, semistructured, and unstructured (xml, flat files, scanner files).

Siloed business data, as shown in Figure 190 makes it difficult to take full advantage of the information available across the enterprise. To the County, this could mean employees are limited in their ability to perform certain job functions or provide the services citizens need. This can result in added frustration for both employees and citzens.

Figure 190. Siloed Business Data



When data is siloed, it is more difficult and time consuming for County employees to find the information needed to support citizens.

EIM provides an essential framework for managing and governing information (data) across the enterprise and requires:

- Governance and stewardship
- Integration
- Methodologies and standards
- Architecture and technologies
- Enterprise data models

The payoff for an EIM solution is clear—the County will be better prepared to more rapidly meet the needs of employees and citizens by gaining greater insight from the data it collects, as shown in Figure 191.

Figure 191. Integrated Data Across the Enterprise.

Easy access to all available data facilitates decision making and helps to achieve superior business outcomes.

As HPES and the County develop a modernized Information Architecture and Governance model, we will consider a wide-range of common challenges that include:

- Inconsistent definitions of key business data, leading to incomplete, incorrect business metrics
- Information that is not available, incomplete, inaccurate, and untimely to enable informed business decision
- Time-consuming, manual processes, adding to employee workload and citizen frustration
- Fragmented data, preventing or delaying comprehensive situational analysis and appropriate actions
- Siloed project work, preventing integration or extension across enterprise
- Inconsistent data, preventing standardization and reuse of processes, methods, among others
- Siloed decision making, which may be counterproductive to the enterprise
- Poor data quality and fragmented data security/auditability, exposing compliance risks (SOXA, HIPAA, ISSA, CCA, FRCP, Basel II Accord, PCI, EU Privacy Directive, etc.)
- Unknown data retention needs/requirements, transforming data assets into data liabilities (storage costs & exposure risks).

HPES recommends EIM for developing a coherent and supportable Information Architecture and Governance model. This approach will focus on developing an information strategy and a roadmap for implementing the strategy, and then to invest in delivering the supporting initiatives.

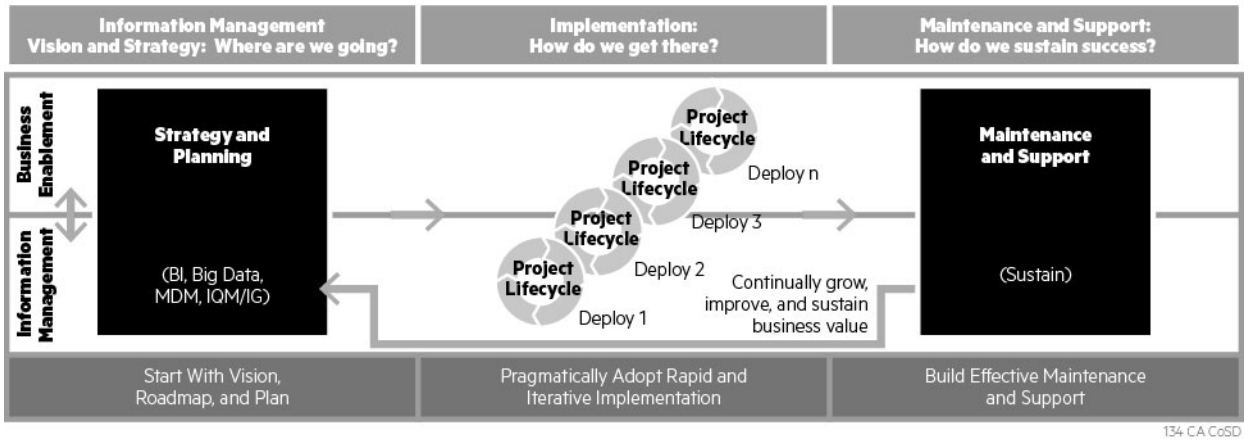
- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

We propose a two-phased approach to establish a coherent EIM program. The first phase is a stand alone project and it is priced as a new capability in Schedule 16.1.1. This project focuses on the objective defining the County's EIM program. Key deliverables from this project include: Vision and Strategy Document and EIM Roadmap.

The second phase is would consist of a number of separate projects detailed in the Roadmap from Phase 1. Each project will have well defined objectives and deliverables defined throughout the implementation process. Specific intitiatives/projects identified in the roadmap are executed in a rapid and iterative approach. HPES scopes the implementation projects upon completion of the vision and strategy. Projects associated with the second phase are not priced in this proposal and would be completed via work request.

Figure 192 illustrates the HPES approach to EIM. Of particular note, our approach is to address and align business enablement with information management.

Figure 192. HPES Approach to EIM



Our approach aligns business enablement and information management that address true business needs.

Rationale: EIM provides the framework for managing and governing information across the enterprise. An EIM program enables data sharing for better decision making and provides County leaders with insight into to the quality of services that they deliver to their citizens.

Timing: We estimate the time required to develop the information management vision and strategy and roadmap to be a 3- to 4- month period that would occur after transition. We will work with the County to determine the business needs and to document the supporting technical requirements. To minimize the County's time investment, while maximizing impact, we will conduct information gathering through a series of focused discussions with stakeholders. This helps us to have an accurate understanding of the current environment as well as the desired future state. At the end of this effort, we will deliver a strategy and roadmap for review and approval by the County.

Risks: None identified.

Dependencies: Developing an effective EIM program is dependent on the active involvement of the business groups as well as the CTO.

Milestones: Key milestones in the planning and implementation of EIM include the following:

- **Milestone 1 – Business Needs Assessment.** A core component of the information gathering phase of the strategy and vision project that focuses on the needs of the business in terms of EIM.
- **Milestone 2 – Current State Assessment.** The second core component of the information gathering phase focuses on documenting the existing technical environment to support EIM
- **Milestone 3 – Desired State Gap Analysis.** The transition step into analysis and planning phase where we document the gaps between what the County's business needs are and the current technical environment.
- **Milestone 4 – Strawman Vision and Roadmap**. This milestone reflects HPES draft strategy and roadmap for the County.
- **Milestone 5 – Final Vision and Roadmap.** Once the County reviews and approves, HPES provides the final strategy and roadmap to guide implementation the of EIM program.

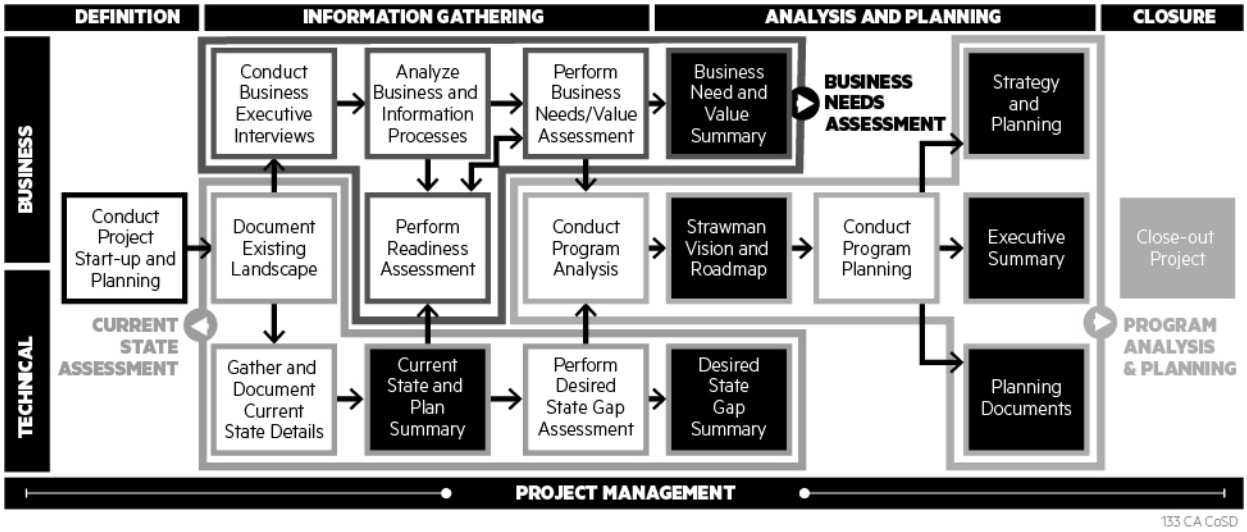
- Resource and Facility Approach Summary – Proposed deployment plan for resources and use of facilities

For the development of the County's Information Management Strategy, Vision, and the supporting Roadmap, HPES provides a small team of experienced consultants to work on-site in San Diego with the local support team and key County stakeholders.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

During the past 40 years, HPES has developed and documented its IT Solution Architecture (ITSA). This methodology, described in detail in Section 2.5.6 of this proposal. This methodology will provide the foundation for our EIM solution. With Figure 193 identifies the detailed steps for both the development of strategy and vision and implementation.

Figure 193. HPES Global Methods for Information Strategy Master Plan



HPES uses a collaborative approach to identify and document requirements and gain concurrence for the way forward.

The methodology uses a collaborative approach to align business needs with technology by documenting the current state of technology, process and strategy. Through structured information gathering we document the desired state and analyze of this information to identify gaps between the current state and the desired state. We use this information to develop the roadmap to address the gaps. Each step in the framework results in detailed artifacts tailored to the County. Our consultants are trained on the methodology and are experienced in guiding the process, making sure that the County's experience is positive and the results meet their information management needs.

While not included in the proposed initiative, HPES anticipates that after the County develops its EIM strategy and roadmap, there will be a need to support implementation of EIM. HPES has a mature methodology for implementation and is prepared to support the County in this phase. This methodology applies proven templates and suggests industry best practices to gather the correct information needed for successful implementation. We will work with HPES account team and provide our expertise to help guide project implementation as identified in the County roadmap. Common implementation projects address information management/quality, master data management, information governance, enterprise data modeling, and development of enterprise standards.

- Automated Tools – Automated systems and tools involved in proposed solution

The process for planning and implementing EIM projects relies on standardized templates to gather and document requirements. These result in well-defined deliverables that are guided by an extensive set of artifacts and knowledge libraries. HPES will use its existing methodologies and associated processes to develop the strategy and plan. As we assess the current environment and conduct a gap analysis, we document technology requirements for subsequent implementation projects.

- Qualifications and Experience

HPES has delivered EIM to the following clients:

HealthNet Federal Services (HNFS): Tricare is the Health Care Program for the U.S. Department of Defense (DoD). They recognized that a necessary first step in implementing an effective enterprise information strategy was to develop a roadmap and they engaged HPES. We worked collaboratively with HNFS during an 8-week consulting project using the HPE Global Methods master plan methodology to create the strategy roadmap. Following this initial effort, HNFS has executed on a number of the projects defined in the roadmap, with a goal to improve the quality of service for their customers through better use of data and information.

Customer Challenges:

- Needed better insight into current operations to competitively recompete for its contract with Tricare
- Gain greater insight into needs of customers and quality of services through the effective use of quality data
- Achieve a view into future state architectures for HNFS and look for opportunities for alignment and adoption to HealthNet corporate strategic initiatives.

Customer Benefits:

- Business driven roadmap enabled rapid implementation of key EIM projects
- Improved information quality and governance
- Quality of decision making increased through greater insight gained through information.

Pennsylvania Patient Safety Authority (PSA): PSA engaged HPES to conduct a short-duration consulting engagement, where we guided PSA to create an enterprise-wide information strategy and Business Intelligence (BI) Master Plan. This Master Plan included 1- 3- and 5-year roadmaps outlining a plan for addressing foundational environment and data requirements for critical business analytics. Additionally, it developed the advanced analytics environment for addressing 100% of PSA's data, to include not only structured data but also unstructured (text and narrative) data. This included approximately 300 servers with data spanning 5 years, and a total volume of 1 petabyte.

Additionally, HPES implemented specific projects detailed in the roadmap. Specific activities included data profiling (documented values vs. actual values), data cleansing (identify and remove dirty data only), alignment, data de-duplication, survive, transform, validate, augment, translate ontology, model, steward, certify, survive, encrypt, synchronize, distribute, replicate, publish, and audit. Further, we helped document more than 20 KPIs with associated reporting and analytics models.

Customer Challenges:

- Alleviating the manual gathering of information, creating reports, and conducting analyses
- Addressing inconsistent definitions and data governance that inhibits consistent and meaningful reporting
- Creating effective and supportable metrics for measuring business value.

Customer Benefits:

- Improved patient safety due to improved insight driven by better metrics and consistent reporting
- Extended reporting including true business intelligence and an advanced analytics capability.

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

- Alternative Approaches (*optional*) – Submit a description of an alternative approach if you believe it is worth consideration by the County, including rationale, trade-offs and potential benefits.

None.

Other Proposed Initiative: Comprehensive Applications Threat Analysis (CATA) Service

- Key Considerations and Potential Alternative Approaches

Building in security from the beginning is essential to keeping the County applications out of harm's way. Likewise for existing applications, assessing security requirements and control gaps, and architectural security robustness and resilience, or lack thereof, is essential to reducing the number and severity of vulnerabilities and maximizing the chance that applications are not missing major security requirements or controls. Industry-standard conventional software development may fail to find, fix, and avoid many vulnerabilities introduced in applications development. HPES would apply our extensive knowledge of SDLC and secure development best practices to design and build the County applications. The additional practices described here would avoid, find, and fix far more vulnerabilities than standard development practices, as these approaches are focused on proactive software security quality improvement and increasing software assurance levels.

With the number and complexity of security attacks on the rise, the County would be well-served by a proactive approach to security quality that saves costs and minimizes risk by greatly reducing security requirements and control gaps as well as reducing the number of undiscovered security defects or vulnerabilities.

- Solution Summary & Rationale – Description of proposed solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches. Include timing and risk considerations, key dependencies and milestones

Our Comprehensive Applications Threat Analysis (CATA) service uses well-established return on investment (ROI) practices for quality improvement. These practices demonstrate that fixing defects after code implementation can be 30 to 100 times more costly than discovering, avoiding, or reducing the severity of defects early, during requirements analysis, architecture, and design. Conventional software development practices discover and fix only a small fraction of security vulnerabilities later in the application development life cycle; CATA enables achievement of a much higher level of assurance with security and lower rework costs. CATA minimizes security-related rework by helping get it right the first time by identifying security issues in higher layers of abstraction of the application (requirements, architecture, design). This can pervasively improve applications security to complement other efforts to address security issues in source code (static) and run-time behavior (dynamic).

Projects: CATA reviews will be conducted on a subset of the County's applications, selected and prioritized according to factors such as County-provided priority, sensitivity/criticality of data managed by application, impact if the application is compromised (confidentiality, integrity, or availability), significance/scope of application updates (especially new requirements, updated architecture, design, transformation/modernization), any available risk characterizations, and other factors agreed to by HPES and the County. Likewise, prioritization criteria and decisions will be made for static security code reviews and applications vulnerability assessment and penetration testing. In cases where a CATA review is conducted, and it is deemed appropriate to conduct a follow-on CATA review on the same application (for instance, above the risk prioritization threshold for CATA reviews, and having another major release

since prior review), a CATA delta review will be conducted, starting with the CATA baseline analysis initially performed or a prior CATA delta review.

Objectives: the identification of security requirements/controls gaps and vulnerability risks, and recommendations to address (close gaps, lower risks) for each security assessment (CATA, static security code review, vulnerability assessment / penetration test) with intent of improving the security of these applications by a prioritized incorporation of the review recommendations.

Deliverables: A prioritized and vetted list of security findings from each of two CATA phases (Security Requirements Gap Analysis; and Architectural Threat Analysis) with project team commitments to address factored into before and after severities. These can be in the form of summary slides (most common form of deliverable), samples of which are shown below in the Methodology & Key Processes section, or longer written reports at the County's option, which include additional explanatory narrative and background on the specific analysis results that contributed to the findings. Findings from code review and vulnerability assessment and penetration testing are in the form of written reports describing findings, along with severities and remediation recommendations.

Pricing for various CATA offerings are included in Exhibit 16.1.1.

- Methodology & Key Processes – Key methodologies and processes in proposed solution

CATA is a two-phase activity—Security Requirements Gap Analysis and Architectural Threat Analysis––that includes interviews with HPES development staff, analysis by HPES staff and tools, and reporting.

The **Security Requirements Gap Analysis** determines security requirements and control gap for deployment of the application in compliance with applicable regulatory frameworks and industry best practices. The gap analysis will establish security control objectives and lay the groundwork for the threat analysis.

During the Security Requirements Gap Analysis phase, HPES will identify relevant sources for security requirements derived from applicable regulatory requirements. We then will establish traceability from the County's regulatory or business environment to a prioritized set of security requirements. From the information we gather through our proprietary templates and stakeholder interviews, we will determine the plans and commitments for addressing these requirements, with special focus on already-designated technical solutions and already-documented security expectations, and the remaining gaps.

The Security Requirements Gap Analysis is based on:

- Expert system-like templates, with partially encoded expert security knowledge
- Weighted and prioritized input
- Data that is reviewed and calibrated by certified security reviewers
- Efficient, repeatable results
- Requirements traceability from a robust collection of governance sources, including regulations, laws, and best practices.

The end result is a Security Requirements Gap Analysis that will identify important security requirements that may not be met through current plans. It places these at-risk requirements in priority or severity order.

Figure 194 is a sample of summary level Security Requirements Gap Analysis findings, which will be part of a larger findings slide deck.

Figure 194. Security Requirements Gap Analysis Sample Summary of Findings

Remaining Disconnect and Review Progress	Current Release Impact	Future Roadmap
Lacking Least Privilege 	Daemons (Tomcat/JBoss) exposed to internet run with **full-privilege** accounts, **increasing security risks** and potentially increasing security-related **support cost.** Making customer compliance with GLB, BS7799, HIPAA, and PCI-DSS difficult.	**Next Release** **Modify** Tomcat/JBoss (and other **automated processes**) to **run** as restricted users with **least privilege needed.** It may be necessary to do that for Current Release, depending on Threat Analysis results.
Certificate Lifecycle Management 	Supports **only self-signed certificates,** which **require reliance** on **DNS (proven to be unsecure)** and do **not** allow for **revocation verification,** potentially causing **unauthorized access** to customer **credentials.** Making customer compliance with BS7799, HIPAA, and PCI-DSS difficult.	**Next Release** Add **support for CA signed certificates** and certificate **revocation** thru OCSP or CRL verification.
Missing Security Negative Tests 	**No Security Negative Tests** because QA has no experience with negative testing. Making customer compliance with BS7799, HIPAA, and PCI-DSS difficult.	**Next Release** Train QA team on security test tools (e.g., WebInspect) and **include security negative** tests to test plan.
Non-Configurable Cipher Suites 	The **cipher** and **hash algorithms** are **not configurable.** Thus, **customers** may **not** be able to **follow** their **IT policies** and **cannot disable weak algorithms.** Making customer compliance with HIPAA and PCI-DSS difficult.	**Future Release** Make **cipher and hash algorithms configurable.**

173 CA CoSD

This sample report shows an overall security assessment of Medium Risk from non-supported security requirements.

The **Architectural Threat Analysis** is an architecture-level review of the security properties of the underlying components and interfaces and provides recommendations for mitigating all identified moderate- and high-risk areas.

CATA combines information about the target application and deployment environment with target application security plans. An HPES security consultant, uses CATA tools and templates that include a requirements traceability questionnaire and database, and an architectural threat analysis heuristic template. These tools add repeatability, semiautomated risk calculations, and serve as an "additional reviewer in the room." Our security consultant then analyzes the resultant data.

In the Architectural Threat Analysis phase, the CATA team acts as an independent party, and will interview the designated Project Security Architect for the specified application or system. We will then review architecture-level documents to gather information regarding architectural interfaces, components, data, and security characteristics, in addition to security mitigations already planned. HPES has developed a repeatable process that uses a variety of well-established heuristics to identify interfaces and security properties that have the greatest risk of security defects. The HPES analyst will factor in the risk reduction resulting from the mitigations and controls reportedly applied, and identify areas of residual elevated risk as well as technical control opportunities.

The Architectural Threat Analysis invariably finds unnecessarily elevated security risks that would benefit from additional technical controls. HPES investigates specific solutions to address the security risks and provides recommendations based on best fit for the County's organization and mission. This task does not include implementation of the solutions. Architectural Threat Analysis can preempt building security flaws into applications based on the following elements:

- Expert system-like artifacts, encoded with first-order expert security knowledge
- Weighted and prioritized input
- Data that is reviewed and calibrated by certified security reviewers

- Efficient, repeatable results.

Figure 195 is a sample of summary level Architectural Threat Analysis findings (part of a larger findings slide deck).

Figure 195. Sample Architectural Threat Analysis Report

Security Risk Area and Review Progress	Past Behavior	Fix
Least Privilledge	All **process** daemons **running as root** gaining **full access** to the box and **defects can lead to unauthorized** code running as **root**	Create **restricted user** account and use it to **run** the process **daemons**
Support for Third-Party Certificates	Using **self-signed** certificates **hinders** customer **validation, exposing** customer and servers to **man-in-the-middle attacks.**	**Replaced self-signed certificates and provided** means for **validating the certificates** correctly
Full Privilledge Database Account	**Web application using** an admin **root account** was **unneces-sarily** risking to **expose database data**	**Replaced admin** account by **restricted account**
Duplication of Validation Routines	Validation routines were disperse in the code raising the risk of missing bug fixes	**Integrate** in the project a **well-documented** validation **library**
World-Writable Directory	Web application **configuration files** were **world-writable exposing** them to an external **attacker** to be able to **modify important application characteristics**	Included **file system checks** in build **scripts**
Exposed Passwords	Web application and CC service would **leave credit card** information in **clear text** after **freeing memory**	**Wipe memory buffer** before freeing memory

174 CA C65D

The Architectural Threat Analysis prevents security risks from being introduced into application code.

Missing or incomplete security requirements, architectural threats, and/or previously investigated remediation may be identified during the analysis. HPES will report these findings based on their severity: High (Red), Moderate (Yellow), and Low (Green). Severities can be modified if required to match specific regulatory frameworks.

Findings will include a high-level executive summary, slide tables of individual prioritized findings with remediation recommendations, and if a written report is required, a technical discussion section.

While CATA is highly effective for proactively identifying and mitigating potential security risks in the targeted applications, we recommend combining CATA with secure code analysis by a security expert using the Fortify tool or with hybrid combinations such as HPES' human expert security code reviews, in addition to our applications vulnerability assessment and penetration testing. This will result in identifying vulnerabilities through both static and dynamic security analysis, as these highly complement CATA. Static security analysis identifies issues in source code, and dynamic security analysis identifies vulnerabilities in run-time behavior, while CATA identifies security issues in requirements, architecture, and high-level design.

CATA – Complementary Security Services: CATA is a high-level service focused on the requirements and architectural level. Problem areas identified through CATA can often be addressed through other HPES security service offerings. The following additional services help assess whether the security designed in early stages is also implemented correctly:

- **Secure Code Analysis** – Provides validation that the application, once it has been designed correctly, is implemented as designed. This may be a combination of human expert security code review and automated static scanning, such as with HPE Fortify.
- **Applications Vulnerability Assessment** – Provides a further layer of validation that once the application is implemented as designed, known attack vectors do not "break" it. Vulnerability assessment can be performed not only prior to deployment, but also throughout the production lifetime of the application. The assessment can catch some emerging or "zero day" problems with applications that have already been deployed to the field.
- **Penetration Testing** – Penetrates beyond vulnerability assessment to test vulnerabilities discovered in vulnerability assessment for exploitability.

- Automated Tools – Automated systems and tools involved in proposed solution

HPE Fortify on Demand, CATA tools and templates, referenced above. Note that HPE Fortify is distinct from CATA, which analyzes analyses security requirements, architecture, and high-level design, and is human methodology, whereas Fortify is a product/tool to scan code statically (for instance Fortify SCA) and dynamically (WebInspect). These tools are highly complementary, and when used in combination with human expert and hybrid Secure Code Analysis and application vulnerability assessment and penetration testing, they cover security across all major aspects of the SDLC.

- Qualifications and Experience

CATA employs a mature approach with a long history of success. HPES has conducted CATA reviews hundreds of times during the past decade and the results have helped clients to avoid the impact of thousands of vulnerabilities. This service is also enhanced by the following HPES applications security capabilities and professionals:

- Global network of 10 strategically placed HPE Security Operations Centers (SOCs) for monitoring, management, and threat remediation, 24x7x365
- HPES' cybersecurity capabilities cover 67 countries across all industry verticals
- 5,000+ security professionals who manage more than 10,000 enterprise clients
- Greater than 75% of the world's financial companies use HPES services and products
- Tracks billions of security events monthly, securing 1.8+ million devices and 47+ million users
- Manages and monitors more than 6,000 firewalls and 3,000 intrusion detection systems
- More than 800 local, state, and Federal agencies in the U.S. who HPE security services
- Combined security intelligence based on 4 million+ virtual machine sensors and 100,000+ hours of incident response per year.

- Assumptions – Any material assumptions involved with proposed solution, e.g., proposed leverage of current assets, required involvement of County resources beyond what is described in this RFP.

None.

- Alternative Approaches (*optional*) – Submit a description of an alternative approach if you believe it is worth consideration by the County, including rationale, trade-offs and potential benefits.

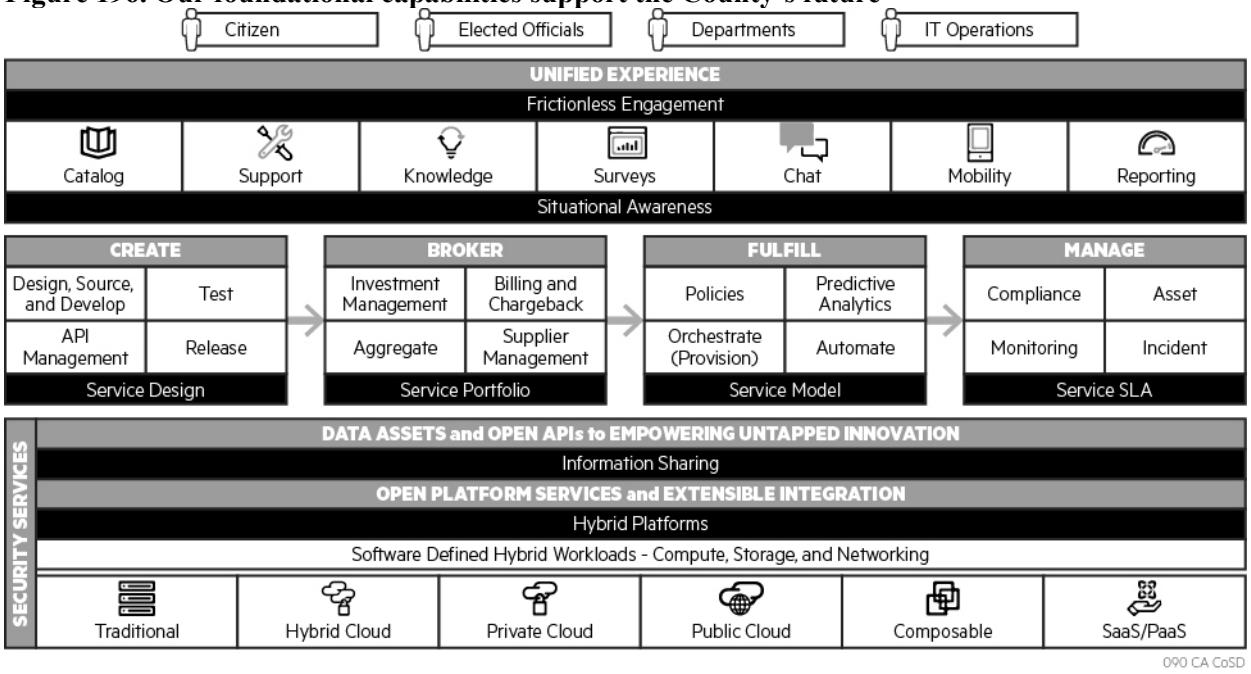
None.

Executive Summary – The County's Future State

As described in our approach to each of the Transformation Projects, HPES will provide the required and recommended transformational mechanisms to generate new ideas, foster a new way thinking (bi-modal), and spark creativity within the employee teams across the County and industry partners—to collectively realize the benefits of transformational activities.

Our implementation of these Transformation Projects will put the County in the position to support the next generation of employees and citizens who are proactive, connected, collaborative, and aspiring to contribute. This future state is depicted in Figure 196. Providing access to open platforms, tools, and data services enables citizens to participate in transformational activities.

Figure 196. Our foundational capabilities support the County's future



As the County continues moving forward, it will deliver more and more services to constituents that are easily accessible and facilitate information sharing and consumption.

Cross-Framework/Component Integration: When identifying and assessing opportunities for transformation, HPES has the experience with the County to understand the complete picture to make sure that Transformation Projects are compatible and that their implementation will flawlessly integrate with the existing environment.

Competitive Differentiators and Benefits to the County: Through our experience under the current contract, HPES is best qualified to identify, assess, and implement Transformational Projects that maximize the reuse of existing technology and return on investment (RoI), while taking into consideration the County's culture and the needs of the businesses and citizens that interact with the County. HPES' recommendations for Transformation Projects will be built on the following:

- **A Thorough Understanding of County Business:** Our experience working side-by-side with the County gives us an advantage in understanding the Operational Plan, priorities, goals, objectives, preferences, and approaches. This is applicable to governance, reporting, County interactions, and delivery of services.
- **Reliability:** The County has a critical mission in providing services to residents, including support of safe communities, sustainable environments, and healthy families. Many of these services rely on IT systems that must be capable of growing and changing to meet County objectives.
- **Predictability:** HPES recognizes the importance of predictability in the annual budgeting process, and we understand that this is a critical element of any Transformation Project. We know the County's budgeting process, and we understand that the County will rely on the cost inputs that we provide. As such, we are diligent in our estimating so that our costs are reliable and predictable and help to avoid budget issues for the County.

- **Innovation/Technology Leadership:** HPES is a cornerstone in the IT industry, and we are at the forefront of technology innovation. We recognize that local government depends on getting the right technologies in place to support the new era of digital government services; HPES can provide those technologies. HPE Labs invests more than $2 billion per year in research and development to bring innovation to our clients. This includes investment to develop one of the broadest portfolios of cloud services in the market. At the local (account) level, we built on the County Innovation initiative and created an Innovation Council to identify and develop new ideas, technologies, and processes to benefit the County. The Innovation Council's intent is to address real business needs and reduce costs as well as to increase efficiency and productivity. The next step in the evolution of the Innovation Council will be to add representation from HPE Labs and forge a sustained relationship between the Chief Technology Officer (CTO), the HPES account, and HPE Labs. To the extent allowed by County HR guidelines, HPES welcomes Innovation Council membership and participation from County Departments and County End-Users.
- **Depth and Breadth:** As a world-class provider of IT services, HPES has the capabilities necessary to help move the County forward through new technology implementation and new processes to speed service delivery to constituents. Along with our key partner AT&T, HPES has proven that we have the depth, breadth, and staff knowledge to continue to transform County services. In addition, HPES is a stable, recognizable, financially strong company that you can rely on to be your trusted partner and provider for years to come.

2.13 Offeror Response to Exhibit O-Schedule 7.6 Shared Resources

Offeror to provide information as instructed in Exhibit O-Schedule 7.6 Shared Resources and provide as an appendix with populated information.

Following is a list of the shared resources used in our solution to provide services to the County. The list consists primarily of software tools. For software or infrastructure that runs in the data center, or as a service, the County should infer that the hardware that runs this software is also a shared resource, with appropriate security boundaries in place to protect County data. In the interest of brevity we have not listed these related hardware components. For software that runs on individual workstations, items included here are licensed by HPES or its partners for use in supporting our customers, but are not specifically licensed for any specific customer.

Version numbers and tools are accurate as of the time of this proposal submission. Note that version numbers on HPE software commercial products customized for HPES internal use may not coincide with the version numbers available to the public.

Table 88. Cross-Functional Equipment, Software, Tools, and Systems

RESOURCE / TOOL NAME	INFORMATION
Enterprise System List (ESL)	Type: Software Manufacturer: HPES Version: 16.1.1 Purpose/Use: ESL (Enterprise System List) is a Delivery-focused Configuration Management System for managing System/Application Configuration Items, Services/Contracts and Customer/Account Information. Other Information:
Asset Manager	Type: Software Manufacturer: HPE Version: 3.7P1 Purpose/Use: Tracks end-user and network assets Other Information:
Discovery and Dependency Mapping Inventory (DDMI)	Type: Software Manufacturer: HPE Version: 9.32 P1 Purpose/Use: discovers and reports assets found on the network; integrates with Asset Manager. Other Information:
Service Manager	Type: Software Manufacturer: HPE Version: 4.0.5p31 Purpose/Use: Used by the Service Desk and all support staff for ticketing of Incidents, Problems and Changes. Other Information:
Request Manager	Type: Software Manufacturer: HPE Version: 2.5.1.R2.22

RESOURCE / TOOL NAME	INFORMATION
	Purpose/Use: Used to enter and manage Service Requests and Catalog items. Other Information:
End User Access (EUA)	Type: Software Manufacturer: HPES Version: 2.1.6 Purpose/Use: Service Portal Other Information: While the core software and interfaces are standardized and centrally controlled to interact with the rest of the cross functional tools, the Service Portal is separately instantiated and customized for each client for whom it is deployed.
Aries/Aldea	Type: Software Manufacturer: HPES Version: 3.5.6 / 8.9.3 Purpose/Use: Tool used by HPES internally to request resources (e.g., staffing assignments, workload placement) from the broader HPE community Other Information:
RevGen	Type: Software Manufacturer: SAP Ariba Version: 9r1 Purpose/Use: Procurement of products and services Other Information:
Enabling Delivery and Global Excellence (EDGE)	Type: Knowledge Repository Manufacturer: HPES Version: 4.3 Purpose/Use: EDGE is a holistic environment that includes all the information needed to enable Enterprise Services (ES) to deliver and excel in the global marketplace. EDGE supports all individuals in each of the ES business units by providing process artifacts that can be leveraged and used as part of their day-to-day work. Other Information:
Enterprise Architect	Type: Software Manufacturer: Sparx Systems Version: 9.3 Purpose/Use: Enterprise Architect provides full life cycle modeling for: Business and IT systems Software and Systems Engineering Real-time and embedded development Other Information:
ProVision	Type: Software Manufacturer: OpenText Version: 9.0.2

RESOURCE / TOOL NAME	INFORMATION
	Purpose/Use: ProVision is HPES's standard modeling tool, to be used for Business Process, Enterprise Architecture and IT solution modeling. It enables business & IT teams to visually create models, describing business process, process interactions and detailed workflow Other Information:
Disaster Recovery Subscription Services, consisting of all leveraged hardware and software used to provide: Server services Storage services Network services Security services Backup services	Type: Disaster Recovery Subscription Services Manufacturer: various Version: N/A Purpose/Use: Leveraged hardware and software Other Information: Note that the Centera and the dedicated firewalls located in the DR site are not considered to be part of this list, since they are dedicated to the County.
ArcSight Security Information and Event Management (SIEM)	Type: Software/appliance Manufacturer: HPE Version: 6.9.1 Purpose/Use: Event logging and monitoring Other Information:
Global Delivery Capacity & Performance Management (GDCPM)	Type: Software Manufacturer: HPES (based on SAS and other underlying tools) Version: 2.0 Purpose/Use: Collects, aggregates and analyzes capacity and performance data from various disparate sources for reporting and analysis Other Information:

Service Desk Equipment, Software, Tools, and Systems

Note: Software used in providing Service Desk services is listed in the Cross-Functional section, since this software is also used by other frameworks.

IVR and ACD hardware and software, and other tools/facilities used by the Service Desk are internal to HPE, and are not listed individually

Table 89. End-User Equipment, Software, Tools and Systems

RESOURCE / TOOL NAME	INFORMATION
System Center Configuration Manager (SCCM)	Type: Software Manufacturer: Microsoft Version: 2012 Purpose/Use: Discovery and software distribution to end-user devices Other Information:

Table 90. Network Equipment, Software, Tools, and Systems

RESOURCE / TOOL NAME	INFORMATION
Leveraged Internet Service (LIS) firewalls in the Tulsa and Colorado Springs data centers	Type: Hardware Manufacturer: Checkpoint Version: D2 Purpose/Use: Internet access/security Other Information: In the future these are slated to be replaced by Fortinet firewalls
AT&T Commonly Shared Network	Type: equipment, tools, software, systems and other materials Manufacturer: Various Version: N/A Purpose/Use: For clarity, the AT&T Commonly Shared Network means (i) the public or shared networks of AT&T, its Affiliates and their subcontractors, and the equipment, tools, technologies, systems, software, and other materials that are components thereof; (ii) equipment, tools, technologies, systems, software and other materials used by AT&T, its Affiliates and their subcontractors in shared network management and back office environments including , without limitation, TIRKs, iGEMS, BusinessDirect, Billing Edge, the AT&T Global Network Client and AT&T Connect and any other items listed above in this Exhibit; and (iii) all modifications, upgrades, derivative works, enhancements, improvements and extensions of any of the foregoing.
SIMS (Security Information Management System)	Type: Software Manufacturer: AT&T Version: n/a Purpose/Use: Security event correlation Other Information:
SDNOM (Software Defined Network Order Management)	Type: Software Manufacturer: AT&T Version: 1.0 Release 1604 Purpose/Use: Circuit Ordering Other Information:
Nectar Unified Communication Management Platform	Type: Software Manufacturer: Nectar Version: 5.5.2.1 Purpose/Use: Voice Network Performance Management Other Information:
MDM-Airwatch SaaS Console (Mobile Device Management)	Type: Software Manufacturer: AT&T Version: 8.2 Purpose/Use: Mobile device management Other Information:
SORD (Service Order Retrieval and Distribution)	Type: Software Manufacturer: AT&T Version: 8.1.10

RESOURCE / TOOL NAME	INFORMATION
	Purpose/Use: Service order entry Other Information:
Telegence	Type: Software Manufacturer: AT&T Version: 1602.3 Purpose/Use: Billing Other Information:
BOSS (Billing and Ordering Support System)	Type: Software Manufacturer: AT&T Version: 8.1.01 Purpose/Use: Product billing, tracking and reporting Other Information:
DPSS (Data Products and Services System)	Type: Software Manufacturer: AT&T Version: N/A Purpose/Use: Data product and services tracking Other Information:
BusinessDirect/eBill	Type: Software Manufacturer: AT&T Version: N/A Purpose/Use: Account management Other Information:
Exchange Plus	Type: Software Manufacturer: AT&T Version: 13.1 Purpose/Use: Carrier resource tracking Other Information:
ICES (Integrated Customer Enterprise System) ServiceCenter/AssetCenter	Type: Software Manufacturer: AT&T Version: 5.1.2 Purpose/Use: Asset Inventory Other Information:
SAINT	Type: Software Manufacturer: AT&T Version: 7.20.13 Purpose/Use: Security scanning and testing Other Information:
Nmap	Type: Software Manufacturer: Nmap Version: v7.0 Purpose/Use: Network scanning and mapping Other Information:
WFA (Work Force Administration)	Type: Software Manufacturer: Telcordia

RESOURCE / TOOL NAME	INFORMATION
	Version: n/a Purpose/Use: Trouble ticketing and work flow Other Information:
TIRKS (Trunks Integrated Record Keeping System)	Type: Software Manufacturer: Telecordia Version: n/a Purpose/Use: Circuit design Other Information:
AOTS-TM (AT&T One Ticketing System – Trouble Management)	Type: Software Manufacturer: AT&T/Remedy Version: n/a Purpose/Use: trouble ticketing Other Information:
NMA (Network Monitoring and Analysis)	Type: Software Manufacturer: Telecordia Version: n/a Purpose/Use: Network monitoring Other Information:
Avaya Site Administration	Type: Software Manufacturer: Avaya Version: 6.0 Purpose/Use: Voice system administration Other Information:

Table 91. Data Center Equipment, Software, Tools, and Systems

RESOURCE / TOOL NAME	INFORMATION
Server Automation	Type: Software Manufacturer: HPE Software Version: 10.11 Purpose/Use: Distributing operating system and layered product patches and upgrades Other Information: The core mesh is a shared resource; distribution satellite servers within the County's network zones are dedicated to the County
Operations Manager	Type: Software Manufacturer: HPE Software Version: 9.2 Purpose/Use: Monitoring and alerting for various data center components, such as servers, domain controllers, databases, etc.
Microsoft Office 365 Government Community Cloud	Type: Software as a Service Manufacturer: Microsoft Version: 2016

RESOURCE / TOOL NAME	INFORMATION
	Purpose/Use: E-Mail (Exchange Online), Collaboration (SharePoint Online, Skype for Business), Cloud File Management (OneDrive for Business)
E2E Complete	Type: Software Manufacturer: BinaryTree Version: 4.0 Purpose/Use: Automation tool for migration of mail services from Exchange to the Microsoft Office 365 Cloud
Helion Virtual Private Cloud for US Public Sector	Type: Infrastructure as a Service Manufacturer: HPES Version: 7.6 Purpose/Use: Virtual Private Cloud (VPC) for Windows and Linux environments. VPC is a Government Community Cloud currently used to run the County's Beach and Water Quality website.
Watchdog	Type: Software Manufacturer: HPES Version: N/A Purpose/Use: Internally developed utility that monitors/removes privileged access implemented via non-approved methods

Applications Maintenance and Operations Equipment, Software, Tools and Systems

All tools identified for applications development below may also be used in the applications Maintenance and Operations (M&O) environment.

Table 92. Applications Development Equipment, Software, Tools, and Systems

RESOURCE / TOOL NAME	INFORMATION
StarTeam	Type: Software Manufacturer: Microfocus/Borland Version: N/A Purpose/Use: Software Change and Configuration Management Other Information: This tool may also be used in Business Analysis and Applications M&O
Together	Type: Software Manufacturer: Microfocus/Borland Version: N/A Purpose/Use: Together enables software to be designed using industry-standard UML notation and conventions. With a large number of built-in utilities to manage the software design process, validate designs and generate code, Together helps maximize the efficiency and accuracy of the software development process Other Information: This tool may also be used in Business Analysis and Applications M&O
Agile Manager	Type: Software Manufacturer: HPE

RESOURCE / TOOL NAME	INFORMATION
	Version: N/A Purpose/Use: Agile project management is a SaaS (software-as-a-service) solution that helps teams to organize, plan, and execute Agile projects. Other Information: This tool may also be used in Business Analysis and Applications M&O
Team Foundation Server	Type: Software Manufacturer: Microsoft Version: N/A Purpose/Use: Microsoft Team Foundation Server (TFS) is a set of tools and technologies that enable a team to collaborate and coordinate the development and build efforts for a .NET software product or completing a .NET software project. Other Information: This tool may also be used in Business Analysis and Applications M&O

2.14 Offeror Response to Exhibit Q-Schedule 10.1.1 Contractor Key Personnel

Offeror to provide a proposed list of named individuals listed in Exhibit Q-Schedule 10.1.1 Contractor Key Personnel.

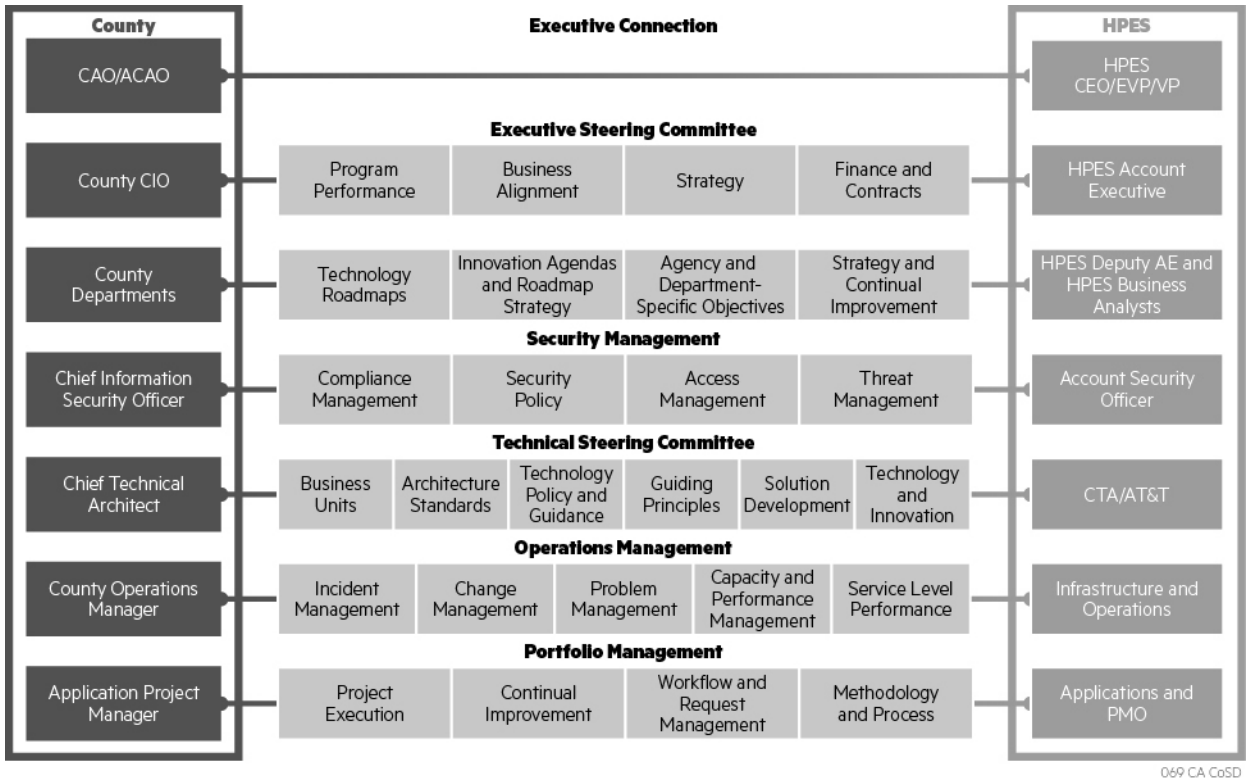
KEY POSITIONS	PROPOSED NAMED INDIVIDUAL
Account Executive	Cathy Varner
Deputy Account Executive	Laura Floyd
Enterprise Service Delivery Manager (SDM)	Kathleen Barghols
FG3 Service Delivery Manager (SDM)	John Steed
CSG Service Delivery Manager (SDM)	Frank Krone
HHSA Service Delivery Manager (SDM)	Sandra Messina
PSG Service Delivery Manager (SDM)	Albert Hatcher
LUEG Service Delivery Manager (SDM)	David Pugh
Contracts Manager	Max Pinna
Chief Information Security Officer (CISO)	Marcelo Peredo
Chief Technology Architect (CTA)	Thif Iruthayarajah
Cross Functional Services Manager	Mark Morin
Service Desk Manager	Curtis Yancey
End User Services Manager	Hector Vaquedano
Network Services Manager	Jeff Williams
Data Center Services Manager	Michael Boscarino
Application Maintenance and Operations Services Manager	Tina Terlecki
Applications Development Services Manager	Mark Roehr
Project Management Office (PMO) Manager	Nelson Diaz
Transition Services Manager	Chris Spanka

2.15 Offeror Response to Exhibit R-Schedule 10.3 Relationship Management

Offeror to propose a counterpart for relationship management between the County on the Offeror organization.

HPES has implemented a multi-tiered relationship framework for communication and decision- making that provides effective collaboration and timely action. This framework, illustrated in Figure 197, maximizes communication based on the County's organizational structure. HPES and County leaders are aligned to the framework to produce results consistent with technical and process architectures. From requirements definition to solution realization, this framework fosters an in depth understanding of business needs and effectively identifies opportunities for innovation and process improvement to the benefit of the County. The framework supports the collaborative development of plans of action based on agreed decisions to achieve the best outcomes for County staff and its citizens. HPES will work with the County to facilitate alignment to the existing governance within the County Technology Office (CTO) and individual County groups.

Figure 197. Multi-tiered Interactive Framework for Communication



HPES' relationship framework aligns HPES and County leaders to foster clear communication, a solid understanding of business needs, and opportunities for innovation and improvement.

We designed the HPES-County of San Diego Account organization structure to achieve the best balance of economy and effectiveness. Senior staff are assigned to lead each functional area for this program. The HPES account team is made up of highly qualified experts—with more than 320 years of combined experience supporting the County. This multitiered relationship framework builds mutual trust and results in effective, collaborative interactions with everyone focused on getting from idea to value as quickly and efficiently as possible.

2.15.1 Relationship Counterpart

Table 93 outlines the relationship counterparts between the County and HPES roles.

Table 93. Relationship Counterpart

COUNTY OF SAN DIEGO	HPES
CIO	Vice President and Account Executive (AE)
ACIO	Deputy AE
GITMs	Deputy AE, Enterprise Service Delivery Manager, Service Delivery Managers, Applications Development Services Manager, Project Management Office Manager
CTA	CTA
Contracts Manager	Contracts Manager
Chief Information Security Officer	Chief Information Security Officer
Applications Management	Applications development services manager
Chief Data Architect	CTA
Enterprise Application Project Manager	Project Management Office Manager
Operations Managers	Service Delivery Managers

To enhance this multitiered framework, a complementing communication matrix has been established based on the County's organizational structure and requirements that substantiate the County and HPES leadership and operational teams are focused and informed on the needs of the County. Table 94 outlines the proposed stakeholder communication matrix to facilitate a strong communication and collaboration to advance County business and technical objectives.

Table 94. Proposed Stakeholder Communication Matrix

COMMUNICATION	PURPOSE/OBJECTIVE	FREQUENCY	AUDIENCE
Executive Meeting	HPES/County Alignment of Objectives and Program Escalations	Bimonthly, or as determined by the County participant	County CIO, HPES State and Local Government VP and HPES AE
Program Status and Strategy	Program management overall program health	Weekly	County CIO, HPES AE
CIO Security Briefing	Briefing to County CIO on security strategy, initiatives, and status	Monthly	County CISO. HPES CISO and HPES security officer
Executive Liaison Program Meetings	One-on-one communication between HPES AE and key County stakeholders to discuss vision and strategy. Intent is to make certain HPES is prepared to respond to County requirements.	Quarterly, biannually, or annually, as determined by the County participant	County GMs, ROV, DHR, County Council, and select elected officials, HPES AE and/or deputy AE

COMMUNICATION	PURPOSE/OBJECTIVE	FREQUENCY	AUDIENCE
CTO Enterprise Architecture Meetings	Review enterprise architecture solution designs, annual updates to hardware and software standards for servers, and end-user compute devices, exceptions to standards via notice of decisions, vendor technology roadmaps	Weekly	County CTA, CTO IT Staff, GITMs, County agency and/or department representation, HPES CTA, HPES technology office and other HPES leaders, as needed.
Enterprise Architecture Review	Reviews proposed architectural changes, large project designs, architectural issues	Weekly	County CTA, CTO IT staff, GITMs. HPES CTA, HPES technology office, and other HPES leaders, as needed.
Network Architecture Meetings	Review network roadmaps and technology upgrades	Weekly	County CTA and other CTO IT staff. HPES CTA, and other HPES technical leaders, as needed, AT&T chief architect
Core Meeting	Preview enterprise solution designs (detailed walkthrough) and changes to standards	Weekly	County CTA, CTO IT staff and CISO. HPES CTA, HPES CISO, and other HPES leaders, as needed
Infrastructure Project Review	Provides schedule, issue, and status data for active infrastructure projects	Weekly	County CTA, GITMs, CTO IT staff. HPES CTA, HPES technology office, and other HPES leaders, as needed
Platform Status Reviews	Review project for critical County application platforms	Weekly	County CTA, CTO IT staff. HPES Application Development Leader and other HPES Leaders, as needed.
Portfolio Review	Provide review of high visibility, critical projects	Monthly	County CTA, GITMs, and CTO IT Staff. HPES business analysts, HPES deputy AE and other HPES leaders, as needed
Portfolio Steering Committees	Review portfolio and future plans	Quarterly	County GITMs. HPES Business Analysts, and other HPES leaders, as needed
ITPMO Review	Discuss processes and procedures related to project	Weekly	County CTO IT staff, CTA, HPES PMO and

COMMUNICATION	PURPOSE/OBJECTIVE	FREQUENCY	AUDIENCE
	management and process improvement with CTO		other HPES leaders, as needed
Quarterly Program Review	Provide program status, accomplishments, and operational data	Quarterly	County CTO IT staff, CTA and GITMs. HPES AE, Deputy AE, and other HPES leaders, as needed *
Service Delivery Operations	Mitigation/review of operation changes and issues with CTO	Biweekly	County CTO IT staff, CTA. HPES Service Delivery Executive, and other HPES leaders, as needed
Service Delivery Operations Monthly	Mitigation/review of operation changes and issues with the County Technology Office (CTO) and GITMs	Monthly	County CTA, CTO IT staff, and GITMs. HPES service delivery executive, SDMs, and other HPES leaders, as needed
County Bricks (Technology Standards)	Document past, current, and future technology standards using Gartner's Brick framework. Bricks guides solutions for the County and is updated when there are specific changes to a technology item.	As needed, triggered by product, vendor, or technology changes	County CTO IT staff, CTA, GITMs. HPES CTA, HPES technology office and other HPES leaders, as needed *
Voice of the Client (VOC) – Service Excellence Initiative	Includes self-assessed ratings pertaining to delivery and client satisfaction results based on client survey feedback; our objective is continual improvement of client satisfaction and retention	Yearly	County CTO IT staff. HPES VOC Interviewer
Information Technology Improvement Needs Assessment (ITINA) Process	HPES provides support for the County enterprise IT project planning and budgeting process—prioritization, estimating, and selection for County enterprise IT initiatives	Yearly	County IT Planning Board, GITMs, CTO IT staff, HPES participants based on subject matter expertise

**HPES Technology Team includes AT&T*

2.16 Offeror Response to Exhibit Y: Schedule 14.1 Approved Subcontractors

Offeror to complete the table in Exhibit Y-Schedule 14.1 Approved Subcontractors and provide as an appendix.

Table 95. Key Subcontractors of Contractors

NAME	DATE ADDED TO SCHEDULE
AT&T Corp.	To be added at contract award.

2.17 Assumptions

Assumptions for the technical response made by the Offeror in responding to this RFP do not obligate the County in any way. The number and extent of assumptions made by the Offeror may impact the score in the evaluation. Additionally, assumptions made by the Offeror may make the Proposal conditional and may cause the Offeror's Proposal to be rejected.

None.

2.18 Offeror Response to Technical Exception List

Schedule 4.3 Operational Services has been provided in PDF format as part of the RFP (see Exhibit H-Schedule 4.3 Operational Services).

The Contractor shall provide a response to Exhibit H-Schedule 4.3 Operational Services in the following format:

Table 100: Exception List

ITEM #	Technical REFERENCE (Schedule/Exhibit, Section, Page, Paragraph)	Exception (Short Description of text or requirement)	OFFEROR PROPOSED SOLUTION/RATIONALE AND BENEFITS OF PROPOSED SOLUTION TO THE COUNTY	N (Not Met) R (Revised Approach)
1.	Exhibit J, Schedule 4.8 Service Levels, 7.6 First Call Resolution (SL 28)	We propose that the County accept the performance target of 70% with < 5% recalls offered in our solution.	Seventy percent (70%) first-call resolution rate (FCR) is the industry-accepted service level. Gartner reports, under Service Desk Statistics on FCR, 2014, the industry average has dropped to 63%. Indeed, HPES' review of Service Desk statistics in general found that once self-service is introduced, FCR falls because the overall ticket volume decreases resulting in an increase in the proportion of tickets requiring SME support.	R
2.	Exhibit J, Schedule 4.8 Service Levels, Section 4.8, SL 10.2 Daily Backup (SL40)	We propose that the County accept the performance target of 99% offered in our solution.	98% is standard in the industry. 99% is the SL we are subject to today. We believe that the additional cost to provide the additional .9% may not justify the benefit. We invite further discussion on this topic if the County strongly requires 99.9% performance.	R
3.	Exhibit J, Schedule 4.8 Service Levels, Section 4.8, SL 11.4 Application Availability (SL51)	HPES is being held accountable for environments where the configurations are not within our control.	We accept the Service Level requirement, but propose excluding the following scenarios: Application environments that have performance issues not within HPES' control to correct	R
4.	Exhibit J, Schedule 4.8 Service Levels, 11.6 Application Respond Time (SL 53)	HPES is being held accountable for environments where the configurations are not within our control. The list of Applications and Transactions subject to this	We accept the Service Level requirement, but propose excluding the following scenarios: Application environments that have performance issues not within HPES' control to correct We propose defining a specific list of Applications and Transactions subject to this Service Level so that its measurement can be instrumented without putting undue strain on the network and potentially requiring an infrastructure cost	R

ITEM #	Technical REFERENCE (Schedule/Exhibit, Section, Page, Paragraph)	Exception (Short Description of text or requirement)	OFFEROR PROPOSED SOLUTION/RATIONALE AND BENEFITS OF PROPOSED SOLUTION TO THE COUNTY	N (Not Met) R (Revised Approach)
		service level is not defined. Low performance network is not defined.	that outweighs the value of the Service Level to the County. Defining the term will prevent future disputes.	

2.19 Appendix - Completed Exhibits

Exhibit O: Schedule 7.6 Shared Resources

Offeror to provide information as instructed in Exhibit O-Schedule 7.6 Shared Resources and provide as an appendix with populated information.

Following is a list of the shared resources used in our solution to provide services to the County. The list consists primarily of software tools. For software or infrastructure that runs in the data center, or as a service, the County should infer that the hardware that runs this software is also a shared resource, with appropriate security boundaries in place to protect County data. In the interest of brevity we have not listed these related hardware components. For software that runs on individual workstations, items included here are licensed by HPES or its partners for use in supporting our customers, but are not specifically licensed for any specific customer.

Version numbers and tools are accurate as of the time of this proposal submission. Note that version numbers on HPE software commercial products customized for HPES internal use may not coincide with the version numbers available to the public.

Table 96. Cross-Functional Equipment, Software, Tools, and Systems

RESOURCE / TOOL NAME	INFORMATION
Enterprise System List (ESL)	Type: Software Manufacturer: HPES Version: 16.1.1 Purpose/Use: ESL (Enterprise System List) is a Delivery-focused Configuration Management System for managing System/Application Configuration Items, Services/Contracts and Customer/Account Information. Other Information:
Asset Manager	Type: Software Manufacturer: HPE Version: 3.7P1 Purpose/Use: Tracks end-user and network assets Other Information:
Discovery and Dependency Mapping Inventory (DDMI)	Type: Software Manufacturer: HPE Version: 9.32 P1 Purpose/Use: discovers and reports assets found on the network; integrates with Asset Manager. Other Information:
Service Manager	Type: Software Manufacturer: HPE Version: 4.0.5p31 Purpose/Use: Used by the Service Desk and all support staff for ticketing of Incidents, Problems and Changes. Other Information:
End User Access (EUA)	Type: Software Manufacturer: HPES Version: 2.1.6 Purpose/Use: Service Portal

RESOURCE / TOOL NAME	INFORMATION
	Other Information: While the core software and interfaces are standardized and centrally controlled to interact with the rest of the cross functional tools, the Service Portal is separately instantiated and customized for each client for whom it is deployed.
Aries/Aldea	Type: Software Manufacturer: HPES Version: 3.5.6 / 8.9.3 Purpose/Use: Tool used by HPES internally to request resources (e.g., staffing assignments, workload placement) from the broader HPE community Other Information:
RevGen	Type: Software Manufacturer: SAP Ariba Version: 9r1 Purpose/Use: Procurement of products and services Other Information:
Enabling Delivery and Global Excellence (EDGE)	Type: Knowledge Repository Manufacturer: HPES Version: 4.3 Purpose/Use: EDGE is a holistic environment that includes all the information needed to enable Enterprise Services (ES) to deliver and excel in the global marketplace. EDGE supports all individuals in each of the ES business units by providing process artifacts that can be leveraged and used as part of their day-to-day work. Other Information:
Enterprise Maps	Type: Software Manufacturer: HPE Version: 3.0 Purpose/Use: HPE Enterprise Maps software plans and drives IT transformation roadmaps by mapping the overall IT landscape with business outcomes. Other Information: Enterprise Maps is certified as ArchiMate 2 Tool and incorporates principles from TOGAF Enterprise Architecture Framework
Enterprise Architect	Type: Software Manufacturer: Sparx Systems Version: 9.3 Purpose/Use: Enterprise Architect provides full life cycle modeling for: Business and IT systems Software and Systems Engineering Real-time and embedded development Other Information:
ProVision	Type: Software Manufacturer: OpenText

RESOURCE / TOOL NAME	INFORMATION
	Version: 9.0.2 Purpose/Use: ProVision is HPES's standard modeling tool, to be used for Business Process, Enterprise Architecture and IT solution modeling. It enables business & IT teams to visually create models, describing business process, process interactions and detailed workflow Other Information:
Disaster Recovery Subscription Services, consisting of all leveraged hardware and software used to provide: Server services Storage services Network services Security services Backup services	Type: Disaster Recovery Subscription Services Manufacturer: various Version: N/A Purpose/Use: Leveraged hardware and software Other Information: Note that the Centera and the dedicated firewalls located in the DR site are not considered to be part of this list, since they are dedicated to the County.
ArcSight Security Information and Event Management (SIEM)	Type: Software/appliance Manufacturer: HPE Version: 6.9.1 Purpose/Use: Event logging and monitoring Other Information:
Global Delivery Capacity & Performance Management (GDCPM)	Type: Software Manufacturer: HPES (based on SAS and other underlying tools) Version: 2.0 Purpose/Use: Collects, aggregates and analyzes capacity and performance data from various disparate sources for reporting and analysis Other Information:

Service Desk Equipment, Software, Tools, and Systems

Note: Software used in providing Service Desk services is listed in the Cross-Functional section, since this software is also used by other frameworks.

IVR and ACD hardware and software, and other tools/facilities used by the Service Desk are internal to HPE, and are not listed individually

E2E Complete	Type: Software Manufacturer: BinaryTree Version: 4.0 Purpose/Use: Automation tool for migration of mail services from Exchange to the Microsoft Office 365 Cloud
Helion Virtual Private Cloud for US Public Sector	Type: Infrastructure as a Service Manufacturer: HPES Version: 7.6 Purpose/Use: Virtual Private Cloud (VPC) for Windows and Linux environments. VPC is a Government Community Cloud currently used to run the County's Beach and Water Quality website.
Watchdog	Type: Software Manufacturer: HPES Version: N/A Purpose/Use: Internally developed utility that monitors/removes privileged access implemented via non-approved methods

Applications Maintenance and Operations Equipment, Software, Tools and Systems

All tools identified for applications development may also be used in the applications Maintenance and Operations (M&O) environment.

Table 100. Applications Development Equipment, Software, Tools, and Systems

RESOURCE / TOOL NAME	INFORMATION
StarTeam	Type: Software Manufacturer: Microfocus/Borland Version: N/A Purpose/Use: Software Change and Configuration Management Other Information: This tool may also be used in Business Analysis and Applications M&O
Together	Type: Software Manufacturer: Microfocus/Borland Version: N/A Purpose/Use: Together enables software to be designed using industry-standard UML notation and conventions. With a large number of built-in utilities to manage the software design process, validate designs and generate code, Together helps maximize the efficiency and accuracy of the software development process Other Information: This tool may also be used in Business Analysis and Applications M&O
Agile Manager	Type: Software Manufacturer: HPE

RESOURCE / TOOL NAME	INFORMATION
	Version: N/A Purpose/Use: Agile project management is a SaaS (software-as-a-service) solution that helps teams to organize, plan, and execute Agile projects. Other Information: This tool may also be used in Business Analysis and Applications M&O
Team Foundation Server	Type: Software Manufacturer: Microsoft Version: N/A Purpose/Use: Microsoft Team Foundation Server (TFS) is a set of tools and technologies that enable a team to collaborate and coordinate the development and build efforts for a .NET software product or completing a .NET software project. Other Information: This tool may also be used in Business Analysis and Applications M&O

Exhibit Q: Schedule 10.1.1 Contractor Key Personnel

Offeror to provide a proposed list of named individuals listed in Exhibit Q-Schedule 10.1.1 Contractor Key Personnel.

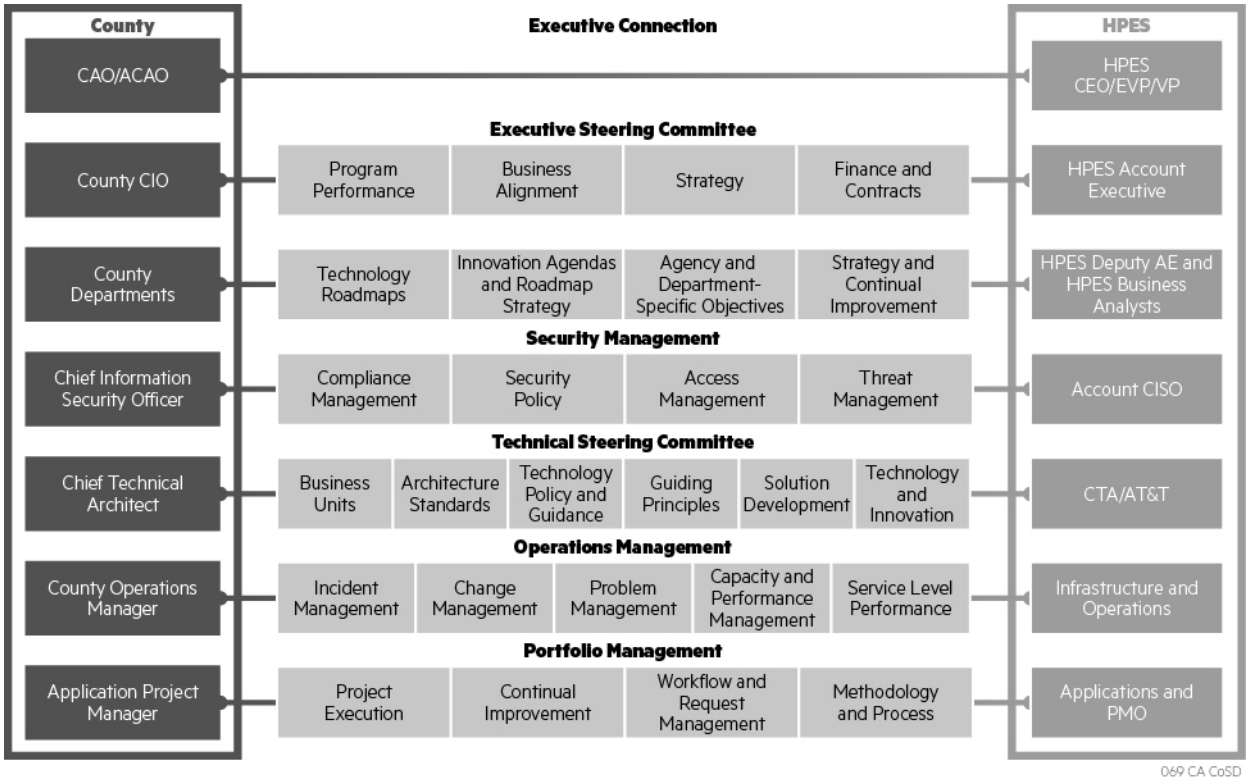
KEY POSITIONS	PROPOSED NAMED INDIVIDUAL
Account Executive	Cathy Varner
Deputy Account Executive	Laura Floyd
Enterprise Service Delivery Manager (SDM)	Kathleen Barghols
FG3 Service Delivery Manager (SDM)	John Steed
CSG Service Delivery Manager (SDM)	Frank Krone
HHSA Service Delivery Manager (SDM)	Sandra Messina
PSG Service Delivery Manager (SDM)	Albert Hatcher
LUEG Service Delivery Manager (SDM)	David Pugh
Contracts Manager	Max Pinna
Chief Information Security Officer (CISO)	Marcelo Peredo
Chief Technology Architect (CTA)	Thif Iruthayarajah
Cross Functional Services Manager	Mark Morin
Service Desk Manager	Curtis Yancey
End User Services Manager	Hector Vaquedano
Network Services Manager	Jeff Williams
Data Center Services Manager	Michael Boscarino
Application Maintenance and Operations Services Manager	Tina Terlecki
Applications Development Services Manager	Mark Roehr
Project Management Office (PMO) Manager	Nelson Diaz
Transition Services Manager	Chris Spanka

Exhibit R: Schedule 10.3 Relationship Management

Offeror to propose a counterpart for relationship management between the County on the Offeror organization.

HPES has implemented a multi-tiered relationship framework for communication and decision- making that provides effective collaboration and timely action. This framework, illustrated in Figure 198, maximizes communication based on the County's organizational structure. HPES and County leaders are aligned to the framework to produce results consistent with technical and process architectures. From requirements definition to solution realization, this framework fosters an in depth understanding of business needs and effectively identifies opportunities for innovation and process improvement to the benefit of the County. The framework supports the collaborative development of plans of action based on agreed decisions to achieve the best outcomes for County staff and its citizens. HPES will work with the County to facilitate alignment to the existing governance within the County Technology Office (CTO) and individual County groups.

Figure 198. Multi-tiered Interactive Framework for Communication



HPES' relationship framework aligns HPES and County leaders to foster clear communication, a solid understanding of business needs, and opportunities for innovation and improvement.

We designed the HPES-County of San Diego Account organization structure to achieve the best balance of economy and effectiveness. Senior staff are assigned to lead each functional area for this program. The HPES account team is made up of highly qualified experts—with more than 320 years of combined experience supporting the County. This multitiered relationship framework builds mutual trust and results in effective, collaborative interactions with everyone focused on getting from idea to value as quickly and efficiently as possible.

Relationship Counterpart

Table 101 outlines the relationship counterparts between the County and HPES roles.

Table 101. Relationship Counterpart

COUNTY OF SAN DIEGO	HPES
CIO	Vice President and Account Executive (AE)
ACIO	Deputy AE
GITMs	Deputy AE, Enterprise Service Delivery Manager, Service Delivery Managers, Applications Development Services Manager, Project Management Office Manager
CTA	CTA
Contracts Manager	Contracts Manager
Chief Information Security Officer	Chief Information Security Officer
Applications Management	Applications development services manager
Chief Data Architect	CTA
Enterprise Application Project Manager	Project Management Office Manager
Operations Managers	Service Delivery Managers

To enhance this multitiered framework, a complementary communication matrix has been established based on the County's organizational structure and requirements that substantiate the County and HPES leadership and operational teams are focused and informed on the needs of the County. Table 102 outlines the proposed stakeholder communication matrix to facilitate a strong communication and collaboration to advance County business and technical objectives.

Table 102. Proposed Stakeholder Communications

COMMUNICATION	PURPOSE/OBJECTIVE	FREQUENCY	AUDIENCE
Executive Meeting	HPES/County Alignment of Objectives and Program Escalations	Bimonthly, or as determined by the County participant	County CIO, HPES State and Local Government VP and HPES AE
Program Status and Strategy	Program management overall program health	Weekly	County CIO, HPES AE
CIO Security Briefing	Briefing to County CIO on security strategy, initiatives, and status	Monthly	County CISO. HPES CISO and HPES security officer
Executive Liaison Program Meetings	One-on-one communication between HPES AE and key County stakeholders to discuss vision and strategy. Intent is to make certain HPES is	Quarterly, biannually, or annually, as determined by the County participant	County GMs, ROV, DHR, County Council, and select elected officials, HPES AE and/or deputy AE

COMMUNICATION	PURPOSE/OBJECTIVE	FREQUENCY	AUDIENCE
	prepared to respond to County requirements.		
CTO Enterprise Architecture Meetings	Review enterprise architecture solution designs, annual updates to hardware and software standards for servers, and end-user compute devices, exceptions to standards via notice of decisions, vendor technology roadmaps	Weekly	County CTA, CTO IT Staff, GITMs, County agency and/or department representation, HPES CTA, HPES technology office and other HPES leaders, as needed.
Enterprise Architecture Review	Reviews proposed architectural changes, large project designs, architectural issues	Weekly	County CTA, CTO IT staff, GITMs. HPES CTA, HPES technology office, and other HPES leaders, as needed.
Network Architecture Meetings	Review network roadmaps and technology upgrades	Weekly	County CTA and other CTO IT staff. HPES CTA, and other HPES technical leaders, as needed, AT&T chief architect
Core Meeting	Preview enterprise solution designs (detailed walkthrough) and changes to standards	Weekly	County CTA, CTO IT staff and CISO. HPES CTA, HPES CISO, and other HPES leaders, as needed
Infrastructure Project Review	Provides schedule, issue, and status data for active infrastructure projects	Weekly	County CTA, GITMs, CTO IT staff. HPES CTA, HPES technology office, and other HPES leaders, as needed
Platform Status Reviews	Review project for critical County application platforms	Weekly	County CTA, CTO IT staff. HPES Application Development Leader and other HPES Leaders, as needed.
Portfolio Review	Provide review of high visibility, critical projects	Monthly	County CTA, GITMs, and CTO IT Staff. HPES business analysts, HPES deputy AE and other HPES leaders, as needed
Portfolio Steering Committees	Review portfolio and future plans	Quarterly	County GITMs. HPES Business Analysts, and other HPES leaders, as needed
ITPMO Review	Discuss processes and procedures related to project management and process improvement with CTO	Weekly	County CTO IT staff, CTA, HPES PMO and other HPES leaders, as needed

COMMUNICATION	PURPOSE/OBJECTIVE	FREQUENCY	AUDIENCE
Quarterly Program Review	Provide program status, accomplishments, and operational data	Quarterly	County CTO IT staff, CTA and GITMs. HPES AE, Deputy AE, and other HPES leaders, as needed *
Service Delivery Operations	Mitigation/review of operation changes and issues with CTO	Biweekly	County CTO IT staff, CTA. HPES Service Delivery Executive, and other HPES leaders, as needed
Service Delivery Operations Monthly	Mitigation/review of operation changes and issues with the County Technology Office (CTO) and GITMs	Monthly	County CTA, CTO IT staff, and GITMs. HPES service delivery executive, SDMs, and other HPES leaders, as needed
County Bricks (Technology Standards)	Document past, current, and future technology standards using Gartner's Brick framework. Bricks guides solutions for the County and is updated when there are specific changes to a technology item.	As needed, triggered by product, vendor, or technology changes	County CTO IT staff, CTA, GITMs. HPES CTA, HPES technology office and other HPES leaders, as needed *
Voice of the Client (VOC) – Service Excellence Initiative	Includes self-assessed ratings pertaining to delivery and client satisfaction results based on client survey feedback; our objective is continual improvement of client satisfaction and retention	Yearly	County CTO IT staff. HPES VOC Interviewer
Information Technology Improvement Needs Assessment (ITINA) Process	HPES provides support for the County enterprise IT project planning and budgeting process—prioritization, estimating, and selection for County enterprise IT initiatives	Yearly	County IT Planning Board, GITMs, CTO IT staff, HPES participants based on subject matter expertise

**HPES Technology Team includes AT&T*

HP Enterprise Services' Response to the County of San Diego Request for Proposals (RFP) 7189 – Information Technology & Telecommunications Services

Final Submission

October 2016

Volume III - Pricing Proposal

Executive Summary

In recent years, the County of San Diego has transformed the way residents and visitors receive valuable services, obtain information and interact with County officials. With successful efforts to provide digital government, mobility services, business continuity and workforce optimization, the County has been recognized as one of the nation's most technologically advanced counties, achieving numerous awards and accolades. Whereas recognition is notable, the beneficial impact to County employees, taxpayers and residents is what is truly impressive. HPES is proud to have been your partner over the past 10 years in this drive to achieve operational excellence.

HPES understands the County's mission to improve the lives of San Diegans through Safe Communities, Sustainable Environments, Healthy Families, and Operational Excellence. The technology foundation enabling the support of these initiatives relies on systems and services delivered and maintained by our team. Our approach and performance provides the County peace of mind that IT is being managed properly so you can focus on that noblest of motives, the public good.

We must also continue to address the challenges facing County residents, particularly those in danger of being disenfranchised, Veterans, foster children, the homeless, and those suffering from mental illness. We view our role in the County, not just in the context of technology, but as a key enabler to better business outcomes as you strive to "connect the unconnected."

San Diego County has a proud military heritage. Our team will implement programs to support military residents and returning Veterans. Working with groups such as Mission Edge San Diego (Three Wise Men), we will develop training programs tailored for military personnel with the goal of providing the technology skills required to be competitive in the job market.

The County has been successful in raising the "IT IQ" of County personnel. We embrace this concept and will, in collaboration with CTO and support from key providers like Adobe and Microsoft, deliver training programs for County personnel focused on transformative learning that will enable them to most effectively utilize the capabilities and functionality of software and services in which the County is investing.

Our approach to providing IT services to the County has always been to deliver the right solution at the best price, in line with County's strategic objectives. Our commitment is to build on that approach. We have strong relationships with top tier providers including EMC, Oracle and IBM. Whether a technology comes from a strategic partner or a perceived competitor, we will bring the best solution to the County to achieve the best business outcome. The delivery of reliable, predictable and quality results, with high end-user satisfaction, is of utmost importance to us. We are pleased to note that together with County CTO, we achieved the highest rating to date in the annual Gartner IT customer satisfaction survey, reaching the top category, "Best in Class".

Operational excellence requires the pursuit of continuous improvement. At all levels across our organization, our focus on problem solving, teamwork and leadership will ensure we consistently identify and seize opportunities to provide optimal results. The transformative specifics in our proposal provide mechanisms the County can leverage to foster new ways of thinking and spark creativity among our teams across the County, industry partners, and constituents. We will ensure a sound foundation from which the County can address current challenges as well as provide services to the next generation resident - one who is proactive, connected, and aspiring to contribute. Like the County, we believe that "Good Government Demands the Intelligent Interest of Every Citizen" and we will collaborate with the

County to identify and implement technologies and programs to encourage that interest, and enable every citizen to be engaged.

Building on the vision established by the CTO, HPES developed a local Innovation Council. The council's charter is to address real business needs, increase efficiency and reduce County spend. Once a year, we host Innovation Day at the COC for all interested County users where these innovation ideas are showcased. Since 2014, the Innovation Council has presented 26 ideas, 10 of which have been implemented into production. These solutions have had a positive impact on County users and citizen-centric services.

HPES is honored to be a Live Well San Diego partner. Our commitment to the community is also demonstrated through engagements like election night support, fielding a team for the Live Well San Diego 5K, sponsoring and attending the State of the County address, and providing speakers and technical support for County events such as Passport to Life Career & Education Expo and the Dick Wayman Technology Center Ribbon Cutting Ceremony at the Ramona Library. At numerous other County events you will find the employees of HPES and our partner AT&T in the mix; participating, supporting and occasionally sponsoring. We are engaged and involved on a personal level.

And for good reason: We live here. Our highly qualified team is primarily comprised of San Diego County residents. We understand what we do matters, to our families, our friends, our neighbors, and the entire San Diego region.

You will see many familiar names in our list of 20 Key Personnel; individuals who have worked shoulder to shoulder with the County delivering consistent results, solving problems and building a relationship of trust. The team will continue to be led by Cathy Varner, our current and proposed Account Executive, who has been supporting the County since 2006. Our telecommunications partner, AT&T, will continue to be led by Grant Morgan, who has also supported the County for 10 years. Together, our team has a broad set of skills uniquely suited to supporting the County. From architects and engineers to service desk and desk side support, we are steadfast in our commitment. We are knowledgeable of County business and culture and we demonstrate that knowledge in every aspect of our performance.

It has been a privilege for HPES to support the County's IT and Telecommunications for the past 10 years. We do not take for granted the trust the County has placed in us. Our core tenet has been and will continue to be, "we must earn the opportunity to do business with the County". As the incumbent, our knowledge and experience presents the lowest risk transition. We will continue to consistently deliver the County's IT operations while we transition and transform to the technologies required by the new scope of work and beyond.

The new frontier for our partnership will be a model of excellence in reliability, continuous improvement, transformation, and strategic alignment, advancing the gauge for County staff, constituents, and visitors.

As we move forward in our partnership, you can be assured that your reputation as the best managed local government in America will continue to be affirmed.

3.4 Financial Position

3.4.1 Prime Contractor Financial Information

Attached are Hewlett Packard Enterprise's (HPE) 2013, 2014, and 2015 Annual Reports. We extracted the audited financial sections from each report so they are concise, economical, and easy to find. Upon request, we will be happy to provide electronic pdf files or complete hard copies of HPE financial reports for the past 3 years. Please note that the total three years information is over 650 pages.

A complete copy of the 2013 HP Annual Report can be found here:
http://h30261.www3.hp.com/~/media/Files/H/HP-IR/documents/reports/2014/hpq-annual-report-2013.pdf

A complete copy of the 2014 HP Annual Report can be found here:
http://h30261.www3.hp.com/~/media/Files/H/HP-IR/documents/reports/2015/hpq-annual-report-2014.pdf

On November 1, 2015, HP Enterprise Service' former corporate parent, the Hewlett-Packard Company (HPCo), separated into two publicly traded Fortune 50 companies. One company consists of HPCo's enterprise technology infrastructure, software, and services businesses and is now an independent, publicly traded company, the Hewlett Packard Enterprise Company (HPE). The other company, HP Inc., (formerly known as Hewlett-Packard Company) consists of HPCo's printing and personal systems businesses and retains the HP logo. As part of the planning for this transaction, HPCo took steps to maintain the strength and reliability of HP Enterprise Services, LLC, and other entities.

HP Enterprise Services, LLC (HPES, LLC) is a fully owned subsidiary of Hewlett Packard Enterprise Company (HPE). HPE is well capitalized with high, investment-grade credit ratings.

A complete copy of the 2015 Hewlett Packard Enterprise Annual Report can be found here:
http://proxy.investors.hpe.com/~/media/Files/H/HPE-Proxy/documents/proxy-statement-2015-annual-report.pdf.

3.4.1.2. Provide your organization's annual revenue for the past three (3) years.

Hewlett Packard Enterprise's annual net revenue for the past three 3 years as shown in Table 1 (2013 and 2014 reflect annual revenue of our predecessor company, Hewlett Packard Company prior to separation).

Table 2. Hewlett Packard Enterprise's Annual Net Revenue

2013	2014	2015
$112.298 billion	$111.454 billion	$52.107 billion

3.4.2 Subcontractor Financial Information

Please see attachments for AT&T's Annual Reports for 2013, 2014, and 2015. We extracted the audited financial sections from each report so they are concise, economical, and easy to find. Upon request, we will be happy to provide electronic pdf files or complete hard copies of AT&T's financial reports for the past 3 years. Please note that the total three years information is over 300 pages.

3.4.2.2. Provide each subcontractor's annual revenue for the past three (3) years.

AT&T's annual operating revenue is shown in Table 3.

Table 3. AT&T's Annual Operating Revenue

2013	2014	2015
$128.752 billion	$132.447 billion	$146.801 billion

3.5 Resource Unit Pricing

3.5.1 Pricing Concepts

HPES has used the pricing template as defined in Exhibits 16.1-1 as the basis for pricing. In the section below, HPES provides insight into the pricing concepts we used to develop the Resource Unit (RU) pricing.

Cross-Functional

For the Cross-Functional services, we performed a bottom-up pricing effort to build up the per month price. The major cost drivers for each RU are listed below:

- Contract and Acquisition Management Services – Basis includes all resources who perform contract and subcontract management, as well as those who perform acquisition (procurement) services.
- Integrated Asset Management Services – Basis includes all resources performing asset management services. Tool costs, which are driven by volume, are associated with the appropriate RU.
- Billing Management Services – Basis includes resources who perform billing management services, billing, and charge back/invoicing services associated with the appropriate RU.
- Security Management Services – Includes all resources, tools, and core infrastructure providing security management services. This also includes response to the annual audit request that we provide today. Security Management Services costs, which are driven by volume, are associated with the appropriate RU.
- Service Delivery Management Services – Basis is the Service Delivery Managers listed in the key personnel section of the technical proposal.
- Project Management Services – Project Management Office (PMO) for intake and governance of applications and infrastructure work requests. HPES has also taken this opportunity to offer additional value to the CoSD customer by consolidating Infrastructure Project Management efforts, which were previously part of the monthly server RUs, into our project management service. This will provide value to our customer while continuing to facilitate HPES's goal to integrate all project management services under one set of best practices.
- Integration and Testing Services – Engineering resources who perform integration and testing services in support of infrastructure services.
- Incident Management Services – Resources to manage governance of processes for Incident Management.
- Problem Management Services – Resources to manage governance of processes for Problem Management.
- Change Management Services – Resources to manage governance of processes for Change Management.
- Release Management Services – Resources to manage governance of processes for Release Management.
- Configuration Management – Resources to manage governance of processes for Configuration Management.
- Capacity Planning and Performance Management Services – Resources to manage governance of processes for Capacity Planning, and Capacity and Performance Management.
- Disaster Recovery (DR) Management Services – Basis includes the resources who maintain DR plans and coordinate DR tests and network connectivity, as well as the subscription cost to cover all of the infrastructure required to provide Disaster Recovery environments for those applications that have designated Recovery Time and Recovery Point Objectives as of this submission. The subscriptions costs include the following: Per server costs based on size of server, storage costs charged per TB, Continuous Data Protection, Network Infrastructure costs, Internet bandwidth, and DR exercise coordination. As DR requirements and application infrastructure composition changes, this RU will be revisited. As an alternative pricing structure for DR, to provide greater flexibility, HPES suggests

the County consider using this RU to cover the cost of planning, testing, and network services only, and then create a set of RUs to cover the incremental per server and storage Disaster Recovery subscription services. This would more accurately reflect usage and results in savings to the County. In addition, this alternative pricing structure will align with the County's goal that changes in scale will be addressed via volume changes rather than RU changes.

- Identity Access Management (IDAM) Services – Basis is resources and tools providing the IDAM service, including Symantec PKI and the Oracle IDAM Platform support. This includes maintenance of end-user accounts, password resets, and managing permissions.
- Reporting Management Services – Basis is the resources who manage the process to produce and publish reports, and meet with the County to review, refine, and identify new requirements.
- Domain Name Management Services – Basis is the resources to provide management of Domain Names.
- Business Analyst Services – Basis is five Full-Time Equivalents (FTEs) to provide the services as described.
- Chief Technical Architect Services – Basis is one FTE (Key Personnel) to provide the services as described.
- Enterprise Applications Architect Services – Basis is one FTE (Key Personnel) to provide the Services as described.
- Innovation Management Services – Basis is one FTE (Key Personnel) to serve as Innovation Officer.
- The basis for the breakdown of the Cross Functional Resource Units is based on the labor and tools required to provide each service.

Service Desk

HPES has priced this RU to support the HPES-proposed service levels at the current call volumes actual cost reflects an average with an anticipated reduction built in based on self service.

End User

All of the End-User Services RUs include hardware, software, and resources to support each type of platform. Refresh has been included at the required intervals and the price includes the remaining lease cost from the existing contract. The subscription costs for Office 365 is included in our pricing.

The following RUs have additional information:

- Mobile Device Support Services – Resources and tools to support mobile devices.
- Early Refresh - Mobile PC and Early Refresh - Desktop – This RU contains the sum of the future hardware decomposition fees (remaining lease).
- County Retained Device, Desktop – DCSS, Laptop - DCSS – These RUs include the software and resources to support the device, with no hardware component or refresh.

Network

HPES has teamed with AT&T to continue to provide fast, highly secure mobile connectivity and network services to the County.

Network Access – Static Wired Service is provided on a fixed monthly fee per active account. Unit pricing includes the cabling and switching systems (5-year refresh), routing (4-year refresh), security (4-year refresh), Wide Area Network (WAN) circuits, Internet access, and VTC QOS/infrastructure access.

Network Access – Wired/Wireless – Unit prices provided are per active account and include cabling, switching systems (5-year refresh), routing (4-year refresh), security (4-year refresh), WAN circuits, Internet access, VTC QOS/infrastructure access, and wifi secured access. Additional unit pricing is provided for units that are greater or less than 10% above or below the baseline volume band provided.

Virtual Private Network (VPN) Access Level 1 is provided on a fixed monthly fee per access. Unit pricing includes SSL VPN infrastructure and licensing, maintenance and support, to enable network persistent, secure access.

Virtual Private Network (VPN) Access Level 2 - Basis is the software maintenance and support cost for application persistence. This RU is an optional uplift to Network Access Wire/Wireless, and cannot be purchased as a stand-alone. Note that new users will need to order a license as a one-time purchase from the OIC.

Voice Services are provided on a fixed monthly fee per unit. Units proposed include seconds, calls, phones (for pay phones), active lines, and active accounts. There are no charges for on- and off-net resource units (calls) supported by PBX/VoIP services. The following voice services are individually priced (except where noted).

- Calls – Casual Use – Calls not originated as direct dial or inbound requiring special handling charges, including operator-assisted calls both inbound and outbound
- Calls – Conference Bridge – Conference Bridge support
- Calls – Directory Assistance – charges apply to 411 dialed calls only
- Calls – International – charges apply to direct dialed international calls only
- Calls – Off-Net Local – No charges
- Calls: Off-Net Toll – No charges
- Calls – Off-Net Long Distance (CA) – No charges
- Calls – Off-Net Long Distance (USA) – No charges
- Calls – On-Net – No charges
- Calls – 800 Service (CA) – Prices provided are for PBX/VoIP supported sites
- Calls – Toll Free 800 (San Diego and Imperial) – Prices provided are for PBX/VoIP supported sites
- Calls – Toll Free 800 (USA) – Prices provided are for PBX/VoIP supported sites
- Pay Phones – Prices provided are per phone per month and include PSTN circuit connection and cabling. Pay phones are coin/card operated and owned by the provider (not a County retained/purchased asset)
- Voice – Analog Line – Unit prices provided are per active line and include telephone set break-fix support, ATA/Gateways (to support VoIP environment), circuit and BVoIP infrastructure to eliminate outbound direct distance dialing usage charges for domestic calls. Existing telephones will be used as much as possible.
- Voice – Single Line – Unit prices provided are per active line and include telephone set break-fix support, Gateways for PSTN connectivity, circuits, and BVoIP infrastructure to eliminate outbound direct distance dialing usage charges associated with domestic calls. Existing VoIP telephones will be used as much as possible and will replace TDM-based phones and cabling (Cat 3 to Cat 5E as required).
- Voice – Multi-Line – Unit prices provided are per active line and include telephone set break-fix support, Gateways for PSTN connectivity, circuits, and BVoIP infrastructure to eliminate outbound direct distance dialing usage charges associated with domestic calls. Existing VoIP telephones will be used as much as possible and will replace TDM-based phones and cabling (Cat 3 to Cat 5E as required).
- Voicemail – Unit prices provided are per active account and include Unified Communications (UC) capabilities of integration with UC services from multiple manufacturers. Includes geo redundant architecture with no single point of failure.
- Voicemail to Email Services – Unit prices provided are per active account and include service administration and support, and cloud-based licensing and maintenance/support for the Mutare service. Available to all voice single-line, multi-line subscribers.

- **Interactive Voice Services** – Unit prices provide include infrastructure (hardware and software), circuitry, and limited software development of the IVS applications. Additional charges will apply should external databases/systems require access or custom development. Unit prices are based on complexity of the service and features utilized. Three RU categories have been defined: Small, Medium and Large.
- **Interactive Voice Services** – Support for County Retained – Unit prices provided include trunking and PSTN connectivity to County owned IVS systems not included in this Agreement.

Video Conferencing Services – Unit prices provided are per system and include codec and head end infrastructure, software, and administration needed to support and maintain services. Two categories of VTC have been priced, Room System Video Teleconferencing Services and Personal Video Teleconferencing Services.

The Bluejeans integrated video teleconferencing offer included in this proposal includes a 100 host license, where designated video conferencing hosts will be identified by the County. Additional licensing options are available up to an enterprise scale, allowing all users on the County domain the ability to host a multi-platform video conference. The Bluejeans service has been allocated across the Network Access RU and will not have a separate price point. Changes to this licensing model could materially impact the RU price offered under this solution.

Town Hall Services – Unit prices provided includes 12+ VM Servers with Storage Area Network and 4 Video Network Edge appliances (CDN) and AVMS/QUMU application license and VNE/CDN licenses with a 5 year refresh cycle. Labor includes Application, Content Distribution and Portal support, Townhall administrator and Portal updates. Origination and distribution bandwidth and Originator connectivity limited to available facilities.**Video Streaming and Archiving** – Unit prices provided are per system and include access and circuitry for the existing Granicus webcasting solution at the current subscribed level.

Wireless Access Point (WAP) – Unit prices provided are per access point and include support, LAN andconnectivity, equipment, and infrastructure required to install and maintain wireless access points at official County sites. Outdoor WAPs are included; however, mounts and cabling are limited to "on existing building." Additional unit pricing is provided for units that are greater or less than 10% above or below the baseline volume band provided.

Third-Party Network Access Services – Unit prices provided are fixed monthly prices for the associated network. Pricing includes leased-line-based access to the County data network, administration, maintenance, support, cross-connects, DMZ, and firewall interface for a third-party-provided leased line in the AT&T POP. The following third-party network access services are leased-line-based:

- Category 1
- Category 2
- Category 3.

The following third-party network access services are Internet based and include access via ISP and peering configuration on firewall in the AT&T POP, administration, maintenance, and support:

- IP Sec (5 Mbps)
- IP Sec (10 Mbps)

The following third-party network access services are virtual and include access for third parties occupying County facilities and providing access to either external services or specified County access via the firewall. Prices include administration, support, and maintenance.

- Virtual Access (1 Mbps)
- Virtual Access (2 Mbps)
- Virtual Access (3 Mbps)
- Virtual Access (4 Mbps)
- Virtual Access (5 Mbps)
- Virtual Access (6-10 Mbps)
- Virtual Access (20 Mbps)
- Virtual Access (30 Mbps)
- Virtual Access (40 Mbps)
- Virtual Access (50 Mbps)

External DNS Management – Unit prices are fixed monthly fees per unit and include all administration and support of the Akamai Fast DNS Cloud Solution.

New Site Installation Services – Unit prices are fixed rates that can be decoupled based on the County's selection of optional services. The following are the new installation services provided and priced:

- Base services (the fixed component), will include activities such as pre-field work and requirements gathering, network design, circuit design/provisioning, installation of network hardware and project management that are required regardless of the cabling vendor used.
- The optional services (the variable component), will include all cabling vendor activities as well as contractor project management oversight. These optional components are broken into two work categories in an effort to allow the County to select either all or a subset of the cabling work necessary at the new site. The first component within the optional services will be identified as "Riser Cabling". This component will include the placement of pathway and rack infrastructure as well as the placement and testing of fiber/copper based cabling runs between MPOE and MDF, and between MDF and IDF rooms/floors. Trenching is not included in this service and will be the obligation of the County or its contractor to provide. The second optional component of the service will be identified as "Horizontal Cabling". Included in this service will be the placement and testing of all wall jacks, patch panels and plenum cabling between the IDF and the workstations or designated end points.
- Should the County elect to move one or both of these optional service components to a vendor of their choice, the resource unit will be decomposed to provide adequate cost recovery for the remaining New Site services.

Data Center

The basis of the RU pricing for Data Center Services follows:

- Mainframe – Basis is the cost to continue operating the current workload on the current mainframe environment without refresh (per CPU hour).
- Physical Servers – Basis is all hardware, software, tools, and support resources for a physical server. Sizing is based on the current definitions in Report 49.
- Virtual Guest Servers – Basis includes support resources and an allocation of certain hardware/software, tools, and facilities costs to run the environment. The cost of hardware and software for the physical host on which the virtual guest resides is priced separately as either a medium or a large UNIX server.

As an alternative to the current approach, HPES suggests creating sized RUs for Virtual Servers similar to Physical Servers (Extra-Small, Small, Medium, Large, Extra-Large). This would permit the cost of the physical server infrastructure to be allocated equitably into the Virtual Servers based on how much resource each Virtual consumes. Physical infrastructure would be automatically ordered and added as needed to support expansion of the Virtual Server environment without the County having to order and fund these servers explicitly.

- AS/400 – Basis is the cost to continue operating the current server without refresh.
- Infrastructure Services – Basis includes all hardware, software, network, facility, and support resources to manage the services explicitly listed in Schedule 4.3, Section 6.8. These services include WAN Acceleration, Load Balancing, core Data Center Network elements (firewalls, switches, all Servers and Storage used to support underpinning services (such as Active Directory, Distributed File Systems, ADFS, . A portion of the MPC costs associated with supporting the infrastructure have been allocated to this RU.
- Development and Test Environment – Basis includes all hardware, software, network, and labor to support non-production environments used for new development projects. A portion of the MPC environment, calculated based on the current mix of Development vs M&O infrastructure, is allocated to this RU.

  There are two alternative pricing approaches that the County may wish to consider. Either or a combination of both may be applied at the County's discretion:
  - Include the infrastructure and support for the on-demand managed private cloud in this RU, and all other development/test environments (anything not cloud compatible) would be funded on a per-server basis as they are today.
  - Include all Applications M&O environments in this RU, so that as applications move from development to M&O, the environments used for them do not have to change in their accounting/reporting structure – this would prevent the scenario of potentially having to re-price both RUs when a large application moves into production.
- Email Services – Basis is licensing and resources supporting the email portion of Office 365 with Exchange Online Advanced Threat Protection and Archiving. It also includes hardware, software, and support resources for Data Loss Prevention, RightFax™, and SMTP relay. Because encryption is included in the service, Email Encryption Services are not separately priced. Also included is the cost of HPES Enhanced Support for Office 365, which is a bridge service between the HPES Service Desk and Microsoft Support.
- Office 365 Network Enabler – This new Service has been added as a New Capability in Exhibit 16-1.1. The basis for the price is Netbond and MS Azure ExpressRoute service for Office 365 connectivity.

Storage

Storage RU does not include Disaster Recovery, storage in the Disaster Recovery site is covered by the Disaster Recovery Cross-Functional RU. Under the current tier definitions, any tier may also be presented as Network Attached Storage.

- Attached Storage – WINTEL- Basis is 1 GB of direct-attached storage, RAID – Protected.
- Attached Storage – UNIX - Basis is one GB of direct-attached storage, RAID – Protected.
- Storage - Document Processing Center (DPC) – Basis is one 5 TB dedicated storage array, and all hardware, software, and support resources for the server environment supporting this service. This also includes the cost of replication and VTL-based backups under current retention requirements.
- Storage - Primary Tier – Basis is hardware, software, and support resources for 1 GB 3PAR storage (SSD +10K drives), thick provisioned in the highest performing RAID configuration. This also includes the cost of VTL-based backups under current retention requirements.

- Storage - Secondary Tier – Basis is hardware, software, and support resources for 1 GB 3PAR storage (10K drives), thin provisioned. This also includes the cost of VTL-based backups under current retention requirements.
- Storage - Archive Tier – Basis is hardware, software, and support resources for 1 GB 3PAR storage (7200 RPM drives), thin provisioned. This also includes the cost of VTL-based backups under current retention requirements.
- Storage - Immutable Tier (1 TB) – Basis is hardware, software, and support resources to manage 1 TB storage on an EMC Centera or similar technology.
- Storage - Immutable Tier (500 GB) – Basis is hardware, software, and support resources to manage 500 GB storage on an EMC Centera or similar technology.

Print

- Print per 1,000 images (Paper) – Basis is printer hardware and software, forms, materials, and support resources to manage the centralized Print Services environment (per 1,000 images)
- Microfiche Originals – Basis is service to create fiche, support resources, and materials to manage the service.
- Microfiche Duplicates – Basis is service to duplicate fiche, support resources, and materials to manage the service.

Third-Party Agreements

Please refer to Section 3.5.4, Three-Tiered Resource Unit Approach, in this volume, for a description of these RUs.

Application Services

Applications Development Time and Materials (T&M) hours represent 1 hour of time for a person who meets the qualifications as defined in Exhibit EE/16.1-4, Labor Categories. Application Maintenance and Operations Services include resources and the development/test tools to support the environment. The pricing developed for Exhibit FF: Exhibit 16.1-5, Firm Fixed Price for Applications M&O includes all infrastructure, including a portion of the MPC, used to support this activity. The price does not include the effort for the Applications marked as retired in Exhibit 16.1-5 Applications.

Based on the hours included in Exhibit AA: Exhibit 16.1-1, Resource Unit Price Summary, price sheets, it appears the hours for Applications Maintenance and Operations support are also included in the evaluation volumes, and that Exhibit FF: Exhibit 16.1-5, Firm Fixed Price for Applications M&O, would duplicate the costs.

Transition Services

Each framework transition includes the cost to make process changes, develop new reports, update existing reports, set-up to measure and report new or modified service levels and post artifacts to the service portal. One-time costs to implement specific projects are included in the frameworks as required by Schedule 2.1, Transition Services, as listed below:

- Transition Services – Service Desk Framework – Resources and tools cost to implement the Service Portal.
- Transition Services – Application Services Framework - Resources to transition the SaaS applications.
- Transition Services – End-User Services Framework – No projects required.
- Transition Services – Network Services Framework - No projects required.

- Transition Services - Data Center Services Framework – Consolidation to one data center, implementation of new DR strategy and infrastructure, migration to MS Office 365, implementation of the on-demand Development and Test Environment, Storage Architecture.
- Transition Services – Cross-Functional Services Framework – Implementation of component-level management plans, and implementation of new DR Plans, Service Levels, Reporting, and Security requirements for the other Frameworks. The Cross Functional transition also includes some specific initiatives:
  - replacement of myRequests
  - implementation of the Application Performance Management Suite of tools (this is included in Cross Functional because it crosses and supports multiple frameworks)
  - Implementation of a number of Identity Management capabilities required by the Statement of Work.
- Transition Services – Transition Completion – No additional projects required.

Transformation Services

All transformation activities described include those projects specifically requested. All pricing provided is based on high-level assumptions and a notional project scope. As requirements are received, we will validate or refine the solution accordingly. Basis information for these projects follows.

- Desktop Services – Basis is infrastructure, software, and labor to implement and support an Application Virtualization environment for a widely used candidate application, such as Kronos. We estimated a starting user base of 200, with per-user pricing beyond that volume. A possible alternative would be to implement a small-scale pilot first, then develop a design targeted for specific applications.
- User Data Services – Basis is enhanced support for OneDrive for Business on a per-user basis. Data encryption in transit and at rest is included; however, no uplifted security or data protection design has been applied, beyond the native file versioning available from Microsoft.
- IT Application Portfolio Management Services – Basis is resources, hardware, and software to implement a project to implement the Mega tool, including consultants to install, customize, and configure the IT Portfolio Management Plus Solution - Advanced Edition solution and train HPES and County users. Notional solution basis (license volume) is:
  - One WorkBench User (Solutions)
  - One Administrator User (Solutions)
  - 30 ITPM Plus Solution - Contributors
  - 10 ITPM Plus Solution - Portfolio Manager - Advanced Edition Users
  - 5 ITPM Plus Solution - Portfolio Manager Users
- Network Transformation – Basis is AT&T Netbond dedicated, scalable, secure connection service to a third-party cloud provider. The following tiers are offered:
  - NetBond 1 Mbps
  - NetBond 3 Mbps
  - NetBond 10 Mbps
  - NetBond 25 Mbps
  - NetBond 40 Mbps
  - NetBond 100 Mbps
  - NetBond 155 Mbps
  - NetBond 300 Mbps
  - NetBond 600 Mbps
  - NetBond 800 Mbps
  - NetBond 1,000 Mbps
  - NetBond 2,000 Mbps
  - NetBond 3,000 Mbps

  - NetBond 4,000 Mbps
  - NetBond 5,000 Mbps

Note that connectivity to each cloud provider will require both a NetBond component and that cloud provider's equivalent.

- Voice Services Transformation – Included in Network Base Services under the Voice RU's. Not separately priced.
- Storage Architecture – Basis includes implementation and ongoing management of the ControlPoint software environment, based on an estimated 100 TB of unstructured data, and a pilot implementation (one-time cost only) of Structured Data Management. There are numerous other types of storage that could be offered for the County's consideration.
- E911 – Included in Network Base Services under the Voice RU's. Not separately priced.
- Identity Federated Services – Basis is tiered pricing for HPES Identity and Access Management as a Service (IAMaaS). Based on actual expected user volumes, we can modify the tier structure.
  - Identity Federated Services - up to 50k bundle
  - Identity Federated Services - up to 100k bundle
  - Identity Federated Services - up to 150k bundle
  - Identity Federated Services - up to 250k bundle
  - Identity Federated Services - up to 500k bundle
  - Identity Federated Services - up to 999k bundle
  - Identity Federated Services - up to 1,500k bundle

Two additional projects were suggested in the transformation volume of this proposal:

- Enterprise Information Management (EIM) – a consulting engagement focused on defining the vision and strategy for EIM as well as documenting the roadmap for subsequent implementation.
- Comprehensive Applications Threat Analysis (CATA) Services – these services can be ordered in the following ways:

  - Standard CATA Review includes a Security Requirements Gap Analysis (SRGA) and Architectural Threat Analysis (ATA) for one Application Architecture, for that Application's first review.
  - Delta CATA Review includes the same services as a Standard CATA Review, for one Application Architecture, for subsequent reviews, due to (for example) application changes or changes in security policy. A Standard CATA Review must have been completed at some previous time.
  - Time and Materials – Rates are provided for Strategist, Master, and Expert levels. These rates may be used for code assessments, application vulnerability assessments, and Penetration Testing, or other application security services, as required.

Additional or Alternative Resource Units

Hybrid Cloud Environment Add-On RUs - The following optional resource units are offered for the County's consideration. These are add-ons to the hybrid cloud environment, and cannot be implemented independently. Pricing for these options includes the ability to provision and monitor the instances, and does not include the cost of the instance resources themselves, nor underlying infrastructure as noted in the sub-bullets.

- Option to provision virtual server environments in Amazon Web Services or Microsoft Azure public or Government clouds.
  - Cost of Netbond-type connectivity will be priced and offered separately once the County's bandwidth requirement for this service is determined.

- Option to provision Oracle VM Server for SPARC VMs in the Tulsa Data Center.
  - Cost of underlying infrastructure (Oracle physical servers and operating software) would be priced separately as part of the underlying resource units' infrastructure, as with traditionally hosted environments

Disaster Recovery (DR) Management Services RUs - To assist with one of the County's goals of having changes in scale addressed through volume changes, HPES is proposing an alternative RU structure for the Disaster Recovery (DR) Management Services. HPES proposes the following RU's:

- DR Labor – Represents the Labor to manage and update DR process and plans. This RU also contains the labor for DR Exercise Coordination and providing Exercise Collateral.
- DR Infrastructure – Represents the Hardware, Software, and Labor to support the DR Infrastructure. This costs includes the cost of the BRS Site Service Charge, Base Network and circuit costs, Recovery Management and Configuration Servers, and 100MBPs Internet Bandwidth.
- DR Small Windows/Linux – 72 Hour RTO – Represents the server subscription price for small physical servers. Servers falling under this band will contain 1-2 cores and includes ProLiant BL460, and PowerEdge 2850s.
- DR Medium Windows/Linux – 72 Hour RTO – Represents the server subscription price for medium physical servers. Servers falling under this band will contain 4-8 cores include ProLiant BL660, and PowerEdge 1950s.
- DR Large Windows/Linux – 72 Hour RTO – Represents the server subscription price for large physical servers. Servers falling under this band will contain 8-16 cores.
- DR X-Large Windows/Linux – 72 Hour RTO – Represents the server subscription price for extra large physical servers. Servers falling under this band will contain greater than 16 cores and includes ProLiant DL580e G9 or the equivalent.
- DR Medium Solaris – 72 Hour RTO – Represents the server subscription price for small physical servers. Servers falling under this band will contain 16 cores and includes SPARC T4-1 or SPARC T4-4
- DR Large Solaris – 72 Hour RTO – Represents the server subscription price for small physical servers. Servers falling under this band will contain 16-32 cores and includes SPARC Enterprise M5000
- DR X-Large Solaris – 72 Hour RTO – Represents the server subscription price for small physical servers. Servers falling under this band includes SPARC Enterprise M3000
- DR VTL Based Storage – 72 Hour RTO – Includes the hardware, software and labor support for VTL storage.
- DR Small Virtual – 48 Hour RTO - Represents the server subscription price for small physical servers. Servers falling under this band will contain 1-2 cores
- DR Medium Virtual – 48 Hour RTO Represents the server subscription price for small physical servers. Servers falling under this band will contain 4 cores
- DR Large Virtual – 48 Hour RTO Represents the server subscription price for small physical servers. Servers falling under this band will contain 8 cores
- DR 3PAR Based Storage – 48 Hour RTO – Includes the hardware, software and labor support for storage. Includes Continuous Data Protection.

3.5.2 Resource Unit Fee Modification

HPES has provided the banded pricing as defined in Exhibit BB:Exhibit 16.1-1a, Fees Sample Calculation.

3.5.3 Third-Party Applications

Under the Applications M&O Services, these 169 cloud-based applications have been included as M&O bundles in Exhibit FF. HPES will create help desk scripts as required for Tier 1 support. The application information will be entered and maintained in the applications CMDB.

Cloud-Based Retained Assets can be submitted for transfer to HPES as third-party software using the existing County and HPES Contract Transfer Request Form. Cloud-Based Retained Assets transferred as Third-Party Software will incur the Third-Party Agreement fees.

3.5.4 Three-Tiered Resource Unit Approach

HPES is proposing the following pricing tiers based on our experience supporting the County of San Diego as shown in Table 4. . These fees are applicable as defined in Schedule 16.1-1, Section 8.1.1 and distinct from the Contract and Acquisition Management Services resource unit.

Table 4. Pricing Tiers

RESOURCE UNIT	FEE	DESCRIPTION
Third Party – Tier 1	$10,000 per occurrence	Negotiation of an agreement with a New Third-Party Vendor, as defined below,in excess of $500,000
Third Party – Tier 2	$5,000 per occurrence	Negotiation of an agreement with a New Third-Party Vendor up to $500,000
Third Party – Tier 3	5% of transaction amount with a minimum fee of $100 and maximum fee of $50,000	Fee applied to the below transactions for products and services which are not provided by services for which Contractor is paid a Resource Unit Fee • Portfolio Software - Perpetual License Purchase • Portfolio Software - Perpetual License Maintenance Renewal • Portfolio Software - SaaS Subscription Licenses Purchase/Renewal • Portfolio Software - Cloud/ASP Subscription • Labor SOW • Labor Agency Contractor • Hardware • Hardware Maintenance

Tier 1 or Tier 2 is assessed on execution of a signed contract between HPES and the New Third-Party Vendor. A New Third-Party Vendor is defined as a vendor with whom HPE does not have a current agreement applicable to the transaction, whether never existed or expired, for which new terms and conditions must be negotiated.

Tier 3 is assessed, in addition to Tier 1 or Tier 2 if those are applicable, upon receipt of invoices from third-party vendor. The Tier 3 fee is assessed on the total transaction amount including shipping costs and taxes.

Below are examples of the application of above Resource Units:

- County requests HPES to contract with company AAA for labor services in the amount of $100,000. Company AAA is a third-party vendor currently contracted by HPES in support of the Services.

The total fees are:

- (1) "Third Party – Tier 3" for 5% of transaction amount of $100,000 equaling $5,000.

- County requests HPES to contract and purchase software licenses from company BBB. Company BBB is not a third-party vendor currently contracted by HPES in support of the Services. The vendor price of the software is $80,000 plus $20,000 for the first year of software maintenance.

The fees are:

- (1) "Third Party – Tier 2" for $5,000 plus
- (1) "Third Party – Tier 3" for 5% of transaction amount of $100,000 equaling $5,000.

Total fees are $10,000.

1. County requests HPES to transact a software maintenance renewal from company BBB Company. Company BBB is a third-party vendor currently contracted by HPES in support of the Services. The vendor price for the software maintenance renewal is $20,000.

The total fees are:

- (1) "Third Party – Tier 3" for 5% of transaction amount of $20,000 equaling $1,000.

2. County requests HPES to purchase a large scanner not available in the OIC catalog or as a Resource Unit. The price of the scanner is $10,000. The scanner can be purchased by HPES through a third-party vendor currently contracted by HPES in support of the Services.

The total fees are:

- "Third Party – Tier 3" for 5% of transaction amount of $10,000 equaling $500.

The following table shows County's historical third-party spend through the ITO Contract, including licenses, license maintenance, ISRs (labor, hardware), and the OIC catalog.

Table 5. Historical ITO Third-Party Resale Spend

HISTORICAL ITO THIRD-PARTY RESALE SPEND

Period: May 2011 - June 2016

Left blank intentionally

3.5.6 Pricing Appendix

See Appendix 3.8, Exhibit AA: Exhibit 16.1-1 Resource Unit Price Summary, and Exhibit CC: Exhibit 16.1-2, Resource Unit Price Decomposition, for required exhibit.

3.5.6.3. Complete and submit in Microsoft Word Exhibit 16.1-3 Maximum Annual Fee as follows:

See Appendix 3.8, Exhibit DD: Exhibit 16.1-3 Maximum Annual Fee, for required exhibit.

3.5.6.4. Complete and submit in Microsoft Excel Exhibit 16.1-5 Fixed Price for Applications Maintenance & Operations as follows based on instructions in the 'Exhibit 16.1-5 Questions' tab.

See Appendix 3.8, Exhibit FF: Exhibit 16.1-5 Firm Fixed Price for Applications M&O, for required exhibit.

3.5.6.5. Complete and submit in Microsoft Word Exhibit 16.1-5b Fixed Price for Applications Maintenance & Operations as follows:

See Appendix 3.8, Exhibit GG: Exhibit 16.1-5b Firm Fixed Price for Applications M&O, for required exhibit.

3.6 Assumptions

ITEM #	REFERENCE (SECTION, PAGE, PARAGRAPH)	DESCRIPTION	RATIONALE
1.	General	The County and HPES will execute a letter agreement regarding Telecom Transport Services similar to the existing agreement dated 4/12/2011 or otherwise incorporate such changes into the RFP terms and conditions prior to contract signature.	This will support HPES compliance with Federal law regarding certain regulated telecommunications services and allow for more favorable pricing to the County

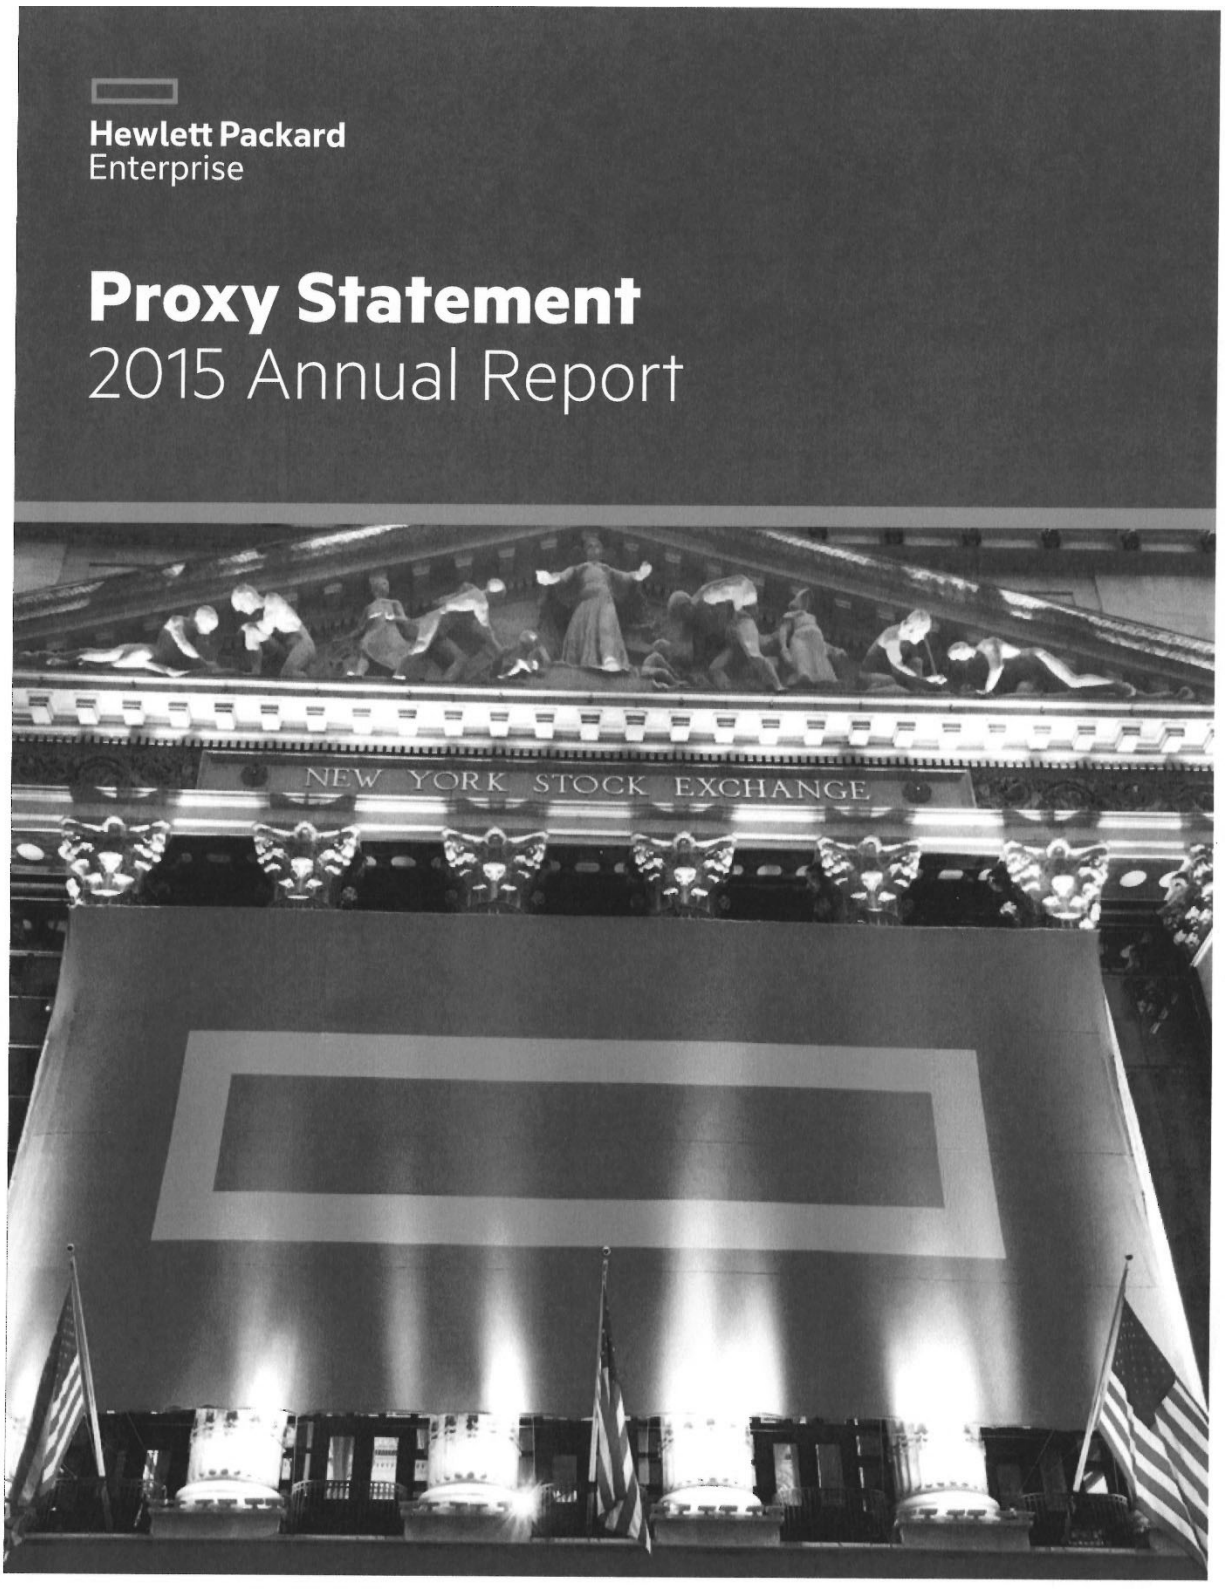
3.7 Offeror Response to Pricing Exceptions

ITEM #	REFERENCE (SECTION, PAGE, PARAGRAPH)	EXCEPTION	OFFEROR PROPOSED SOLUTION/RATIONALE AND BENEFITS OF PROPOSED SOLUTION TO THE COUNTY
1.			
2.			
3.			

HPES has no pricing exceptions.

3.8 Appendix

HPES 3-year Audited Financials



Hewlett Packard
Enterprise
Proxy Statement
2015 Annual Report
NEW YORK STOCK EXCHANGE

Report of Independent Registered Public Accounting Firm

To the Board of Directors and Stockholders of Hewlett Packard Enterprise Company

We have audited the accompanying combined and consolidated balance sheets of Hewlett Packard Enterprise Company and subsidiaries (the "Company") as of October 31, 2015 and 2014, and the related combined and consolidated statements of earnings, comprehensive income, cash flows, and equity for each of the three years in the period ended October 31, 2015. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. We were not engaged to perform an audit of the Company's internal control over financial reporting. Our audits included consideration of internal control over financial reporting as a basis for designing audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the Company's internal control over financial reporting. Accordingly, we express no such opinion. An audit also includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements, assessing the accounting principles used and significant estimates made by management, and evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the financial statements referred to above present fairly, in all material respects, the combined and consolidated financial position of Hewlett Packard Enterprise Company and subsidiaries at October 31, 2015 and 2014, and the combined and consolidated results of their operations and their cash flows for each of the three years in the period ended October 31, 2015, in conformity with U.S. generally accepted accounting principles.

HEWLETT PACKARD ENTERPRISE COMPANY AND SUBSIDIARIES

Combined and Consolidated Statements of Earnings

	For the fiscal years ended October 31		
	2015	2014	2013
	In millions, except per share amounts		
Net revenue:			
Products	$19,635	$19,171	$19,383
Services	32,111	35,551	37,541
Financing income	361	401	447
Total net revenue	52,107	55,123	57,371
Costs and expenses:			
Cost of products	12,978	12,394	12,360
Cost of services	23,950	26,815	28,958
Financing interest	240	277	312
Research and development	2,338	2,197	1,956
Selling, general and administrative	8,025	8,717	8,601
Amortization of intangible assets	852	906	1,228
Restructuring charges	954	1,471	983
Acquisition and other related charges	89	11	21
Separation costs	797	—	—
Defined benefit plan settlement charges	225	—	—
Impairment of data center assets	136	—	—
Total costs and expenses	50,584	52,788	54,419
Earnings from operations	1,523	2,335	2,952
Interest and other, net	(53)	(91)	(81)
Earnings before taxes	1,470	2,244	2,871
Benefit (provision) for taxes	991	(596)	(820)
Net earnings	$ 2,461	$ 1,648	$ 2,051
Net earnings per share[1]:			
Basic	$ 1.36	$ 0.91	$ 1.14
Diluted	$ 1.34	$ 0.90	$ 1.12
Number of shares used to compute net earnings per share[1]:			
Basic	1,804	1,804	1,804
Diluted	1,834	1,834	1,834

(1) On November 1, 2015, HP Inc. (formerly Hewlett-Packard Company) distributed a total of 1.8 billion shares of Hewlett Packard Enterprise common stock to HP Inc. stockholders as of the record date. The number of shares used to compute basic and diluted net earnings per share ("EPS") for the period ended October 31, 2015 is used for the calculation of net EPS for all periods presented. See Note 16, "Net Earnings Per Share", for further details.

The accompanying notes are an integral part of these Combined and Consolidated Financial Statements.

HEWLETT PACKARD ENTERPRISE COMPANY AND SUBSIDIARIES

Combined and Consolidated Statements of Comprehensive Income

	For the fiscal years ended October 31		
	2015	2014	2013
	In millions		
Net earnings	$ 2,461	$1,648	$2,051

2014
Annual Report
hp

Report of Independent Registered Public Accounting Firm

To the Board of Directors and Stockholders of Hewlett-Packard Company

We have audited the accompanying consolidated balance sheets of Hewlett-Packard Company and subsidiaries as of October 31, 2014 and 2013, and the related consolidated statements of earnings, comprehensive income, stockholders' equity, and cash flows for each of the three years in the period ended October 31, 2014. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the financial statements referred to above present fairly, in all material respects, the consolidated financial position of Hewlett-Packard Company and subsidiaries at October 31, 2014 and 2013, and the consolidated results of their operations and their cash flows for each of the three years in the period ended October 31, 2014, in conformity with U.S. generally accepted accounting principles.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), Hewlett-Packard Company's internal control over financial reporting as of October 31, 2014, based on criteria established in Internal Control—Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission (1992 framework) and our report dated December 17, 2014 expressed an unqualified opinion thereon.

San Jose, California
December 17, 2014

Report of Independent Registered Public Accounting Firm

To the Board of Directors and Stockholders of Hewlett-Packard Company

We have audited Hewlett-Packard Company's internal control over financial reporting as of October 31, 2014, based on criteria established in Internal Control—Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission (1992 framework) (the COSO criteria). Hewlett-Packard Company's management is responsible for maintaining effective internal control over financial reporting, and for its assessment of the effectiveness of internal control over financial reporting included in the accompanying Management's Report on Internal Control Over Financial Reporting. Our responsibility is to express an opinion on the company's internal control over financial reporting based on our audit.

We conducted our audit in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, testing and evaluating the design and operating effectiveness of internal control based on the assessed risk, and performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In our opinion, Hewlett-Packard Company maintained, in all material respects, effective internal control over financial reporting as of October 31, 2014, based on the COSO criteria.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the accompanying consolidated balance sheets of Hewlett-Packard Company and subsidiaries as of October 31, 2014 and 2013, and the related consolidated statements of earnings, comprehensive income, stockholders' equity and cash flows for each of the three years in the period ended October 31, 2014 and our report dated December 17, 2014 expressed an unqualified opinion thereon.

Management's Report on Internal Control Over Financial Reporting

HP's management is responsible for establishing and maintaining adequate internal control over financial reporting for HP. HP's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with U.S. generally accepted accounting principles. HP's internal control over financial reporting includes those policies and procedures that (i) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of HP; (ii) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of HP are being made only in accordance with authorizations of management and directors of HP; and (iii) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of HP's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

HP's management assessed the effectiveness of HP's internal control over financial reporting as of October 31, 2014, utilizing the criteria set forth by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) in Internal Control—Integrated Framework (1992 framework). Based on the assessment by HP's management, we determined that HP's internal control over financial reporting was effective as of October 31, 2014. The effectiveness of HP's internal control over financial reporting as of October 31, 2014 has been audited by Ernst & Young LLP, HP's independent registered public accounting firm, as stated in their report which appears on page 82 of this Annual Report on Form 10-K.

2013
Annual
Report

Report of Independent Registered Public Accounting Firm

To the Board of Directors and Stockholders of Hewlett-Packard Company

We have audited the accompanying consolidated balance sheets of Hewlett-Packard Company and subsidiaries as of October 31, 2013 and 2012, and the related consolidated statements of earnings, comprehensive income, stockholders' equity, and cash flows for each of the three years in the period ended October 31, 2013. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the financial statements referred to above present fairly, in all material respects, the consolidated financial position of Hewlett-Packard Company and subsidiaries at October 31, 2013 and 2012, and the consolidated results of their operations and their cash flows for each of the three years in the period ended October 31, 2013, in conformity with U.S. generally accepted accounting principles.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), Hewlett-Packard Company's internal control over financial reporting as of October 31, 2013, based on criteria established in Internal Control—Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission (1992 framework) and our report dated December 27, 2013 expressed an unqualified opinion thereon.

Report of Independent Registered Public Accounting Firm

To the Board of Directors and Stockholders of Hewlett-Packard Company

We have audited Hewlett-Packard Company's internal control over financial reporting as of October 31, 2013, based on criteria established in Internal Control—Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission (1992 framework) (the COSO criteria). Hewlett-Packard Company's management is responsible for maintaining effective internal control over financial reporting, and for its assessment of the effectiveness of internal control over financial reporting included in the accompanying Management's Report on Internal Control Over Financial Reporting. Our responsibility is to express an opinion on the company's internal control over financial reporting based on our audit.

We conducted our audit in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, testing and evaluating the design and operating effectiveness of internal control based on the assessed risk, and performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In our opinion, Hewlett-Packard Company maintained, in all material respects, effective internal control over financial reporting as of October 31, 2013, based on the COSO criteria.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the accompanying consolidated balance sheets of Hewlett-Packard Company and subsidiaries as of October 31, 2013 and 2012, and the related consolidated statements of earnings, comprehensive income, stockholders' equity and cash flows for each of the three years in the period ended October 31, 2013 and our report dated December 27, 2013 expressed an unqualified opinion thereon.

Management's Report on Internal Control Over Financial Reporting

HP's management is responsible for establishing and maintaining adequate internal control over financial reporting for HP. HP's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with U.S. generally accepted accounting principles. HP's internal control over financial reporting includes those policies and procedures that (i) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of HP; (ii) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of HP are being made only in accordance with authorizations of management and directors of HP; and (iii) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of HP's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

HP's management assessed the effectiveness of HP's internal control over financial reporting as of October 31, 2013, utilizing the criteria set forth by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) in Internal Control—Integrated Framework (1992 framework). Based on the assessment by HP's management, we determined that HP's internal control over financial reporting was effective as of October 31, 2013. The effectiveness of HP's internal control over financial reporting as of October 31, 2013 has been audited by Ernst & Young LLP, HP's independent registered public accounting firm, as stated in their report which appears on page 78 of this Annual Report on Form 10-K.

The accompanying notes are an integral part of these Consolidated Financial Statements.

HEWLETT-PACKARD COMPANY AND SUBSIDIARIES

Notes to Consolidated Financial Statements

Note 1: Summary of Significant Accounting Policies

Principles of Consolidation

The Consolidated Financial Statements include the accounts of Hewlett-Packard Company ("HP") and the subsidiaries and affiliates in which HP has a controlling financial interest or is the primary beneficiary. HP accounts for equity investments in companies over which HP has the ability to exercise significant influence but does not hold a controlling interest under the equity method, and HP records its proportionate share of income or losses in Interest and other, net in the Consolidated Statements of Earnings. HP presents non-controlling interests as a separate component within Total stockholder's equity in the Consolidated Balance Sheets. Net earnings attributable to the non-controlling interests are eliminated within Interest and other, net in the Consolidated Statements of Earnings and are not presented separately as they were not material for any period presented. HP has eliminated all significant intercompany accounts and transactions.

Reclassifications and Segment Reorganization

HP has made certain segment and business unit realignments in order to optimize its operating structure. Reclassifications of certain prior-year segment and business unit financial information have been made to conform to the current-year presentation. None of the changes impacts HP's previously reported consolidated net revenue, earnings from operations, net earnings or net earnings per share. See Note 18 for a further discussion of HP's segment reorganization.

Use of Estimates

The preparation of financial statements in accordance with U.S. generally accepted accounting principles ("GAAP") requires management to make estimates and assumptions that affect the amounts reported in HP's Consolidated Financial Statements and accompanying notes. Actual results could differ materially from those estimates.

Revenue Recognition

HP derives net revenue primarily from the sale of products and services. The following revenue recognition policies define the manner in which HP accounts for sales transactions.

HP recognizes revenue when persuasive evidence of a sales arrangement exists, delivery has occurred or services are rendered, the sales price or fee is fixed or determinable, and collectibility is reasonably assured. Additionally, HP recognizes hardware revenue on sales to channel partners, including resellers, distributors or value-added solution providers at the time of delivery when the channel partners have economic substance apart from HP, and HP has completed its obligations related to the sale. HP generally recognizes revenue for its stand-alone software sales to channel partners upon receiving evidence that the software has been sold to a specific end user.

When a sales arrangement contains multiple elements, such as hardware and software products, licenses and/or services, HP allocates revenue to each element based on a selling price hierarchy. The selling price for a deliverable is based on its vendor specific objective evidence ("VSOE") of selling price, if available, third party evidence ("TPE") if VSOE of selling price is not available, or estimated selling price ("ESP") if neither VSOE of selling price nor TPE is available. HP establishes VSOE of selling price using the price charged for a deliverable when sold separately and, in rare instances, using the price established by management having the relevant authority. HP establishes TPE of selling price

AT&T 3-year Audited Financials

mobilizing our world
AT&T INC. 2013 ANNUAL REPORT

Report of Independent Registered Public Accounting Firm

The Board of Directors and Stockholders of AT&T Inc.

We have audited the accompanying consolidated balance sheets of AT&T Inc. (the Company) as of December 31, 2013 and 2012, and the related consolidated statements of income and comprehensive income, changes in stockholders' equity, and cash flows for each of the three years in the period ended December 31, 2013. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the financial statements referred to above present fairly, in all material respects, the consolidated financial position of the Company at December 31, 2013 and 2012, and the consolidated results of its operations and its cash flows for each of the three years in the period ended December 31, 2013, in conformity with U.S. generally accepted accounting principles.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the Company's internal control over financial reporting as of December 31, 2013, based on criteria established in Internal Control-Integrated Framework (1992 framework) issued by the Committee of Sponsoring Organizations of the Treadway Commission and our report dated February 21, 2014 expressed an unqualified opinion thereon.

Ernst & Young LLP

Dallas, Texas
February 21, 2014

Report of Independent Registered Public Accounting Firm on Internal Control over Financial Reporting

The Board of Directors and Stockholders of AT&T Inc.

We have audited AT&T Inc.'s (the Company) internal control over financial reporting as of December 31, 2013, based on criteria established in Internal Control—Integrated Framework (1992 framework) issued by the Committee of Sponsoring Organizations of the Treadway Commission (the COSO criteria). The Company's management is responsible for maintaining effective internal control over financial reporting, and for its assessment of the effectiveness of internal control over financial reporting included in the accompanying Report of Management. Our responsibility is to express an opinion on the Company's internal control over financial reporting based on our audit.

We conducted our audit in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, testing and evaluating the design and operating effectiveness of internal control based on the assessed risk, and performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In our opinion, the Company maintained, in all material respects, effective internal control over financial reporting as of December 31, 2013, based on the COSO criteria.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the consolidated balance sheets of the Company as of December 31, 2013 and 2012, and the related consolidated statements of income and comprehensive income, changes in stockholders' equity, and cash flows for each of the three years in the period ended December 31, 2013 and our report dated February 21, 2014 expressed an unqualified opinion thereon.

AT&T INC. 2014 Annual Report

Report of Independent Registered Public Accounting Firm

The Board of Directors and Stockholders of AT&T Inc.

We have audited the accompanying consolidated balance sheets of AT&T Inc. (the Company) as of December 31, 2014 and 2013, and the related consolidated statements of income, comprehensive income, changes in stockholders' equity, and cash flows for each of the three years in the period ended December 31, 2014. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the financial statements referred to above present fairly, in all material respects, the consolidated financial position of the Company at December 31, 2014 and 2013, and the consolidated results of its operations and its cash flows for each of the three years in the period ended December 31, 2014, in conformity with U.S. generally accepted accounting principles.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the Company's internal control over financial reporting as of December 31, 2014, based on criteria established in Internal Control-Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission (2013 framework) and our report dated February 20, 2015 expressed an unqualified opinion thereon.

Ernst & Young LLP

Dallas, Texas
February 20, 2015

Report of Independent Registered Public Accounting Firm on Internal Control over Financial Reporting

The Board of Directors and Stockholders of AT&T Inc.

We have audited AT&T Inc.'s (the Company) internal control over financial reporting as of December 31, 2014, based on criteria established in Internal Control—Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission (2013 framework) (the COSO criteria). The Company's management is responsible for maintaining effective internal control over financial reporting, and for its assessment of the effectiveness of internal control over financial reporting included in the accompanying Report of Management. Our responsibility is to express an opinion on the Company's internal control over financial reporting based on our audit.

We conducted our audit in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, testing and evaluating the design and operating effectiveness of internal control based on the assessed risk, and performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In our opinion, the Company maintained, in all material respects, effective internal control over financial reporting as of December 31, 2014, based on the COSO criteria.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the consolidated balance sheets of the Company as of December 31, 2014 and 2013, and the related consolidated statements of income, comprehensive income, changes in stockholders' equity, and cash flows for each of the three years in the period ended December 31, 2014 and our report dated February 20, 2015 expressed an unqualified opinion thereon.

AT&T Inc. 2015 Annual Report

Report of Independent Registered Public Accounting Firm

The Board of Directors and Stockholders of AT&T Inc.

We have audited AT&T Inc.'s (the Company) internal control over financial reporting as of December 31, 2015, based on criteria established in Internal Control-Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission (2013 framework) (the COSO criteria). The Company's management is responsible for maintaining effective internal control over financial reporting, and for its assessment of the effectiveness of internal control over financial reporting included in the accompanying Report of Management. Our responsibility is to express an opinion on the Company's internal control over financial reporting based on our audit.

We conducted our audit in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, testing and evaluating the design and operating effectiveness of internal control based on the assessed risk, and performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

As indicated in the accompanying Report of Management, management's assessment of and conclusion on the effectiveness of internal control over financial reporting did not include the internal controls of its DIRECTV and Mexico wireless businesses, which are included in the December 31, 2015 consolidated financial statements of the Company. DIRECTV constituted 20.3% of total assets and 9.9% of total revenues for the year then ended. The Mexico wireless businesses constituted 1.6% of total assets and 1.3% of total revenues for the year then ended. Our audit of internal control over financial reporting of the Company did not include an evaluation of the internal control over financial reporting of DIRECTV or the Mexico wireless businesses.

In our opinion, the Company maintained, in all material respects, effective internal control over financial reporting as of December 31, 2015, based on the COSO criteria.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the consolidated balance sheets of the Company as of December 31, 2015 and 2014, and the related consolidated statements of income, comprehensive income, changes in stockholders' equity and cash flows for each of the three years in the period ended December 31, 2015 and our report dated February 18, 2016 expressed an unqualified opinion thereon.

Report of Independent Registered Public Accounting Firm on Internal Control over Financial Reporting

The Board of Directors and Stockholders of AT&T Inc.

We have audited AT&T Inc.'s (the Company) internal control over financial reporting as of December 31, 2013, based on criteria established in Internal Control—Integrated Framework (1992 framework) issued by the Committee of Sponsoring Organizations of the Treadway Commission (the COSO criteria). The Company's management is responsible for maintaining effective internal control over financial reporting, and for its assessment of the effectiveness of internal control over financial reporting included in the accompanying Report of Management. Our responsibility is to express an opinion on the Company's internal control over financial reporting based on our audit.

We conducted our audit in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, testing and evaluating the design and operating effectiveness of internal control based on the assessed risk, and performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In our opinion, the Company maintained, in all material respects, effective internal control over financial reporting as of December 31, 2013, based on the COSO criteria.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the consolidated balance sheets of the Company as of December 31, 2013 and 2012, and the related consolidated statements of income and comprehensive income, changes in stockholders' equity, and cash flows for each of the three years in the period ended December 31, 2013 and our report dated February 21, 2014 expressed an unqualified opinion thereon.

5. Final Transition Milestones 25

1. OVERVIEW

Transition is the expeditious, seamless and uninterrupted changeover of Services within the scope described in this Request for Proposal (RFP) from the Legacy Provider to the Contractor.

Such transition shall be planned and accomplished by the Contractor in such a way as to have no adverse effect upon the County, nor upon the quality or continuity of the Services being provided.

The Contractor shall work in close cooperation with the Legacy Provider throughout the transition. From the start of the transition and prior to the final cutover date on which the Contractor will assume full responsibility for the Services, the Contractor shall "shadow" the Legacy Provider. This ensures a complete knowledge transfer of all information needed in providing the Services to the Contractor.

The Contractor shall develop and deliver a complete Transition Project Plan that will address all the requirements in Schedule 2.1 and fully implement the Services.

2. REQUIREMENTS

2.1. Human Resources Transition

For purposes of knowledge transfer or other reasons, it may be beneficial for the Contractor (or its subcontractors) to hire some of the personnel providing Services who are currently employed by the Legacy Provider (or by such Legacy Provider's subcontractors). The Contractor shall propose a process and communications strategy for soliciting, making offers to, and hiring such personnel.

2.2. Knowledge Transfer

Contractor shall propose and implement a complete and effective set of transition procedures that will ensure a complete and robust transfer of knowledge of County-specific functions, applications, designs, documentation, processes and any other data needed to provide current Services from the County and the Legacy Provider.

2.3. Asset Transfer

The County has a right to purchase from the Legacy Provider the assets that are currently used to provide the Services. The Contractor shall, as part of its due diligence and response to the RFP, analyze the current Assets and make a proposal to the County as to whether the Contractor will use some or all of such Assets.

Notwithstanding the foregoing, Contractor shall purchase from the Legacy Provider all Desktop Framework Assets (as that term is defined in the IT and Telecommunications Services Agreement dated January 24, 2006 and Restated on June 24, 2014 between the County of San Diego and HP Enterprise Services, LLC) at Contractor's Cutover to the End-User Services Framework. Contractor shall pay the Legacy Provider the net book value of the Desktop Framework Assets as determined by the terms of the IT and Telecommunications Services Agreement dated January 24, 2006 and Restated on June 24, 2014 between the County of San Diego and HP Enterprise Services, LLC. Contractor shall not be entitled to or claim from County any additional compensation for this purchase other than that allowed for in Schedule 16.1 – Fees.

2.4. Assignment or Management of Third-Party Contracts/Licenses/Leases

A number of Third-Party contracts, licenses and leases exist that are currently used to provide Services. The Contractor shall analyze this group of contracts, licenses and leases held by the Legacy Provider to determine which will transition to the Contractor. All County contracts, licenses and leases used to provide the Services currently, shall be transitioned to the Contractor. The Contractor shall propose and implement appropriate processes to assure the smooth transition of these contracts from the County and the Legacy Provider.

2.5. Data Transfer

The Contractor shall propose processes and techniques for transferring stewardship of County data from the Legacy Provider to the Contractor without compromising, disclosing, corrupting or losing such data.

2.6. Compliance with Service Levels

The Contractor shall develop a plan specifying firm dates by which Services transitioned will be expected to perform in full accordance to the Service Levels. Contractor and/or Legacy Provider shall maintain all Service Levels throughout the transition.

2.7. Assumption of Current Projects

A number of IT projects will be in various stages of completion when the Contractor transitions the Services. The Contractor shall assume control of all these projects without causing any material adverse impact to their individual deadlines, budgets and milestones.

2.8. Communications/Governance Plan for the County and the Legacy Provider

The Contractor and the Legacy Provider shall communicate and manage transition tasks and issues as they occur. The Contractor shall propose communications and governance strategies and plans to make the transition work smoothly with all the parties involved.

2.9. Contingency Planning/Risk Mitigation

The Contractor shall propose contingency planning and risk mitigation strategies to ensure the transition process shall not adversely affect the quality of the Services received by the County and its constituents.

2.10. Measurable Success Criteria

The County must have a clear understanding and accounting of when elements of the transition, particularly the cutover to the Contractor of a Service Framework, are accomplished successfully.

For each Service Framework, the Contractor shall propose an appropriate process (including measurable success criteria) by which the County can determine that the transition has been successfully completed, including a process by which not only the County, but also the Legacy Provider have the right to indicate as to whether the Services have been transitioned completely from the Legacy Provider to the Contractor. The County expects the Contractor to propose a staggered transition of the services, on a Service Framework by Service Framework basis, in the following order: (1) Service Desk, (2) Applications Services, (3) End User Services, (4) Network Services, and (5) Data Center Services. The only remaining Service Framework—Cross Functional Services—is integrated into each Service Framework and by its nature should ramp up incrementally throughout transition to correspond with the Cross Functional Services performed under each of the transitioned Service Frameworks. Because of such integration, upon the successful transition of each of the other Service Frameworks, the Cross Functional Services Framework should be completely transitioned to the Contractor.

2.11. Transition Project Plan

Contractor shall provide a detailed transition project plan and methodology, incorporating the elements described above and the projects, tasks and milestones defined below, as well as any assumptions made by the Contractor in the development of the transition plan.

2.12. Transition Staffing

Contractor shall assign, with County approval, a dedicated Transition Project Manager and dedicated Transition staff from the start to completion of the Transition of Services. Contractor Transition Project Manager shall provide weekly status reports on the progress of the Transition to the County.

2.13. Transition Schedule

Contractor shall complete the transition of Services by April 30, 2018. The transition starting date is the January 2, 2017. The tentative schedule for transition of the Service Frameworks is outlined below.

Task	Start Date	Completion Date
Transition Project Organization	1/2/2017	9/29/17
Transition Start-Up	1/2/2017	1/17/17
Service Desk Services	1/2/2017	4/30/18
Applications Services	1/2/2017	6/30/17
End-User Services	1/2/2017	7/31/17
Network Services	1/2/2017	8/31/17
Data Center Services	1/2/2017	4/30/18
Cross Functional Services	1/2/2017	4/30/18

3. TRANSITION PROJECTS

During the RFP and negotiation process with the Contractor, the County expects the Contractor to address the following key projects pertaining to transition:

3.1. Cross Functional Services

Cross Functional Services are a critical Component in the support and management of the Services. As each Cross Functional Component is developed and delivered, it should be documented completely, reviewed and approved by the County, and posted on the Service Portal. This document set will be referred to as the management plan.

Each Cross Functional Component will have a management plan. The basic outline for the management plan is: Introduction, Scope, Requirements, Design, Process and Appendixes to complete the document.

The initial transition of Cross Functional Services will require the completion and County approval of each management plan, respectively. The Contractor shall annually update the Cross Functional management plan and deliver to the County for approval. The Contractor shall maintain the content accuracy of the Service Portal for each Cross Functional Management plan.

The current Components of Cross Functional required to have a management plan are listed below:

1. Contract and Acquisition Management Services
2. Integrated Asset Management Services
3. Billing Management Services
4. Security Management Services
5. Service Delivery Management (SDM) Services
6. Architecture Services
7. Project Management Services
8. Integration and Testing Services
9. Incident Management Services
10. Problem Management Services
11. Change Management Services
12. Release Management Services
13. Configuration Management Services

14. Capacity Planning and Performance Management Services
15. Disaster Recovery Management Services
16. Identity Access Management Services
17. Reporting Management Services
18. Domain Name Management Services
19. Business Analyst Services

3.2. E-Mail Services

The County of San Diego E-Mail system, based on Microsoft Exchange 2010, requires an upgrade that shall be performed at the time of Transition. As E-Mail is a critical service used by all County, the technical currency and operational reliably must be sustained. Additional features and functions of the E-Mail service, not currently in place, shall be enabled to facilitate current and future County business requirements.

The current Exchange 2010 data center hosted service is operationally reliable but not technically current. The current service does not provide features and functions needed for County use, such as archive, e-journaling or e-discovery. County E-mail uses a retention cycle of no more than 60 days for any message in the current environment. This stated retention cycle will remain in place without exception. Spam and Malware protection is offered through a data center hosted service using Cisco IronPort. With respect to licensing, the County has a Microsoft Enterprise Agreement (EA) in place that includes Office 365. The Microsoft EA also includes licensing for the data center Exchange servers.

The next generation E-Mail system for County users should put into place technical currency coupled with needed features. Always-on and Always-available are earmarks to the new and updated service. Options to move to cloud based should be considered as well as potential hybrid type solutions.

Contractor shall develop and deliver an E-Mail transition plan for County approval. The E-Mail transition plan shall include the migration strategy, the overall design of E-Mail, communications package, detailed tasks and schedules and other associated project planning information. The implementation of the E-Mail transition plan shall occur during the transition of Services. The initial list of items that are in scope are outlined below:

- Migrate to the current version of Exchange
- Migrate to the current version of Outlook to desktops

- Maintain County retention policies without exception
- Complete migration of all active E-Mail users
- Maintain versions of Exchange within 12 months of new releases
- Maintain patch levels of Exchange within 3 months of any new release
- Unlimited Mailbox storage
- Unlimited user archive storage
- Immutably preserve or In-Place Hold for user data, as requested
- Redundancy built-in to insure minimal down time for E-Mail user
- Continuous backup to prevent failure due to data loss
- Malware and anti-spam protection at the perimeter and within the Outlook client
- Protection against unsafe attachments at the perimeter and the Outlook client
- Data Loss Prevention implemented per County policy
- E-discovery implemented and used as requested by the County
- Migration of PST files to Exchange archive
- Elimination of PST file from End-User environment
- Implement Outlook Web Access (OWA)
- Lockdown OWA to further protect County information
- Mobile aware and productivity included

3.3. Development and Test Environment

The County requires a robust, scalable, and dynamic, virtual-based Development and Test Environment. This enhanced capability will bring the provisioning of standard servers and storage from preconfigured templates within hours with a near replicated production environment. This ability will reduce cost, delays in project schedules and increase customer satisfaction.

The Development and Test Environment shall have resource management tools to track usage for cost management through the agreed upon method of billing. As an agile virtual environment that may reside in the data center, private cloud or hybrid combination this represents an optimized infrastructure built to perform work on-demand. The need to deploy dedicated physical servers hosted in the data center for Development and Test requirements should be eliminated. The process of adding a physical server to support Development and Test will follow the County exception to standards process.

Contractor shall develop and deliver a Development and Test transition plan for County approval. The Development and Test transition plan shall include the migration strategy, the overall design of the Development and Test environment, communications package, operational procedures, detailed tasks and schedules and other associated project planning information. The implementation of the Development and Test transition plan shall occur during the transition of Services. The initial list of items that are in scope are outlined below:

- Comply with Schedule 4.3, Operational Services, section 6.9 Development and Test Services
- Design based on data center, private cloud or hybrid combination approach
- Ability to stage unused instances only consuming storage
- Provision required environment within hours
- Scalable to support County Application Development demands
- Architected to support efficient and cost effective license models
- Detailed daily usage report by server
- Ability to provision a standard set of database, application ready, and web servers
- Meet to all associated Service Levels
- Ability to provision standard server types (e.g. web server, application server and database server)

3.4. Consolidated and Single Data Center

The County currently operates two production data centers. The initial plan was that the second data center would act as a disaster recovery site for the other and vice versa. As data center methodologies have emerged the need to operate two unique production data centers may not be warranted.

Leveraging changes being proposed in the Disaster Recovery Services section, it seems feasible that the County can consolidate to a single production data center. The reduction in physical computing assets along with the reductions in redundant and duplicative license costs and simplified application architecture make the feasibility of consolidating desirable.

Contractor shall develop and deliver a consolidated data center transition plan for County approval. The consolidated data center transition plan shall include the migration strategy, the overall design of consolidated data center environment, communications package, operational procedures and processes, detailed tasks and schedules and other associated project planning information. The implementation of the consolidated transition plan shall occur during the transition of Services. The initial list of items that are in scope are outlined below:

- Compliance with Schedule 4.3, Operational Services
- Network architecture design
- Storage architecture design
- Virtual server farm design
- Internet connection
- Hybrid cloud design
- Migration sequence of servers
- License consolidation
- Server/application consolidation
- Multiple and redundant WAN connections to County Points of Presence sites

3.5. Storage Architecture

The County of San Diego Storage Architecture is used to host End-User unstructured data and Portfolio Application data. The current storage architecture does not provide functions and features needed to manage and control the constant increases to physical data requirements. Appropriate tier of storage based on specific data types along with archiving techniques to migrate old and unused data to lower cost storage solutions can provide needed features of the storage architecture.

County Portfolio Application data requires a storage architecture that facilitates a higher degree of optimization. Portfolio application data repositories are not archived or use tier methodology which increases data bloat and decreases overall application performance. Strategies in Portfolio Application data management are a requirement for the storage architecture delivered in Transition.

The development of cloud based storage alternatives provides features that can enhance End-User productivity are not in place. Allowing remote or mobile End-Users the ability to have data available at all times, allow data synchronization, security of data, single cloud storage option and facilitate End-User device backups are needed requirements of the managed storage architecture.

Emerging methodologies of storage in the data center are evolving. Storage architectures range from traditional storage models, to virtual storage solutions to more advanced hyper-converged infrastructure. Hybrid and cloud based storage solutions exist that further enhance an overall architecture for storage. The

Contractor shall be required to develop a storage architecture and strategy that will manage County data well into the future.

Contractor shall develop and deliver a storage architecture transition plan for County approval. The storage architecture transition plan shall include the migration strategy of current data repositories, the overall design of storage environment, a cloud based strategy for End-Users, communications package, operational procedures and processes, detailed tasks and schedules and other associated project planning information. The implementation of the storage architecture transition plan shall occur during the transition of Services. The initial list of items that are in scope are outlined below:

- Comply with Schedule 4.3, Operational Services, section 6, Data Center Services
- Design a storage architecture for Portfolio Applications that uses more advanced techniques
- Design an End-User storage architecture for unstructured data in both data center centric and cloud based environments
- Support a highly virtual infrastructure in the storage architecture
- Develop archiving of data that meets certain criteria
- Develop and implement multiple tiers of storage based on data classifications
- Backup and recovery techniques that assure zero data lost for critical County data
- Backup and recovery techniques that assure near zero data lost for non-critical County data
- End-User reporting and data management capabilities via the Service Portal
- Centralized management of all data repositories by Contractor
- Scalable storage infrastructure that immediately meets critical demands
- Access speed

3.6. Service Portal

The need for a centralized and continuously managed focal point for all communications and information related to the Services is the fundamental requirement of the Service Portal. The Service Portal can provide enterprise wide communications and information assisting End-Users in resolving Incidents on their own as well as providing user tips and FAQs on the Services. The Service Portal shall be the main communication and information hub to all End-Users from the Contractor.

Contractor shall develop and deliver a Service Portal transition plan for County approval. The Service Portal transition plan shall include the migration strategy of current repositories, the overall design of Service

Portal environment, communications package, operational procedures and processes, detailed tasks and schedules and other associated project planning information. The implementation of the Service Portal transition plan shall occur during the transition of Services. The initial list of items that are in scope are outlined below:

- Comply with Schedule 4.3, Operational Services
- Design access to the Service Portal from the internet and the County intranet
- Create and submit Incidents and Services Requests
- View a list of all Incidents and Services Requests
- Allow End-Users to change and reset passwords
- View an up-to-date knowledge base with solutions, tip sheets and Frequently asked Questions (FAQs)
- View Countywide announcements related to the Services
- Access all Contractor deliverables and reports
- Service Request Management Services landing page
- Access to the Standards and Procedures Manual
- Help desk tip sheets, FAQs and end user self-help (self-service portal) information
- Service Levels Reports
- Management Plans
- RCA and Reports Portal
- SSO integration
- Post all published IT related material

4. HIGH-LEVEL TRANSITION MILESTONES AND TASKS

4.1. Transition Start-up and Organization

Task	Due Date	Transition Milestone
1. Each party shall assemble and name a transition management team for each Service Framework, including overall transition managers responsible for oversight of the entire transition process for each party.	1/2/2017	
2. Deliver to the County a detailed process and communications strategy for soliciting, making	N/A	

Task	Due Date	Transition Milestone
offers to, and hiring personnel used to perform the services.		
3. Propose, finalize and implement the communications and governance plan for the County and the County's Legacy Provider.	1/13/2017	
4. Conduct kick-off meetings with the Legacy Provider's disentanglement teams and the County's transition teams.	1/17/2017	

4.2. Service Desk Framework

Task	Due Date	Transition Milestone
1. Identify the current projects pertaining to this Service Framework (including current projects for Cross-Functional Services applicable to this Service Framework) that will be the responsibility of the Contractor as of the Cutover Date for this Service Framework.	N/A	
2. Provide the County with a detailed disaster recovery plan for this Service Framework (as well as the Cross-Functional Services applicable to this Service Framework) for its review, comment and approval.	2/2/2017	
3. Shadow the Legacy Provider and implement knowledge transfer processes for this Service Framework and the Cross-Functional Services applicable to this Service Framework.	N/A	
4. Complete interviews of personnel providing services to the County under this Service Framework (including any personnel providing Cross-Functional Services to the County under this Service Framework, as applicable) and make offers to same.	N/A	
5. Complete the assignment to the Contractor of third party contracts, licenses and leases that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
6. Complete the assignment to the Contractor of assets that are currently used to provide the	N/A	

Task	Due Date	Transition Milestone
services (including any applicable Cross-Functional Services) to the County under this Service Framework.		
7. Hire personnel providing services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
8. Deliver a reasonable and appropriate draft Standards and Procedures Manual sections to the County pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework) for the County's review, comment and approval.	1/18/2017	
9. Finalize and deliver to the County the Standards and Procedures Manual sections pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework), incorporating all of the County's suggestions and comments.	3/28/2017	
10. Submit for County approval the design document for the Service Portal	2/23/2017	
11. Finalize and deliver the Service Portal. Add Service Desk related content to the Service Portal	3/28/2017	
12. Cutover Date for this Service Framework (including any Cross-Functional Services applicable to this Service Framework), effective date of the Service Levels applicable to this Service Framework, implementation date for the final approved Disaster Recovery Plan for this Service Framework.	04/30/18	Yes

4.3. Application Services Framework

Task	Due Date	Transition Milestone
1. Identify the current projects pertaining to this Service Framework (including current projects for Cross-Functional Services applicable to this Service Framework) that will be the responsibility of the Contractor as of the Cutover Date for this Service Framework.	N/A	

Task	Due Date	Transition Milestone
2. Provide the County with a detailed disaster recovery plan for this Service Framework (as well as the Cross-Functional Services applicable to this Service Framework) for its review, comment and approval.	Cutover Date minus 90 days	
3. Shadow the Legacy Provider and implement knowledge transfer processes for this Service Framework and the Cross-Functional Services applicable to this Service Framework.	N/A	
4. Complete interviews of personnel providing services to the County under this Service Framework (including any personnel providing Cross-Functional Services to the County under this Service Framework, as applicable) and make offers to same.	N/A	
5. Complete the assignment to the Contractor of third party contracts, licenses and leases that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
6. Complete the assignment to the Contractor of assets that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
7. Hire personnel providing services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
8. Deliver a reasonable and appropriate draft Standards and Procedures Manual sections to the County pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework) for the County's review, comment and approval.	1/18/2017	
9. Finalize and deliver to the County the Standards and Procedures Manual sections pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework), incorporating all of the County's suggestions and comments.	6/30/2017	

Task	Due Date	Transition Milestone
10. Add Applications Services related content to the Service Portal	6/30/2017	
11. Cutover Date for this Service Framework (including any Cross-Functional Services applicable to this Service Framework), effective date of the Service Levels applicable to this Service Framework, implementation date for the final approved Disaster Recovery Plan for this Service Framework.	6/30/2017	Yes

4.4. End-User Services Framework

Task	Due Date	Transition Milestone
1. Identify the current projects pertaining to this Service Framework (including current projects for Cross-Functional Services applicable to this Service Framework) that will be the responsibility of the Contractor as of the Cutover Date for this Service Framework.	N/A	
2. Provide the County with a detailed disaster recovery plan for this Service Framework (as well as the Cross-Functional Services applicable to this Service Framework) for its review, comment and approval.	Cutover Date minus 90 days	
3. Shadow the Legacy Provider and implement knowledge transfer processes for this Service Framework and the Cross-Functional Services applicable to this Service Framework.	N/A	
4. Shadow the Legacy Provider and implement knowledge transfer processes for this Service Framework and the Cross-Functional Services applicable to this Service Framework.	N/A	
5. Complete interviews of personnel providing services to the County under this Service Framework (including any personnel providing Cross-Functional Services to the County under this Service Framework, as applicable) and make offers to same.	N/A	
6. Complete the assignment to the Contractor of third party contracts, licenses and leases that are	N/A	

Task	Due Date	Transition Milestone
currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.		
7. Complete the assignment to the Contractor of assets that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
8. Hire personnel providing services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
9. Deliver a reasonable and appropriate draft Standards and Procedures Manual sections to the County pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework) for the County's review, comment and approval.	1/18/2017	
10. Finalize and deliver to the County the Standards and Procedures Manual sections pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework), incorporating all of the County's suggestions and comments.	7/31/2017	
11. Add End-User Services related content to the Service Portal	7/31/2017	
12. Cutover Date for this Service Framework (including any Cross-Functional Services applicable to this Service Framework), effective date of the Service Levels applicable to this Service Framework, implementation date for the final approved Disaster Recovery Plan for this Service Framework.	7/31/2017	Yes

4.5. Network Services Framework

Task	Due Date	Transition Milestone
1. Identify the current projects pertaining to this Service Framework (including current projects for Cross-Functional Services applicable to this Service Framework) that will be the responsibility	N/A	

Task	Due Date	Transition Milestone
of the Contractor as of the Cutover Date for this Service Framework.		
2. Provide the County with a detailed disaster recovery plan for this Service Framework (as well as the Cross-Functional Services applicable to this Service Framework) for its review, comment and approval.	Cutover Date minus 90 days	
3. Shadow the Legacy Provider and implement knowledge transfer processes for this Service Framework and the Cross-Functional Services applicable to this Service Framework.	N/A	
4. Complete interviews of personnel providing services to the County under this Service Framework (including any personnel providing Cross-Functional Services to the County under this Service Framework, as applicable) and make offers to same.	N/A	
5. Complete the assignment to the Contractor of third party contracts, licenses and leases that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
6. Complete the assignment to the Contractor of assets that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
7. Hire personnel providing services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
8. Deliver a reasonable and appropriate draft Standards and Procedures Manual sections to the County pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework) for the County's review, comment and approval.	1/18/2017	
9. Finalize and deliver to the County the Standards and Procedures Manual sections pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service	8/31/2017	

Task	Due Date	Transition Milestone
Framework), incorporating all of the County's suggestions and comments.		
10. Finalize and deliver to the County the Standards and Procedures Manual sections pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework), incorporating all of the County's suggestions and comments.	8/31/2017	
11. Add Network Services related content to the Service Portal	8/31/2017	
12. Cutover Date for this Service Framework (including any Cross-Functional Services applicable to this Service Framework), effective date of the Service Levels applicable to this Service Framework, implementation date for the final approved Disaster Recovery Plan for this Service Framework.	8/31/2017	Yes

4.6. Data Center Service Framework

Task	Due Date	Transition Milestone
1. Identify the current projects pertaining to this Service Framework (including current projects for Cross-Functional Services applicable to this Service Framework) that will be the responsibility of the Contractor as of the Cutover Date for this Service Framework.	N/A	
2. Provide the County with a detailed disaster recovery plan for this Service Framework (as well as the Cross-Functional Services applicable to this Service Framework) for its review, comment and approval.	Cutover Date minus 90 days	
3. Shadow the Legacy Provider and implement knowledge transfer processes for this Service Framework and the Cross-Functional Services applicable to this Service Framework.	N/A	
4. Complete interviews of personnel providing services to the County under this Service Framework (including any personnel providing Cross-Functional Services to the County under	N/A	

Task	Due Date	Transition Milestone
this Service Framework, as applicable) and make offers to same.		
5. Complete the assignment to the Contractor of third party contracts, licenses and leases that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
6. Complete the assignment to the Contractor of assets that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
7. Complete the assignment to the Contractor of assets that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
8. Hire personnel providing services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
9. Deliver a reasonable and appropriate draft Standards and Procedures Manual sections to the County pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework) for the County's review, comment and approval.	1/18/2017	
10. Finalize and deliver to the County the Standards and Procedures Manual sections pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework), incorporating all of the County's suggestions and comments.	9/29/2017	
11. Add Data Center Services related content to the Service Portal	9/29/2017	
12. Submit for County approval the design document for the E-Mail Service	1/30/2017	
13. Submit for County approval the design document for the Development and Test Environment	2/13/2017	

Task	Due Date	Transition Milestone
14. Submit for County approval the design document for the Consolidated Data Center	4/25/2017	
15. Submit for County approval the design document for the Storage Architecture	1/20/2017	
16. Develop and Deliver E-Mail Services	4/26/2017	
17. Develop and Deliver Development and Test Environment	8/4/2017	
18. Develop and deliver Consolidated Data Center	9/29/2017	
19. Develop and deliver Storage Architecture	7/5/2017	
20. Cutover Date for this Service Framework (including any Cross-Functional Services applicable to this Service Framework), effective date of the Service Levels applicable to this Service Framework, implementation date for the final approved Disaster Recovery Plan for this Service Framework.	04/30/18	Yes

4.7. Cross Functional Service Framework

Task	Due Date	Transition Milestone
1. Identify the current projects pertaining to this Service Framework (including current projects for Cross-Functional Services applicable to this Service Framework) that will be the responsibility of the Contractor as of the Cutover Date for this Service Framework.	N/A	
2. Provide the County with a detailed disaster recovery plan for this Service Framework (as well as the Cross-Functional Services applicable to this Service Framework) for its review, comment and approval.	Cutover Date minus 90 days	
3. Shadow the Legacy Provider and implement knowledge transfer processes for this Service Framework and the Cross-Functional Services applicable to this Service Framework.	N/A	
4. Complete interviews of personnel providing services to the County under this Service Framework (including any personnel providing Cross-Functional Services to the County under	N/A	

Task	Due Date	Transition Milestone
this Service Framework, as applicable) and make offers to same.		
5. Complete the assignment to the Contractor of third party contracts, licenses and leases that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
6. Complete the assignment to the Contractor of assets that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
7. Complete the assignment to the Contractor of assets that are currently used to provide the services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
8. Hire personnel providing services (including any applicable Cross-Functional Services) to the County under this Service Framework.	N/A	
9. Deliver a reasonable and appropriate draft Standards and Procedures Manual sections to the County pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework) for the County's review, comment and approval.	1/18/2017	
10. Finalize and deliver to the County the Standards and Procedures Manual sections pertaining to this Service Framework (including any Cross-Functional Services applicable to this Service Framework), incorporating all of the County's suggestions and comments.	9/29/2017	
11. Develop and deliver to the County for approval a completed Management Plan for each Cross Functional Component	9/29/2017	
12. Add all Cross Functional Services content to the Service Portal	9/29/2017	
13. Add all Cross Functional Management Plans to the Service Portal	9/29/2017	

Task	Due Date	Transition Milestone
14. Implement and deliver each Cross Functional Management Plan	9/29/2017	
15. Cutover Date for this Service Framework (including any Cross-Functional Services applicable to this Service Framework), effective date of the Service Levels applicable to this Service Framework, implementation date for the final approved Disaster Recovery Plan for this Service Framework.	04/30/2018	Yes

5. FINAL TRANSITION MILESTONES

Task	Due Date	Transition Milestone
1. Final date of any interim Service Levels	N/A	
2. Completion date of Cross Functional Services Transition Project	9/29/2017	
3. Completion date of E-Mail Services Transition Project	4/26/2017	
4. Completion date of Development and Test Environment Transition Project	8/4/2017	
5. Completion date of Consolidated data center Transition Project	9/29/2017	
6. Completion date of Storage Architecture Transition Project	7/5/2017	
7. Completion date of Service Portal Transition Project	3/28/2017	
8. Delivery date of first invoice covering all Services.	10/10/2017	
9. Provide a listing of Contractor Personnel to reside at various County Locations	10/2/2017	
10. Provide an update to Contractor Key Personnel	10/2/2017	
11. Final completion date for all transition activities	04/30/2018	Yes

END OF SCHEDULE

Schedule 3.2 – Form Bill of Sale

The County of San Diego ("County") acting through its Chief Administrative Officer and Purchasing Agent, and Peraton Enterprise Solutions LLC ("Contractor"), a Limited Liability Company, are Parties to the Information Technology and Telecommunications Service Agreement dated as of November 15, 2016, (the "Agreement"), pursuant to which the County has agreed to convey, assign, transfer, and deliver to Contractor the Purchased Assets designated to be transferred from the County to Contractor, as set forth in Appendix A.5 (the "Purchased County Assets") (terms capitalized in this Bill of Sale but not defined herein shall have the meanings ascribed to them in the Agreement).

For [$_____] and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the County does hereby sell, transfer, assign, convey, and deliver to Contractor, its successors and assigns, in accordance with the Agreement, all right, title, and interest in and to the Purchased County Assets.

THE PURCHASED COUNTY ASSETS ARE DELIVERED TO CONTRACTOR "AS IS, WHERE IS" AND CONTRACTOR ACKNOWLEDGES THAT, EXCEPT AS EXPRESSLY SET FORTH IN THE AGREEMENT AND HEREIN, THE COUNTY HAS NOT MADE, DOES NOT MAKE, AND WILL NOT MAKE ANY REPRESENTATION OR WARRANTY, EXPRESS OR IMPLIED, ON WHICH CONTRACTOR HAS RELIED OR MAY RELY, WITH RESPECT TO THE MERCHANTABILITY, FITNESS, SAFETY, DESIGN, CONDITION, QUALITY, CAPACITY, OPERATION, PERFORMANCE, DURABILITY, OR SUITABILITY FOR CONTRACTOR'S PURPOSES OF THE PURCHASED COUNTY ASSETS IN ANY RESPECT, THE PURCHASED COUNTY ASSETS' COMPLIANCE WITH ANY LAW, RULE, SPECIFICATION, OR CONTRACT PERTAINING THERETO, OR PATENT STATUS, PATENTABILITY, PATENT INFRINGEMENT, VISIBLE OR LATENT DEFECTS, OR ANY OTHER REPRESENTATION, WARRANTY, OR COVENANT, EXPRESS OR IMPLIED.

Notwithstanding the foregoing, the County hereby assigns and conveys to Contractor the full benefit of all representations, warranties, and indemnities held or enjoyed by the County with respect to the Purchased County Assets, to the extent assignable by the grantor thereof.

The County agrees that it will, at Contractor's reasonable request, without further consideration, do, execute, acknowledge, and deliver or will cause to be done, executed, acknowledged, and delivered, all such further acts, deeds, assignments, transfers, or conveyances as may be considered by Contractor, its successors or assigns, to be reasonably necessary or proper for the sale, transfer, assignment, or conveyance of the Purchased County Assets.

This instrument shall be binding upon, inure to the benefit of, and be enforceable by, any of Contractor's successors and assigns.

The County has caused this Bill of Sale to be signed on its behalf by a duly authorized individual as of _____.

Schedule 3.3 – Form Assignment and Assumption Agreement

The County of San Diego ("County"), acting through its Chief Administrative Officer and Purchasing Agent, and Peraton Enterprise Solutions LLC ("Contractor"), a Limited Liability Company, are Parties to the Information Technology and Telecommunications Service Agreement dated as of November 15, 2016 (the "Agreement"), pursuant to which the County has agreed to convey, assign, transfer, and deliver to Contractor the Assigned Leases and the Assigned Contracts described in the Agreement (collectively, the "Assigned Assets"). The Agreement is incorporated by this reference, and terms capitalized in this Assignment and Assumption Agreement but not defined herein shall have the meanings ascribed to them in the Agreement.

For valuable consideration, the receipt of which is hereby acknowledged by the Parties, the County does hereby sell, transfer, assign, delegate, convey and deliver to Contractor, its successors and assigns, and Contractor hereby accepts and assumes, all right title, and interest in and to, and all obligations associated with, the Assigned Assets.

IT IS EXPRESSLY UNDERSTOOD THAT THE COUNTY MAKES NO REPRESENTATIONS OR WARRANTIES WITH RESPECT TO THE EQUIPMENT THAT IS THE SUBJECT OF THE ASSIGNED LEASES, ALL OF WHICH IS BEING ACCEPTED "AS IS."

The County agrees that it will, at Contractor's reasonable request, without further consideration, do, execute, acknowledge, and deliver or will cause to be done, executed, acknowledged, and delivered, all such further acts, deeds, assignments, transfers, or conveyances as may be considered by Contractor, its successors or assigns, to be reasonably necessary or proper for the sale, transfer, or conveyance of the Assigned Assets. This instrument shall be binding upon, inure to the benefit of, and be enforceable by, any Contractor's successors and assigns.

The Parties hereto have caused this Assignment and Assumption Agreement to be signed on their behalf by duly authorized individuals as of _____.

1. OVERVIEW OF SERVICES

1.1. Overview

This section describes the Services to be provided by the Contractor in various Service Frameworks, collectively also described herein as the Statement of Work (SOW). The objectives and requirements described in this Section 1 "Overview of Services" shall apply to all Service Frameworks without exception.

Capitalized terms used herein shall have the meaning assigned to them in Schedule A (Defined Terms) to the Agreement unless otherwise expressly defined in this Schedule.

1.2. High Level Requirements

1.2.1. Contractor shall provide Services to the County with a high level of quality and performance that meet or exceed the Service Levels.

1.2.2. Contractor shall provide equal or better service on all Service Frameworks in highest performance, capacity, and functionality as provided by the Legacy Provider.

1.2.3. Contractor shall provide continuous improvement to increase efficiency and effectiveness of County IT and Telecommunications Services over the life of the Agreement.

1.2.4. Contractor shall provide the technology expertise and resources required to provide Services in the most efficient and effective manner to meet the County's requirements.

1.2.5. Contractor shall provide strategies on emerging technologies that improve the County business operations and processes.

1.2.6. Contractor shall participate in, and support, the County's retained authorities in architecture, technology planning and standards establishment.

1.2.7. Contractor shall acquire and implement Services with availability guarantees that meet or exceed the defined Service Levels.

1.2.8. Contractor shall provide Services that can leverage operational scale and best practices to achieve optimum County price performance.

1.2.9. Contactor shall provide an annual report on improvements made since the previous report and improvements planned in the next year.

1.2.10. Contractor shall provide continuous improvement in Service Levels and provide a plan annually for improvements to Service Levels.

1.2.11. Contractor shall perform technology refresh and maintain technical currency that exceed or meet requirements.

1.2.12. Contractor shall acquire ongoing feedback mechanisms to ensure performance meets expectations.

1.2.13. Contractor shall maintain compliance with industry standards (e.g., ITIL) and government regulations.

1.2.14. Contractor shall maintain a customer focus and customer satisfaction while providing Services that are measurable and includes continuous improvement.

1.3. Environment

1.3.1. Tiers of Support

1.3.1.1. Contractor shall provide the up to five (5) tiers of support to End-Users.

1.3.1.2. Contractor shall provide all Tiers of Support 24/7/365.

1.3.1.3. Contractor shall continuously improve Tier 0 for End-User self-service.

1.3.1.4. Contractor shall continuously improve the performance and increase the knowledge at Tier 1 to resolve more End-Users Incidents at first call.

1.3.1.5. Defined Tiers of Support:

1.3.1.5.1. Tier 0

Tier 0 is the continuous updating and posting on the Service Portal of automated or self-service solutions, documents, instructions, videos, FAQs and like material that County End-Users can access without the aid of the Service Desk or Contractor Personnel.

1.3.1.5.2. Tier 1

Tier 1 are Service Desk calls that can provide basic support and troubleshooting, such as password resets, printer configurations, break-fix instructions, Incident routing and escalation to Tier 2 and Tier 3 support for End-Users. May also escalate to applications support or call for outside Third-Party maintenance (Tier 4), as needed.

1.3.1.5.3. Tier 2

Tier 2 support involves technical knowledge by more experienced technicians who have strong exposure to troubleshooting and handles break-fix, configuration issues, troubleshooting, software installations, and hardware. Tier 2 handles escalated Incidents from Tier 1. Tier 2 shall escalate unresolved Incidents to Tier 3 or to Tier 4.

1.3.1.5.4. Tier 3

Tier 3 is a very specialized job provided by the specialists who are usually involved in the product development and are capable of handling complex Incidents.

1.3.1.5.5. Tier 4

Tier 4 refers to Third-Party support, outside the County or Contractor. Escalation to Tier 4 support is for Incident resolution. This usually involves hardware and software Third-Party support for Portfolio Applications as an example.

1.3.2. Hardware and Software

Contractor shall provide all Hardware, Software, tools and knowledge databases used in the delivery of Services for each Service Framework. Contractor shall provision, install, manage, maintain, and support these Assets.

1.3.3. Facilities

1.3.3.1. County

All County Locations are within scope of the Agreement.

1.3.3.2. Contractor

All Locations utilized by the Contractor to provide the Services shall be provided, maintained, provisioned, and managed by the Contractor.

1.3.4. Personnel

Contractor shall be responsible for providing staff resources with the skills, qualifications, and experience to perform the Services in a high quality manner and to meet or exceed all Service Levels. Contractor's Account Executive, Contract Manager and two selected Key Personnel shall reside at the County Administration Center. A listing of Contractor Personnel to reside at various County Locations is to be developed and included in the final Transition Plan.

1.3.5. Policies, Procedures and Standards

Contractor shall be responsible for complying with all of the County's policies, procedures, and standards, including the Standards and Procedures Manual.

1.3.6. Agreements and Licenses

Contractor shall be responsible for the acquisition, management, and support of all agreements and licenses required for the Services.

1.3.7. Required Language(s)

English is the current required language. Contractor shall ensure that the level of English communications by all Contractor resources is sufficient to (i) be understandable by County staff and (ii) understand County staff.

1.4. Service Requirements

The descriptions of Operational Services in this Schedule follow the hierarchy of objectives and requirements:

1.4.1. This Overview of Services provides high-level requirements that apply to all of the Service Frameworks.

1.4.2. Each individual Service Framework includes a summary section describing requirements that apply to all of the Framework Components within the given Service Framework.

1.4.3. Each Framework Component includes requirements that apply specifically to the Framework Component, except for the Cross Functional Service Framework.

1.4.4. The Cross Functional Service Framework Components include requirements that apply to all Service Frameworks and Framework Components.

1.4.5. The Service Levels, referenced in Schedule 4.8, contain descriptions of Service Level requirements that apply across all the Service Frameworks.

1.4.6. Within each section, tables describing Roles and Responsibilities are included. These tables depict the County's Plan, Build, and Operate structure.

1.4.7. Service requirements in this Section use the structure depicted below:

Overview of Services

- Overview
- High Level Requirements
- Environment
- Service Requirements

These apply to all Service Frameworks and Framework Components

Service Frameworks

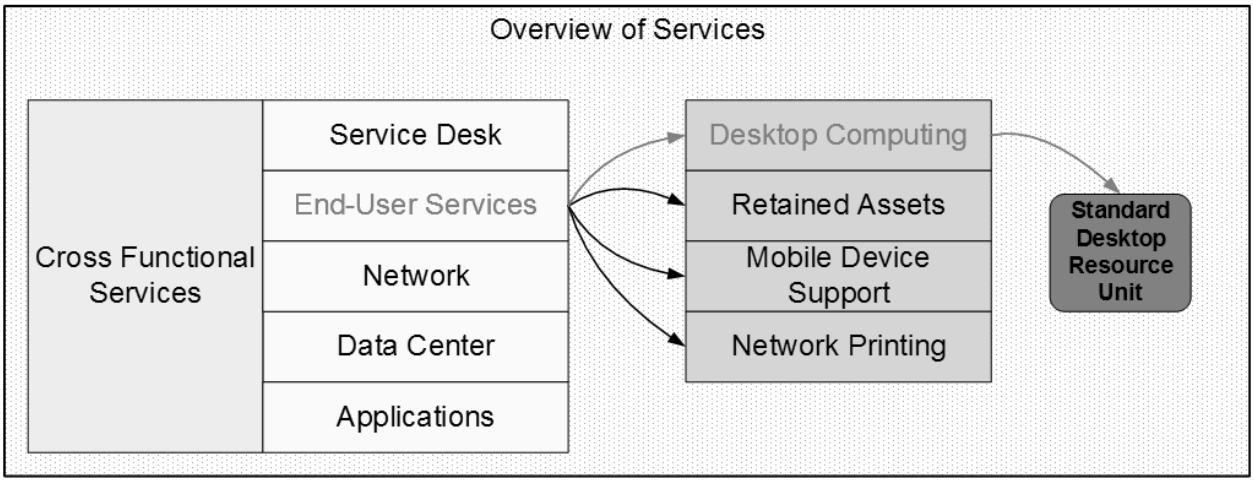
These correspond to specific Resource Units



2. CROSS FUNCTIONAL SERVICES

2.1. Overview

This section pertains to the Cross Functional Services Framework. Cross Functional Services consist of the Plan, Build and Operate Services that spans across all Service Frameworks.

Cross Functional Services are composed of the following Framework Components:

- Contract and Acquisition Management Services
- Integrated Asset Management Services
- Billing Management Services
- Security Management Services
- Service Delivery Management (SDM) Services
- Architecture Services
- Project Management Services
- Integration and Testing Services
- Incident Management Services
- Problem Management Services
- Change Management Services
- Release Management Services
- Configuration Management Services
- Capacity Planning and Performance Management Services
- Disaster Recovery Services
- Identity Access Management Services
- Reporting Management Services
- Domain Names Management Services
- Business Analyst Services

Cross Functional Services include lifecycle services that Contractor shall provide across the County Service Frameworks. All requirements, roles and responsibilities described in Cross Functional Services considered to be within the scope for each Service Framework.

2.2. High Level Requirements

2.2.1. Contractor shall provide all Cross Functional Services Framework Components across each Service Framework.

2.2.2. Contractor shall recommend, for County approval, qualified Cross Functional Service Manager as Contractor Key Personnel to ensure delivery and quality of Cross Functional Services.

2.2.3. Contractor shall implement industry leading practices, process, quality, and project methodologies to align processes to people and technology to provide the Services.

2.2.4. Contractor shall develop and submit during Transition, management plans for each Cross Functional Services Framework Component to be included in the Standards and Procedures Manual.

2.2.5. Contractor shall continuously update and submit Cross Functional Services Framework Component management plans, for County approval, and include in the Standards and Procedures Manual.

2.2.6. Contractor shall continuously improve Cross Functional Services by monitoring trends and service quality improvement through independent research and recommending changes annually that improve efficiencies and reduce overall costs.

2.2.7. Contractor shall provide the County with insight into future direction, initiatives, and technology road maps of Third-Parties performing Cross Functional Services.

2.2.8. Contractor shall provide County with Applications, Software and business experience and expertise to support continuous improvement to Cross Functional Services.

2.2.9. Contractor shall provide inventory management across all Cross Functional Services Framework Components to ensure accurate counts, information, consolidated views, etc.

2.3. Contract and Acquisition Management Services

2.3.1. Overview

This section pertains to the Contract and Acquisition Management Services of the Cross Functional Framework. Contract and Acquisition Management Services are the roles and responsibilities for the management of the Agreement, Contractor's relationship with the County and to provide acquisition services.

Contractor's primary responsibilities under Contract and Acquisition Management Services are to:

- Serve as the single point of contact to work with the County to manage the Agreement and all related contracts to provide Operational Services, including disputes, amendments, communications and training.
- Execute and manage the Optional Items Catalog, licenses/support maintenance renewals, subscription renewals, perpetual license renewals, Cloud ASP renewals, Hardware maintenance, Software as a Service (SaaS) renewal, competitively procured Applications Development projects among Contractor sub-contractors and partners.
- Execute Third-Party procurements and market scan / procurement activities.

2.3.2. High Level Requirements

2.3.2.1. Contractor shall provide continuous improvement of Contract and Acquisition Management Services.

2.3.2.2. Contractor shall assign a full-time Contract Manager to act as the single point of contact for the County on all contractual matters, including subcontract(s). The Contract Manager shall cooperatively, promptly and continuously communicate with County-designated staff.

2.3.2.3. Contractor shall deliver quality, high and prompt response Contract Management Services to the County.

2.3.2.4. Contractor shall be responsive and work cooperatively with the County to address requests and resolve issues and disputes.

2.3.2.5. Contractor shall continuously assess the Agreement and recommend improvements to enable the continuous improvement delivery of the Services, with focus on optimizing County's operational performance.

2.3.2.6. Contractor shall work cooperatively to efficiently implement changes to the Agreement.

2.3.2.7. Contractor shall perform procurement activities to support and provide Services and respond to Service Requests (e.g., DAD, OIC, contracts, licenses, etc.).

2.3.2.8. Contractor shall negotiate and enter into contracts with the Third-Parties (except for situations where the Contractor and County agree in advance that the Contract shall be between the County and the Third-Party) upon County approval.

2.3.2.9. Contractor shall create, maintain and post on the Service Portal an accurate inventory of current contracts, procured services, County owner, purchases and other relevant key information that is readily accessible for validation, certifications, reviews and tracking.

2.3.2.10. Contractor shall manage the service catalog (e.g., Third-Party service contracts).

2.3.2.11. Contractor shall maintain a log of all and any purchases with information to track the requesting information to the End-User.

2.3.2.12. Contractor shall provide early notifications to the County point of contact(s) or County department for renewals.

2.3.2.13. Contractor shall manage license, subscriptions, maintenance, certifications agreements to ensure contract and County policy compliance.

2.3.2.14. Contractor shall provide County with requested support for County operational and financial planning information.

2.3.2.15. Contractor shall develop and document in the Standards and Procedures Manual a competitive procurement process that aligns with County competition procedures as outlined below:

- Board of Supervisors Policies A-87 – Competitive Procurement
- Policy A-97 – Protest Procedures for Award of Contracts
- B-39a – Veteran Owned Business (VOB) and Disabled Veterans Business Enterprise (DVBE) Program
- B-53 – Small Business Policy (SBP)

2.3.2.16. Contractor shall solicit market scans and proposals to respond to County-established business requirements and evaluation criteria, and participate with the County in the evaluation against the County-established business requirements and evaluation criteria (including associated integration requirements, if necessary) and shall enter into a contract with the selected Third-Party at the County's direction.

2.3.2.17. Contractor shall provide the County with assessments and recommendations for procurements of services in the cloud, including:

- Develop entry and exit criteria for any engagement with a Third-Party prior to contract signing that identify risks, portability, integration points and relevant impacts
- Develop and provide as part of any solution or procurement one-time and recurring costs, the associated contract terms, Service Levels, liability, insurance and related contract and legal information.
- Ensure the Third-Party meets County policies, regulatory requirements and mandatory requirements

2.3.2.18. Contractor shall create a section in the Standards and Procedures Manual for Contract and Acquisition Management activities and procedures including the procedures that link Contract and

Acquisition Management Services with, Service Desk Services, Applications M&O Services, and Applications Development.

2.3.2.19. Contractor shall annually update and deliver the Contract and Acquisition Management Services Management plan, for County approval, and post on the Service Portal.

2.3.3. Roles and Responsibilities

The following table identifies the Plan Build and Operate roles and responsibilities associated with Contract and Acquisition Management Services.

Contract and Acquisition Management Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit Contract and Acquisition Management policies and procedures.	X	
2. Review and approve Contract and Acquisition Management policies and procedures.		X
3. Produce and submit an overall performance measurement plan to complement the Service Levels. The performance measurement plan shall collect key metrics to enable the County and the Contractor to identify productivity gains, better manage the Services, and provide information for continuous improvement.	X	
4. Review and approve performance measurement plan.		X
Build Roles and Responsibilities	**Contractor**	**County**
5. Implement Contract and Acquisition Management policies and procedures.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
6. Support Contract and Acquisition Management policies and procedures with necessary staff and resources.	X	
7. Produce and submit a weekly and monthly program status report.	X	
8. Conduct monthly program status reviews with the County including status on the Contractor's achievement of the contractual objectives, specific issues with recommended solutions, and planned activities, and to receive feedback.	X	

Contract and Acquisition Management Roles and Responsibilities		
9. Produce and submit descriptions of contract issues and/or recommended contract PRR on as-needed basis.	X	
10. Review and approve contract PRR.		X
11. Provide program performance metrics to designated County staff members via Service Portal.	X	
12. Provide the County with weekly status updates to apprise relevant parties on the status of backlogged Service Requests and expected resolution dates.	X	
13. Manage relationship contact points with Third-Parties to deliver a single point of contact for the processing and resolution of issues and problems.	X	
14. Assist the County in developing and executing routine reports that allow insight into costs associated with the Agreement.	X	
15. Assist the County in the development of its annual budget by providing: • Current, detailed, and accurate information relating to past operations • Assistance in costing and balancing the implementation of major initiatives • Assistance in spreading the costs of these major initiatives over multiple budget cycles as appropriate • Technical support to determine the impact of changes in technology on costs. • Analysis of usage (i.e., volumes of Resource Unit consumption) and performance • Identification of technical solutions for the reduction of operational costs	X	
16. Produce and submit updates to the County Standards and Procedures Manual.	X	
17. Review and approve updates to the County Standards and Procedures Manual.		X
18. Conduct annual review of existing Third-Party agreements (including cloud applications) to ensure that the County is receiving optimal value from such agreements.	X	

Contract and Acquisition Management Roles and Responsibilities		
19. Review and approve the annual review of existing Third-Party agreements to ensure that the County is receiving optimal value from such agreements.		X

2.4. Integrated Asset Management Services

2.4.1. Overview

This section pertains to the Integrated Asset Management Services Framework Component of the Cross Functional Framework. The Integrated Asset Management Services are the activities and processes associated with tracking, managing, optimizing and continuously improving the overall control and inventory of Assets. Integrated Asset Management Services provides the capabilities to centrally manage all Asset repositories and report across all Assets. Integrated Asset Management Services enable an accounting of all Asset costs, to support strategy, architecture, funding and sourcing decisions.

2.4.2. High Level Requirements

2.4.2.1. Contractor shall acquire and provision all Assets required to perform the Services.

2.4.2.2. Contractor shall provide a County approved Integrated Asset Management System.

2.4.2.3. Contractor shall provide an Integrated Asset Management System that provides centralized management of all integrated Asset repositories including, but not limited to, inventory, financial and contractual data.

2.4.2.4. Contractor shall list ownership of all Assets (e.g., Contractor, County, and Third-Party) in the Integrated Asset Management System.

2.4.2.5. Contractor shall design and deliver an auto-discovery function for all Assets.

2.4.2.6. Contractor shall provide accessibility and search-ability by County for all Integrated Asset Management data.

2.4.2.7. Contractor shall provide monthly reports on all Assets.

2.4.2.8. Contractor shall effectively manage Assets from requisition to retirement.

2.4.2.9. Contractor shall continuously analyze, optimize and leverage County Asset licensing to ensure that the County is in compliance with all license requirements and also that the County is using the most economical number and distribution of licenses.

2.4.2.10. Contractor shall continuously analyze and optimize County maintenance and support agreements to ensure that the County has adequate maintenance and support.

2.4.2.11. Contractor shall identify any unnecessary maintenance and support agreements and promptly terminated.

2.4.2.12. Contractor shall ensure inventory of all Assets are maintained and accurate.

2.4.2.13. Contractor shall provide Integrated Asset Management System reports including Hardware, Software (Desktop Applications Directory and Applications Portfolio) License Compliance, Application and Infrastructure Servers and Personal Computing Assets.

2.4.2.14. Contractor shall optimize pricing and terms for all Third-Party Assets.

2.4.2.15. Contractor shall provide Integrated Asset Management data for analytics for trending, forecasting, planning to facilitate decisions based on Asset information.

2.4.2.16. Contractor shall annually update and deliver the Integrated Asset Management Service Management plan, for County approval, and posted on the Service Portal.

2.4.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Integrated Asset Management Services.

Integrated Asset Management Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Design and implement an Integrated Asset Management System.	X	
2. Review and approve an Integrated Asset Management System.		X
3. Produce and submit recommended policies, processes and procedures to be added to the Standards and Procedures Manual.	X	
4. Review and approve changes to be added to the Standards and Procedures Manual.		X
5. Produce and submit recommended Asset Management monthly report format (e.g., End-User name, department, account code, location, low-org).	X	
6. Review and approve Asset management monthly report format.		X
7. Produce and submit recommended software license monthly report format.	X	
8. Review and approve recommended software license monthly report format.		X
9. Produce and submit Asset Management policies and procedures.	X	
10. Review and approve Asset Management policies and procedures.		X
11. Produce and submit software license management policies and procedures.	X	
12. Review and approve software license management policies and procedures.		X
13. Produce and submit comprehensive inventory of Assets tracked, managed and reportable through the Asset Management System.	X	
14. Review and Approve comprehensive inventory list provided by the Contractor.		X

Integrated Asset Management Roles and Responsibilities		
Build Roles and Responsibilities	**Contractor**	**County**
15. Develop operational policies standards and procedures manual for security management.	X	
16. Implement Asset Management policies and procedures.	X	
17. Implement Software License management policies and procedures.	X	
18. Implement software License monthly report.	X	
19. Implement Asset Management monthly report.	X	
20. Deploy an electronic Integrated Asset Management System that meets the County's requirements, adheres to defined policies and includes the following asset information (if applicable): • Manufacturer • Model • Serial number • Asset identification number • Asset location • Ownership information (Contractor/County - lease/purchase) • Asset cost information • Maintenance information and history including the age of the Asset and duration of contract terms • Warranty information • Other billing information (e.g., lease information, County-specific information) • Transaction edit history (e.g., locations, billing and User)	X	
21. Provide and support an electronic Integrated Asset Management System which includes asset auto discovery tools to maintain asset data and User profiles.	X	
22. Provide acquisition and tracking as required to fulfill County requests.	X	
23. Negotiate, enter into, track and manage all contracts, including licenses, with Third-Parties as required for the provision of the Services.	X	
24. Provide and support an electronic interface to the County's finance and chargeback systems to meet accounting, tracking, and reporting requirements.	X	
25. Develop and implement online access to Asset Management information.	X	

Integrated Asset Management Roles and Responsibilities		
26. Implement and support interfaces to feed asset location and financial data, including Third-Party data such as relevant taxation, book and depreciation value data to an online reporting dashboard.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
27. Track and manage all Assets provided by the Contractor.	X	
28. Conduct periodic reviews and provide exception reports resulting from use of asset auto discovery tools.	X	
29. Produce and submit monthly reports on Assets.	X	
30. Produce and submit copies of all Third-Party contracts, including licenses, upon request of the County.	X	
31. Produce and submit monthly software license management report.	X	
32. Review and approve monthly software license management report.		X
33. Validate compliance with applicable software licensing agreements using automated software tools and manual processes as required.	X	
34. Verify installed software for non-networked PCs (that periodically touch the network to check E-Mail, for example), while those PCs are in contact with the network.	X	
35. Report any license compliance issues no more than 30 days from the date of the issue.	X	
36. Report on contract expirations, license changes/upgrades, etc. in advance to prevent disruptions in service, non-compliance issues, etc.	X	
37. Report any expiration or renewal requirements for Assets to allow for planning and mitigation.	X	
38. Manage the ordering, procurement and delivery processes in compliance with County procurement and acceptance processes.	X	
39. Maintain version control on asset inventory.	X	
40. Dispose Assets (e.g. donation, sale, disposal) per County direction and generally acceptable accounting and financial standards or requirements.	X	
41. Provide reports of Asset Management review results.	X	

Integrated Asset Management Roles and Responsibilities		
42. Provide and, upon County approval, implement Asset Management remediation plan for Asset Management deficiencies.	X	
43. Review and approve review reports and remediation plans of Asset inventory management information.		X
44. Provide reports of County asset financial information including depreciation, maintenance contracts and value of Assets.	X	
45. Conduct periodic/ad hoc quality assurance review of Integrated Asset Management System.		X

2.5. Billing Management Services

2.5.1. Overview

Billing Management Services consist of the activities and processes associated with the timely and accurate billing for the Services. Billing Management Services shall collect consumption data for all Frameworks, calculate all charges and billing information, produce and provide invoices to the County, provide chargeback details that meet the County's requirements, and provide all necessary support to ensure the timely and accurate processing of both the invoice and chargeback.

2.5.2. High Level Requirements

2.5.2.1. Contractor shall digitally interface its Contractor billing system with the County chargeback management system (iTrack).

2.5.2.2. Contractor shall manage and support the operational availability of the iTrack to Oracle Financials interface.

2.5.2.3. Contractor shall use a billing program that efficiently and effectively handles the tracking of billable resources and maintains a direct interface to the Integrated Asset Management Services.

2.5.2.4. Contractor shall make provide, for County approval, all process and procedural documentation pertaining to Billing Management Services.

2.5.2.5. Contractor shall provide accurate and timely invoices with an appropriate level of detail.

2.5.2.6. Contractor shall promptly provide accurate and timely detailed electronic billing information that facilitates the County's chargeback activities.

2.5.2.7. Contractor shall support all activities required to review, validate, substantiate, and detail its billings.

2.5.2.8. Contractor shall work with the County to optimize the invoice and chargeback process, including continuous improvement of reporting and automation.

2.5.2.9. Contractor shall communicate to County information impacting the billing of resources.

2.5.2.10. Contractor shall provide details for any billing inquiries to support the costs billed to the County or invoiced to the County upon request.

2.5.2.11. Contractor shall annually update and deliver the Billing Management Services Management plan, for County approval, and posted on the Service Portal.

2.5.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Billing Management Services.

Billing Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommended policies, processes and procedures to be added to the Standards and Procedures Manual.	X	
2. Review and approve changes to be added to the Standards and Procedures Manual.		X
3. Identify chargeback and reporting requirements.		X

Billing Management Services Roles and Responsibilities		
4. Identify monthly invoicing requirements.		X
5. Produce and submit recommended monthly invoice/billing report format in accordance with County requirements.	X	
6. Review and approve monthly billing report format.		X
7. Document and maintain invoicing requirements.	X	
8. Participate in, and support, billing reviews as requested by the County.	X	
Build Roles and Responsibilities	**Contractor**	**County**
9. Provide an automated interface with the County's finance system for Billing Management Services.	X	
10. Provide an automated interface with the County's chargeback system in accordance with County requirements, including the ability for the County to review the chargeback reports and supporting data online through the Service Portal without any delays.	X	
11. Produce and submit monthly reports (both hardcopy and electronically) detailing all usage and charges.	X	
12. Maintain an electronic repository of all Billing Management records (reports, invoices, chargeback, etc.) for the duration of the contract.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
13. Contractor shall verify staff enter billable time on a daily basis for accurate tracking of project costs.	X	
14. Produce and submit to County chargeback reports and monthly invoices.	X	
15. On a monthly basis, meet with the County's finance staff to review invoices including: • Provide a mock invoice for review and agreement • If discrepancies are identified, clarify and resolve them • Meet again within a week to reach agreement on the changes or clarifications so the submitted invoice can be signed off	X	
16. Approve chargeback reports.		X
17. Download on a monthly basis all usage and charge information to the County chargeback application.	X	
18. Provide invoices per County requirements.	X	

Billing Management Services Roles and Responsibilities		
19. Document and maintain County chargeback reporting requirements.	X	
20. Calculate, report, and chargeback all applicable taxes and provide monthly billing for current and past services as well as track payments and balances.	X	
21. Provide the billing data needed to reconcile bills.	X	
22. Approve invoices.		X
23. Maintain and provide an electronic archive of all billing and its details.	X	
24. Retain all source system data used for billing to provide audits trails or verification of details for the duration of the Agreement.	X	

2.6. Security Management Services

2.6.1. Overview

The Security Management Services Framework Component within the Cross Functional Framework applies to the discipline of designing, implementing and maturing security practices to protect critical County business processes and Assets across the enterprise.

2.6.2. High Level Requirements

2.6.2.1. Contractor shall provide the continuous improvement in overall security services that protect the County.

2.6.2.2. Contractor shall provide a qualified Chief Information Security Officer (CISO), with County approved, that will work directly with the County CISO.

2.6.2.3. Contractor shall ensure Contractor assigned CISO is not directly involved in the management of day-to-day operations.

2.6.2.4. Contractor CISO shall work with the Contractor assigned CTA to ensure strategic alignment with architecture standards and guidelines.

2.6.2.5. Contractor shall develop strategic risk guidance for Service Requests, including the evaluation and recommendation for technical controls.

2.6.2.6. Contractor shall participate in architecture and strategy sessions with the County to determine and maintain the Security Management roadmap.

2.6.2.7. Contractor shall work with each Service Framework to ensure alignment, training, validation, compliance with Security Management Services.

2.6.2.8. Contractor shall ensure confidentiality of all Hardware and Software used to provide the Services.

2.6.2.9. Contractor shall ensure the availability of all Hardware and Software providing the Services is only used for its intended purpose.

2.6.2.10. Contractor shall design, develop, procure, implement and monitor a strategic, and continuously improving comprehensive security and risk management program to protect the integrity, confidentiality and availability of County Data and the Services.

2.6.2.11. Contractor shall establish a hierarchical security governance program that includes the formation of an information security steering committee which includes the County and Contractor staff and provides for the centralized governance of security services.

2.6.2.12. Contractor shall design, develop, implement, maintain and publish up-to-date information security policies, procedures, training, standards and guidelines to the Service Portal.

2.6.2.13. Contractor shall, with County CISO approval, create and manage information security and risk management awareness training programs for End-Users, Third-Party and approved system users.

2.6.2.14. Contractor shall design, develop, implement and maintain risk assessment and risk management processes for the Services.

2.6.2.15. Contractor shall, with the County CISO approval, design, develop and maintain categories for information ownership, classification, accountability and protection.

2.6.2.16. Contractor shall continuously assess and improve the Security Management Services against an industry-standard maturity model.

2.6.2.17. Contractor shall perform all necessary security-related reviews and annually attest to security compliance for delivering the Services.

2.6.2.18. Contractor shall use the NIST Computer Security Resource Center (CSRC) security framework as a guide for Security Management Services.

2.6.2.19. Contractor shall continuously monitor security and risk environmental factors for evolving trends and threats.

2.6.2.20. Contractor shall develop and implement plans to remediate any identified threat.

2.6.2.21. Contractor shall develop and maintain an annual Security life cycle report for the Services.

2.6.2.22. Contractor shall design, develop, implement and maintain a security incident management and response plan, for County approval, and post to the Service Portal.

2.6.2.23. Contractor shall provide periodic executive reports on the "State of Security" which includes the overall effectiveness, efficiency, maturity and other relevant matters related to the Services.

2.6.2.24. Contractor shall develop a security information and event management (SIEM) solution and the required set of operational procedures in defining, using and maturing the processes.

2.6.2.25. Contractor shall maintain Federal and State compliance to security for any applicable County program, application or other Service.

2.6.2.26. Contractor shall annually update and deliver the Security Management Services Management plan, for County approval, and posted on the Service Portal.

2.6.2.27. Contractor shall provide the Enterprise Application Access (EAA) solution.

2.6.2.27.1. EAA integrates data path protection, identity and access management (IAM), application security, multi-factor authentication (MFA), single sign-on (SSO), and management visibility and control into a unified service across all application locations and types (on-premises, Internet, IaaS, SaaS, etc.).

2.6.2.27.2. EAA will be implemented on all active applications (PA, CA, IA) to the enterprise portal.

2.6.2.27.3. EAA will be implemented on all County departments, San Diego County Sheriff Department, San Diego County District Attorney and San Diego County Employees Retirement Association and be available to associated subcontractors, partners and citizens in support of the County.

2.6.2.28. Contractor shall provide the Multi-Factor Authentication (MFA) solution.

2.6.2.28.1. The MFA Service integrates with County EAA solution to provide advanced multi-function authentication functionality across all County applications using supported EAA MFA methods (e.g., FIDO/FIDO2; SMS; Hardware OTP; Software OTP; Push).

2.6.2.28.2. The MFA Service is implemented across all County departments for users of County shared applications including County subcontractors performing work on

behalf of County, partners and Contractor staff supporting the Agreement.

2.6.2.28.3. The County EAA Service is extended to the County of San Diego Sheriff's Department, County of San Diego District Attorney's Office and to San Diego County Employees Retirement Association, to the extent required to access County applications using the County MFA solution.

2.6.2.29. Contractor shall provide the Malware Protection solution to all County websites protected by the Akamai Web Application Firewalls.

2.6.2.29.1. Malware Protection shall protect web apps and Application Programming Interface (APIs) from malicious file uploads by scanning file uploads at the Akamai edge.

2.6.2.29.2. Malware Protection shall integrate with Akamai Web Application Firewall to detect and block malware at the Akamai edge by scanning files once, at the edge, to avoid setting scanning at every application.

2.6.2.30. Contractor shall provide the Secure Internet Access (SIA) solution to all County managed devices.

2.6.2.30.1. SIA shall provide a cloud-based secure web gateway (SWG) that protects County network.

2.6.2.30.2. SIA shall proactively block requests to known malware, phishing, command and control, and Domain Name System (DNS) data exfiltration domains.

2.6.2.30.3. SIA shall block malicious payload downloads with improved zero-day protection before they compromise endpoint devices.

2.6.2.30.4. SIA shall protect devices when on and off the network, including mobile devices.

2.6.2.30.5. SIA shall protect all outbound DNS traffic including Internet of Things (IoT), servers and peripherals.

2.6.2.30.6. SIA shall provide detection/prevention of zero-day phishing attacks.

2.6.2.30.7. SIA shall enforce acceptable use policies.

2.6.2.30.8. SIA shall block categories of domains.

2.6.2.30.9. SIA shall provide visibility and control over internet-based applications, such as social media.

2.6.2.30.10. SIA shall control the types of files that can be uploaded/downloaded on the internet.

2.6.2.30.11. SIA shall provide web-based Data Loss Prevention (DLP) controls.

2.6.2.30.12. SIA shall include tools to identify the specific devices on the network making requests that violate the configured policy.

2.6.3. Environment

The environment scope of Security Management Services includes, but is not limited to, the following:

2.6.3.1. Technical

2.6.3.1.1. Approve appropriate methods for the protection of all Assets used for the Services.

2.6.3.1.2. Propose authentication methods, password policy, encryption methods, etc.

2.6.3.1.3. Propose rules for secure teleworking.

2.6.3.1.4. Define required security features of Internet services.

2.6.3.1.5. Define principles for secure development of information systems.

2.6.3.1.6. Review logs of user activities in order to recognize suspicious behavior.

2.6.3.2. Business continuity

2.6.3.2.1. Coordinate the business impact analysis process and the creation of response plans.

2.6.3.2.2. Coordinate exercising and testing.

2.6.3.2.3. Perform post-Incident review of the recovery plans.

2.6.3.3. Compliance

2.6.3.3.1. Develop the list of interested parties related to information security.

2.6.3.3.2. Develop the list of requirements from interested parties.

2.6.3.3.3. Remain in continuous contact with authorities.

2.6.3.3.4. Coordinate all efforts related to personal data protection.

2.6.3.4. Risk management

2.6.3.4.1. Develop Contractor training on performing risk assessment.

2.6.3.4.2. Coordinate the process of risk assessment.

2.6.3.4.3. Propose the selection of safeguards.

2.6.3.4.4. Propose the deadlines for safeguards implementation.

2.6.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Security Management Services.

Security Management Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Define County requirements at the enterprise level for all security services (e.g., business, technology strategy, functional, availability, capacity, performance, applications, backup and continuity service).		X
2. Assist in developing Security standards, policies and procedures including leading industry practices.	X	
3. Produce and submit quarterly updates to security requirements, standards, procedures and policies including regulatory requirements for County approval.	X	
4. Review and approve security requirements, standards, procedures and policies for County.		X
5. Develop security patching standards relevant to the environment including asset management integration with Third-Party security vulnerability notifications services (e.g., NIST NVD).	X	
6. Review and approve security patching standards relevant to the environment.		X
7. Perform feasibility studies for the implementation of new security technologies that best meet County business needs and meet cost, performance and quality objectives.	X	

Security Management Roles and Responsibilities		
8. Participate in technical and business planning sessions to establish security standards, architecture and project initiatives.	X	
9. Conduct technical reviews and provide recommendations for improvements to the infrastructure, application development and operations that increase the overall effectiveness, efficiency and prudent resource and cost management of security.	X	
10. Produce and submit operational policies and procedures for Security Management.	X	
11. Review and approve operational policies and procedures for Security Management.		X
12. Recommend appropriate controls for individual departments that meet requirements (e.g., HIPAA, HHSA, etc.).	X	
13. Review and approve appropriate controls for individual departments meet requirements (e.g., HIPAA, HHSA, etc.).		X
14. Recommend Security Management testing and vulnerability analysis standards on a yearly basis.	X	
15. Review and approve Security Management testing and vulnerability analysis standards on a yearly basis.		X
16. Produce and submit policies and procedures for relevant to the Services and are necessary for protecting the Confidentiality, Integrity and Availability of Assets, information and resources.	X	
17. Review and approve policies and procedures for relevant to the Services and are necessary for protecting the Confidentiality, Integrity and Availability of Assets, information and resources.		X
18. Produce and submit annual security strategies and roadmaps for the Services.	X	
19. Review and approve annual security strategies and roadmaps for the Services.		X
Build Roles and Responsibilities	**Contractor**	**County**
20. Develop and maintain a Security and Risk Management Manual.	X	
21. Review and approve the Security and Risk Management Manual.		X
22. Develop and maintain a Risk Assessment Process and Procedure Manual.	X	

Security Management Roles and Responsibilities		
23. Review and approve the Risk Assessment Process and Procedure Manual.		X
24. Identify relevant and applicable standards and methods to apply to County systems and applications to meet all special statutory and regulatory objectives and requirements.	X	
25. Comply with all statutory and regulatory requirements associated with the delivery of the Services, requirements regarding systems, including specific regulatory requirements for systems affiliated with the California Law Enforcement Telecommunications System (CLETS) and the FBI Criminal Justice Information Systems (CJIS).	X	
26. Evaluate and provide risk reduction and cost effectiveness of security processes and procedures.		X
27. Review all security patches relevant to the environment and classify the need and speed in which the security patches must be installed.	X	
28. Maintain all documentation required for security reviews and internal control and control testing.	X	
29. Recommend encryption technologies, security monitoring, anti-virus programs and relevant patches and upgrades as required by County policies and standards.	X	
30. Review and approve encryption technologies, security monitoring, anti-virus programs and relevant patches and upgrades as required by County policies and standards.		X
31. Design a web-based security dashboard that displays metrics, aggregated security log data across all frameworks, and enable total security awareness of the County's security environment.	X	
32. Review and approve the web-based security dashboard that displays metrics, aggregated security log data, and enable total security awareness of the County's security environment.		X
33. Develop and recommend improvement plans for Locations as needed to maintain effective physical security.	X	
34. Review and approve physical security improvement plans for Locations.		X
35. Develop and document technical design plans and environment configuration based on County security requirements.	X	

Security Management Roles and Responsibilities		
36. Review and approve all adjustments to County security policies, regulations and procedures as a result of new service features and components.		X
37. Produce and submit System and Application security procedures.	X	
38. Review and approve System and Application security procedures.		X
Operate Roles and Responsibilities	**Contractor**	**County**
39. Conduct security assessments and report monthly on vulnerabilities and recommended mitigations.	X	
40. Conduct scheduled review meetings between the Contractor's security officer and the County security officer and related security working group(s).	X	
41. Support County requested internal and Third-Party security reviews, vulnerability and penetration testing.	X	
42. Support periodic reviews of security practices, process and procedures as required by County.	X	
43. Review the County's security policies annually and work with the County security officer to recommend updates, additions, or changes as the County's working environment changes.	X	
44. Develop and maintain a Security Risk Registry of all identified County security risks.	X	
45. Create and maintain a secured online repository for all Security related documents and artifacts (e.g., Customer Service Request Forms, Security Assessments, Security Audits, Security Roadmaps, Risk Assessments, etc.).	X	
46. Review and validate management and current updates are performed to the Security on-line repository.		X

2.7. Service Delivery Management (SDM) Services

2.7.1. Overview

This section pertains to Service Delivery Management Services Cross Functional Framework Component. Each County Business Group (FG3, CSG, PSG, HHSA and LUEG) has a single, assigned Service Delivery Manager. The Service Delivery Manager(s) shall act as a liaison to the Business Group with respect to all Services, including but not

limited to, operational support, billing management, escalation management, change management, release management, Incident management, Problem management, availability and capacity management, Service Request status, communications and service continuity in the event of unplanned outages, declared emergency or disaster.

The Enterprise Service Delivery Manager shall interface directly to the CTO and shall coordinate the delivery of Services to the assigned Business Group Service Delivery Managers. The Business Group Service Delivery Manager shall continuously receive and assess customer feedback in order to improve overall service delivery goals.

2.7.2. High Level Requirements

2.7.2.1. Contractor shall recommend, for County approval, a qualified Service Delivery Manager as Contractor Key Personnel that reports to CTO.

2.7.2.2. Contractor shall recommend, for County approval, qualified Business Group Service Delivery Managers as Contractor Key Personnel to manage Service Delivery Management Services.

2.7.2.3. Contractor Service Delivery Manager shall be familiar with ITIL and have experiences in a variety of frameworks including but not limited to, Service Desk, End-User Services, Network Management, Data Center Management, Change Management, Program Management, application delivery, and Release Management.

2.7.2.4. Contractor shall define and maintain, for County approval, processes for all Service Delivery Manager Services.

2.7.2.5. Contractor Service Delivery Managers shall maintain and build relationships with County Business Groups and departments.

2.7.2.6. Contractor Service Delivery Managers shall handle all Incident and Problem escalations and trending to provide consistency to the level of service quality.

2.7.2.7. Contractor shall work collaboratively with the County to ensure the most efficient and effective use of SDM resources and processes.

2.7.2.8. Contractor shall annually update and deliver the Service Delivery Management Service Management plan, for County approval, and posted on the Service Portal.

2.7.3. Contract and Acquisition Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with SDM Services.

SDM Management Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Develop SDM job standards and requirements.	X	
2. Review and approve SDM job standards and requirements.		X
3. Provide resumes of SDMs meeting the approved standards and requirements.	X	
4. Select a SDMs meeting the approved standards and requirements.		X
5. Produce and submit SDM Services policies and procedures.	X	
6. Review and approve SDM Services policies and procedures.		X
Build Roles and Responsibilities	**Contractor**	**County**
7. Implement SDM Services policies and procedures.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
8. Perform internal SDM activities to ensure a high-level of performance and quality across all Service Frameworks.	X	
9. Audit Contractor Operations and Maintenance activities for compliance with Operational policies & procedures.		X
10. Produce and submit results of internal reviews relating to the County's service frameworks.	X	
11. Review and approve internal review findings.		X
12. Incorporate review findings into County Service frameworks as necessary to maintain compliance.	X	

SDM Management Roles and Responsibilities		
13. Recommend resolutions to address recurring operational Problems or Incidents.	X	
14. Review and approve resolutions to address recurring operational Problems or Incidents.		X
15. Track and report recurring operational Problems or Incidents and provide associated consequences of Problems or Incidents if there is a business impact to the County.	X	
16. Ensure that recurring operational Incidents are reviewed using root cause analysis processes and implement corrective actions as appropriate.	X	
17. Routinely assess customer satisfaction at program and service element levels using automated survey tool.	X	
18. Initiate additional survey processes as required to measure Contractor's performance rating.		X
19. Report results and trend analysis of customer satisfaction surveys with corrective action plans, as needed, in the monthly status report.	X	
20. Periodically review selected functions to verify that established policies and procedures are being followed and, if variances are noted, recommend corrective actions.	X	
21. Perform periodic internal reviews to check that standards are being followed.	X	
22. Perform regular reviews of Contractors services and performance against Service Levels and other performance measures.	X	
23. Lead and manage internal delivery teams to review incidents, problems and any other operational Incidents affecting client production and non-production environments.	X	
24. Drive the Contractor teams to remediate the problems and provide root cause analysis as needed.	X	
25. Review change management requests and participate in Change Management Boards.	X	
26. Provide a consolidated monthly report on service delivery information, challenges and insights.	X	

2.8. [Reserved]

2.9. Project Management Services

2.9.1. Overview

Project Management Services defines the structured effort to manage risk that achieves expected results. Project Management Services shall deliver products, Assets, change and/or components within agreed resources and a defined start and end time.

2.9.2. High Level Requirements

2.9.2.1. Contractor shall provide qualified program and project management resources with relevant background and experience including PMI certification.

2.9.2.2. Contractor shall recommend, for County approval, qualified Project Management Office Manager as Contractor Key Personnel to manage Project Management Services.

2.9.2.3. Contractor PMO shall report directly to the Contractor Account Management team.

2.9.2.4. Contractor PMO shall establish continuous mentoring and training for Project Managers.

2.9.2.5. Contractor shall define standards, methods and best practices that shall be used in the delivery of Project Management Services.

2.9.2.6. Contractor shall establish centralized tracking and reporting for all projects accessible from the Service Portal.

2.9.2.7. Contractor shall define all processes in the delivery of Project Management Services and that are posted on the Service Portal.

2.9.2.8. Contractor shall define measurements to ensure the delivery of projects on time, on budget and in scope.

2.9.2.9. Contractor shall implement, with County approval, a standardized project management methodology that incorporates industry typical practices. This methodology shall be used by the Contractor in providing all of the Services.

2.9.2.10. Contractor shall annually update and deliver the Project Management Services Management plan, for County approval, and posted on the Service Portal.

2.9.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Project Management Services.

Project Management Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations for standard project management tools, reports, and artifacts.	X	
2. Review and approve standard project management tools, reports, and artifacts.		X
3. Produce and submit recommendations for project-specific tools and artifacts.	X	
4. Review and approve project-specific tools and artifacts.		X
5. Produce and submit resource-loaded project plans for all projects.	X	
6. Review and approve resource-loaded project plans for all projects.		X
7. Produce and submit project status reports on no less than a monthly basis.	X	
8. Provide a range of training options in the service catalog.	X	
9. Produce and submit project management policies and procedures.	X	
10. Review and approve project management policies and procedures.		X
11. Recommend business process reengineering methodologies.	X	

Project Management Roles and Responsibilities		
12. Assess and approve business process re-engineering methodologies.		X
13. Identify opportunities for business process improvements.	X	
14. Provide industry knowledge applicable to County departmental business to identify opportunities for business process reengineering and Application development and integration/modification.	X	
Build Roles and Responsibilities	**Contractor**	**County**
15. Develop operational policies standards and procedures manual for Project Management Services.	X	
16. Implement County authorized Project Management discipline.	X	
17. Work in conjunction with the County's training and development resources to provide a common look and feel to training delivery methods.	X	
18. Implement and manage County-authorized Project Management tools and processes based on industry standards.	X	
19. Develop and maintain a training course catalog in cooperation with County HR and the Business Groups to provide End-Users access to training so they can develop the necessary skills to fulfill their responsibilities.	X	
20. Implement approved project management policies and procedures.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
21. Support project management policies and procedures.	X	
22. Provide high quality project management for all initiatives and projects undertaken as part of the Services.	X	
23. Participate in Program management and Project management activities as required to ensure successful work efforts.		X
24. Facilitate project status reviews with County management and staff on no less than a monthly basis.	X	
25. Track projects through timekeeping tool and biweekly status reports.	X	
26. Distribute the standard project processes, templates, or other vehicles, to all stakeholders to collect relevant project operational and performance data.	X	

Project Management Roles and Responsibilities		
27. Support the County's Verification & Validation activities including assisting in identifying errors, risk factors, omissions, discrepancies, constraints, performance and security Incidents, and other obstacles in project implementations.	X	
28. Provide local venues for training, particularly for Cross-Functional Services training or special purpose training when delivering training to Users in their environment is not practical (e.g., when providing training on new systems or applications for which a computer laboratory type environment is necessary and shall be leveraged across many training sessions).	X	
29. Provide project planning, tracking and management of project activities.	X	
30. Document project lessons learned and summarize the outcomes of the project.	X	
31. Ensure that all changes to the project are reviewed and approved in advance by coordinating all changes across the project and notifying stakeholders of approved changes.	X	
32. Approve project changes.		X
33. Examine project issues to determine their impact to the analysis or project effort.	X	
34. Categorize risks within a project and analyze as to the consequences, probability, impact, exposure, mitigation, contingency and triggers.	X	

2.10. Integration and Testing Services

2.10.1. Overview

Integration and Testing Services are the activities associated with ensuring that all individual components configured with or added to the environment work together cohesively to achieve the intended results. The following table identifies the Integration and Testing roles and responsibilities that Contractor and County shall perform.

2.10.2. High Level Requirements

2.10.2.1. Contractor shall conduct tests integration or interfaces between components, interactions to different parts of the system such as an

operating system, file system and hardware or interfaces between systems.

2.10.2.2. Contractor shall develop and deliver, for County approval, and implement a methodology and tool sets for conducting Integration and Testing Services.

2.10.2.3. Contractor shall update annually the methodology for conducting Integration and Testing Services.

2.10.2.4. Contractor shall continuously update tools sets used for conducting Integration and Testing Services.

2.10.2.5. Contractor shall verify functional, performance, and reliability requirements are placed on major design items.

2.10.2.6. Contractor shall detect any inconsistencies between the software units integrated together or between any of the instances of the standard hardware.

2.10.2.7. Contractor shall define and maintain, for County approval, processes for all Integration and Testing Services

2.10.2.8. Contractor shall develop and deliver a management plan, for County approval, during Transition and posted on the Service Portal.

2.10.2.9. Contractor shall annually update and deliver the Integration and Testing Services Management plan, for County approval, and posted on the Service Portal.

2.10.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Integration and Testing.

Integration and Testing Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**

Integration and Testing Services Roles and Responsibilities		
1. Define Integration and Testing requirements and policies.		X
2. Develop, document and maintain in the Standards and Procedures Manual Integration and Testing procedures that meet requirements and adhere to defined policies.	X	
3. Review and approve Integration and Testing procedures.		X
Build Roles and Responsibilities	**Contractor**	**County**
4. Develop operational policies standards and procedures manual for Integration and Testing.	X	
5. Define Test requirements.		X
6. Manage and schedule integration test environment.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
7. Maintain software release matrices across development, QA, and production environments and Networks.	X	
8. Validate and approve the software release matrix.		X
9. Evaluate all new and upgraded components or services for compliance with County security policies, regulations and procedures.	X	
10. Validate new and upgraded components or services for compliance with County security policies, regulations and procedures, as required.		X
11. Assess and communicate the overall impact and potential risk to components prior to testing completion.	X	
12. Conduct integration and security testing for all new and upgraded equipment, Networks, software or services to include unit, system, integration and regression testing based on requirements defined in requirements and design documents.	X	
13. Stage new and upgraded equipment, software or services to smoothly transition into existing environment based on requirements defined in requirements and design documents.	X	
14. Perform modifications and performance-enhancement adjustments to County system software and utilities as a result of changes to architectural standards or additions and upgrades to the environment.	X	

Integration and Testing Services Roles and Responsibilities		
15. Test new releases of supported Hardware and Software to ensure required performance and functionality is maintained in conformance with County Service Levels.	X	
16. Provide Middleware required to integrate Software and Hardware.	X	
17. Support Middleware required to integrate Software and Hardware.	X	
18. Provide integration of application software.	X	

2.11. Incident Management Services

2.11.1. Overview

Incident Management Services Framework Component of Cross Functional Services are the roles and responsibilities that support activities associated with restoring service operations to County End-Users. Incident Management will restore unplanned disruption to the Services as quickly as possible while providing minimal impact to County business operations. An Incident is any unplanned event, which causes an interruption or a reduction to the quality of the Services.

The Service Desk is responsible for primary ownership of recording and tracking all Incidents and is responsible for the close coordination and ongoing monitoring and tracking of, and reporting on, Incidents. The Service Desk shall be responsible for escalating Incidents and coordinating with all appropriate Tier 2, Tier 3 and Tier 4 support groups.

The Incident Management processes and activities are inter-related and complementary with Change Management, Release Management and Configuration Management, as well as Problem Management.

2.11.2. High Level Requirements

2.11.2.1. Contractor shall develop, deliver (for County approval), post on the Service Portal and continuously maintain all procedures and processes related to Incident Management Services.

2.11.2.2. Contractor shall develop, deliver, post on the Service Portal and continuously maintain the Incident Management methodology.

2.11.2.3. Contractor shall own, record and track all Incidents end-to-end.

2.11.2.4. Contractor shall follow all defined Service Level priorities for all Incidents.

2.11.2.5. Contractor shall assume the highest severity for any Incident lacking complete clarity.

2.11.2.6. Contractor shall immediately communicate with the County CTO of all Severity 1 and Severity 2 Incidents.

2.11.2.7. Contractor shall define, document and continuously maintain an Incident Response Team for all Severity 1 and Severity 2 Incidents.

2.11.2.8. Contractor shall investigation and diagnosis all Incidents.

2.11.2.9. Contractor shall develop and deliver an RCA for all Severity 1 and Severity 2 Incidents or ad-hoc Incidents as requested by County.

2.11.2.10. Contractor shall develop and post escalation procedures for Incidents Contractor shall develop and deliver a management plan, for County approval, during Transition and posted on the Service Portal.

2.11.2.11. Contractor shall annually update and deliver the Incident Management Services Management plan, for County approval, and posted on the Service Portal.

2.11.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Incident Management Services.

Incident Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Establish criteria for Incident Management support requirements, including equipment and services to be covered, severity levels, definitions and characteristics, Incident classification and prioritization schema, escalation requirements.		X

Incident Management Services Roles and Responsibilities		
2. Develop Incident Management policies, process and procedures that support County's Incident Management support requirements.	X	
3. Review and approve Incident Management policies and procedures.		X
Build Roles and Responsibilities	**Contractor**	**County**
4. Develop operational policies standards and procedures manual for Incident Management.	X	
5. Provide and continuously maintain an Incident Management system and knowledge management database, including all Hardware, Software, databases, automated monitoring tools, and management and reporting tools, which are acceptable to County.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
6. Provide unrestricted read access by County-authorized staff and other personnel to all current and historical Incident records and knowledgebase data.	X	
7. Monitor the Incident Management system for automatically generated and logged Incident alerts and events.	X	
8. Resolve Incidents on the first call in accordance with the Procedures Manual, knowledge database documents, and configuration database(s).	X	
9. Identify, filter, and classify Events and Incidents to a severity level and handle according to agreed-upon Incident response procedures.	X	
10. Diagnose and resolve Incidents; where possible use desktop remote control with user's approval and disconnecting when complete. Where possible, implement appropriate corrective actions for known errors (e.g., workarounds for known unresolved Incidents).	X	
11. Escalate Incidents to the appropriate next-level service group within Contractor, County, or Third-Party service as soon as it is clear that the Incident is unable to be resolved without additional assistance or as required to comply with Service Level response times.	X	
12. Monitor and track Incident resolution progress through to final closure and record/update Incident record status as appropriate.	X	

Incident Management Services Roles and Responsibilities		
13. Provide expert functional and process assistance for applications at Tier 1 and escalate to Tier 2 or 3 resource as required.	X	
14. Provide Tier 1 assistance to inquiries on the features, functions and usage of Hardware and Software.	X	
15. Provide Tier 1 support for applications software on the supported applications.	X	
16. Propose training and Tier 1 scripts and workarounds for the Service Desk for applications software on the approved list.	X	
17. Approve training and Tier 1 scripts and workarounds for the Service Desk for applications software on the approved list.		X
18. Provide Tier 2 and Tier 3 support for Applications software on the supported applications list.	X	
19. Verify that all records (e.g., inventory, asset and configuration management records) are updated to reflect completed/resolved Incident.	X	
20. Assist End-Users with questions relating to functionality and use of End-User Hardware and Software.	X	
21. Document solutions to resolved Incidents in central knowledgebase. Accurately update all information pertinent to Incidents including general verbiage, codes, et al.	X	
22. Notify designated County personnel of all Severity 1 and Severity 2 Incidents within the designated timeframe.	X	
23. Contact designated County business personnel of applicable Severity 1 and Severity 2 Incidents.		X
24. Maintain current and historical records of all calls and the resolution of those calls for the life of the contract and provide reporting and trends.	X	
25. Troubleshoot, diagnose and resolve Incidents for all Hardware and Software warranty and non-warranty devices, including removing and / or repairing physically broken or inoperable devices.	X	
26. Provide Dispatch for End-User devices as required.	X	
27. Provide end-to-end Incident Identification, Escalation and Resolution Management; and a Closure Process including the management of those Incidents escalated to Third-Parties.	X	

Incident Management Services Roles and Responsibilities		
28. Track ongoing status of any Incident and their corresponding Incident record to ensure that identified Incidents are addressed and resolved.	X	
29. Ensure Incident resolution activities conform to defined Change Management procedures set forth in the Process and Procedures Manual.	X	
30. Coordinate and take ownership of Incident resolution across all Frameworks with County and Third-Parties.	X	
31. Periodically review the status of open, unresolved Incidents and related Incidents and the progress being made in addressing Incidents.	X	
32. Participate in Incident Management review sessions as appropriate.	X	
33. Conduct Incident review sessions and provide listing and status of same categorized by Incident severity impact.	X	
34. Participate in Incident Management review sessions.		X
35. Coordinate with County and Third-Party Tier 2 support groups to acquire and transfer knowledge on Incident resolution and record this knowledge gained into the knowledge base to facilitate increased ability for Third-Party Tier 1 Service Desk in providing first-call resolution.	X	
36. Conduct follow-up with End-Users who reported the Incident to verify that the Incident was resolved to the End-User satisfaction.	X	
37. Close out Incidents that were resolved satisfactorily.	X	
38. Provide Incident Management reporting as required.	X	

2.12. Problem Management Services

2.12.1. Overview

Problem Management Services Framework Component of Cross Functional Services are the roles and responsibilities that support activities associated of resolving not-yet-known root cause behind one or more Incidents.

The Problem Management processes and activities are inter-related and complementary with Change Management, Release Management and Configuration Management, as well as Incident Management.

2.12.2. High Level Requirements

2.12.2.1. Contractor shall develop, deliver (for County approval), post on the Service Portal and continuously maintain all procedures and processes related to Problem Management Services.

2.12.2.2. Contractor shall develop, deliver, post on the Service Portal and continuously maintain the Problem Management Services methodology.

2.12.2.3. Contractor shall own all reported or diagnosed Problems end-to-end.

2.12.2.4. Contractor shall develop and implement proactive problem management for Incidents and identify trends to prevent future Incidents.

2.12.2.5. Contractor shall provide Problem Management Services for all identified Problems and systemic Incidents related to the Services.

2.12.2.6. Contractor shall provide coordination and assistance to Third-Party in performing for Problem Management Services.

2.12.2.7. Contractor shall provide reactive Problem Management Services by diagnosing and solving Problems in response to one or more Incidents.

2.12.2.8. Contractor shall maintain, update and report information about Problems and the appropriate workarounds and resolutions.

2.12.2.9. Contractor shall continuously work to reduce the number and impact of Incidents and Problems occurring within the County.

2.12.2.10. Contractor shall be responsible for ensuring that resolutions to Problems are implemented in a timely fashion.

2.12.2.11. Contractor shall fully document and deliver, for County review, all Problems including symptoms through final resolution.

2.12.2.12. Contractor shall prevent recurrence of Incidents related to these errors by determining the unknown underlying cause (e.g., root cause) and resolving them.

2.12.2.13. Contractor shall annually update and deliver the Problem Management Services Management plan, for County approval, and posted on the Service Portal.

2.12.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Problem Management Services.

Problem Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Define requirements and policies for Problem Management (e.g., events that trigger a Root Cause Analysis (RCA), categorization and prioritization schema, etc.).		X
2. Participate in developing Problem Management requirements and policies.	X	
3. Develop appropriate process and procedures and methodologies that support County-approved Problem Management requirements and policies that comply with County requirements.	X	
4. Approve appropriate process and procedures and methodologies that support County-approved Problem Management requirements and policies that comply with County requirements.		X
Build Roles and Responsibilities	**Contractor**	**County**
5. Develop operational policies standards and procedures manual for Problem Management.	X	

Problem Management Services Roles and Responsibilities		
6. Implement appropriate process and procedures and methodologies that support County-approved Problem Management requirements and policies that comply with County requirements.	X	
7. Establish and maintain a Problem Management knowledgebase (Service Portal) that is accessible to County where information about Problems, Root Cause, Known Errors, Workarounds and problem resolution actions will reside.	X	
8. Provide unrestricted access by County-authorized staff and other County designated personnel to all current and historical Problem Management records and knowledgebase data.	X	
9. Ensure Problem Management activities conform to defined Change Management procedures set forth in the Procedures Manual.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
10. Coordinate with appropriate Incident Management teams and take ownership of Problem Management activities of all problems determined to reside in the Frameworks.	X	
11. Coordinate, escalate and track Problem Management activities within County and Third-Parties related to problems determined to reside in all infrastructure areas.	X	
12. Flag all Incidents that require further RCA to be conducted (i.e., Severity 1 and Severity 2 Incidents) per the agreed-to procedures.	X	
13. Ensure that recurring problems that meet defined criteria related to the Contractor's service responsibility area are reviewed using RCA procedures.	X	
14. Conduct proactive trend analysis of Incidents and problems, and other data elements to identify recurring situations that are or have the potential to be indicative of future problems and points of failure.	X	
15. Track and report on problems and trends or failures and identify associated consequences of problems.	X	
16. Develop and recommend corrective actions or solutions to address recurring Incidents and problems, as well as mitigation strategies and actions to take to avert potential problems identified through trend analysis.	X	

Problem Management Services Roles and Responsibilities		
17. Identify, develop, document, and recommend appropriate Workarounds for known errors of unresolved problems and notify Incident Management and all other appropriate stakeholders of its availability if approved. Document the workaround in the knowledgebase.	X	
18. Review and approve Workarounds for implementation, as appropriate.		X
19. Coordinate and monitor status of root-cause analysis activities performed by County and Third-Party.	X	
20. Document and update Problem Management knowledgebase with information regarding problem resolution actions, activities and status (e.g., root cause, known errors, workarounds, etc.) and notify all appropriate stakeholders of availability of information.	X	
21. Coordinate with County and Third-Party service to ensure that knowledge on Problems related to Frameworks is captured and entered into a centralized Problem Management knowledgebase.	X	
22. Ensure problem resolution activities conform to defined Change Management procedures set forth in the Process and Procedures Manual.	X	
23. Provide status reports detailing the root cause and procedure for correcting recurring Problems and Severity 1 and Severity 2 Incidents until closure as determined by County.	X	
24. Conduct Problem Management review meetings and provide listing and status of same categorized by problem impact.	X	
25. Participate in Problem Management review meetings and review and approve recommendations for actions, where appropriate.		X
26. Periodically review the state of open Incidents and related problems and the progress being made in addressing Problems.	X	
27. Participate in and review and approve as appropriate all Problem Management generated Request for Change (RFCs) as part of the Change Management.		X
28. Create Request for Change (RFC) documentation with recommended corrective actions to be taken to resolve a problem and submit to County for review and approval.	X	
29. Conduct periodic problem management proactive review sessions.	X	

Problem Management Services Roles and Responsibilities		
30. Provide Problem Management reporting on a weekly basis for all activity.	X	

2.13. Change Management Services

2.13.1. Overview

Change Management Services Framework Component of Cross Functional Services are the roles and responsibilities that support activities associated with standardized methods and procedures that are used for efficient and prompt handling of all changes. Change Management Service apply to all changes across all Frameworks, and minimize the impact of any change to the quality and operation of the Services.

The Change Management processes and activities are inter-related and complementary with Release Management and Configuration Management, as well as Incident Management and Problem Management.

2.13.2. High Level Requirements

2.13.2.1. Contractor shall develop, deliver (for County approval), post to Service Portal and continuously maintain standardized methods and procedures for Change Management Services.

2.13.2.2. Contractor shall develop process for handling Hardware and Software version control through Change Management Services.

2.13.2.3. Contractor shall establish a centralized control point for Change Management Services.

2.13.2.4. Contractor shall ensure minimal conflict and potential service disruption for all changes.

2.13.2.5. Contractor shall eliminate and prevent all unauthorized changes to the Services.

2.13.2.6. Contractor shall implement maintenance windows for changes affecting the Services.

2.13.2.7. Contractor shall minimize the amount of emergency changes to the Services.

2.13.2.8. Contractor shall record all changes made to the Services.

2.13.2.9. Contractor shall ensure all changes are evaluated, authorized, prioritized, planned, tested, implemented, documented and reviewed in a controlled manner with County participation.

2.13.2.10. Contractor shall post on the Service Portal all documentation, changes requests, approvals, or any other information related to the Change Management Services.

2.13.2.11. Contractor shall determine metrics for measuring effectiveness of a changes and will post monthly report on the Service Portal.

2.13.2.12. Contractor will coordinate and manage, with County participation, the Change Advisory Board (CAB).

2.13.2.13. Contractor shall ensure County approval is received for all changes are deemed approved.

2.13.2.14. Contractor shall establish and manage the schedule of approved changes Contractor shall develop and deliver a management plan, for County approval, during Transition and posted on the Service Portal.

2.13.2.15. Contractor shall annually update and deliver the Change Management Services Management plan, for County approval, and posted on the Service Portal.

2.13.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Change Management Services.

Change Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**

Change Management Services Roles and Responsibilities		
1. Define Change Management policies and requirements, including change priority schema and classifications, per the Change Management process components outlined above.		X
2. Develop Change Management procedures, communications venues and processes per the Change Management process components outlined above.	X	
3. Participate in the development of the Change Management and CAB procedures, policies, communications venues and approval authorities.		X
4. Review and Approve Change Management process, procedures and policies.		X
Build Roles and Responsibilities	**Contractor**	**County**
5. Develop operational policies standards and procedures manual for Change Management.	X	
6. Oversee the approved change build, test, change communication and implementation processes to ensure these activities are appropriately resourced and completed according to change schedule.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
7. Receive and document all Requests for Change (RFC) and classify proposed changes to the Services.	X	
8. Review and validate that RFCs comply with Change Management policies, procedures, and processes.		X
9. Ensure that appropriate back-out plans are documented and in place in the event of systems failure as a result of the change.	X	
10. Provide Change Management plan to County for review.	X	
11. Review and approve Change Management plan.		X
12. Recommend change management communication venues.	X	
13. Review and approve change management communication venues.		X
14. Develop and maintain a schedule of planned approved changes (Forward Schedule of Changes or FSC) for County to review.	X	

Change Management Services Roles and Responsibilities		
15. Coordinate, schedule, and conduct Change Advisory Board (CAB) meetings to include review of planned changes and results of changes made, ensuring that all appropriate parties are invited and represented in accordance with approved CAB policies.	X	
16. Provide change documentation as required, including proposed metrics as to how effectiveness of the change to be measured.	X	
17. Review and approve change documentation and change effectiveness metrics.		X
18. Review and approve any RFC determined to have significant risk impact to the Services.		X
19. Authorize and approve scheduled changes or alter the schedule change requests as defined in the Change Management procedures.		X
20. Publish and communicate the approved FSC to all appropriate IT and Business Group stakeholders within County of change timing and impact.		X
21. Participate in business risk assessment for change to be introduced without being fully tested.	X	
22. Monitor changes, perform change reviews and report results of changes, impacts, and change effectiveness metrics.	X	
23. Verify that change met objectives based upon predetermined effectiveness metrics and determine follow-up actions to resolve situations where the change failed to meet objects.	X	
24. Review and approve change management results.		X
25. Close out RFCs that met the change objectives or changes that were abandoned.	X	
26. Perform Change Management quality control reviews and reviews of Change Management processes, and records.		X
27. Provide County Change Management reports as required and defined by County.	X	

2.14. Release Management Services

2.14.1. Overview

Release Management Services Framework Component of Cross Functional Services are the roles and responsibilities that are concerned with implementing approved changes to the Services. Release Management Services are activities that take a holistic view of scheduled changes to the Services and ensure that the technical and non-technical dependencies of the release. Release Management Service encompasses the planning, design, build, configuration and testing of hardware and software releases to create a defined set of release policies and procedures.

The Release Management processes and activities are inter-related and complementary with Change Management and Configuration Management, as well as Incident Management and Problem Management.

2.14.2. High Level Requirements

2.14.2.1. Contractor shall establish standardized Release Management policies and procedures, for County approval, and post to the Service Portal.

2.14.2.2. Contractor shall manage the release plans and schedules for approved changes.

2.14.2.3. Contractor shall develop, deliver and continuously manage release documentation.

2.14.2.4. Contractor shall develop, deliver, and continuously manage the release design, build, and configuration processes.

2.14.2.5. Contractor shall implement release testing, if appropriate, for all approved changes.

2.14.2.6. Contractor shall document, deliver and post on the Service Portal rollout planning including quality plans and back-out plans for releases.

2.14.2.7. Contractor shall document, deliver and post on the Service Portal all release communication, preparation, and training.

2.14.2.8. Contractor shall manage the rollout/distribution and installation of all elements of a release.

2.14.2.9. Contractor shall document each release and shall update the Configuration Management Database (CMDB).

2.14.2.10. Contractor shall annually update and deliver the Release Management Services Management plan, for County approval, and posted on the Service Portal.

2.14.3. Environment

2.14.3.1. Releases

Releases consist of a number of corrective action fixes and enhancements to the Services. A Release consists of the new or changed software required and any new or changed Hardware needed to implement the approved changes. Categories of releases are below:

- Major Software releases and Hardware upgrades or replacements, normally containing large areas of new functionality. A major upgrade or release usually supersedes all preceding minor upgrades, releases and emergency fixes
- Minor Software releases and Hardware upgrades, normally containing small enhancements and fixes. A minor upgrade or release usually supersedes all preceding emergency fixes
- Emergency Software and Hardware fixes, normally containing the corrections to a small number of known Incidents

2.14.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Release Management Services.

Release Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Define Release Management policies and requirements per the Release Management process components outlined above.		X
2. Develop Release Management procedures and processes per the Release Management process components outlined above.	X	
3. Participate in the development of the Release Management process and procedures and policies.		X
4. Review and approve Release Management process procedures and policies.		X
Build Roles and Responsibilities	**Contractor**	**County**
5. Develop operational policies standards and procedures manual for Release Management.	X	
6. Establish and maintain an appropriate secure environment(s) where all authorized versions of all Software, in physical or electronic form as applicable (Definitive Software Library or DSL) and where all hardware spares (Definitive Hardware Store or DHS) are stored, protected and accounted.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
7. Maintain master copies of all new versions of Software (both COTS Software packages and application developed custom-built Software) in the secured DSL and update configuration item.	X	
8. Ensure that all hardware spares are secured in the DHS and reflected in the configuration management database(s).	X	
9. Establish, manage, update, and maintain the overall Release Plan and Release Schedule for all planned Releases.	X	
10. Establish and administer the version control schema as it relates to Release Management of County custom applications.	X	
11. Develop, manage, update and maintain formal Release Plans for each Release in coordination with Change Management.	X	
12. Develop quality plans and back-out plans as appropriate for each Release.	X	
13. Provide Release Management Plans and Schedules to County for review.	X	
14. Review and approve Release Management Plans and Schedules.		X

Release Management Services Roles and Responsibilities		
15. Conduct site surveys, as necessary, to assess existing Hardware and Software being used to validate Release package requirements and dependencies.	X	
16. Plan resource levels and requirements for supporting a release.	X	
17. Ensure that any new Software, Hardware, or support services required for the release are procured and available when needed.	X	
18. Ensure that all necessary testing environments are available and properly configured to support Release testing.	X	
19. Ensure there is segregation of duties between the application developer testers and the release management testers.	X	
20. Conduct post-deployment testing as required.	X	
21. Schedule and conduct Release Management meetings to include review of planned releases and results of changes made.	X	
22. Identify and document all Configurable Items (CIs) that need to be included in the Release, as well as all system inter-dependencies.	X	
23. Plan and manage the acceptance testing process for each Release.	X	
24. Review and approve Release acceptance testing plans.		X
25. Provide Release documentation as required.	X	
26. Authorize and approve scheduled Releases or alter the schedule as defined in the Release Management procedures.		X
27. Review Release Management details and alter as appropriate to meet the needs of the County (e.g., back out plan, go/no go decision).	X	
28. Notify County of Release timing and impact and provide communications to the Service Desk.	X	
29. Implement Release in compliance with Change Management requirements and adherence to detailed release plans.	X	
30. Modify configuration database, Asset Management items, and service catalog (if applicable) to reflect changes to CIs due to the Release.	X	

Release Management Services Roles and Responsibilities		
31. Conduct post-mortem of Releases that necessitated implementation of the back out plan and develop and implement appropriate corrective or follow-up actions to minimize future occurrences.	X	
32. Perform quality control reviews and approve Release control results.		X
33. Provide County Release Management reports as required and defined by County.	X	

2.15. Configuration Management Services

2.15.1. Overview

Configuration Management Services Framework Component of Cross Functional Services are the roles and responsibilities that support activities associated with the recording, tracking, updating and disseminating the County's configurations for all Assets. Configuration Management Services will provide an integrated Configuration Management Database (CMDB), will capture all logical configurations of Hardware and Software supporting the Services, contain mappings to physical configuration, inventory data of Hardware and Software, analyze trends and be used to manage and reduce Incidents and Problems.

The Configuration Management processes and activities are inter-related and complementary with Change Management and Release Management, as well as Incident Management and Problem Management.

2.15.2. High Level Requirements

2.15.2.1. Contractor shall deliver and maintain an integrated Configuration Management Database (CMDB).

2.15.2.2. Contractor shall make available the CMDB through the Service Portal for approved County End-Users.

2.15.2.3. Contractor shall develop, deliver (for County approval), post on the Service Portal and continuously maintain all procedures and processes related to Configuration Management Services.

2.15.2.4. Contractor shall develop, deliver, post on the Service Portal and continuously maintain the Configuration Management methodology.

2.15.2.5. Contractor shall own Configuration Management end-to-end.

2.15.2.6. Contractor shall monitor, optimize, maintain, document, and report on all County Hardware and Software configurations, including but not limited to new releases and versions, patches, and bug fixes.

2.15.2.7. Contractor shall update the CMDB promptly after the completion of any approved change or release.

2.15.2.8. Contractor shall identify configuration items, control and manage changes to configuration items, provide status accounting of those changes, verify functional and physical characteristics of configuration items, release and deliver configuration items.

2.15.2.9. Contractor shall perform configuration identification, control, status accounting, reviews and release management according to County policies and procedures.

2.15.2.10. Contractor shall use a tool set or suite of tools to ensure application configuration and code management is securely stored, managed and accessible as the system of record for configuration management and code management.

2.15.2.11. Contractor shall provide an enterprise code version manager to be the central repository for Portfolio Application configurations, patch downloads, software downloads, custom code, scripts and any software asset required to maintain or restore Portfolio Applications.

2.15.2.12. Contractor shall support, maintain and manage the enterprise code version manager including updates to ensure functionality and currency for code release, code deployment and accessibility.

2.15.2.13. Contractor shall develop and deliver a management plan, for County approval, during Transition and posted on the Service Portal.

2.15.2.14. Contractor shall annually update and deliver the Configuration Management Services Management plan, for County approval, and posted on the Service Portal.

2.15.3. Roles and Responsibilities

The following table identifies the Plan Build and Operate roles and responsibilities associated with Configuration Management Services.

Configuration Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit configuration management policies, procedures and policies.	X	
2. Review and approve configuration management policies, procedures and standards.		X
3. Produce and submit recommendations for configuration changes.	X	
4. Review and approve configuration changes.		X
5. Establish and maintain a single approach to manage both the County Configuration Management Database (referred to as the Unified Configuration Management Database) and the Integrated Asset Management System in accordance with the County's requirements.	X	
6. Monitor Third-Party announcements regarding software upgrades, patches, reported Incidents and published solutions.	X	
7. Provide impact analysis and propose installation plans for announced fixes.	X	
8. Recommend the applications packages that can be regularly reviewed for patches or version release upgrades and review this list per a defined schedule.	X	

Configuration Management Services Roles and Responsibilities		
9. Identify and report when patches or version-release upgrades are available for Applications and determine which functionalities are newly available as a result of the upgrade or which system Incidents are addressed by it, particularly when this improves customer ease of use.	X	
10. Establish process interfaces to Incident and Problem Management, Change Management, technical support, maintenance and Asset Management processes.	X	
11. Establish appropriate authorization controls for modifying configuration items and verify compliance with software licensing.	X	
12. Establish guidelines for physical and logical separation between development, test and production and the process for deploying and back-out of configuration items.		X
13. Develop procedures for establishing configuration baselines as reference points for rebuilds, and provide ability to revert to stable configuration states.	X	
14. Develop procedures for establishing security baselines as reference points for rebuilds, and provide ability to revert to stable configuration states.		X
15. Establish procedures for verifying the accuracy of configuration items, adherence to Configuration Management process and identifying process deficiencies.	X	
Build Roles and Responsibilities	**Contractor**	**County**
16. Implement and maintain configuration management policies and procedures.	X	
17. Establish a Change and Release Control Board (CRCB) that approve CM policies and their inclusion in Standards and Procedures in the County Standards and Procedures Manual, and shall approve or delegate approval of changes and releases of updates.	X	
18. Provide the County Standards and Procedures Manual for CRCB for County Approval.	X	
19. Approve the County Standards and Procedures Manual for CRCB.		X
20. Participate in Change and Release Control Board (CRCB) and review and approve CRCB activities and decisions.		X

Configuration Management Services Roles and Responsibilities		
21. Select, install and maintain configuration management tools.	X	
22. Ensure and follow change control and notification processes for installations, upgrades and adjustments to components, software and County processes.	X	
23. Establish appropriate authorization controls for modifying configuration items and verify compliance with software licensing.	X	
24. Establish guidelines for physical and logical separation between development, test and production and the process for deploying and regressing of configuration items.	X	
25. Establish configuration baselines as reference points for rebuilds, and providing ability to revert to stable configuration states.	X	
26. Establish process for verifying the accuracy of configuration items; adherence to configuration standards, management process and the identification of process deficiencies.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
27. Perform configuration management.	X	
28. Identify when configuration item changes or updates affect other services.	X	
29. Install manufacturer field change orders, service packs, firmware, and software maintenance releases, etc.	X	
30. Perform configuration management activities throughout the system life-cycle.	X	
31. Perform configuration management activities throughout the development life cycle.	X	
32. Perform configuration management and change management activities related to integration and testing.	X	
33. Perform product patch, “bug fix,” service pack installation or upgrades to the current installed version.	X	
34. Review configuration management results and accuracy of configuration data.		X
35. Correct any inaccurate configuration data and CIs.	X	

Configuration Management Services Roles and Responsibilities		
36. Maintain master copies of new versions in a secured software library and update configuration databases.	X	
37. Administer the version control system as it relates to release management of County Applications.	X	
38. Ensure that inventory and configuration management records are maintained and that all updates to County and Contractor records are reflected.	X	
39. Provide document version control for all documentation for which Contractor is responsible.	X	
40. Inform the County of changes through the weekly change and release control meetings and periodic integrated change status reporting. Each change request shall identify other related change requests to facilitate integrated reporting.	X	

2.16. Capacity Planning and Performance Management Services

2.16.1. Overview

Capacity Planning and Performance Management Services Framework Component of Cross Functional Services are the roles and responsibilities that support activities associated with optimizing the efficiency, effectiveness, capacity and technical performance of the Hardware and Software performing the Services. Capacity Planning and Performance Management Services will provide process of determining the resources required, will prevent performance or availability impact to County business, develop and manage services response time and quality of services for End-Users.

The Capacity Planning and Performance Management processes and activities are inter-related and complementary with Change Management and Release Management, as well as Incident Management and Problem Management.

2.16.2. High Level Requirements

2.16.2.1. Contractor shall monitor and manage systems to leverage and optimize the Services.

2.16.2.2. Contractor shall develop, deliver (for County approval), post on the Service Portal and continuously maintain all procedures and

processes related to Capacity Planning and Performance Management Services.

2.16.2.3. Contractor shall develop, deliver, post on the Service Portal and continuously maintain the Capacity Planning and Performance Management methodology.

2.16.2.4. Contractor shall own Capacity Planning and Performance Management end-to-end and across all Service Frameworks.

2.16.2.5. Contractor shall analyze historical resource usage by tracking and trending Hardware and Software performing the Services.

2.16.2.6. Contractor shall continuously perform capacity analysis across the Hardware and Software performing the Services.

2.16.2.7. Contractor shall develop, deliver (for County approval) and implement a capacity plan on an annual basis for Hardware and Software performing the Services.

2.16.2.8. Contractor shall develop, deliver (for County approval), and implement a on a monthly basis a list of tuning activities for Hardware and Software performing the Services.

2.16.2.9. Contractor shall continuously monitor, measure, forecast and post to the Service Portal capacity actuals, historical resource use trends and corrective actions on a monthly basis.

2.16.2.10. Contractor shall model short-term and long-term resource usage and performance based on proposed approved releases.

2.16.2.11. Contractor shall identify and implement improvements to better leverage existing capacity.

2.16.2.12. Contractor shall communicate potential capacity or performance Incidents to the County in advance, and implement approved solutions in a timely manner.

2.16.2.13. Contractor shall annually update and deliver the Capacity and Performance Management Services Management plan, for County approval, and posted on the Service Portal.

2.16.3. Roles and Responsibilities

The following table identifies the Plan Build and Operate roles and responsibilities associated with Capacity Planning and Performance Management Services.

Capacity Planning and Performance Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Conduct capacity planning activities that incorporate all Systems, sub-systems, and software, workload balancing, and resource allocation.	X	
2. Develop or provide tools to monitor capacity and performance.	X	
3. Review and approve tools to monitor capacity and performance.		X
4. Recommend changes to capacity to improve service performance.	X	
5. Approve capacity-related recommendations.		X
6. Produce and submit recommendations for changes to optimize capacity management.	X	
7. Review and approve changes to optimize capacity management.	X	
8. Produce and submit projections prior to the start of each contract year regarding estimated usage and loading for all Service Frameworks based on historical trends, anticipated new projects and decommissioning of systems, etc.	X	
9. Develop and maintain a capacity plan to meet the County's existing and future needs. The process components of the capacity Management plan shall include: • Application sizing • Resource forecasting • Demand forecasting • Modeling • Performance monitoring • Workload monitoring	X	
10. Perform Application capacity and performance planning by incorporating business projections provided by the County.	X	

Capacity Planning and Performance Management Services Roles and Responsibilities		
11. Perform capacity and performance planning on an ongoing basis when new business and application growth is anticipated, when changes to existing business requirements are anticipated or occur, or when system configuration changes are performed.	X	
Build Roles and Responsibilities	**Contractor**	**County**
12. Implement comprehensive capacity management planning process as well as tools to monitor capacity and performance.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
13. Maintain capacity levels to optimize use of existing resources and minimize County costs to deliver Services in accordance with the Service Levels.	X	
14. Monitor and manage capacity in all Service Frameworks to maximize performance and efficiency and to minimize service disruptions.	X	
15. Assess impact/risk and cost of capacity changes and submit mitigation recommendations.	X	
16. Continually monitor resource usage to enable proactive identification of capacity and performance Incidents.	X	
17. Capture trending information and forecast future County capacity requirements based on County defined thresholds.	X	
18. Assess capacity impacts when adding, removing or modifying Applications.	X	
19. Assess Incidents/Problems related to throughput performance.	X	
20. Recommend and perform approved DBMS tuning changes.	X	
21. Conduct periodic database reorganizations as indicated by usage and performance.	X	
22. Define and execute database performance and tuning scripts and keep database running at optimal performance for County's workload.	X	
23. Implement and administer appropriate database management tools across all database instances.	X	
24. Validate asset utilization and capacity efficiency.	X	
25. Participate in all capacity planning activities.		X

Capacity Planning and Performance Management Services Roles and Responsibilities		
26. Perform Framework Component tuning to maintain optimum performance in accordance with Change Management procedures.	X	

2.17. Disaster Recovery Management Services

2.17.1. Overview

The Disaster Recovery (DR) Framework Component within the Cross Functional Framework applies to the process for resumption of County business after a disruptive event. Disaster Recovery Management Services will provide strategy, process, type, methodology, locations, documentation and prompt restoration of the Services.

Disaster Recovery Management Services planned and implemented as part of the Data Center Framework. Types of DR to consider would be:

- Active/Active – synchronous
- Active/Passive – asynchronous
- Active/Passive – vault

Contractor shall propose a plan, during transition, to execute for Disaster Recovery Services. The plan should consider the following:

- Portfolio Applications priorities and RTO/RPO requirements
- Active/Active-synchronous methodology
- Active/Passive – asynchronous methodology
- Active/Passive – vault methodology
- Data Synchronization and replication plans
- Reduce licensing costs
- Validation that restoration times meet the requirement of the Service Levels

2.17.2. High Level Requirements

2.17.2.1. Contractor shall develop the type of DR that will be used to support the Services.

2.17.2.2. Contractor shall execute the DR plan upon County declaration of a disruptive event.

2.17.2.3. Contractor shall recover and resume full operations of Severity 1 applications, including all supporting infrastructure and network within 48 hours.

2.17.2.4. Contractor shall recover and resume full operations of Severity 2 applications, including all supporting infrastructure and network within 72 hours.

2.17.2.5. Contractor shall recover all County Data repositories with a data loss of no greater than 28 hours.

2.17.2.6. Contractor shall provide, for County approval, the initial and executable DR plan during the Transition period.

2.17.2.7. Contractor shall submit, for County approval, annual updates to the DR plan.

2.17.2.8. Contractor shall review the County's Business Continuity Plans and use in the development of the DR plan.

2.17.2.9. Contractor shall ensure the DR plan covers all the Service Frameworks.

2.17.2.10. Contactor shall adjust the DR plan with new items that the County, in writing, deems necessary.

2.17.2.11. Contractor shall implement the full DR plan prior to the conclusion of Transition.

2.17.2.12. Contractor shall implement changes, if any, within three (3) months related to the County approved annual DR plan.

2.17.2.13. Contractor shall update the DR plan based on technology related environmental changes and updates.

2.17.2.14. Contractor shall create, update and maintain working procedures for execution of the DR plan in the Standards and Procedures Manual.

2.17.2.15. Contractor shall perform an annual test of the DR plan.

2.17.2.16. Contractor shall provide a full report, for County approval, of the DR plan annual test.

2.17.2.17. Contractor shall correct any discrepancies discovered in the annual DR test within three (3) months Contractor shall develop and deliver a management plan, for County approval, during Transition and posted on the Service Portal.

2.17.2.18. Contractor shall annually update and deliver the Disaster Recovery Management Services Management plan, for County approval, and posted on the Service Portal.

2.17.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with DR Management Services.

DR Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit a DR plans that meets County requirements.	X	
2. Review and approve the DR plan that meets County requirements.		X
3. Produce and submit data recovery plan consistent with the County's business requirements.	X	
4. Review and approve data recovery plan.		X
5. Produce and submit at the start of each Contract Year a revised DR Plan to continually meet County objectives.	X	
6. Review and approve the yearly DR Plan.		X
7. Produce and submit a yearly DR test plan.	X	
8. Approve the DR test.		X
9. On an annual basis, review the prioritization of application portfolio and reclassify, if required, priority levels.	X	
10. Designate the criticality recovery level for each application in the County application portfolio.	X	

DR Management Services Roles and Responsibilities		
11. Review and approve the assigned criticality levels.		X
Build Roles and Responsibilities	**Contractor**	**County**
12. Design and implement DR plan.	X	
13. Design and implement data recovery plan.	X	
14. Coordinate the DR plans with the County Technology Office plans to address any potential disconnects or misunderstanding.	X	
15. Submit yearly DR test Plans to the County.	X	
16. Perform yearly DR test.	X	
17. Submit yearly DR test results to the County.	X	
18. Review and approve yearly DR test results.		X
19. Maintain and document requirements for off-site data storage.	X	
20. Review documentation for off-site data storage.		X
Operate Roles and Responsibilities	**Contractor**	**County**
21. Provide secure offsite storage for designated media and transport media to offsite location as required (include handling, storing, shipping, and receiving media).	X	
22. Ensure archived data is available for use in disaster recovery operations.	X	
23. Provide off-site backup media storage.	X	
24. Establish and maintain contracts for hot-site or cold-site availability as required, coordinate disaster recovery exercises to ensure readiness, and perform required recovery.	X	
25. Promote DR by meeting with the County's CIO, governance committees, the business managers, and the departments to provide appropriate communication during any DR operation.	X	
26. Perform scheduled DR tests per County policies, requirements and the DR Plan.	X	
27. Track and report DR test results to the County.	X	
28. Approve DR testing results.		X
29. Perform corrective action identified during the DR test and provide ongoing status until completion.	X	

DR Management Services Roles and Responsibilities		
30. Provide a written DR test and corrective action report to the County by a mutually agreed upon date each year.	X	
31. Execute DR Procedures when directed by an authorized representative of the County.	X	
32. Provide DR recovery within Service Levels from the time a disaster is declared for Priority 1 Applications.	X	
33. Provide DR recovery within the Service Levels from the time a disaster is declared for Priority 2 Applications.	X	
34. Provide DR recovery within the specified Service Levels from the time a disaster is declared for all required Applications to support Priority 1 and 2 Applications.	X	

2.18. Identity Access Management Services

2.18.1. Overview

Identity Access Management (IAM) Services Framework Component of the Cross Functional Framework applies to the business processes that facilitates the management of electronic identities. The IAM Framework Component includes all the technology, services and support needed to support identity management.

2.18.2. High Level Requirements

2.18.2.1. Contractor shall submit, for County approval, and implement an executable IAM plan to consolidate County identities into a single, federated IAM solution.

2.18.2.2. Contractor shall federate and maintain identities into the IAM solution per County Service Request.

2.18.2.3. Contractor shall provide, for County approval, the initial and executable IAM plan during the Transition period.

2.18.2.4. Contractor shall participate in architecture and strategy sessions with the County to determine and maintain the IAM roadmap.

2.18.2.5. Contractor shall develop automated workflow to manage access Service Requests.

2.18.2.6. Contractor shall implement automation tool for IAM to initiate, capture, record and manage End-User identities and their related access permission.

2.18.2.7. Contractor shall follow County policy in the provision of IAM Services

2.18.2.8. Contractor shall ensure that the IAM solution is reviewable and in compliance with any applicable regulatory process.

2.18.2.9. Contractor shall ensure the maintenance of overall security for the IAM solution.

2.18.2.10. Contractor shall track, maintain and review End-Users access privileges who migrate to different jobs within the County.

2.18.2.11. Contractor shall implement IAM with a centralized directory service that is scalable.

2.18.2.12. Contractor shall implement IAM to facilitate the process of user provisioning and account setup with a controlled and automated workflow.

2.18.2.13. Contractor shall provide monthly reporting on all changes to the IAM repository.

2.18.2.14. Contractor shall retain all Service Requests for IAM Services that can be used for review and reporting.

2.18.2.15. Contractor shall provide automated interface to County PeopleSoft application for employee IAM Services.

2.18.2.16. Contractor shall identify and manage non-County users distinctly from County employees.

2.18.2.17. Contractor shall provide attestation functionality to be used for identity management.

2.18.2.18. Contractor shall implement and maintain synchronization of all non-IAM End-User accounts across disparate applications or cloud-based services.

2.18.2.19. Contractor will continuously consolidate disparate End-User accounts into IAM.

2.18.2.20. Contractor shall implement IAM as the single solution for all County identity services.

2.18.2.21. Contractor shall provide the capability for Portfolio Applications to integrate and use the enterprise single sign-on.

2.18.2.22. Contractor shall maintain the Service Desk for all End-User IAM related Service Requests.

2.18.2.23. Contractor shall annually update and deliver the Identity Access Management Services Management plan, for County approval, and posted on the Service Portal.

2.18.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Identity Access Management Services.

Identity Access Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommended processes for Identity Access Management authentication and authorization.	X	
2. Review and approve processes for Identity Access Management authentication and authorization.		X
3. Produce and submit escalation procedures for quick termination.	X	
4. Review and approve escalation procedures for quick termination.		X

Identity Access Management Services Roles and Responsibilities		
5. Produce and submit End-User Identity Access Management architecture.	X	
6. Establish and manage process to support temporary access.	X	
7. Review and approve End-User Identity Access Management architecture.		X
8. Produce and submit annual End-User account consolidation plan.	X	
9. Review and approve annual End-User account consolidation plan.		X
10. Produce and submit the format for a report detailing all County End-User accounts and End-User data permissions.	X	
11. Review and approve the format for a report detailing all County End-User accounts and End-User data permissions.		X
12. Develop a service ordering process that clearly defines how to order change or delete services.	X	
13. Define logging and archiving policies and requirements.		X
Build Roles and Responsibilities	**Contractor**	**County**
14. Implement systems to centrally manage and maintain Account Management data and activities.	X	
15. Implement approved processes for Identity, Access and Account Management authentication and authorization.	X	
16. Implement reports detailing all County End-User accounts and End-User data permissions.	X	
17. Implement End-User account consolidation plan.	X	
18. Analyze account management architecture and the access control systems of the County's business applications, and develop and implement an End-User Account Consolidation Plan and End-User Identity, Access and Account Management architecture that provides a platform for account synchronization across the enterprise and across disparate systems.	X	
19. Implement End-User Account Management architecture.	X	
20. Implement escalation procedures for quick termination.	X	
21. Provide logging and archiving specifications/design.	X	

Identity Access Management Services Roles and Responsibilities		
22. Approve logging and archiving specification/design.		X
Operate Roles and Responsibilities	**Contractor**	**County**
23. Centrally maintain End-User accounts.	X	
24. Perform End-User account maintenance to include account creation, deletion or modification.	X	
25. Perform End-User account password resets.	X	
26. Perform End-User authorized data permission requests.	X	
27. Facilitate the receipt and tracking of requests for End-User account activation, changes and terminations.	X	
28. Facilitate the creation, change and deletion of End-User accounts.	X	
29. Coordinate as necessary with other specialized areas to manage End-User accounts.	X	
30. Maintain Access Control Lists (ACL) in accordance with policies.	X	
31. Provide report detailing all County End-User accounts and End-User data permissions on a monthly basis.	X	
32. Provide, update and maintain a reviewable record of security modifications and produce reports and notifications of End-User access modifications, transfers, and terminations.	X	
33. Provide support, including break-fix, for all Identity, Access and Account Management Services.	X	
34. On an annual basis, update the End-User Account Consolidation Plan to reflect progress toward reduction of User IDs and credentials, and to make recommendations for implementation of new technologies within the Identity, Access and Account Management architecture.	X	
35. Support and maintain Identity, Access and Account Management technology solution for infrastructure.	X	
36. Perform engineering, configuration and ongoing management of Identity, Access and Account Management technology solution.	X	
37. Log and archive User/account activity according to approved logging and archiving specification/design.	X	

Identity Access Management Services Roles and Responsibilities		
38. Periodically review production system access logs and activities to identify malicious or abnormal behavior in accordance with established County policies and standards.	X	
39. Periodically review all County account IDs to ensure the accounts are valid/required, removing inactive and unneeded accounts in accordance with established County policies and standards.		X
40. Periodically review all privileged User accounts to ensure the accounts are valid/required, removing inactive and unneeded accounts in accordance with established County policies and standards.	X	
41. Periodically review End-User accounts to ensure each User has appropriate minimal permissions required to perform their job function in accordance with established County policies and standards.	X	
42. Periodically review privileged User accounts to ensure each User has appropriate minimal permissions required to perform their job function in accordance with established County policies and standards.	X	

2.19. Reporting Management Services

2.19.1. Overview

Reporting Management Services Framework Component of the Cross Functional Framework applies to the activities associated with the development, generation and submission of deliverables defined in Schedule 5 of the Agreement.

In addition, Contractor shall report system management information (e.g., performance metrics, and System accounting information) to the County in an on-line dashboard and electronic reports.

2.19.2. High Level Requirements

2.19.2.1. Contractor shall provide accurate and timely reporting on performance, trends, Incidents, Assets, and other topics as required by the County.

2.19.2.2. Contractor shall provide, for County approval, the initial and executable Reporting Management Services Management Plan during the Transition period.

2.19.2.3. Contractor shall ensure Reporting Management Services is fully implement prior to the end of Transition.

2.19.2.4. Contractor shall update and maintain the Reporting Management Services Management Plan on an annual basis.

2.19.2.5. Contractor shall post the County approved, Reporting Management Services Management Plan to the Service Portal.

2.19.2.6. Contractor shall post all Schedule 5 deliverables to the Service Portal.

2.19.2.7. Contractor shall develop, with County approval, all deliverables are comprehensive and detailed.

2.19.2.8. Contractor shall maintain and provide electronic online dashboards on the Service Portal for Performance Metrics.

2.19.2.9. Contractor shall annually update and deliver the Reporting Management Services Management plan, for County approval, and posted on the Service Portal.

2.19.3. Roles and Responsibilities

The following table identifies the Plan Build and Operate roles and responsibilities associated with Reporting Management Services.

Reporting Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Define reporting requirements, format and frequency.		X
2. Assist the County to identify recurring reporting and format requirements to support the County's needs for information.	X	
3. Produce and submit Reporting operational policies and procedures based on County requirements.	X	

Reporting Management Services Roles and Responsibilities		
4. Review and approve Reporting operational policies and procedures based on County requirements.		X
5. Produce and submit recommendations for measurement and reporting of Service Levels.	X	
6. Review and approve recommendations for measurement and reporting of Service Levels.		X
7. Produce and submit required County reports.	X	
8. Review and approve required County reports.		X
Build Roles and Responsibilities	**Contractor**	**County**
9. Design and implement required County reports.	X	
10. Design and implement approved recommendations for measurement and reporting of Service Levels.	X	
11. Review and approve Service Level monitoring and Reporting procedures.		X
12. Implement Reporting operational policies and procedures.	X	
13. Design an automated notification system that periodically reminds the report owner of upcoming submission dates.	X	
14. Review and approve an automated notification system that periodically reminds the report owner of upcoming submission dates.		X
15. Implement the approved automated notification system that periodically reminds the report owner of upcoming submission dates. A summary of reports due within 30, 60, and 90 days must be provided.	X	
16. Design and implement a secure Service Portal that provides the County access to web-based, self-service, customer displays of key IT metrics in a dashboard view.	X	
17. Review and approve design for a secure Service Portal that provides the County access to web-based, self-service, personalized customer displays of key IT metrics in a dashboard view.		X
18. Design and implement an automated data collection and reporting system that supports the County of San Diego's yearly budgeting process, and give the County insight into the cost details of yearly operations.	X	

Reporting Management Services Roles and Responsibilities		
Operate Roles and Responsibilities	**Contractor**	**County**
19. Produce and submit all reports and other written deliverables specified in Schedule 5 or Schedule 4.3.	X	
20. Review and approve all reports and other written deliverables specified in Schedule 5 or Schedule 4.3.		X
21. Provide the County access and input to Incident and Problem tracking system to allow for Incident/Problem monitoring and ad hoc reporting.	X	
22. Provide management reports to County on the progress of the all refresh plans.	X	
23. Report on service performance improvement results.	X	
24. Provide County configuration management reports.	X	
25. Measure and Report monthly on each Service Levels.	X	
26. Report on Service Levels performance and improvement results.	X	
27. Coordinate Service Levels monitoring and reporting with designated County representative and Third-Parties.	X	
28. Measure, analyze and provide management reports on performance relative to Service Levels.	X	
29. Conduct Service Levels improvement meetings to review Service Levels and recommendation for improvements.	X	
30. Review and approve Service Levels improvement plans.		X
31. Implement Service Levels improvement plans.	X	
32. Review and approve Service Levels metrics and performance reports.		X
33. Provide the County access to performance and Service Levels reporting and monitoring system and data.	X	
34. Produce and submit monthly reporting on Applications, showing costs broken down by Plan, Build and Operate. The Operate costs needs to be broken down into the categories unscheduled maintenance, scheduled maintenance, administration, User support, and development and integration.	X	
35. Produce and submit trend information on defects, Service Requests and estimate accuracy.	X	

2.20. Domain Name Management Services

2.20.1. Overview

Domain Name Management Services Framework Component of Cross Functional Services includes the activities required to manage all County domain names in a centralized manner. The scope includes registering new domain names, maintaining the renewal schedule, reporting of all domain names, monitoring registered domain names, and insuring overall privacy of all domain names.

Domain names are unique names that identifies and organize County web services for End-Users or external users. Domain names registered with an accredited registrar provide internet based, common name translation to the actual IP address and access to the County service.

2.20.2. High Level Requirements

2.20.2.1. Contractor shall manage all domain names on behalf of the County.

2.20.2.2. Contractor shall use an accredited registrar for all domain name registrations.

2.20.2.3. Contractor shall assume ownership of all Domain Names.

2.20.2.4. Contractor shall register all domain names as requested by a Service Request.

2.20.2.5. Contractor shall comply with the County Standards and Procedures Manual for the procedure of registering, renewing and reporting of domain names.

2.20.2.6. Contractor shall not allow a domain name to expire without prior County approval.

2.20.2.7. Contractor shall notify the County POC at least 30 days in advance of the expiration date of any Domain Name.

2.20.2.8. Contractor shall annually update and deliver the Domain Name Management Services Management plan, for County approval, and posted on the Service Portal.

2.20.3. Environment

2.20.3.1. Portfolio of Domain Names

The Contractor shall maintain the Domain Names portfolio and include the following information in the Integrated Asset Management:

- Domain name ID
- Domain name
- Type / Extension
- Renewal Date
- High Org
- Low Org
- County POC Name, E-Mail and Phone
- Secondary County POC Name, E-Mail and Phone
- Registered Name Servers
- Responding Name Servers

2.20.3.2. Reports

Contractor will provide and post on the Service Portal a monthly report containing the following information:

- Total quantity of managed domain names
- Quantity of new domain names added in the last month
- Quantity of domain names transferred in the last month
- Quantity of domain names retired in the last month
- Quantity of domain names retained by the County
- Summary data for each domain name:
    - Domain name ID
    - Domain name
    - Type / Extension
    - Renewal Date
    - High Org

- Low Org
- County POC Name, E-Mail and Phone
- Secondary County POC Name, E-Mail and Phone

2.20.4. Roles and Responsibilities

The following table identifies the Plan Build and Operate roles and responsibilities associated with Domain Name Management Services.

Domain Names Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit procedures and methodologies for managing Domain Name Management Services.	X	
2. Review and approve procedures and methodologies for managing Domain Name Management Services.		X
Build Roles and Responsibilities	**Contractor**	**County**
3. Implement procedures and methodologies for managing Domain Name Management Services.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
4. Provide support, including break-fix, for all Domain Name Management Services.	X	
5. Manage and support Domain Name Management Services to meet operational and computing procedures.	X	
6. Provide and deliver monthly reports on Domain Name Management Services portfolio.	X	
7. Provide and deliver monthly notifications on renewals and expirations.	X	
8. Provide inventory reports and ensure the Integrated Asset Management sysytem contains the information for Domain Names managed by Contractor.	X	

2.21. Business Analyst Services

2.21.1. Overview

Business Analyst Services Framework Component of Cross Functional Services are the roles and responsibilities of helping County business implement technology solutions in a cost-effective manner. Business Analyst Services will provide development of business

cases, planning and monitoring, developing requirements, translating and simplifying requirements, management and communications of requirements and requirements analysis of behalf of the County business.

2.21.2. High Level Requirements

2.21.2.1. Contractor shall develop, deliver (for County approval), implement and post to the Service Portal the business analysis methodology.

2.21.2.2. Contractor shall deploy business analysts that will assist the County in transformation initiatives.

2.21.2.3. Contractor shall help County business implement technology solutions by determining requirements and communicating them effectively.

2.21.2.4. Contractor shall develop requirements management processes, tracking and reporting and documentation.

2.21.2.5. Contractor shall create Business Analyst Center that will develop relationships between Business Analysts, CTO and County business.

2.21.2.6. Contractor Business Analyst shall develop business requirements document in support of the County business engagement.

2.21.2.7. Contractor Business Analyst shall develop functional requirements in support of the County business engagement

2.21.2.8. Contractor shall annually update and deliver the Business Analyst Services Management plan, for County approval, and posted on the Service Portal.

2.21.3. Roles and Responsibilities

The following table identifies the Plan Build and Operate roles and responsibilities associated with Business Analyst Services.

Business Analyst Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit procedures and methodologies for Business Analyst engagement with County.	X	
2. Review and approve procedures and methodologies for Business Analyst engagement with County.		X
Build Roles and Responsibilities	**Contractor**	**County**
3. Implement procedures and methodologies for Business Analyst engagement with County.	X	
Operate Roles and Responsibilities	**Contractor**	**County**

2.22. Chief Technical Architect (CTA)

2.22.1. Overview

The Chief Technical Architect (CTA) Services Framework Component of Cross Functional Services describes the roles and responsibilities that support County business by providing fundamental technology and process structure and insights for IT and Telecommunications strategies and technology standardization and by providing visibility into infrastructure, applications, and data for County business. The CTA is designated as Key Personnel under the Agreement and will be staffed accordingly.

CTA shall provide architectural and technical leadership, oversight on all projects and develop a set of cognitive roadmaps to guide the progress of the County technology year over year.

The CTA provides the bridge between the deeply technical domain architects, business analysts and solution architects and other subject matter experts to ensure that the technology infrastructure meets enterprise goals, such as adaptability and complexity reduction.

The CTA, together with the Contractor EAA and Contractor CISO, will work directly with the CTO in the development and execution of architectural direction and strategy, develop and plan enterprise initiatives, identify and track emerging trends, identify and track internal Contractor Service catalog and changes to improve overall delivered Services, anticipate and understand transformative shifts in technology, develop and maintain

enterprise and departmental roadmaps, ability to access leveraged resource subject matter experts, maintain strong relationships with leading technology partners.

The CTA shall co-chair the CIO established Enterprise Architecture governance group with responsibilities to review all requirements documentation and designs, recommending, establishing and maintaining IT standards (e.g., Bricks), patterns, IT guiding principles, and communicating decisions to all Contractor IT staff. The CTA shall post all IT standards (bricks), patterns, and guiding principles on the Service Portal as changes occur and are approved by the Enterprise Architecture governance group. At the CIO's discretion, the core group of Enterprise Architecture governance, may consist of designated CTO staff, Contractor CTA, Contractor EAA and Contractor CISO and others as the CIO may designate.

The CTA shall have overall experience in technology architecture with an understanding of application and information architecture disciplines.

2.22.2. High Level Requirements

2.22.2.1. County shall retain authority on all matters related to overall IT Architecture.

2.22.2.2. Contractor shall recommend, for County approval, qualified CTA as Contractor Key Personnel.

2.22.2.3. Contractor CTA will work directly with CTO.

2.22.2.4. Contractor CTA will develop strategy and technical direction, approved by the County, and shall have oversight on all IT projects and Contractor support staff.

2.22.2.5. Contractor shall provide a full-time, dedicated Chief Technical Architect who shall support the County's architectural planning processes and ensure high standards of technical architecture and integration in new technology-based solutions implemented for the County.

2.22.2.6. Contractor CTA shall be responsible for executing the developed strategy including adherence to methodologies, standard processes, best practices, guiding principles, and standards.

2.22.2.7. Contractor CTA shall develop architecture planning that ties all aspects of the existing technical environment to a County business-consistent desired state.

2.22.2.8. Contractor CTA shall actively participate in all IT projects to ensure that they improve the capability and maturity of the Services.

2.22.2.9. Contractor CTA shall work directly with the EAA, the CISO and CTO to develop enterprise-wide standards and initiatives.

2.22.2.10. Contactor CTA shall develop, deliver, for County approval, all technology standards, guiding principles, patterns and design guidelines and criteria. The CTA shall continuously maintain them and post them on the Service Portal.

2.22.2.11. Contractor CTA shall co-chair, with CTO co-chair, the weekly Enterprise Architecture Governance meetings. This includes setting and tracking the agenda, documenting attendance, tracking minutes and decisions, uploading all documentation to the Service Portal, and other functions to ensure the success of the meeting.

2.22.2.12. Contractor CTA shall develop and deliver, for County approval, procedures and process for weekly Enterprise Architecture Governance meetings.

2.22.2.13. Contractor CTA shall work closely with Business Analyst Services to capture new or updated County business requirements as they are developed.

2.23. Enterprise Application Architect (EAA)

2.23.1. Overview

The Enterprise Application Architect (EAA) Services Framework Component of Cross Functional Services describes the roles and responsibilities that support County business by providing governance, review and approval of requirements, solutions, designs, technology, and architecture to integrate and optimize Portfolio Applications, interfaces and integrations across the enterprise. The EAA is designated as Key Personnel under the Agreement and will be staffed accordingly.

The EAA responsibilities include, but are not limited to: reviewing business and technical requirements, focusing on solution development throughout the project lifecycle, establishing and maintaining data standards, enterprise taxonomies, align with information management strategies and overall efforts to continuously improve the provision of Services.

The EAA shall manage and promote the use of County standards, related to software applications, promote the reusability of existing services and expanded use of County platforms, serve as a subject matter expert to projects and provide support for IT project teams. The EAA provides the bridge between County business and the IT staff that ensures that the application architecture meets business goals and objectives, that promotes reusability and provides data and interface connectivity across the Enterprise.

The EAA shall have overall experience in business and application architecture disciplines with an emphasis on information architecture with an understanding of technical architecture.

2.23.1. High Level Requirements

2.23.1.1. Contractor shall recommend, for County approval, qualified Enterprise Application Architect (EAA) as Contractor Key Personnel.

2.23.1.2. Contractor EAA shall work directly with CTO.

2.23.1.3. Contractor EAA shall serve as a technology lead and liaison to County business in developing and linking technical solutions that meet requirements.

2.23.1.4. Contractor EAA shall act as a subject matter expert on the effective use of technology in developing County business solutions.

2.23.1.5. Contractor EAA shall advise IT staff regarding the feasibility of proposed approaches to project solutions in terms of systems capabilities and established application architecture guidelines and standards.

2.23.1.6. Contractor EAA shall review all requirement documents and solution designs and recommend for approval to CTO prior to any development project actions.

2.23.1.7. Contractor EAA shall review all data and information architecture to ensure that data and interfaces are optimized for application use.

2.23.1.8. Contractor EAA shall work directly with the CTA, the CISO and County CTO to develop enterprise-wide standards and initiatives.

2.23.1.9. Contractor EAA, at CIO direction, shall be a member of the Enterprise Architecture Governance Group and will participate in all scheduled meetings.

2.23.1.10. Contractor EAA shall research and track emerging technologies and concepts for solving business problems not addressed in existing, deployed technology.

2.23.1.11. Contractor EAA shall recommend standards, guiding principles and best practices for deploying business and technology solutions.

2.23.1.12. Contractor EAA shall identify gaps between current and desired end-states and recommend solutions that close and provide greater efficiencies.

2.24. Innovation Management Services

2.24.1. Overview

The Innovation Management Services Framework Component of Cross Functional Services describes the roles and responsibilities that support the continuous innovation of County business. Innovation Management Services shall have a designated Innovation Officer as Key Personnel under the Agreement and will be staffed accordingly.

Innovation Management Services shall establish a culture and environment of progressive change throughout the term of the Agreement. The Contractor shall adopt a model of continuous innovation or transformation that allows progressive change in how the Services are delivered. This includes, but is not limited to, delivering Services via a bimodal approach, with an emphasis on exploration, agility, and speed, while still maintaining operational integrity and stability.

Innovation Management Services consist of a series of initiatives in which the Contractor will develop solutions, business case analyses, proposed pricing, possible changes to the Agreement, and project timelines and resources. The proposed initiatives will be reviewed by the Innovation Management Review Board and, if approved, shall be executed using agile and rapid-prototyping methodologies.

Innovation Management Services shall include an Innovation Management Office that will serve as the foundation for continuous business improvement, innovation, and transformation. The Innovation Office shall be the hub of a set of processes, governance, and resources to sustain innovation activities, and create a true environment of agility and high-velocity change at the County, supported by the Operational and steady-state teams.

2.24.2. High Level Requirements

2.24.2.1. Contractor shall recommend, for County approval, qualified Innovation Officer (IO), as Contractor Key Personnel.

2.24.2.2. Contractor IO shall work directly with the CTO and interface directly with County business leaders.

2.24.2.3. Contractor IO will provide recommendations to staff Innovation Management Services, with County approval, starting in Year 2 of this Agreement.

2.24.2.4. Contractor AE and CIO will chair the Innovation Management Review Board (TRB) and shall have joint approval on all proposed innovation initiatives and activities.

2.24.2.5. Contractor IO and CTO shall work with the CIO and County business to get a clear understanding of the strategy, business model and direction of the County.

2.24.2.6. Contractor IO shall develop, for County approval, charter, rules of engagement, success criteria and governance process for Innovation Management Services that shall include, but not limited to, lab environment (Dev/Ops), pilot process for rapid prototyping, joint development workshops, flexible and agile process (e.g., moving to micro services or containers), renovating existing systems (e.g., Hyperconverged infrastructure).

2.24.2.7. Contractor IO shall work with the EA function to understand the business outcomes and business capabilities the County is seeking to create.

2.24.2.8. Contractor IO shall build a collaborative cross-functional Innovation Management Services core team to help drive IT innovation and transformation; create the organizational and governance model needed to drive business innovation.

2.24.2.9. Contractor IO shall track technology innovations and trends, and identify what the opportunities are for the County.

2.24.2.10. Contractor IO shall work with the internal Contractor and County IT teams, key vendors and consultants to shape a roadmap for technology innovation.

2.24.2.11. Contractor IO shall serve as a technology lead and liaison to County business in developing and linking technical solutions that meet requirements.

2.24.2.12. Contractor shall develop the process and governance to enable the continuation of progressive change within the County.

2.24.2.13. Contractor shall continuously look for opportunities to propose innovative and transformational initiatives.

2.24.2.14. Contractor shall perform an annual assessment of Innovation Management Services, for County review and approval.

2.24.2.15. Contractor shall identify potential impacts to the Agreement and propose recommended changes based on innovation initiatives.

3. SERVICE DESK SERVICES

3.1. Overview

This section pertains to the Service Desk Services Framework. Service Desk Services consist of Plan, Build, Operate centralized services to triage, process, track, report, and resolve End-User Incidents, Service Requests and requests for information.

The Service Desk is the single point of contact (SPOC) between End-Users and the Contractor on a day-to-day basis. The Service Desk will be the focal point for reporting, logging Incidents and Service Requests for End-Users and for providing self-help information. The Service Desk shall have a high degree of interactions with End-Users, in various forms, and shall ensure that End-Users receive all services in a timely manner, 24/7/365.

The Service Desk shall provide and maintain a Service Portal that provides communications and information to all End-Users. The Service Portal will assist End-Users in entering Service Requests, reviewing current or resolved Incidents, provide user tips and FAQs on the Services and self-service functions (i.e. password resets).

The Service Desk shall support and maintain the Service Request Management Service. The Service Request Management Service shall be the system used by End-Users for installing new services, modifying current services, moving services or removing services and acts as the primary request function tool across all Frameworks.

3.2. High Level Requirements

3.2.1. Contractor shall recommend, for County approval, qualified Service Desk Manager as Contractor Key Personnel to manage Service Desk Services.

3.2.2. Contractor shall continuously improve customer service interactions and ratings.

3.2.3. Contractor shall continuously improve Incident response time and Incidents resolution.

3.2.4. Contractor shall log, track, and resolve all Incidents and Service Requests submitted from End-Users.

3.2.5. Contractor shall continuously improve County efficiency and effectiveness by providing and utilizing knowledge databases and best practices in the areas of reporting, logging, tracking, routing, resolving and reporting of Incidents and Service Requests.

3.2.6. Contractor shall develop and deliver, for County approval, chat functionality for End-Users engaging the Service Desk.

3.2.7. Contractor shall perform a closed feedback loop process, so that the handling of Incidents that are to be incorporated into lessons learned, best practices, and appropriate solutions to improve economies, efficiencies, and performance.

3.2.8. Contractor shall ensure proficient and highly skilled Service Desk support with appropriate knowledge of the Services.

3.2.9. Contractor shall provide and post all communication of modifications to the Services on the Service Portal.

3.2.10. Contractor shall provide and post all Service Levels and Service Desk statistics in a real-time, up-to-date dashboard posted on the Service Portal.

3.2.11. Contractor shall maintain a repository for all Service Desk scripts and maintain a cycle for updates and accuracy.

3.2.12. Contractor shall create and maintain a Service Portal that allows County End-Users the following:

- Access the Service Portal from the internet and the County intranet
- Create and submit Incidents and Services Requests
- View a list of all Incidents and Services Requests
- Allow End-Users to change and reset passwords
- View an up-to-date knowledge base with solutions, tip sheets and Frequently asked Questions (FAQs)
- View Countywide announcements related to the Services
- Access all Contractor deliverables

3.3. Environment

The following further describe and scope Service Desk Services elements supported by Contractor and with which Contractor shall comply.

3.3.1. Technology Refresh

Contractor shall ensure Service Desk Services maintain technical currency and refresh of all Hardware and Software used to support the Services unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

3.4. Roles and Responsibilities

3.4.1. General Roles and Responsibilities

The following table identifies the Plan, Build and Operate Service Desk Plan roles and responsibilities that Contractor and County shall perform.

Service Desk Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit Service Desk solutions that best meet County business needs and service–level requirements.	X	
2. Review and approve Service Desk solutions and Service Levels.		X
3. Perform operational planning for Service Desk capacity and performance purposes.	X	
4. Perform analysis of County environment to identify the appropriate sets of skills, training, and experience needed by Service Desk staff.	X	
5. Produce and submit operational policies and procedures including escalation.	X	
6. Review and approve operational policies and procedures.		X
7. Develop Self-Help requirements and policies with input from County.	X	
8. Review and approve Self-Help requirements and policies.		X
9. Develop, document and maintain in the Standards and Procedures Manual Self-Help Support Contractor procedures that meet County requirements and adhere to County policies.	X	

Service Desk Roles and Responsibilities		
10. Review and approve Self-Help procedures.		X
11. Develop and improve Service Desk scripts as appropriate to improve performance.	X	
12. Provide all testing services required to support Service Desk Services.	X	
13. Produce and submit all test documentation to County.	X	
14. Provide all deployment services required to support Service Desk Services.	X	
15. Produce and submit to County all deployment documentation.	X	
16. Review and approve all deployment documentation.		X
Operate Roles and Responsibilities	**Contractor**	**County**
17. Provide appropriately trained Service Desk staff.	X	
18. Identify and report all recurring Incidents.	X	
19. Implement and coordinate the RCA process on Incidents and Problems in conjunction with Incident and Problem Management process.	X	
20. Perform RCA of Incidents; document findings and take corrective actions for the Services. Resolve Problems and/or substantiate that all actions taken to prevent future reoccurrence.	X	
21. Manage all Services Requests from inception to closure (e.g., recording, troubleshooting, escalating, coordinating, resolving, reporting, closing).	X	
22. Manage Incidents end-to-end.	X	
23. Provide Service Desk Services, including provision, operation and maintenance of integrated Service Desk Systems (e.g., ACD, electronic workflow, Incident Management, self-help and self-heal, knowledge database, remote desktop control, procurement management, automated provisioning) necessary to document, track and manage Incidents and Service Requests, inquiries and Incident notifications from inception to closure across Service Frameworks using cross functional processes.	X	
24. Maintain and provide Service Desk operational policies and procedures in the Service Desk knowledge database.	X	
25. Review and approve Service Desk operational policies and procedures.		X

Service Desk Roles and Responsibilities		
26. Manage and track Incidents and Service Requests that involve multiple Service Frameworks and Third-Parties and collaborate with Third-Parties to resolution and closure.	X	
27. Provide Third-Party access to the Service Desk as required to support Incidents and Service Requests (e.g. change management, Integrated Asset Management System functions).	X	
28. Utilize Service Desk to resolve Incidents and perform Service Requests (e.g., change management, Integrated Asset Management System functions).	X	
29. Provide support for inquiries on the features, functions and usage of all Portfolio Applications and OIC items in use at County.	X	
30. Perform administration services such as creating, changing and deleting End-User desktop profiles.	X	
31. Provide Self-Help services for End-Users that includes the following, at a minimum: • Password reset tool • Service Request entry, tracking, reporting, updating and status checking	X	
32. Posting of content for current Incidents, frequently asked questions, knowledgebase, and other similar elements to the Service Portal.	X	
33. Monitor and review the effectiveness and usage to End-User self-service on the Service Portal.		X
34. Develop and provide recommendations for improvements to End-User self-service on the Service Portal.	X	
35. Review and approve recommendations for improvements to End-User self-service on the Service Portal.		X
36. Implement approved recommendations for improvements to End-User self-service on the Service Portal.	X	
37. Produce and submit proposed changes to Service Desk processes, operations and procedures.	X	
38. Review and approve proposed changes to Service Desk processes, operations and procedures.		X

Service Desk Roles and Responsibilities		
39. Conduct quality assurance reviews of Service Desk documentation for accuracy and currency annually or as requested by the County.	X	
40. Develop a priority-driven Service Request handoff process consistent with defined tiers of support.	X	
41. Review and approve priority-driven Service Request handoff process for the defined tiers of support.		X
42. Recommend Service Request and Incident Management procedures.	X	
43. Identify and describe priorities, response and resolution targets for Incidents and Service Requests that have differing impacts.		X
44. Develop, document and maintain Request and Incident Management procedures in the Service Desk operational policies and procedures.	X	
45. Review and approve Service Request and Incident Management procedures.		X
46. Select and implement Software and Hardware (e.g., IVR, ACD) needed to collect, track and manage Service Requests and Incidents received by the Service Desk.	X	
47. Verify that all requests are resolved, per the End-User, prior to closure.	X	
48. Develop and maintain a list of supported Portfolio Applications including priority level and key contacts.	X	
49. Review and approve the list of supported Portfolio Applications to handle calls and routing of Incident.		X

3.4.2. Single Point-of-Contact (SPOC) Roles and Responsibilities

Single Point of Contact (SPOC) services provide toll-free support for logging, tracking, resolution and reporting of Incidents and Service Requests for the Services.

The following table identifies any Plan, Build and Operate SPOC roles and responsibilities that Contractor and County shall perform.

Single Point-of-Contact Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**

Single Point-of-Contact Roles and Responsibilities		
1. Recommend SPOC procedures.	X	
2. Review and approve the SPOC procedures.		X
3. Develop, document and maintain the Service Desk knowledge database with all scripts and information needed to provide Service Desk Services.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
4. Provide access to the Service Desk knowledge database from the Service Portal to End-Users.	X	
5. Provide SPOC call-in access via a toll-free number for the Services.	X	
6. Provide SPOC and coordination for all Incidents and requests for information and Service Requests.	X	
7. Provide multiple alternative communications channels (from the Service Portal), including voice messages, E-Mail, Internet, and chat.	X	
8. Initiate Incident management process for Severity 1-3 Incidents.	X	

3.4.3. Remote Device and Software Management Roles and Responsibilities

Remote Device and Software Management Services are the activities associated with managing, maintaining and troubleshooting Hardware and Software remotely and securely over the network to minimize the need to dispatch technical personnel on-site.

The following table identifies any Plan, Build, and Operate Remote Devices and Software Management roles and responsibilities that the Contractor and County shall perform.

Remote Device and Software Management Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit procedures for the Service Desk use of Remote Device and Software Management control tools.		X
2. Develop, document and maintain in the Service Desk operational policies and procedures Service Desk Remote Device and Software Management procedures that meet requirements and adhere to defined policies.	X	
3. Review and approve Remote Device and Software Management procedures.		X

Remote Device and Software Management Roles and Responsibilities		
Operate Roles and Responsibilities	**Contractor**	**County**
4. Each use of Remote Device and Software Management tools shall have End-User authorization.	X	
5. Diagnose Incidents using remote control tools and, when possible, implement remote corrective actions to resolve Incidents. If Resolution is not possible, escalate per the escalation procedures.	X	
6. Utilize remote controls to manage and update software, maintain configuration and inventory information, and enforce compliance standards.	X	

3.4.4. End-User Administration Services Roles and Responsibilities

End-User Administration Services are the activities associated with managing and coordinating account activation, termination, changes and expiration, and the management for End-Users.

The following table identifies any Plan, Build and Operate End-User Administration roles and responsibilities that Contractor and County shall perform.

End User Administration Services Roles and Responsibilities		
Operate Roles and Responsibilities	**Contractor**	**County**
1. Facilitate employee End-User account administration, activation, changes and terminations, including: password/account setup and reset, remote access connectivity, E-Mail accounts, End-User IDs, password resets, remote paging devices, voicemail administration, telephone lines, secure ID cards, OIC requests, etc.	X	
2. Prioritize calls to and from High Response End-Users identified in the Standards and Procedures Manual.	X	
3. Provide and maintain County escalation contact list(s).		X
4. Provide and maintain Contractor escalation contact list.	X	
5. Provide and maintain Service Desk staff access to the County Directory.	X	
6. Issue communications to Service Portal and provide status updates as required for planned and unplanned events.	X	

End User Administration Services Roles and Responsibilities		
Operate Roles and Responsibilities	**Contractor**	**County**
7. Record and maintain an up-to-date System status message that can be selected when calling the Service Desk for assistance.	X	
8. Provide End-User online status access for all requests via the Service Portal.	X	
9. Work with the Contractor operational and technical staff, as well as County, to identify solutions that minimize the need to call the Service Desk (e.g., additional End-User training, self-help opportunities).	X	
10. Approve solutions that minimize the need to call the Service Desk.		X
11. Dispatch on-site technicians as necessary.	X	
12. Categorize, prioritize and log all Incidents, Service Requests and inquiries.	X	
13. Monitor Incidents and escalate per policies and procedures until resolution.	X	
14. Diagnose and troubleshoot Incidents at the Service Desk and prior to escalation.	X	

3.4.5. IMAR (Install, Move, Add, Remove) Services Roles and Responsibilities

IMAR Services are the activities associated the end-to-end management and coordination of IMAR Service Requests including gathering the business requirements, providing authorization, logging the request, and facilitating fulfillment. All authorized IMAR requests passed automatically to the Service Desk. Examples of IMARs include, without limitation, adding Desktop Computing devices or moving network printers or a telephone handset.

The following table identifies any Plan, Build and Operate IMAR roles and responsibilities that Contractor and County shall perform.

IMAR Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit IMAR procedures for all Frameworks.	X	

IMAR Services Roles and Responsibilities		
2. Develop, document and maintain in the Service Desk operational policies and procedures the IMAR procedures.	X	
3. Review and approve IMAR procedures for all Frameworks.		X
Operate Roles and Responsibilities	**Contractor**	**County**
4. Receive and track IMAR Service Requests.	X	
5. Utilize workflow to coordinate and help perform End-User notifications and scheduling related to IMAR Service Requests.	X	
6. Confirm the requirements and scope and acquire County approval of the IMAR Service Request.	X	
7. IMAR Service Requests shall be scheduled to meet the requirements of the Service Levels.	X	
8. Approve IMAR schedule.		X
9. Coordinate approved IMAR Service Requests with Service Desk.	X	
10. Track and report status of IMAR Service Requests.	X	
11. Contact End-User to confirm completion of the IMAR Service Request.	X	
12. Verify completion of the IMAR Service Request.		X

3.4.6. Tracking and Reporting Roles and Responsibilities

The following table identifies the any Plan, Build and Operate IMAR requirements, roles and responsibilities that the Contractor and County shall perform.

Tracking and Reporting Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Annually, or as requested, recommend a list of Service Desk management reports (including standard industry KPIs).	X	
2. Review and approve updates to Service Desk management reports.		X
Operate Roles and Responsibilities	**Contractor**	**County**
3. Analyze and report on Incident trends and patterns on a monthly basis.	X	

Tracking and Reporting Roles and Responsibilities		
4. Monitor and report on Service Desk statistics and trends (e.g., Service Request volumes and trends by types of End-Users) for inclusion in the Service Portal Dashboard and Service Level reporting.	X	
5. Continuously review Incident data to detect trends, help manage high-severity Incidents and monitor training needs.	X	
6. Review report results and Service Desk operations on a monthly basis.		X
7. Provide online/access to Service Desk reports via the Service Portal.	X	
8. Track/manage/report Service Desk utilization.	X	
9. Report, monthly or sooner, repetitive Incidents, abnormal patterns of calls, and resolution recommendations.	X	
10. Review and approve recommended resolutions to the repetitive Incidents and abnormal patterns of calls.		X
11. Conduct Service Desk End-User customer satisfaction surveys on a random sample of Incidents (including both open Incidents and Incidents closed from the previous month) via an E-Mail/web-based tool.	X	
12. Provide results monthly of Service Desk End-User customer satisfaction surveys in the Service Portal.	X	
13. Produce and report on all aging Incidents and Service Requests on a monthly basis.	X	
14. Process and produce immediately tracking numbers for all reported Incidents.	X	
15. Provide reports by Enterprise, Group, Department, or Division level in the Contractor-maintained dashboard for Service Desk provided reports, statistics, and views.	X	

3.5. Service Request Management Services

3.5.1. Overview

This section pertains to the Service Request Management Services Framework Component in the Service Desk Services Framework. Service Request Management Services includes all of the services required to: enter, process, status, report Service Requests from the

County; coordinate Contractor activities to provide the Service Request; and coordinate with Third-Parties to provide the Service Request.

The Service Request Management Services is the single point tool used by End-Users to request services from the Contractor.

3.5.2. High Level Requirements

3.5.2.1. Contractor shall provide efficient and effective electronic processing of County Service Requests.

3.5.2.2. Contractor shall work with the County to develop and implement workflow policies and procedures that provide appropriate efficiency, security, and control of Service Requests.

3.5.2.3. Contractor shall coordinate its own, Subcontractor, and Third-Party resources to Service Requests.

3.5.2.4. Contractor shall provide the Service Request Management tool used to deliver the Service Request Management Services.

3.5.2.5. Contractor shall provide prompt updates to the Service Request Management tool to ensure accuracy of information presented to County End-Users.

3.5.2.6. Contractor shall provide prompt logging and routing of all Service Requests.

3.5.2.7. Contractor shall ensure that all Service Requests are accurately reported.

3.5.2.8. Contractor shall report on a monthly basis all open Service Requests.

3.5.2.9. Contractor shall process Service Requests in accordance to priorities set Standards and Procedures Manual.

3.5.2.10. Contractor shall provide solutions that meet the requirements specified by the Service Request.

3.5.2.11. Contractor shall use Service Requests to manage the workflow of all maintenance tasks and projects including the following:

- Create Service Requests to perform preventive and corrective maintenance
- Purchase parts and materials and committing inventory to a Service Requests
- Tracking the progress of a Service Requests by status
- Tracking all Service Requests costs
- Completing and closing each Service Request

3.5.2.12. Contractor shall provide access to County End-Users on the status (both current and historical) of Service Requests.

3.5.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Service Request Management Services.

Service Request Management Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations for Service Request operational policies and procedures.	X	
2. Review and approve recommendations for Service Request operational policies and procedures.		X
3. Produce and submit the Service Request Management Services design.	X	
4. Review and approve the Service Request Management Services design.		X
5. Produce and submit closed loop methodology for workflow entry, tracking and closing for Service Requests.	X	
6. Review and approve closed loop methodology for workflow entry, tracking and closing for Service Requests.		X

Service Request Management Roles and Responsibilities		
7. Produce and submit recommended monthly report format for Service Request.	X	
8. Review and approve monthly report format for Service Request.		X
Build Roles and Responsibilities	**Contractor**	**County**
9. Implement a closed loop processing for workflow entry, tracking and closing of the Service Requests.	X	
10. Implement the Service Request Management Services design	X	
11. Implement approved Service Request operational policies and procedures.	X	
12. Implement monthly Service Request reporting.	X	
13. Implement and maintain a service ordering process that clearly defines how to order, change or delete services.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
14. Ensure that all Service Requests are routed to the appropriate parties for timely resolution.	X	
15. Provide status, upon request of the County, of all Service Requests.	X	
16. Ensure applicable Service Requests are properly authorized and prioritized.	X	
17. Authorize closure of all Service Requests.		X
18. Manage efficient workflow of Service Request including the involvement of Third-Parties.	X	
19. Process all Service Requests.	X	
20. Update, as needed, the Service Request Management Services design for operational and technical currency.	X	
21. Produce and submit monthly reports detailing all Service Requests.	X	
22. Manage Service Request assignments throughout Service Frameworks and associated workflows as part of Service Desk responsibility.	X	
23. Make changes to the Service Request Management Services to account for all changes in the Services (e.g. new resource units, updated OIC) within 5 business days.	X	

4. END-USER SERVICES

4.1. Overview

This section pertains to the End-User Services Framework. End-User Services are composed of the following Framework Components:

- Desktop Computing Services
- Core Software Services
- County Retained Assets Services
- Mobile Device Support Services
- Unified Communications Services
- Catalog Services
- Network Printer Services
- Electronic File Synchronization and Sharing

4.2. High Level Requirements

4.2.1. Contractor shall recommend, for County approval, qualified End-User Service Manager as Contractor Key Personnel to manage End-User Services.

4.2.2. Contractor shall meet County business needs for highly available, reliable and secure End-User Services.

4.2.3. Contractor shall provide centralized management and control of all End-User Services.

4.2.4. Contractor shall improve End-User productivity and customer satisfaction in providing End-User Services.

4.2.5. Contractor shall continuously improve End-User Services and Service Levels.

4.2.6. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to operational and technical improvements of End-User Services.

4.2.7. Contractor shall develop training documentation and End-User FAQs and post them on the Service Portal.

4.2.8. Contractor shall continuously develop, use, maintain and update help desk scripts and processes for End-User Services support.

4.2.9. Contractor shall provide technology assistance and support to the County in planning and standard-setting activities.

4.2.10. Contractor shall standardize Hardware and Software across End-User Services.

4.2.11. Contractor shall improve asset tracking and reporting and shall provide updates to the Integrated Asset Management System.

4.2.12. Contractor shall support County's business initiatives by ensuring high performance with End-User Services.

4.2.13. Contractor shall provide Incident determination, Root Cause Analysis and Resolution for all End-User Services.

4.2.14. Contractor shall provide IMAR Services for the End-User Services.

4.2.15. Contractor shall maintain updated and publish End-User Services standards in the Standards and Procedures manual posted on the Service Portal.

4.3. Environment

The following further describe and scopes End-User Services elements supported by Contractor and with which Contractor shall comply.

4.3.1. Technology Refresh

Contractor shall refresh End-User Services as specified within each Framework Component, unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

4.4. Roles and Responsibilities

4.4.1. Install, Move, Add, Remove (IMAR) Services Roles and Responsibilities

IMAR Services consist of Service Requests made by End-Users for initial deployment and provisioning of Hardware, Software, office moves, etc. The Contractor shall provide IMAR activities for the End-User Services Framework. All IMAR activities require prompt updates to the Contractor's Integrated Asset Management tracking system and monitored by the Service Desk.

The following table identifies the IMAR Services roles and responsibilities that the Contractor and County shall perform.

IMAR Services Roles and Responsibilities		
General Roles and Responsibilities	**Contractor**	**County**
1. Develop and document in the Standards and Procedures Manual IMAR procedures.	X	
2. Review and approve IMAR procedures.		X
3. Conduct pre-installation and site survey activities (e.g., Network connectivity, power, data jack preparation) in accordance with the IMAR procedures and specific Service Request.	X	
4. Perform Hardware and Software IMARs and re-installations in accordance with the Service Request, IMAR procedures and other application policies (e.g., security policies).	X	
5. Conduct data and application migration that is necessary due to any Hardware or Software IMARs and re-installations.	X	
6. Update all Cross Functional management tools (e.g., Integrated Asset Management database) with required data and Close an IMAR Service Request.	X	
7. Provide basic End-User or technical staff orientation as needed when installing a new End-User Asset.	X	
8. Coordinate with Service Desk and all other necessary Third-Party and County support organizations to manage all IMAR Service Requests to resolution and closure.	X	
9. Coordinate the disposal of obsolete Assets at the direction of the County.	X	

IMAR Services Roles and Responsibilities		
10. Conduct End-User satisfaction survey after the completion of each IMAR Service Request and End-User Assets refresh.	X	
Install Roles and Responsibilities	**Contractor**	**County**
11. Order and deliver the End-User Services Asset to the End-User workspace.	X	
12. Install the End-User Services asset, including configuration, setup, and network connection.	X	
13. Perform all diagnostic testing to ensure End-User Services Framework asset functionality.	X	
14. Remove any boxes and/or packing materials.	X	
15. Promptly update Integrated Asset Management System to ensure accuracy of asset tracking.	X	
16. Provide basic End-User or technical staff orientation when installing a new End-User Asset.	X	
Move Roles and Responsibilities	**Contractor**	**County**
17. Provide move services within a Location or from a Location to a Location, for any End-User Services Asset, which includes disconnecting, moving and reconnecting asset in accordance with the Service Request.	X	
18. Perform all diagnostic testing to ensure End-User Services asset functionality.	X	
19. Promptly update Integrated Asset Management System to ensure accuracy of asset tracking.	X	
Add Roles and Responsibilities	**Contractor**	**County**
20. Provide upgrade or add Hardware or Software to deployed End-User Services Assets in accordance with the Service Request.	X	
21. Modify current configurations to deployed End-User Services Assets to meet approved standards.	X	
22. Promptly update Integrated Asset Management System to ensure accuracy of asset tracking.	X	
Remove Roles and Responsibilities	**Contractor**	**County**
23. Provide Remove Services for End-User Services Assets that are being displaced due to Service Request, refresh or Incident.	X	

IMAR Services Roles and Responsibilities		
24. Promptly update Integrated Asset Management System to ensure accuracy of asset tracking.	X	

4.4.2. On-Site Technical Support Roles and Responsibilities

On-Site Technical Support consists of activities conducted on-site with End-Users to resolve Incidents, execute IMARs or other Service Requests.

The following table identifies the Plan, Build and Operate requirements, roles and responsibilities associated with On-Site Technical Support Services.

On-Site Technical Support Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit On-Site Technical Support requirements and procedures.	X	
2. Develop and document in the Standards and Procedures Manual On-Site Technical Support procedures.	X	
3. Review and approve On-Site Technical Support requirements and procedures.		X
Build Roles and Responsibilities	**Contractor**	**County**
4. Establish and maintain appropriate equipment sparing requirements and spares inventory levels for On-Site Technical Support.	X	
5. Coordinate with the Service Desk and all other necessary Contractor, Third-Party and the County support organizations to manage all On-Site Technical Support requests to Resolution and Closure.	X	
6. Coordinate with End-User or other site staff to schedule On-Site Technical Support visit in response to an Incident or Service Request.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
7. Dispatch appropriate Tier 2 or Tier 3 technician(s) in response to an escalated Incident or Service Request.	X	
8. Troubleshoot, diagnose and resolve Incidents for all devices, including removing and/or repairing physically broken or inoperable devices or servers.	X	

On-Site Technical Support Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
9. Conduct appropriate tests of all repaired device or server to ensure the device or server is operating appropriately.	X	
10. Obtain End-User acknowledgment for completion of Service Request.	X	

4.4.3. End-User Services Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with End-User Services.

End-User Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Recommend and submit Hardware and Software standards for End-User Services Assets.	X	
2. Review and approve Hardware and Software standards for End-User Services Assets.		X
3. Identify, recommend and submit End-User Services solutions that best meet County's business needs.	X	
4. Review and approve End-User Services solutions.		X
5. Perform and deliver operational planning for End-User Services capacity and performance purposes.	X	
6. Recommend and submit Hardware and Software deployment/management policies and procedures.	X	
7. Review and approve Hardware and Software deployment/management policies and procedures.		X
8. Recommend and submit Hardware and Software upgrades to End-User Services Assets.	X	
9. Review and approve Hardware and Software upgrades to End-User Services Assets.		X
10. Recommend and submit updates and patches plan to End-User Services Assets.	X	
11. Review and approve updates and patches plan to End-User Services Assets.		X
12. Update and provide to Contractor a list of high response End-Users.		X

End-User Services Roles and Responsibilities		
13. Produce and submit preventive maintenance plans consistent with OEM practices. Plans shall include equipment model and manufacturer, frequency of PM, and specific actions to be taken such as cleaning, lubricating, adjusting, inspecting, running diagnostic tests, and replacing all parts and components defined by OEM as non-User replaceable or consumable necessary to keep the equipment functioning within the OEM specifications.	X	
14. Review and approve preventive maintenance plans.		X
15. Produce and submit recommendations for "right sizing" printer to employee ratios.	X	
16. Produce and submit annual printer refresh strategy to determine the actual print need compared to the installed base.	X	
17. Produce a technology roadmap two times per contract year, for all Hardware and Software components in End-User Services Framework for current and future version including end of life for support and timelines accordingly for County review.	X	
18. Review and approve submission of Contractor provided technology roadmap for all Desktop Framework Services Hardware and Software.		X
19. Continuously update the Standards and Procedures Manual with all changes to End-User Services.	X	
Build Roles and Responsibilities	**Contractor**	**County**
20. Produce and submit all design and engineering documentation required to build, deploy and support End-User Services Assets.	X	
21. Review and approve all engineering documentation required to deploy and support End-User Services Assets.		X
22. Ensure End-User Services solutions are fully integrated with the Service Desk Services and Integrated Asset Management System processes, including, but not limited to: • A shared system and database • Direct electronic interfaces between the Service Desk agents and field service technicians • Integrated support processes involving desktop, data center, and network for remote server and telephone break-fix	X	
23. Provide all test services required to support End-User Services including providing a test laboratory that develops and verifies desktop images, as well as the support of desktop Hardware and components evaluations and demonstrations.	X	

End-User Services Roles and Responsibilities		
24. Perform desktop Software (e.g., applications, patch packages) and Hardware functionality and product compatibility testing and development in the test laboratory environment using tools and procedures that are specially designed for this purpose (test to include: unit testing, system integration testing, LAN connectivity testing, load testing, and application interconnectivity testing).	X	
25. Develop and document test scripts.	X	
26. Provide documented test results/findings of all data packets and corresponding application, entering and leaving a standard desktop build for approval prior to finalizing a desktop standard image.	X	
27. Regularly monitor Third-Party websites and other communications for new application functionality, updates, and new Software or Hardware.	X	
28. Build/Acquire updates and patches for End-User Services Assets.	X	
29. Test updates and patches for End-User Services Assets.	X	
30. Produce and submit deployment plan for updates and patches for desktop assets.	X	
31. Review and approve the deployment plan for updates and patches for desktop assets.		X
32. Produce and submit all test documentation.	X	
33. Review and approve all test documentation.		X
34. Physically connect End-User Services Assets to the network.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
35. Provide technical support to End-Users for Incident activities.	X	
36. Manage deployment efforts using formal project management tools, methodologies and standards (e.g., ITIL change and configuration management practices).	X	
37. Produce and submit to County all deployment documentation for End-User Services.	X	
38. Review and approve all deployment documentation for End-User Services.		X
39. Conduct deployment reviews and provide results to County.	X	
40. Review and approve results of deployment reviews.		X
41. Ensure that desktop technicians have the tools necessary to improve Incident resolution time and handle all Service Requests or IMARs.	X	

End-User Services Roles and Responsibilities		
42. Provide priority support for designated County High Response End-Users.	X	
43. Perform routine preventive maintenance according to the County approved preventative maintenance plans.	X	
44. Regularly review asset data and failure trends and develop plans to review and proactively repair the equipment.	X	
45. Perform predictive maintenance according to the County approved proactive repair plans.	X	
46. Provide quarterly report on Incidents based on desktop issues that includes a plan to resolve the top three issues.	X	
47. Install and configure any Hardware or Software needed to make Unified Communication and Messaging Services operational.	X	
48. Procure and own End-User Assets (e.g., Hardware, Software, operating system, personal productivity and office automation software, applicable warranty support).	X	
49. Deploy and manage End-User asset Hardware and Software	X	
50. Perform End-User Services optimization (e.g., performance, diagnostics and recovery).	X	
51. Deploy and manage Network-attached printers, storage devices and miscellaneous peripherals.	X	
52. Procure locally attached printers, storage devices and miscellaneous peripherals.	X	
53. Own locally attached printers, storage devices and miscellaneous peripherals.		X
54. Deploy and manage locally attached printers, storage devices and miscellaneous peripherals.	X	
55. Provide Tier 2 and Tier 3 support for Software as coordinated through the Service Desk.	X	
56. Provide Incident and Tier 2 support as coordinated through the Service Desk.	X	
57. Act as the interface to the Original Equipment Manufacturer (OEM) for warranty service on behalf of the County and/or act as a certified service agent and perform the service directly.	X	
58. Conduct warm transfer and/or follow-up and coordination with the OEM.	X	

4.5. Desktop Computing Services

4.5.1. Overview

This section pertains to the Desktop Computing Services Framework Component within the End-User Services Framework. The Desktop Computing Services Framework Component applies to all Hardware, Software and labor needed to maintain and support Desktop Computing Services for End-Users. Desktop Computing Services consist of activities associated with the Plan, Build and Operate of standard Hardware and Software used to support End-User Services.

4.5.2. High Level Requirements

4.5.2.1. Contractor shall provide standardization across the Desktop Computing Services Framework Component for all Hardware and Software.

4.5.2.2. Contractor shall deploy standard core software on all Desktop Computing Services Hardware.

4.5.2.3. Contractor shall recommend annually, for County approval, standards that support the End User Services.

4.5.2.4. Contractor shall ensure that each Desktop Computing Hardware recommended standard shall be available from the manufacturer for the entire Contract Year.

4.5.2.5. Contractor shall implement new Desktop Computing Hardware standards effective at the start of each Contract Year.

4.5.2.6. Contractor shall hard drive encrypt all Desktop Computing Hardware throughout the entire life-cycle.

4.5.2.7. Contractor shall ensure all Desktop Computing Hardware are installed with the defined core software standard.

4.5.2.8. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and

transformational activities related to operational and technical improvements of Desktop Computing Services.

4.5.2.9. Contractor shall provide Desktop Computing performance management consisting of measuring, modeling, planning, optimizing and reporting of Desktop Computing Services to ensure they operate with the speed, reliability and capacity to meet the needs of the County.

4.5.2.10. Contractor shall provide continuous desktop optimization to maximize response time for all County End-Users interactions with Portfolio Applications.

4.5.2.11. Contractor shall continuously maintain a timeline/roadmap of all Desktop Computing Hardware versions and Software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assist in defining the standards.

4.5.2.12. Contractor shall provide Electronic Signature Services through a reliable and secure interface to allow County users to electronically share documents with external entities for review and eSigning via web browser. Electronic documents may be signed by external entities, County staff or both.

The Electronic Signature Services shall include:

- Electronic signature and associated digital signature management
- Service Desk support
- User administration
- Electronic signature service upgrade support
- eSigner authentication support
- WORD tagging support
- Template and workflow support
- eSigned document download support
- Monthly report for e-sign transactions

4.5.2.13. Contractor shall provide the Duo Hardware Token MFA to allow County employees and partners secure access, with Multi Factor Authentication (MFA), to the County network.

4.5.3. Environment

The following sub-sections further describe and scope Desktop Computing Services elements supported by Contractor and with which Contractor shall comply.

4.5.3.1. Hardware and Software

Contractor shall provide all Hardware and Software to support Desktop Computing Services.

4.5.3.2. Desktop - Standard Workstation

4.5.3.2.1. First Contract Year standards shall be those currently in effect with the Legacy Provider as of the Service Framework Transition date.

4.5.3.2.2. All Desktop - Standard Workstations shall be refreshed within a 4-year cycle from initial installation.

4.5.3.2.3. All Desktop - Standard Workstations shall be refreshed no later than 2 months after the expiration of the 4-year cycle.

4.5.3.3. Desktop - Advanced Workstation

4.5.3.3.1. All Desktops - Advanced Workstations shall be refreshed within a 4-year cycle from initial installation.

4.5.3.3.2. All Desktops - Advanced Workstations shall be refreshed no later than 2 months after the expiration of the 4-year cycle.

4.5.3.4. Desktop - Advanced Engineering Workstation

4.5.3.4.1. All Desktops - Advanced Engineering Workstations shall be refreshed within a 4-year cycle from initial installation.

4.5.3.4.2. All Desktops - Advanced Engineering Workstations shall be refreshed no later than 2 months after the expiration of the 4-year cycle.

4.5.3.5. Desktop - Engineering Workstation

4.5.3.5.1. First Contract Year standards shall be those currently in effect with the Legacy Provider as of the Service Framework Transition date.

4.5.3.5.2. All Desktops - Engineering Workstations shall be refreshed within a 4-year cycle from initial installation.

4.5.3.5.3. All Desktops - Engineering Workstations shall be refreshed no later than 2 months after the expiration of the 4-year cycle.

4.5.3.6. Desktop - 3D Workstation

4.5.3.6.1. All Desktop – 3D Workstations shall be refreshed within a 3-year cycle from initial installation.

4.5.3.6.2. All Desktop – 3D Workstations shall be refreshed no later than 2 months after the expiration of the 3-year cycle.

4.5.3.7. Laptop - Standard

4.5.3.7.1. First Contract Year standards shall be those currently in effect with the Legacy Provider as of the Service Framework Transition date.

4.5.3.7.2. All Laptop - Standard assets shall be refreshed within a 3-year cycle from initial installation.

4.5.3.7.3. All Laptop - Standard assets shall be refreshed no later than 2 months after the expiration of the 3-year cycle.

4.5.3.8. Laptop - Ultra-Portable

4.5.3.8.1. First Contract Year standards shall be those currently in effect with the Legacy Provider as of the Service Framework Transition date.

4.5.3.8.2. All Laptop - Ultra-Portable assets shall be refreshed within a 3-year cycle from initial installation.

4.5.3.8.3. All Laptop - Ultra-Portable assets shall be refreshed no later than 2 months after the expiration of the 3-year cycle.

4.5.3.9. Laptop - Engineering

4.5.3.9.1. First Contract Year standards shall be those currently in effect with the Legacy Provider as of the Service Framework Transition date.

4.5.3.9.2. All Laptop - Engineering assets shall be refreshed within a 3-year cycle from initial installation.

4.5.3.9.3. All Laptop – Engineering assets shall be refreshed no later than 2 months after the expiration of the 3-year cycle.

4.5.3.10. Laptop - Ruggedized

4.5.3.10.1. First Contract Year standards shall be those currently in effect with the Legacy Provider as of the Service Framework Transition date.

4.5.3.10.2. All Laptop - Ruggedized assets shall be refreshed within a 3-year cycle from initial installation.

4.5.3.10.3. All Laptop - Ruggedized assets shall be refreshed no later than 2 months after the expiration of the 3-year cycle.

4.5.3.11. Laptop – Standard LTE

4.5.3.11.1. All Laptop – Standard LTE shall be refreshed within a 3-year cycle from initial installation.

4.5.3.11.2. All Laptop – Standard LTE shall be refreshed no later than 2 months after the expiration of the 3-year cycle.

4.5.3.12. Tablet - Ruggedized

4.5.3.12.1. First Contract Year standards shall be those currently in effect with the Legacy Provider as of the Service Framework Transition date.

4.5.3.12.2. All Tablet - Ruggedized assets shall be refreshed within a 3-year cycle from initial installation.

4.5.3.12.3. All Tablet – Ruggedized assets shall be refreshed no later than 2 months after the expiration of the 3-year cycle.

4.5.3.13. Tablet - Convertible

4.5.3.13.1. First Contract Year standards shall be those currently in effect with the Legacy Provider as of the Service Framework Transition date.

4.5.3.13.2. All Tablet - Convertible assets shall be refreshed within a 3-year cycle from initial installation.

4.5.3.13.3. All Tablet Convertible assets shall be refreshed no later than 2 months after the expiration of the 3-year cycle.

4.5.3.14.Desktop Scanner

4.5.3.14.1. All Desktop Scanners shall be refreshed within a 4-year cycle from initial installation.

4.5.3.14.2. All Desktop Scanners shall be refreshed no later than 2 months after the expiration of the 4-year cycle.

4.5.3.15.Desktop - Mini Workstation

4.5.3.15.1. All Desktop - Mini Workstation shall be refreshed within a 4-year cycle from initial installation.

4.5.3.15.2. All Desktop - Mini Workstation shall be refreshed no later than 2 months after the expiration of the 4-year cycle.

4.5.3.16.Desktop - Engineering Workstation Gold

4.5.3.16.1. All Desktop - Engineering Workstation Gold shall be refreshed within a 4-year cycle from initial installation.

4.5.3.16.2. All Desktop - Engineering Workstation Gold shall be refreshed no later than 2 months after the expiration of the 4-year cycle.

4.5.3.17.Tablet – Surface Pro LTE

4.5.3.17.1. All Tablet-Surface Pro LTE shall be refreshed within a 3-year cycle from initial installation.

4.5.3.17.2. All Tablet-Surface Pro LTE shall be refreshed no later than 2 months after the expiration of the 3-year cycle.

4.5.3.18.Desktop - Small Form Factor with Optical Drive

4.5.3.18.1. All Desktop - Small Form Factor with Optical Drive shall be refreshed within a 4-year cycle from initial installation.

4.5.3.18.2. All Desktop – Small Form Factor with Optical Drive shall be refreshed no later than 2 months after the expiration of the 4-year cycle.

4.5.4. Early Refresh

The County may request early refresh of Desktop Computing asset. Early refresh is determined as refresh of the Desktop Computing asset; if the asset is not within 6 months of the scheduled refresh date. County shall request early refresh via a Service Request.

4.5.5. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Desktop Computing Services.

Desktop Computing Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Recommend and submit all Desktop Computing Hardware and non-Hardware standards on an annual basis.	X	
2. Review and approve Desktop Computing Hardware standards.		X
3. Produce and submit yearly Desktop Computing Hardware refresh plan.	X	
4. Review and approve yearly Desktop Computing Hardware refresh plan.		X
5. Recommend and submit Desktop Computing software deployment/management policies and procedures.	X	
6. Review and approve Desktop Computing software deployment/management policies and procedures.		X
Build Roles and Responsibilities	**Contractor**	**County**
7. Deploy Legacy Provider desktop standards that were in effect as of the Service Framework Transition date during the first Contact Year.	X	
8. Develop core software image for Desktop Computing based on approved standards.	X	
9. Test standard core software image for Desktop Computing prior to deployment based on approved standards.	X	
10. Review results of test and approve deployment for the core software image for Desktop Computing.		X

Desktop Computing Services Roles and Responsibilities		
11. Deploy approved core software image to all Desktop Computing Assets.	X	
12. Provide staging Services for Desktop Computing at non-County Locations.	X	
13. Deploy and manage Desktop Computing Hardware and Software (e.g., operating system, personal productivity and office automation software and Services).	X	
14. Deploy software (e.g., patches, applications, drivers and operating systems) using a Contractor provided electronic software distribution tool.	X	
15. Provide a rapid response team during software deployment for assisting affected End-Users in the event a deployed package adversely affects End-Users or any systems.	X	
16. Deploy, manage, communicate and report activities related to Desktop Computing refresh.	X	
17. Review and approve reports for Desktop Computing refresh.		X
18. Develop and provide training related to the implementation of new products and services.	X	
19. Refresh all Desktop Computing Assets no later than 2 months after the expiration of a 3-year or 4-year cycle from initial installation, whichever is applicable.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
20. Provide support, including break-fix, for all Desktop Computing.	X	
21. Implement revised new desktop hardware standards so that they become effective at the start of each Contract Year.	X	
22. Encrypt hard drive of all Standard Desktops throughout the entire life cycle of the asset.	X	
23. Provide IMAR Services.	X	
24. Conduct data, End-User profile (e.g., favorites, bookmarks, MS Outlook profile) and Application migration that are necessary due to any Desktop Computing refresh, IMAR or Incident activity.	X	
25. Provide support for Desktop Computing refresh.	X	

Desktop Computing Services Roles and Responsibilities		
26. Provide core software updates, OIC software installation and new software releases for Desktop Computing Assets.	X	
27. Provide each End-User orientation on operational concepts of the new Desktop Computing at time of deployment.	X	
28. Provide and submit End-User tip sheets on such items as log on procedures, networked drives, system usage, core software, data storage and other practices that are essential to daily tasks.	X	
29. Review and approve End-User tip sheets prior to deployment.		X
30. Continually utilize automated Integrated Asset Management System tools to identify unlicensed software on desktops and servers and to pinpoint desktop devices not running the most recent antivirus software stipulated County standards and policies.	X	

4.6. Core Software Services

4.6.1. Overview

This section pertains to the Core Software Services Framework Component within the End-User Services Framework. The Core Software Services Framework Component describes the baseline, standard software installed on all Desktop Computing Assets, County Retained Assets, and other Computing Assets determined applicable by the County.

4.6.2. High Level Requirements

4.6.2.1. Contractor shall provide standardization of Core Software Services across all Desktop Computing Assets, County Retained Assets and other Computing Assets determined applicable by the County.

4.6.2.2. Contractor shall continuously maintain currency of core software standards deployed within the Desktop Computing Services Framework Component.

4.6.2.3. Contractor shall make recommendations for County approval of Core Software standards annually.

4.6.2.4. Contractor shall present and discuss Core Software standards at the County/Contractor Enterprise Architecture Governance.

4.6.2.5. Contractor shall publish Core Software standards in the Standards and Procedures Manual on the Service Portal.

4.6.2.6. Contractor shall refresh Core Software to latest standards annually for all Desktop Computing Assets and Retained Assets.

4.6.2.7. Contractor shall maintain currency, at all times, of Core Software deployed within the Desktop Computing Services and Retained Assets.

4.6.2.8. Contractor shall ensure all Desktop Computing Assets shall be deployed with the current standard Core Software.

4.6.2.9. Contractor shall ensure that there is no degradation of performance on all Core Software installed hardware.

4.6.2.10. Contractor shall ensure that optimal network performance on all Core Software installed hardware.

4.6.2.11. Contractor shall develop automated deployment strategies for Core Software installation on all hardware.

4.6.2.12. Contractor shall recommend annually, for County approval, standards that support the Core Software Services.

4.6.2.13. Contractor shall leverage all existing license agreements when recommending annual Core Software standards.

4.6.2.14. Contractor shall provide Core Software standards recommendations and submit for County approval.

4.6.2.15. Contractor shall ensure all Core Software is fully tested with all Desktop approved software to ensure the highest degree of operational integrity.

4.6.2.16. Contractor shall promptly patch and maintain all Core Software to the highest operational level throughout each Contract Year.

4.6.2.17. Contractor shall make effective new Core Software standards at the start of each Contract Year.

4.6.2.18. Contractor shall promptly update all Desktop Computing Assets to the latest Core Software standards annually or as the Core Software standards change.

4.6.2.19. Contractor shall maintain a timeline/roadmap of all Core Software Services software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Core Software that assists in defining the standards.

4.6.3. Environment

4.6.3.1. Software

Contractor shall supply all software to support Core Software Services.

4.6.4. Department of Child Support Services (DCSS) Core Software

The DCSS Core Software complies with the County Core Software standards with the following addition:

- INFO Connect version 4.1

4.6.5. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Core Software Services.

Core Software Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Recommend and submit annually core software standards for Desktop Computing Assets.	X	
2. Review and approve core software standards annually for Desktop Computing Assets.		X

Core Software Services Roles and Responsibilities		
3. Recommend and submit core software deployment/management policies and procedures.	X	
4. Review and approve core software deployment/management policies and procedures.		X
5. Develop a technical life cycle roadmap for each item in Core Software Services.	X	
6. Review and approve the technical life cycle roadmap for each item in Core Software Services.		X
7. Maintain all Core Software with the latest release version on all Desktop Computing Assets as defined in the approved standard.	X	
Build Roles and Responsibilities	**Contractor**	**County**
8. Maintain the same level of approved Core Software at all times for all Desktop Computing Assets.	X	
9. Develop core software image for Desktop Computing Assets based on approved standards.	X	
10. Test standard core software image for Desktop Computing Assets prior to deployment based on approved standards to ensure operational integrity.	X	
11. Review results of test and approve deployment for the core software image for Desktop Computing Assets.		X
12. Deploy approved Desktop Computing core software image.	X	
13. Engineer the core software image and provide any and all version changes, upgrades, enhancements, and additions to the core software image, to ensure that the core software image shall function properly on the desktop and the Applications Portfolio.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
14. Provide support, including break-fix, for all Core Software Incidents.	X	
15. Provide Core Software updates, OIC software installation and new software releases for Desktop Computing Assets.	X	
16. Provide each End-User orientation on operational concepts of the new Core Software features and functions at time of deployment.	X	
17. Provide and submit End-User tip sheets on Core Software to the Service Portal.	X	

Core Software Services Roles and Responsibilities		
18. Continuously update all Core Software items including, latest patches, service releases, on all Desktop Computing Assets.	X	

4.7. County Retained Assets Services

4.7.1. Overview

This section pertains to the County Retained Assets Services Framework Component within the End-User Services Framework. County Retained Assets definition is Desktop Computing Services standard hardware purchased by the County and supported by the Contractor.

4.7.2. High Level Requirements

4.7.2.1. Contractor shall document, deliver (for County approval) and post to the Service Portal enrollment procedure for County Retained Assets.

4.7.2.2. Contractor shall document all County Retained Assets in the Integrated Asset Management System.

4.7.2.3. Contractor will maintain and support all County Retained Assets currently enrolled.

4.7.2.4. Contractor shall install standard Core Software on all County Retained Assets.

4.7.2.5. Contractor shall install the standard Core Software or DCSS Core Software for DCSS retained assets as determined by End-User Service Request.

4.7.2.6. Contractor shall exclude County Retained Assets from Desktop Computing Services refresh.

4.7.2.7. Contractor shall maintain Core Software to approved standards on County Retained Assets.

4.7.2.8. Contractor shall report to End-User the end of life of the County Retained Asset annually.

4.7.2.9. Contractor shall not exclude any County Retained Asset from the Services.

4.7.3. Environment

4.7.3.1. Hardware

The standard Desktop Computing Services Assets, published in the Standards and Procedures manual, are in scope for County Retained Assets Services.

4.7.3.2. Desktop - DCSS

4.7.3.2.1. All Desktop - DCSS owned by the State are Retained Assets.

4.7.3.2.2. All Desktop - DCSS shall follow the DCSS Core Software standards.

4.7.3.2.3. Contractor shall perform hardware refreshes for the Desktop - DCSS.

4.7.3.2.4. Desktop – DCSS will be refreshed every four years.

4.7.3.2.5. Contractor shall be responsible for IMARs, break-fix, and disposal of Desktop - DCSS in coordination with DCSS and the State.

4.7.3.3. Laptop – DCSS

4.7.3.3.1. Laptop – DCSS owned by the State shall be treated as County Retained Assets.

4.7.3.3.2. Laptop – DCSS shall follow the DCSS Core Software standards.

4.7.3.3.3. Laptop – DCSS refresh cycle shall be completed no later than 6 months after State provisioning.

4.7.3.3.4. Laptop refresh cycle shall begin upon the receipt of the initial laptop shipment from the State.

4.7.3.3.5. Contractor shall be responsible for IMARs, break-fix, and disposal for Laptop – DCSS in coordination with DCSS and the State.

4.7.3.4. Enrollment Requirements

Enrollment of County Retained Assets requirements are as follows:

- For new enrollment, the County Retained Assets must be compliant with current Desktop Computing Services hardware standards
- County Service Request is issued to initiate the enrollment process
- Contractor shall verify the requirements to enroll County Retained Assets

4.7.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with County Retained Assets Services.

County Retained Assets Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit plans for use of the Integrated Asset Management System to track Retained Assets.	X	
2. Review and approve plans for use of the Integrated Asset Management System to track Retained Assets.		X
3. Ensure that DCSS Retained Assets comply with the DCSS Core Software standards.	X	
Build Roles and Responsibilities	**Contractor**	**County**
4. Validate during enrollment, that the new Retained Assets are compliant with current Desktop Computing Services standards.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
5. Provide support, including break-fix, for all County Retained Assets Incidents.	X	
6. Provide hardware support for all County Retained Assets.	X	
7. Maintain and update the County Retained Assets inventory.	X	
8. Maintain and support County Retained Assets currently enrolled at the time of Transition.	X	
9. Tag Retained Assets with a Contractor's asset tag in addition to the existing County property tag and track these in the Integrated Asset Management System.	X	

County Retained Assets Services Roles and Responsibilities		
10. Verify Retained Asset enrollment requirements and submit to County for review and approval.	X	
11. Review and approve Retained Asset enrollment requirements.		X
12. Perform the Retained Asset enrollment.	X	
13. Install current Core Software Standard County Retained Assets.	X	
14. Install the current Core Software Standard or DCSS Core Software for DCSS Retained Assets.	X	
15. Perform hardware refresh of each DCSS Retained Assets in accordance with the State refresh standards.	X	
16. Provide IMARs, break-fix, and disposal of DCSS Retained Assets in coordination with DCSS and the State.	X	

4.8. Mobile Device Support Services

4.8.1. Overview

This section pertains to the Mobile Device Services Framework Component within the End-User Services Framework. The Mobile Device Services Framework Component applies to providing support to County End-Users in the operational and business use of County owned Mobile Devices which include Retained Assets and authorized BYOD. Mobile Device Services consist of activities associated with the Plan, Build and Operate of managed mobile devices and bring-your-own mobile devices (BYOD).

4.8.2. High Level Requirements

4.8.2.1. Contractor shall provide Service Desk Services support and End-User Services support for supported County owned Mobile Devices.

4.8.2.2. Contractor shall support End-User Mobile Devices as requested by a Service Request. Contractor shall consider this optional support.

4.8.2.3. Contractor shall enable and support connectivity for a supported Mobile Device to County resources.

4.8.2.4. Contractor shall assist End-Users with the operational use of supported Mobile Devices.

4.8.2.5. Contractor shall continuously provide, update and maintain documentation, FAQs and other related tip sheets to County End-Users via the Service Portal.

4.8.2.6. Contractor shall support End-User authentication to County resources for all supported Mobile Devices.

4.8.2.7. Contractor shall provide Incident tracking, escalation and resolution for supported Mobile Devices.

4.8.2.8. Contractor shall continuously develop and update training documentation and End-User tip sheets and post on the Service Portal for County End-Users on the use of supported Mobile Devices.

4.8.2.9. Contractor shall continuously develop, update and maintain Service Desk scripts and processes for Mobile Device Support Services End-User support.

4.8.2.10. Contractor shall continuously update instructions, FAQs and other documentation for End-Users on the Service Portal.

4.8.2.11. Contractor shall support BYOD devices as specified in County policy.

4.8.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Mobile Device Support Services.

Mobile Device Support Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Implement mobile device support Services per the approved procedures.	X	

Mobile Device Support Services Roles and Responsibilities		
2. Produce and submit recommendations (on annual basis) the Mobile Device supportable assets standards.	X	
3. Review and approve all Mobile Device supportable assets standards recommendations.		X
4. Review and approve standardization across the managed Mobile Device Services Framework Component for all mobile hardware and software.		X
Operate Roles and Responsibilities	**Contractor**	**County**
5. Provide enterprise mobile device application store support.	X	
6. Manage County-approved BYOD devices and the installed County-approved applications on such devices.	X	
7. Deploy or remove mobile applications using the Enterprise Application Store.	X	
8. Perform device password resets as required.	X	
9. Assist End-Users with any Incidents or Incidents arising from application releases and patches.	X	
10. Coordinate Incident and Service Request resolution among End-Users, the Service Desk and Third-Parties to manage all End-User MDM related Incidents and Service Requests as needed.	X	
11. Troubleshoot and resolve access Incidents to authorized enterprise content from any authorized mobile device.	X	
12. Monitor and report the usage of self-service for mobile devices.	X	
13. Produce and submit mobile device support solutions that best meet County business needs and security policies.	X	
14. Review and approve mobile device support solutions.		X
15. Produce and submit End-User instructions on provisioning and configuration of mobile devices.	X	
16. Review and approve End-User instructions on provisioning and configuration of mobile devices.		X

Mobile Device Support Services Roles and Responsibilities		
17. Manage mobile Users enrollment and access by Active Directory (AD) group membership.	X	

4.9. Unified Communications Services

4.9.1. Overview

The Unified Communications Services Framework Component within the End-User Services Framework applies to the process allowing County End-Users to communicate efficiently and effectively through various integrated methods. Unified Communications Services provide strategy, process, methodology, support and documentation Real-Time or Non Real-Time methods deployed to End-User Services.

Real-Time methods are, but not limited to, instant messaging (IM), presence, voice, mobility, audio, desktop web & video conferencing, desktop sharing, data sharing, interactive whiteboards, call control.

Non Real-Time methods are, but not limited to, integrated voice mail, E-Mail, SMS and fax.

4.9.2. High Level Requirements

4.9.2.1. Contractor shall provide Service Desk Services support and End-User Services support for Unified Communications Services.

4.9.2.2. Contractor shall support End-User authentication to County resources for all Unified Communications Services.

4.9.2.3. Contractor shall provide, upon County approval, Unified Communications Services externally (off County network).

4.9.2.4. Contractor shall provide Incident tracking, escalation and resolution for Unified Communications Services.

4.9.2.5. Contractor shall support BYOD devices as specified in County policy for Unified Communications Services.

4.9.2.6. Contractor shall provide standardization across the Unified Communications Services client software.

4.9.2.7. Contractor shall be own, provision, maintain, update and support all Hardware and Software associated with providing Unified Communications Services.

4.9.2.8. Contractor shall deploy to all Desktop Computing Assets, Retained Assets and mobile devices client software needed to engage in Unified Communications Services.

4.9.2.9. Contractor shall maintain at all times, current standard version of Unified Communications Services client software to all Desktop Computing Assets, Retained Assets and mobile devices.

4.9.2.10. Contractor shall provide Incident tracking, escalation and resolution for Unified Communications Services.

4.9.2.11. Contractor shall continuously develop and update training documentation and End-User tip sheets and post on the Service Portal for County End-Users on the use of Unified Communications Services.

4.9.2.12. Contractor shall continuously develop, update and maintain help desk scripts and processes for Unified Communications Services End-User support.

4.9.2.13. Contractor shall recommend, for County approval, Unified Communications Services client software standards annually.

4.9.3. Environment

4.9.3.1. All Desktop Computing Services Assets shall be supported for Unified Communications Services.

4.9.3.2. All County owned and managed mobile devices shall be supported for Unified Communications Services.

4.9.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Unified Communications Services.

Unified Communications Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit Unified Communications Services policies and procedures.	X	
2. Review and approve Unified Communications Services policies and procedures.		X
3. Recommend (on annual basis) the Unified Communications Services standards.	X	
4. Review and approve the recommended Unified Communications Services standards.		X
5. Develop and submit recommended standardization across the managed Unified Communications Services.	X	
6. Review and approve standardization across the managed Unified Communications Services.		X
Build Roles and Responsibilities	**Contractor**	**County**
7. Perform the installation, testing, and tuning of all technical environment Hardware, Software, peripherals and interfaces related to the support of Unified Communications Services platforms.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
8. Perform end-to-end Incident determination and resolution for all Unified Communications Services related Incidents.	X	
9. Provide and support Remote Access Services for Unified Communications Services for defined County resources.	X	
10. Take corrective action as needed for all Unified Communications Services.	X	
11. Coordinate Incident resolution with Technical Support, Incident & Problem Management and Third-Parties.	X	
12. Provide troubleshooting, repair and escalation of Incidents within the Unified Communications Services platform environment.	X	

Unified Communications Services Roles and Responsibilities		
13. Provide End-User training, tip sheets, FAQs and post to the Service Portal.	X	
14. Perform Incident support activities as required, remotely or on-site.	X	
15. Provide Tier 2 and 3 technical assistance and support for Unified Communications Services End-Users.	X	

4.10. Catalog Services

4.10.1. Overview

Catalog Services Framework Component of End-User Services consist of activities associated with Optional Item Catalog (OIC). The OIC contains the Hardware and Software items that are approved for the End-User Services environment; consisting of distinct categories of goods and services available for purchase by the County.

4.10.2. High Level Requirements

4.10.2.1. Contractor shall promptly publish the current OIC in the Standards and Procedures Manual as changes occur.

4.10.2.2. Contractor shall make available the updated and current OIC within the Service Request system.

4.10.2.3. Contractor shall acquire, configure, deliver, install and support OIC items throughout their useful life.

4.10.2.4. Contractor shall maintain, as changes occur, the published OIC.

4.10.2.5. Contractor shall recommend, for County approval, changes to the OIC.

4.10.2.6. Contractor shall maintain currency of all items in the OIC with recommendations to the County.

4.10.2.7. Contractor shall meet all IMAR Service Level obligations for all items in the OIC.

4.10.2.8. Contractor shall provide recommended updates, for County approval, to the OIC based on Desktop Computing Services standards.

4.10.2.9. Contractor shall provide recommend software packages that comply with Core Software standards.

4.10.2.10. Contractor shall acquire, configure, deploy, support and maintain all OIC items delivered to End-Users throughout the useful like of the OIC item.

4.10.2.11. Contractor shall configure, deploy, support and maintain, as needed, Portfolio Application client software needed for End-Users business functions.

4.10.2.12. Contractor shall continuously develop and update training documentation and End-User tip sheets and post on the Service Portal for County End-Users on the use of Catalog Services and the OIC.

4.10.2.13. Contractor shall continuously develop, update and maintain help desk scripts and processes for Catalog Services End-User support.

4.10.2.14. Contractor shall continuously maintain a timeline/roadmap of all OIC Hardware and Software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of Hardware and Software that assist in defining the standards.

4.10.3. Environment

The OIC categories of components are segmented and distinct categories. These categories offer organization and definition to the OIC. These segmented and distinct categories are as follows:

Desktop Peripheral Hardware	Hardware physically connected to a Desktop Computing asset, including, but not limited to, printers, scanners,

	keyboards, managed mobile devices and monitor upgrades.
Stand-Alone Hardware	Hardware that is not physically connected to a Desktop Computing asset Including, but not limited to, videoconferencing optional equipment, audio/video equipment, and replacement parts.
Desktop Software	Classified in accordance with the Desktop Applications Directory (DAD). Includes acquisition, license management, engineering, deployment, rights management, and full maintenance of the software by the Contractor. The County shall manage the DAD, including adds, deletes, and updates of approved Applications on the list.
Portfolio Application Client Software	Portfolio Application client software not otherwise covered by a Resource Unit (i.e., Non-DAD Commercial Off-the-Shelf ("COTS") Software).
IT Training Courses	IT Training Courses as needed to support County business needs and enterprise license agreements.

4.10.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Catalog Services:

Catalog Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Define, add, modify and delete Hardware and Software items in Optional Item Catalog (OIC).		X
2. Produce and submit recommendations for updates to Hardware and Software items in the OIC.	X	
3. Review and approve updates to Hardware and Software items in the OIC.		X
Build Roles and Responsibilities	**Contractor**	**County**
4. Maintain currency of items in the OIC.	X	

Catalog Services Roles and Responsibilities		
5. Host and make available the OIC to County Users on a proven table-driven catalog management system.	X	
6. Organize the OIC to facilitate ordering and viewing for End-Users.	X	
7. Publish the OIC on the Service Portal, with online help functions, for viewing and ordering.	X	
8. Provide all engineering necessary to ensure functionality of all Hardware and Software items in the OIC with Desktop Computing Assets.	X	
9. Test all new and updated Hardware and Software items listed in the OIC prior to deployment.	X	
10. Develop and submit a deployment plan for any multi-End-User OIC implementations.	X	
11. Review and approve deployment plan for any multi-End-User OIC implementations.		X
12. Publish all new and updated items in the OIC at the conclusion of the engineering activity.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
13. Authorize items to be included in OIC.		X
14. Add or modify the DAD listed in the OIC via a Service Request.	X	
15. Maintain and support (as listed in the "Level of Support" section of the OIC), including break-fix, all Software and Hardware in the OIC.	X	
16. Provide IMAR Services for OIC items.	X	
17. Maintain and publish on a monthly basis the OIC.	X	
18. Provide Web access and ordering abilities for the OIC to all County End-Users.	X	
19. Provide ongoing OIC User training.	X	
20. Provide End-User orientation on operational concepts of new Hardware or Software installed via order from the OIC.	X	
21. Review new manufacturers' product posted offerings, verify the currency of the listed equipment, and maintain the accuracy of the OIC.	X	

4.11. Network Printer Services

4.11.1. Overview

This section pertains to the Network Printer Services Framework Component within the End-User Services Framework. The Network Printer Services Framework Component applies to all Hardware, Software and back-end infrastructure needed to maintain and support networked Printer Assets. Network Printer Services consist of the activities associated with the Plan, Build and Operate of all networked Printer Assets.

4.11.2. High Level Requirements

4.11.2.1. Contractor shall provide recommend standards, for County approval, annually for Network Printer Services.

4.11.2.2. Contractor shall provide a redundant, highly available, and technical current back-end infrastructure to support Network Printer Services.

4.11.2.3. Contractor shall deploy and manage back-end infrastructure that is redundant with complete fail-over minimizing any associated print service Incident.

4.11.2.4. Contractor shall maintain currency on all print drivers used to deliver the Network Printer Services.

4.11.2.5. Contractor shall maintain currency, at all times, of Network Printer Assets firmware.

4.11.2.6. Contractor shall determine, with County approval, categories of Network Printer Assets.

4.11.2.7. Contractor shall ensure that each Network Printer recommended standard be available from the manufacturer for the entire Contract Year.

4.11.2.8. Contractor shall publish in the OIC the standards for Network Printer Services.

4.11.2.9. Contractor shall continuously develop and update training documentation and End-User tip sheets and post on the Service Portal for County End-Users on the use of Network Printer Services.

4.11.2.10. Contractor shall continuously develop, update and maintain help desk scripts and processes for Network Printer Services End-User support.

4.11.2.11. Contractor shall leverage existing license agreements to the extent possible for all Network Printer Services.

4.11.2.12. Contractor shall make effective new Network Printer standards at the start of each Contract Year.

4.11.2.13. Contractor shall supply, via Service Portal, a list of consumables, updated annually or as standards change, for current printers deployed to County End-Users in the environment.

4.11.2.14. Contractor shall exclude Printers not attached or connected to the County network.

4.11.2.15. County shall be responsible for Network Printer consumables which are defined as paper and ink/toner.

4.11.2.16. Contractor shall be responsible for all maintenance and availability, including break-fix, of Network Printer Services.

4.11.2.17. Contractor shall maintain and update annually a timeline/roadmap of all Core Software versions and life cycles to adequately plan timeframes and completion dates to stay within supported versions.

4.11.3. Environment

4.11.3.1. Hardware

The County current Network Printer standards fall into the following categories:

- Monochrome Network Workgroup Printer — Standard Format (abbreviated as "MNWP")
- Monochrome Network Workgroup Printer — Large Format (11x17) (abbreviated as "MNWP-LF")
- Monochrome Network High Volume Printer — Large Format (11x17) (abbreviated as "MNWP-LF-H")
- Color Network Workgroup Printer — Large Format (abbreviated as "CNWP-LF")
- Color Network Workgroup Printer — Standard Format (abbreviated as "CNWP")

4.11.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Network Printer Services.

Network Printer Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Recommend and submit Network Printer Assets policies, procedures and Hardware standards on an annual basis.	X	
2. Review and approve Network Printer Assets policies, procedures and hardware standards.		X
3. Produce and submit the annual Network Printer asset refresh plan.	X	
4. Review and approve the annual Network Printer asset refresh plan.		X
5. Provide standardization across the Network Printer Services Framework Component for all Hardware and Software.	X	
Build Roles and Responsibilities	**Contractor**	**County**
6. Determine which multifunction or specialized printer devices shall be purchased.	X	
7. Review and approve the purchase of the multifunction or specialized printer devices.		X
8. Provide network connectivity and print queue installation for County purchased. Such devices shall be reviewed with Contractor prior to selection.	X	

Network Printer Services Roles and Responsibilities		
9. Provide staging Services for Network Printer Assets at non-County locations.	X	
10. Deploy and manage Network Printer Hardware and Software (e.g., printer drivers).	X	
11. Deploy, manage, communicate and report activities related to Network Printer refresh.	X	
12. Review and approve reports for Network Printer refresh.		X
13. Identify the IT Coordinator for each deployed Network Printer prior to transition or deployment.	X	
14. Develop and provide training related to the implementation, use and operation of Network Printers.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
15. Perform the Network Printer hardware asset refresh not later than two months after the expiration of the four-year cycle.	X	
16. Provide support, including break-fix, for all Network Printer Assets.	X	
17. Provide Network Printer IMAR Services.	X	
18. Provide support for Network Printer Assets refresh.	X	
19. Provide printer driver updates.	X	
20. Provide each departmental IT coordinator orientation on operational concepts of the new printer asset at time of deployment.	X	
21. Order and replace toner cartridges and paper from County office supply sources.	X	

4.12. Electronic File Sharing and Synchronization Services

4.12.1. Overview

This section pertains to the Electronic File Sharing Services (EFSS) component within the End User Services Framework. The Electronic File Sharing Services Framework Component applies to all Hardware, Software and labor needed to maintain and support EFFS.

4.12.2. High Level Requirements

4.12.2.1. Contractor shall provide, maintain and support a centralized, secure EFSS with access through browsers on approved and managed County computing devices.

4.12.2.2. Contractor shall provide EFSS with granular permissions to protect confidential, sensitive and public information that may be posted.

4.12.2.3. Contractor shall provide EFSS that allows County users to share and collaborate on files internally and externally.

4.12.2.4. Contractor shall provide EFSS that allows external users to consume or share files to and/or from County users.

4.12.2.5. Contractor shall provide standard County single sign-on for authenticating County Active Directory users.

4.12.2.6. Contractor shall provision County users to access EFSS as per authorized Service Request.

4.12.2.7. Contractor shall provide County users with the ability to create temporary secure locations for sharing files that are too large for email. The temporary secure location shall be accessible to County users and external users with access expiring after designated time period as set by sharing party or after twenty-four (24) hours, whichever is less.

4.12.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with EFFS.

Electronic File Sharing Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Implement EFFS as per approved procedures.	X	
2. Produce and submit plans for updates/upgrades to EFSS.	X	

Electronic File Sharing Services Roles and Responsibilities		
3. Review and approve plans for updates/upgrades to EFSS.		X
Operate Roles and Responsibilities	**Contractor**	**County**
4. Provide onboarding support for EFSS.	X	
5. Provide, update and maintain documentation, FAQs and other related tip sheets to County End Users via the Service Portal.	X	
6. Assist End Users with any Incidents associated with EFSS.	X	
7. Maintain and support EFSS. This includes maintaining all the integration points (e.g., Single Sign On, Content Delivery Network services), break-fix, etc.	X	
8. Provide IMAR Services for EFSS.	X	
9. Provide operational reports for EFSS.	X	

4.13. Audio/Video (A/V) Conference Rooms Services

4.13.1. Overview

This section pertains to the A/V Conference Rooms Installation Services Framework Component within the End User Services Framework. The A/V Conference Rooms Services Framework Component applies to the installation and support for Audio/Video Conference Rooms.

4.13.2. High Level Requirements

4.13.2.1. Contractor shall provide three (3) standardized Audio/Video Conference Rooms Services:

a. A/V Conference Room - Small
b. A/V Conference Room - Medium
c. A/V Conference Room - Large

4.13.2.2. Audio/Video Conference Rooms Services shall include the following:

- Equipment
- Equipment installation
- 3-year System support

The above items are defined in Exhibit 4.3-2 Audio/Video Conference Rooms Configuration and Support.

4.13.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Audio/Video Conference Rooms Services.

Audio/Video Conference Rooms Installation Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Submit request to initiate Audio/Video Conference Rooms installation indicating Conference Room size.		X
2. Produce and submit plans for Audio/Video Conference Rooms installation.	X	
3. Review and approve plans for Audio/Video Conference Rooms installation.		X
4. Produce and submit procedures for Audio/Video Conference Rooms installation.	X	
5. Review and approve procedures for Audio/Video Conference Rooms installation.		X
Build Roles and Responsibilities	**Contractor**	**County**
6. Design and implement Audio/Video Conference Rooms installation.	X	
7. Approve design and implementation of Audio/Video Conference Rooms installation.		X
Operate Roles and Responsibilities	**Contractor**	**County**
8. Support Audio/Video Conference Rooms as defined in Exhibit 4.3-2 Audio/Video Conference Rooms Configuration and Support.	X	

4.14. Digital Signage Services

4.14.1. Overview

This section pertains to the Digital Signage Services Framework Component within the End User Services Framework.

Services provided by this Framework Component include, but are not limited to, the following:

- Automatically download text, images and other content from websites
- Extract data in multiple formats
- Connect and Control screens over the internet
- Send extracted data to specified location

4.14.2. High Level Requirements

4.14.2.1. Contractor shall procure Digital Signage subscription services and/or devices.

4.14.2.2. Contractor shall renew Digital Signage subscriptions services with County approval.

4.14.2.3. Contractor shall provide installation, incident support, escalation, and resolution for Digital Signage Services.

4.14.2.4. Contractor shall replace a defective Digital Signage device within the warranty period.

4.14.2.5. Contractor will provide for purchase, via the OIC, Digital Signage services and/or devices.

4.14.3. Environment

The following further describe, and scope Digital Signage Services elements supported by Contractor and with which Contractor shall comply.

4.14.3.1. Hardware and Software

Contractor shall provide all devices, needed to provide the Digital Signage Services as offered by Third Party.

4.14.3.2. Technology Upgrade and Refresh

Digital Signage devices supported within the Digital Signage Services are eligible for refresh or upgrade on a three-year subscription cycle and provided for purchase, via the OIC.

4.14.4. Roles and Responsibilities

Digital Signage Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Provide Digital Signage Services recommendations and specifications.	X	
2. Review and approve Digital Signage Services recommendations and specifications.		X
3. Develop IMAR and Incident process flows for Digital Signage Services.	X	
4. Develop OIC plans for approved Digital Signage Services.	X	
5. Provide OIC information for Digital Signage Services.	X	
6. Review and approve plans for Digital Signage Services processes.		X
Build Roles and Responsibilities	**Contractor**	**County**
7. Implement Digital Signage Services inventory process.	X	
8. Implement Digital Signage Services device warranty management.	X	
9. Implement Help Desk scripts for Digital Signage Services issues.	X	
10. Deploy OIC offerings for Digital Signage Services.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
11. Provision Digital Signage Services as ordered by the County.	X	
12. Provide IMAR and Incident services for Digital Signage Services.	X	
13. Manage Asset Management database of Digital Signage Services for warranty and upgrade/refresh purposes.	X	
14. Provide in-warranty Digital Signage Services devices replacement as needed.	X	
15. Provide for on-site Digital Signage Services for incidents.	X	

4.15. Reserved.

4.16. Survey Solution Support Services

4.16.1. Overview

This section pertains to the Survey Solution Support Services component within the End User Services Framework. Survey Solution is designed to collect, assess, and share survey responses.

4.16.2. High Level Requirements

4.16.2.1. Contractor shall migrate existing County users based upon County-approved plan.

4.16.2.2. Contractor shall migrate existing survey data based upon County-approved plan.

4.16.2.3. Contractor shall provide Service Desk support services, including for external users.

4.16.2.4. Contractor shall be responsible for managing Administrative Users per authorized Service Requests. Administrative Users control the workgroups, create subdivisions of such workgroups, invite County Casual Users, and control the sharing of data across workgroups. Administrative Users must have an sdcounty.ca.gov email address.

4.16.2.5. Contractor shall allow for an unlimited number of Casual Users. Casual Users have view/collaboration privileges only as subordinate to one or more Administrative Users and can send surveys with less than 10 questions.

4.16.2.6. Contractor shall be responsible for managing top-level workgroups per authorized Service Requests.

4.16.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Survey Solution Support Services.

Survey Solution Support Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Develop plan for County review for implementation, operations, and support, including (but not limited to) asset management, incident management, Service Portal updates, annual procurement support, user and data migration activities, workgroup definitions and activities, documentation, required integration points, required reporting, etc.	X	
2. Review implementation, operations, and support, including (but not limited to) asset management, incident management, Service Portal updates, annual procurement support, user and data migration activities, workgroup definitions and activities, documentation, required integration points, required reporting, etc.		X
Build Roles and Responsibilities	**Contractor**	**County**
3. Responsibility to execute the Implementation portion of the Plan developed in the Plan R&R.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
4. Responsibility to execute the Support portion of the Plan developed in the Plan R&R.	X	

5. NETWORK SERVICES

5.1. Overview

Network Services Framework includes the Hardware, Software and services associated with the transport of voice, video and/or data across the infrastructure, internet, data centers, and cloud based services and/or external Third-Parties to/from End-Users. Activities included are the plan, build, and operate of networked assets and services used for the transport of voice, video and/or data.

Network Services Framework includes the following Framework Components:

- Data Network Services
- Remote Access Services
- Voice Services
- Network Security Services
- Video Conferencing Services
- Video Streaming and Archiving Services
- Mobility Infrastructure Services
- Wireless Network Access Services
- Third-Party Network Access Services
- External DNS Management Services
- IP Address Management Services
- New Site Installation Services

5.2. High Level Requirements

5.2.1. Contractor shall recommend, for County approval, qualified Network Service Manager as Contractor Key Personnel to manage Network Services.

5.2.2. Contractor shall provide a reliable, scalable, responsive and secure data network with connectivity to all Locations.

5.2.3. Contractor shall provide highly available, scalable, reliable, and secure voice services with features and functions that meet or exceed County business requirements.

5.2.4. Contractor shall continuously improve Network Services.

5.2.5. Contractor shall provide all Network Services across, at a minimum, two Point of Presence locations within the County that maintains complete failover and redundancies for all Network Services.

5.2.6. Contractor shall implement a dedicated, secure, high capacity, and redundant backbone with County defined bandwidth that shall be dual homed across the two Point of Presence Locations.

5.2.7. Contractor shall provide redundant, secure, diverse Internet connections for County End-Users at each Point of Presence location.

5.2.8. Contractor shall ensure County business continues to operate during any unplanned event or outage.

5.2.9. Contractor shall provide architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Network Services.

5.2.10. Contractor shall continuously investigate emerging technology and services that improve the overall network efficiencies, lowers overall network costs and improves End-User network performance and security.

5.2.11. Contractor shall provide technology assistance and support to the County in planning and standardsetting activities.

5.2.12. Contractor shall maintain a secure network perimeter.

5.2.13. Contractor shall provide secure network remote access to County End-Users and authorized Third-Parties.

5.2.14. Contractor shall provide bandwidth, as County deems necessary, to accommodate the County needs and for the Services.

5.2.15. Contractor shall measure and report bandwidth consumption across all Network Services.

5.2.16. Contractor shall incorporate technology security improvements for business requirements without compromising the security, integrity, and performance of the County enterprise and information resources.

5.2.17. Contractor shall refresh and consolidate network assets to ensure operability, supportability and performance.

5.2.18. Contractor shall continuously identify and correct, with County approval, any single point failures found within Network Services.

5.2.19. Contractor shall perform centralized management and performance monitoring of Network Services.

5.2.20. Contractor shall provide network bandwidth as needed to meet County performance and operational requirements.

5.2.21. Contractor shall ensure that all Sites have sufficient bandwidth, at all times, to support the Services.

5.2.22. Contractor shall ensure that all Network Services Hardware and Software are operating at optimal and maximum performance.

5.2.23. Contractor shall report performance and capacity results monthly on Network Services.

5.2.24. Contractor shall ensure that all Network Services Hardware and Software related to network security are physically located in secure Locations.

5.2.25. Contractor shall interconnect all Sites to facilitate endtoend business functions and allow network access to shared resources.

5.2.26. Contractor shall maintain a timeline/roadmap of all Network Services Hardware versions and Software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

5.2.27. Contractor shall configure, install, activate, monitor and provide break-fix support to County for equipment and circuits funded through the E-Rate Program, as agreed to and defined in the Standards and Procedures (SnP) Manual for the San Diego County Branch Libraries.

5.3. Environment

5.3.1. Scope of Environment

Network Services shall cover all County Locations.

5.3.2. Hardware and Software

Contractor shall own, provision, install, manage, maintain, and support all Hardware, Software, licenses, tools needed in the delivery of Network Services.

5.3.3. Facilities

5.3.3.1. County

Network Services for all County Locations.

5.3.3.2. Contractor

Network Services for Contractor Locations used by the Contractor to provide the Services.

5.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Network Services.

Network Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Collaborate with Third-Party network carriers and other industry leaders on an initial and ongoing basis to develop and establish the most favorable, cost-effective strategic direction for voice technology for the County.	X	
2. Produce and submit network architecture documentation.	X	
3. Review and approve network architecture documentation.		X
4. Produce and submit network asset refresh plan.	X	
5. Review and approve network asset refresh plan.		X
6. Produce and submit capacity and trending analysis for network infrastructure.	X	
7. Review and approve capacity and trending analysis for network infrastructure.		X
8. Produce and submit impact analyses and associated plans.	X	
9. Review and approve impact analyses and associated plans.		X

Network Services: Plan, Build and Operate Roles and Responsibilities		
10. Produce and submit standards for network cable plant to include wiring standards, fiber standards, terminations, faceplates, cable run, and cable type.	X	
11. Review and approve standards for network cable plant to include wiring standards, fiber standards, terminations, faceplates, cable run, and cable type.		X
12. Produce and submit recommendations on maintaining the network cable plant to industry standard.	X	
13. Review and approve recommendation on maintaining the network cable plant to industry standard.		X
14. Produce and submit plans for Site additions or deletions upon request.	X	
15. Review and approve plans for Site additions or deletions upon request.		X
16. Recommend network capacity thresholds.	X	
17. Approve network capacity planning thresholds.		X
18. Provide consulting for strategy and direction including architecture consultative support.	X	
Build Roles and Responsibilities	**Contractor**	**County**
19. Design and implement network architecture based on approved documentation.	X	
20. Design, configure, deploy and report network assets based on the approved refresh plan.	X	
21. Review and approve network asset refresh plan.		X
22. Design and implement changes to the network infrastructure based on results of the capacity and trending analysis.	X	
23. Design and implement changes to the network infrastructure based on impact analyses and associated plans.	X	
24. Design and implement approved recommendations on maintaining the network cable plant to industry standard.	X	
25. Implement network cable plant standards.	X	

Network Services: Plan, Build and Operate Roles and Responsibilities		
26. Design and implement network devices to meet County availability requirements (e.g., ensure that critical servers such as Domain Name System (DNS), Dynamic Host Configuration Protocol (DHCP), Active Directory, E-Mail, etc. have dual-attached network interface cards (NICs) to independent LAN switches and/or have backup servers).	X	
Operate Roles and Responsibilities	**Contractor**	**County**
27. Provide maintenance and support for all Network Services, including the cable plant, network hardware and circuits.	X	
28. Perform proactive 24/7/365 network monitoring and maintenance functions for all Framework Components (e.g., voice systems, video systems, and data network transport) from County-approved network operations centers (NOC).	X	
29. Manage all network devices in accordance with County's policies (including security oversight and change management policies).	X	
30. Manage User accounts as needed for access and maintaining network resources (e.g., logon User-id and password maintenance).	X	
31. Maintain and provide verified information including access, general logs, application logs in accordance with County's security policies.	X	
32. Ensure that network administration activities are coordinated through defined change management processes.	X	
33. Support and manage network cable plant to approved standards.	X	
34. Provide updates to network Standards documentation as required.	X	
35. Synchronize all network device time clocks using appropriate tools that meets county requirements (e.g., Network Time Protocol (NTP)).	X	
36. Backup network device configurations.	X	
37. Review and approve Services and standards for all network Services.		X
38. Respond and resolve data network-related Incidents.	X	
39. Provide management of hardware refresh activities for network infrastructure.	X	

Network Services: Plan, Build and Operate Roles and Responsibilities		
40. Manage and perform refresh of Network hardware per County standard hardware refresh cycles.	X	

5.5. Data Network Services

5.5.1. Overview

This section pertains to the Data Network Services Framework Component within the Network Services Framework. The Data Network is the transport layer of a converged network with voice, video and data communications coexisting seamlessly.

Services provided within this Framework Component include, but are not limited to, the following:

- Network management
- Network capacity and performance monitoring
- Site to site connectivity
- Bandwidth management
- End-User to network connectivity
- Network engineering
- Internet access
- Hardware and Software refresh
- Technology transformation to improve overall service delivery
- Uninterrupted Power Supply (UPS) equipment support

5.5.2. High Level Requirements

5.5.2.1. Contractor shall maintain currency on Data Network Services Hardware and Software.

5.5.2.2. Contractor shall maintain an accurate and up-to-date inventory of all Data Network Services Hardware and Software.

5.5.2.3. Contractor shall standardize, with County approval, all Hardware and Software used in the delivery of Data Network Services.

5.5.2.4. Contractor shall provide bandwidth, as needed, for all Data Network Services, including the Internet, in support of the Services.

5.5.2.5. Contractor shall provide continuous monitoring and corrective action of the Data Network Services, 24/7/365.

5.5.2.6. Contractor shall participate in continuous architecture planning of upgrades, refresh and transformational activities related to operational and technical improvements of Data Network Services.

5.5.2.7. Contractor shall design all Wide-Area-Networks (WAN) with requirements for cloud connectivity.

5.5.2.8. Contractor shall continuously assess network impact of County adoption of cloud based services.

5.5.2.9. Contractor shall participate in County cloud review committee.

5.5.2.10. Contractor shall centralize the management of Data Network Services including cloud activity.

5.5.2.11. Contactor shall include cloud services in Service Levels.

5.5.2.12. Contractor shall provide network performance management consisting of measuring, modeling, planning, optimizing and reporting of Data Network Services to ensure they carry traffic with the speed, reliability and capacity to meet the needs of the County.

5.5.2.13. Contractor shall manage network performance by continuously measuring delay, packet loss, retransmissions, and throughout.

5.5.2.14. Contractor shall promptly correct and reported performance or capacity Incidents with Data Network Services.

5.5.2.15. Contractor shall perform monitoring and break/fix support and break/fix support of Contractor provided UPS equipment.

5.5.2.16. Contractor shall perform active and passive techniques for measuring and analyzing network performance as needed to support Incident Management and Problem Management.

5.5.3. Environment

The following further describe and scope Data Network Services elements supported by the Contractor and with which Contractor shall comply.

5.5.3.1. Technology Refresh

Contractor shall refresh Data Network Services core hardware and software on a 4-year refresh schedule and Data Network Services LAN Switch hardware and software on a 5-year refresh schedule unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

5.5.3.2. Hardware and Software

Contractor shall own, provision, install, manage, maintain, and support all Hardware, Software, licenses, tools needed in the delivery of services for Data Network Services.

5.5.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Data Network Services.

Data Network Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendation for Data Network Services architecture.	X	
2. Review and approve recommendations for Data Network Services architecture.		X
3. Produce and submit Data Network Services refresh plan on a yearly basis.	X	
4. Review and approve Data Network Services refresh plan on a yearly basis.		X
5. Identify, recommend and submit Data Network Services solutions that best meet County business needs.	X	

Data Network Services: Plan, Build and Operate Roles and Responsibilities		
6. Review and approve Data Network Services.		X
7. Perform and submit recommendations for Data Network Services capacity and performance policies and procedures.	X	
8. Review and approve recommendations for Data Network Services capacity and performance policies and procedures.		X
9. Produce and submit recommendations for Data Network Services migration to current technology.	X	
10. Review and approve recommendations for Data Network Services migration to current technology.		X
11. Produce and submit operational policies and procedures for monitoring and maintaining Data Network Services.	X	
12. Review and approve operational policies and procedures for monitoring and maintaining Data Network Services.		X
13. Produce and submit network provisioning policies and procedures.	X	
14. Review and approve network provisioning policies and procedures.		X
15. Produce and submit network administration policies and procedures.	X	
16. Review and approve network administration policies and procedures.		X
17. Produce and submit documentation of Data Network Services asset configuration files and IP addressing schemas.	X	
18. Review and approve documentation of Data Network Services asset configuration files and IP addressing schemas.		X
Build Roles and Responsibilities	**Contractor**	**County**
19. Produce and submit to County all design and engineering documentation to support Data Network Services.	X	
20. Review and approve all design and engineering documentation for Data Network Services.		X
21. Design, test and implement approved Data Network Services architecture.	X	
22. Deploy, manage, communicate and report on activities related to Data Network Services refresh.	X	

Data Network Services: Plan, Build and Operate Roles and Responsibilities		
23. Review and approve Data Network refresh report.		X
24. Design and Implement Data Network Services capacity and performance policies and procedures.	X	
25. Design, test and implement Data Network Services migration to current technology.	X	
26. Implement operational policies and procedures for monitoring and maintaining Data Network Services.	X	
27. Design and implement network provisioning policies and procedures.	X	
28. Implement approved recommendations for Sites additions or deletions.	X	
29. Implement approved network administration policies and procedures.	X	
30. Order and expedite WAN circuits, Assets and Services.	X	
31. Configure Data Network Assets prior to installation.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
32. Provide support, including break-fix, for all Data Network Services.	X	
33. Manage public carriers and other circuit Third-Parties to ensure delivery of WAN Services.	X	
34. Monitor Data Network Services to established baseline and thresholds.	X	
35. Provide and support Data Network Services refresh.	X	
36. Provide and support Data Network Services migration to new technology or architecture.	X	
37. Produce and submit Data Network Services utilization, capacity and performance reports monthly.	X	
38. Review and approve requirements for WAN/LAN/VPN/Firewall Services.		X
39. Provide LAN/WAN connectivity to Locations.	X	
40. Manage and support provisioning of new and upgraded Data Network Services.	X	

Data Network Services: Plan, Build and Operate Roles and Responsibilities		
41. Procure, provision and maintain all network components and circuits.	X	
42. Provide support in accordance with approved network administration policies and procedures.	X	
43. Perform day-to-day network operations and administration activities.	X	
44. Maintain TCP/IP addressing schemes, router configurations, routing tables, VPN configurations, network addresses, MAC addresses, etc.	X	
45. Support legacy data networks and associated terminals, controllers and CSU/DSU, tied to current mainframe and midrange platforms.	X	
46. Manage LAN infrastructure, including wiring, patch panels, jack configuration and documentation.	X	
47. Implement measures for proactive monitoring and self-healing to limit network Incidents.	X	
48. Identify network Incidents and resolve in accordance with Incident Management Services.	X	
49. Perform and support physical (e.g., equipment) and logical (e.g., IP address change) IMAR associated with Sites for LAN/WAN and transport environments.	X	
50. Manage the performance of public carriers (and other Third-Parties) to meet defined schedules, Project plans, and performance.	X	
51. Coordinate ordering, procurement and inventory management of network circuits from public carriers.	X	
52. Perform point-to-point and promiscuous network traffic analysis.	X	
53. Provide monitoring and break/fix support for Contractor supplied UPS equipment.	X	

5.6. Remote Access Services

5.6.1. Overview

This section pertains to the Remote Access Services Framework Component within the Network Services Framework. Services provided by this Framework Component include,

but are not limited to, the provision of a persistent, secure, and wireless connection to internal County-networked Hardware, Software and applications from outside the County network perimeters for authorized End-Users on a 24/7/365 basis.

Services provided within this Framework Component include, but are not limited to, the following:

- VPN
- Mobile VPN
- Akamai Enterprise Application Access (EAA)
- Network persistence
- Application persistence
- Network access control
- Application tunneling
- External and mobile authentication
- Active directory account integration
- Integration with the County certificate authority
- Technology refresh

5.6.2. High Level Requirements

5.6.2.1. Contractor shall maintain a safe, reliable and secure session that allows County End-Users and authorized external Users access to designated County network resources.

5.6.2.2. Contractor shall continuously identify and correct, with County approval, any single point failures with Remote Access Services.

5.6.2.3. Contractor shall provide network persistence as part of the Remote Access Services and shall be referred to as Virtual Private Network Level 1.

5.6.2.4. Contractor shall provide application persistence as part of the Remote Access Services and shall be referred to as Virtual Private Network Level 2.

5.6.2.5. Contractor shall provide network access control (NAC) to all Remote Access Services.

5.6.2.6. Contractor shall apply County approved security policies to all Remote Access Services.

5.6.2.7. Contractor shall provide End-User Authentication for all Remote Access Services.

5.6.2.8. Contractor shall provide secure application tunneling or similar HTTP/SSL tunneling technology for County End-Users.

5.6.2.9. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Remote Access Services.

5.6.2.10. Contractor shall develop training documentation and End-User FAQs and post it on the Service Portal for County End-Users.

5.6.2.11. Contractor shall develop, use, maintain and update help desk scripts and processes for Remote Access Services End-User support.

5.6.2.12. Contractor shall provide secure, external facing portal access to County applications for approved End-Users.

5.6.3. Environment

The following further describe and scope Remote Access Services elements supported by Contractor and with which Contractor shall comply.

5.6.3.1. Technology Refresh

Contractor shall refresh Remote Access Services Hardware and Software on a 4-year refresh schedule unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

5.6.3.2. Hardware and Software

Contractor shall own, provision, install, manage, maintain, and support all Hardware, Software, licenses, tools and Akamai Enterprise Application Access cloud services needed in the delivery of Remote Access Services.

5.6.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Remote Access Services.

Remote Access Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations for a consolidated Remote Access Services architecture.	X	
2. Review and approve recommendations for Remote Access Services architecture.		X
3. Produce and submit operational policies and procedures for Remote Access Services.	X	
4. Review and approve operational policies and procedures for Remote Access Services.		X
5. Produce and submit plans for updates and patches to Remote Access Services.	X	
6. Review and approve plans for updates and patches to Remote Access Services Assets.		X
7. Produce and submit Remote Access Services reporting requirements.	X	
8. Review and approve Remote Access Services reporting requirements.		X
9. Recommend Remote Access Services Desktop Application.	X	
Build Requirements, Roles and Responsibilities	**Contractor**	**County**
10. Design, test and implement County-approved Remote Access Services.	X	
11. Design and implement County-approved operational policies and procedures for Remote Access Services.	X	
12. Design, test and implement approved plans for updates and patches to Remote Access Services.	X	
Operate Requirements, Roles and Responsibilities	**Contractor**	**County**

Remote Access Services: Plan, Build and Operate Roles and Responsibilities		
13. Provide support, including break-fix, for all Remote Access Services Assets.	X	
14. Maintain, support and report on Remote Access Services.	X	
15. Review and approve report on Remote Access Services.		X
16. Maintain and support County Locations requiring Remote Access Services.	X	
17. Maintain and support approved operational policies and procedures.	X	

5.7. Voice Services

5.7.1. Overview

This section pertains to the Voice Services Framework Component within the Network Services Framework. The Voice Services Framework Component applies to Hardware and Software needed to operate the telecommunications systems within the County.

Services provided within this Framework Component include, but are not limited to, the following:

- Single and multi-line voice services
- Single and multi-line Voice over Internet Protocol (VoIP) services
- Voice Mail
- Local dial plans
- Long distance plans
- Voice mail to E-Mail
- Basic and Simple Interactive Voice Services
    - Basic and Simple Interactive Voice Service are defined as the support for Auto Attendant and Automated Call Distributor services as a right to use feature within Voice Services. Functionality is inherent to the Avaya enterprise voice network.
- Auto Attendants
- Automated Call Distribution (ACD)
- Analog jacks
- Short Messages Services

- Telephone handsets
- IP Conference Phones
- 4-1-1 operator Services
- Virtual Phone

5.7.2. High Level Requirements

5.7.2.1. Contractor shall interconnect all Locations along a common voice network to facilitate end-to-end business functions, reduce toll calls and lower costs.

5.7.2.2. Contractor shall provide Voice Services as a highly converged and highly redundant part of Network Services.

5.7.2.3. Contractor shall utilize SIP trunking internally and externally to provide cost optimization and network efficiency for Voice Services.

5.7.2.4. Contractor shall continuously maintain technical currency and modernization of Voice Services.

5.7.2.5. Contractor shall deploy VOIP services to all new County Sites.

5.7.2.6. Contractor shall, on Service Request, upgrade County Site to VOIP services.

5.7.2.7. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Voice Services.

5.7.2.8. Contractor shall provide Voice Mail Services that can be transcribed and delivered to County End-User E-Mail as requested by the County.

5.7.2.9. Contractor shall continuously identify and correct, with County approval, any single point failures with Voice Services.

5.7.2.10. Contractor shall develop plan, implement and integrate Unified Communication Services into Voice Services.

5.7.2.11. Contractor shall develop plan, implement and integrate Voice Services onto Desktop Computing Services Assets.

5.7.2.12. Contractor shall implement, maintain and support basic and simple IVS systems.

5.7.2.13. Contractor shall recommend a plan for County approval, and execute the approved plan for changes to continuously reduce County usage costs for Voice Services.

5.7.2.14. Contractor shall deploy and maintain VoIP Services to appropriate quality of service.

5.7.2.15. Contractor shall enable a Switched Ethernet connection (Power over Ethernet (POE)) for VoIP Services.

5.7.2.16. Contractor shall continuously provide and update documentation that details operation and use VoIP services and post them on the Service Portal Users.

5.7.2.17. Contractor shall recommend, for County approval, technology and architectural standards on a yearly basis for all Voice Services.

5.7.3. Environment

The following further describe and scope Voice Services elements supported by Contractor and with which Contractor shall comply.

5.7.3.1. Hardware and Software

Contractor shall own, provision, install, manage, maintain, and support all Hardware, Software, licenses, tools needed in the delivery of Voice Services.

5.7.3.2. Technology Refresh

Contractor shall refresh Voice Services Hardware and Software on a 5-year refresh schedule unless otherwise agreed by the County in writing, and at a

County-approved deployment schedule that minimizes disruption and reduces risk.

5.7.3.3. Single-Line Voice Services

Single-Line Voice Services are all the Hardware, Software and services necessary to provide single-line phone services to End-Users.

5.7.3.4. Multi-Line Voice Services

Multi-Line Voice Services are all the Hardware, Software and services necessary to provide multi-line phone services to End-Users.

5.7.3.5. Single VoIP Services

Single-Line VoIP Services are all the Hardware, Software and services necessary to provide single-line VoIP Services to End-Users.

5.7.3.6. Multi-Line VoIP Services

Multi-Line VoIP Services are all the Hardware, Software and services necessary to provide multi-line VoIP Services to End-Users.

5.7.3.7. Voice Mail

Voice Mail is an available option to Voices Services upon End-User Service Request or as a stand-alone option available to End-Users without a phone.

The second available option is voice-to-text conversion for Voice Mail. The appropriate E-Mail address receives the converted voice message. This option requires an End-User Service Request.

5.7.3.8. Analog Jack

Analog Jacks are available upon End-User Service Request.

5.7.3.9. [Reserved]

5.7.3.10.Telephone Handsets

Contractor shall own, provision, install, manage, maintain, and support all telephone handsets, including VOIP, with the exclusion of the Microsoft Teams Phone handsets.

5.7.3.11.Virtual Phone

Virtual Phone Services are all the Hardware with the exclusion of the Microsoft Teams Phone handsets., Subcontractor Software, Third Party Software (other than Third Party Software provided by Contractor), and services necessary to provide Virtual Phone Services to End-Users.

5.7.3.12 Virtual Phone Advanced Features

Virtual Phone Services – Advanced Features is an available option to Virtual Phone - Microsoft (MS) Teams Phone and provides auto attendant and call queues. These Advanced Features are only available to MS Teams – Phone subscribers.

5.7.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Voice Services.

Voice Service: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations for Voice Services solutions that best meets County business requirements.	X	
2. Review and approve recommended Voice Services solutions that best meet County business requirements.		X
3. Produce and submit a VOIP migration plan.	X	
4. Review and approve VOIP migration plan.		X
5. Produce and submit operational plans for Voice Services capacity and performance management.	X	
6. Review and approve operational plans for Voice Services capacity and performance policies and procedures.		X
7. Produce and submit recommendations for Voice Services architecture.	X	
8. Review and approve recommendations for Voice Services architecture.		X
9. Produce and submit Voice Services refresh plan on a yearly basis.	X	

Voice Service: Plan, Build and Operate Roles and Responsibilities		
10. Review and approve Voice Services refresh plan on a yearly basis.		X
11. Produce and submit recommendations for Voice Services migration to current technology.	X	
12. Review and approve recommendations for Voice Services migration to current technology.		X
13. Produce and submit operational policies and procedures for management and support of Voice Services.	X	
14. Review and approve operational policies and procedures for management and support of Voice Services.		X
15. Provide Desk Phone design and engineering to meet County requirements.	X	
16. Approve Desk Phone design and engineering.		X
17. Develop Voice and Web Conferencing Services strategies and requirements.		X
18. Consult on Voice, Web Conferencing Service and Desk Phone strategies with County and actively assist in planning and strategy.	X	
19. Design Voice and Web Conferencing Services to meet County strategies and requirements.	X	
20. Approve Voice and Web Conferencing Services.		X
21. Design and implement customized call flow.	X	
22. Design all queues based on customer requirement that provide Agent mobility.	X	
23. Provide call flow and queue design documentation to each Business Group.	X	
24. Provide consultation to County in developing new or modifying existing ACD applications.	X	

Voice Service: Plan, Build and Operate Roles and Responsibilities		
25. Collaborate with Third-Parties and analyze the following traffic analysis and call reports: • 800 in-bound network traffic summary report • Call detail hourly summary • Call detail traffic summary • Report by each 800 number • Call detail traffic summary by state • Trunk utilization for all trunk groups • Call detail by location • Call completion analysis • Resellers summarized traffic by number • Call prompter summary • Traffic by number and date • Unassigned routing termination number (RTN) • Dial number by RTN	X	
Build Roles and Responsibilities	**Contractor**	**County**
26. Design, test and implement approved Voice Services solutions that best meet County business requirements.	X	
27. Provide least cost routing (LCR) analysis and PBX technology that provides LCR (e.g., "tail end-hop off" LCR methodology).	X	
28. Implement approved operational plans for Voice Services capacity and performance management.	X	
29. Design, test and implement Voice Services architecture.	X	
30. Deploy, manage, communicate and report on activities related to Voice Services refresh.	X	
31. Review and approve Voice refresh report.		X
32. Design, test and implement Voice Services migration to current technology.	X	
33. 33. Install Direct Routing between the O365 Microsoft Teams Tennant and on-premise Avaya Aura infrastructure.	X	
34. Implement approved operational policies and procedures for management and support of Voice Services.		X
Operate Roles and Responsibilities	**Contractor**	**County**
35. Provide support, including break-fix, for all Voice Services Assets.	X	
36. Perform bandwidth management for Voice Services.	X	

Voice Service: Plan, Build and Operate Roles and Responsibilities		
37. Support Voice Services refresh.	X	
38. Support Voice network optimization and traffic engineering.	X	
39. Provide competitive and economically favorable local and long distance rates.	X	
40. Manage and provide end-to-end internal and external phone connectivity including hardware and/or peripherals.	X	
41. Provide Desk Phone requirements (e.g., number of sets, functions and features).		X
42. Assist with set up, troubleshooting, and recommendations on headset options.	X	
43. Provide and maintain End-User Guides, quick reference guides, VoIP training, and End-User Telecom Tips/Q&A for County to publish.	X	
44. Manage PBX systems for class of service according to the authorized County key personnel.	X	
45. Manage the PBX systems to provide least cost routing and tail end hop off for outbound calls.	X	
46. Manage interfaces between PBX network and public carriers.	X	
47. Manage and support Interactive Voice Services.	X	
48. Provide emergency 911 Services to County phones.	X	
49. Provide adaptive voice telecommunications Services and equipment as required by laws affecting the support of the disabled.	X	
50. Manage and maintain private dial plan to be consistent with the County's current dialing method.	X	
51. Provide local and long distance voice Services.	X	
52. Support and manage long distance telephone calling.	X	
53. Provide local and long distance usage monitoring and reporting.	X	
54. Provide and support analog jacks for equipment such as modems, fax machines, or phones.	X	
55. Provide Voice Mail Services.	X	
56. Manage Voice Mail security PBXs, Voice Mail systems, and other Voice Services Assets.	X	

Voice Service: Plan, Build and Operate Roles and Responsibilities		
57. Provide Voice Mail usage monitoring and reporting.	X	
58. Provide Voice Mail storage capacity management.	X	
59. Provide Voice Mail retention management per County requirements and external regulations.	X	
60. Perform Voice Mail mailbox IMARs.	X	
61. Maintain Voice Mail mailboxes configurations by End-User.	X	
62. Provide new Voice Mail End-User training materials.	X	
63. Provide access to voice messages through County E-Mail system.	X	
64. Provide directory Services to the public through a mix of automated and live operators in order to meet call requirements.	X	
65. Provide a secure and searchable online directory service with real time updates (e.g., global directory facility GDF).	X	
66. Provide 411 operator Services for the County which includes a directory of employees, employee locations, departments and telephone numbers.	X	
67. Maintain a directory of County Services for 411 operator Services.	X	
68. Provide 411 operator Services for employee and public inquiries.	X	
69. Update annually telephone numbers.	X	
70. Maintain and update an employee directory website with data from County systems.	X	
71. Maintain business process, systems, and information for phone book and directory assistance in accordance with County approved system design and business processes.	X	
72. Manage local, intrastate, national and international voice teleconferencing Services and support.	X	
73. Provide support for the setup of Voice and Web Conferencing sessions.	X	
74. Create and maintain a monthly and a year-to-date summary report by host, including: conference types, total number of connects, total number of minutes, total call charges, total feature charges, and total charges.	X	

Voice Service: Plan, Build and Operate Roles and Responsibilities		
75. Provide proactive and reactive Voice Services fraud and security management and reporting.	X	
76. Monitor and record all data, such as call rating tables, call usage detail and Move, Add, and Remove orders, generate cost allocation reports for local and long distance usage as well as completed Move, Add and Remove orders.	X	
77. Provide itemized call detail records, including length of each call by telephone number and charge.	X	
78. Provide, maintain and support tollfree (on-net) calls between all County Locations.	X	
79. Provide Casual Use Calling including collect calls, person-to-person calls, person-to-person collect calls, remote calls, operator assistance calls, Third-Party calls, dial one calls, dedicated calls and other miscellaneous calls.	X	
80. Provide Conference Bridge Calls for calls placed to an audio and Web document sharing conference Services that allow multiple people participation and controlled by a unique access code.	X	
81. Provide Directory Assistance Calls for calls placed to obtain a listed telephone directory number.	X	
82. Provide Pay Phones at County Sites for the public's convenience, upon End-User request.	X	
83. Provide an attempted (offered) and handled call volume summary.	X	
84. Provide duration, call transferred and abandoned call reports.	X	
85. Provide PSTN calling for toll free and toll calling as per Exhibit 16.1.1	X	
86. Maintain PSTN calling plan for Microsoft Teams Phone, Single-line Voice and Multi-line Voice RUs as per Exhibit 16.1.1.	X	
87. Operate and maintain Direct Routing between the O365 Microsoft Teams Tennant and on-premise Avaya Aura infrastructure	X	
88. Provide SMS text messaging through IVS applications.	X	
89. Provide IP Conference phones.	X	

5.8. Network Security Services

5.8.1. Overview

The Network Security Services Framework Component of the Network Services Framework includes the Hardware, Software, and services needed to maintain overall network and perimeter security.

Services provided by this Framework Component include, but are not limited to, the following:

- Protection from unauthorized devices, software or users
- Protection from unauthorized access to, or use of, the network and networked assets
- Firewall Services
- Intrusion protection, detection and reporting
- Cloud Access Security Broker (CASB)
- Network Access Control
- Remote Access and Mobile Device Authentication
- Remote Access and Mobile User Authentication
- Data Loss Prevention (DLP)
- Continuous security monitoring, logging and reporting
- Security architecture services
- Data protection
- Prevention of malicious code entry into the network
- Transformational activities to improve the overall security, increase performance and lower costs
- Web content filtering

5.8.2. High Level Requirements

5.8.2.1. Contractor shall develop and maintain a flexible security architecture.

5.8.2.2. Contractor shall provide protection from unauthorized use of, or access to, the County's network and networked resources.

5.8.2.3. Contractor shall control physical access to all Hardware and Software used to provide Network Services.

5.8.2.4. Contractor shall establish secure zones, with County approval, as needed.

5.8.2.5. Contractor shall lock down all Hardware and Software used for Network Services.

5.8.2.6. Contractor shall continuously scan all perimeters and assess vulnerabilities and risk.

5.8.2.7. Contractor shall increase visibility into all data communications and data flows between End-Users and resources within the Data Center or to cloud based services.

5.8.2.8. Contractor shall ensure necessary throughput for perimeter protection and internal security methods that are fast enough to deeply scan and remediate threats at wire speed.

5.8.2.9. Contractor shall implement a "single pane of glass" approach to management and monitoring of Network Security Services.

5.8.2.10. Contractor shall provide management, refresh, support, reporting and logging of all firewalls used in the delivery of the Services.

5.8.2.11. Contractor shall provide information event logging, analysis, reporting and management of all Hardware and Software used to provide Network Security Services.

5.8.2.12. Contractor shall provide intrusion detection and prevention systems.

5.8.2.13. Contractor shall provide unified threat management.

5.8.2.14. Contractor shall update all Hardware and Software used for Network Security Services to the latest patch, service packs, or other updates promptly to ensure operational integrity.

5.8.2.15. Contractor shall refresh all Hardware and Software used for Network Security Services on a 4-year cycle unless otherwise approved by the County.

5.8.2.16. Contractor shall maintain all Hardware used in the delivery of Network Security Services to maximize performance with high-speed network operations.

5.8.2.17. Contractor shall continuously identify and correct, with County approval, any single point failures within the Network Security Services.

5.8.2.18. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Network Security Services.

5.8.2.19. Contractor shall continuously maintain a timeline/roadmap of all Network Security Services Hardware and Software life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

5.8.2.20. Contractor shall provide a cloud-based CASB service that will enforce County security policy on County SaaS data. This will include enforcement of DLP policies, enforcement of collaboration policies, capture of audit trails for forensic use, detection of compromised accounts and other threats, and other features that further extend the County security protection.

5.8.3. Environment

The following further describe and scope Network Security Services elements supported by Contractor and with which Contractor shall comply.

5.8.3.1. Hardware and Software

Contractor shall own, provision, install, manage, maintain, and support all Hardware, Software, licenses, tools needed in the delivery of Network Security Services

5.8.3.2. Technology Refresh

Contractor shall refresh Network Security Services Hardware and Software on a 4-year refresh schedule unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

5.8.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Network Security Services.

Network Security Service: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations for Security architecture.	X	
2. Review and approve recommendations for Security architecture.		X
3. Produce and submit plans for monitoring and managing access to the County Intranet.	X	
4. Review and approve plans for monitoring and managing access to the County Intranet.		X
5. Produce and submit plans that provide security to physical and logical devices connected to the network.	X	
6. Review and approve plans to include the provision and support of methods that provide security to physical and logical devices connected to the network.		X
7. Produce and submit recommendations on firewall policies that comply with County policy.	X	
8. Review, approve and identify firewall policies that comply with County policy.		X
9. Perform firewall engineering and firewall security design	X	
10. Assess firewall security and propose alternative security designs.	X	
11. Review and approve firewall security designs.		X
12. Produce and submit recommendation of Network Security Services Assets refresh or upgrade plan on a yearly basis.	X	
13. Review and approve recommendations on Network Security Services Assets refresh or upgrade plan.		X

Network Security Service: Plan, Build and Operate Roles and Responsibilities		
14. Produce and submit recommendations for improved network security.	X	
15. Review and approve recommendations for improved network security.		X
16. Produce and submit recommendation of policies for security vulnerability and penetration testing.	X	
17. Review and approve policies for security vulnerability and penetration testing.		X
18. Produce and submit plans for Network Security Services asset updates or patches.	X	
19. Review and approve plans for Network Security Services asset updates or patches.		X
Build Roles and Responsibilities	**Contractor**	**County**
20. Design, test and implement approved Network Security architecture.	X	
21. Design and implement monitoring and managing access plans as approved.	X	
22. Design, test and implement plans to secure network attached devices.	X	
23. Design, test and implement approved firewall policies.	X	
24. Design, test, implement and report Network Security Services Assets refresh or upgrade.	X	
25. Review and approve reports for Network Security Services Assets refresh or upgrade.		X
26. Design and implement approved recommendations for improving network security.	X	
27. Design and implement approved policies for security vulnerability and penetration testing.	X	
28. Design, test and implement updates or patches approved for Network Security Services Assets.	X	
29. Design a centralized authentication database for remote County employees, Third-Party and agents using VPN and deploy new systems interfacing with single-sign-on authentication Services.	X	

Network Security Service: Plan, Build and Operate Roles and Responsibilities		
30. Deploy a Security Information Management System (SIMS) for aggregation and centralization of Incident alerts and correlation and provide SIMS information to the County through online access.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
31. Provide support, including break-fix, for all Security Services Assets.	X	
32. Provide 24/7/365 security monitoring Services including a Security Operations Center (SOC), IDS/IPS infrastructure and intranet/Internet firewalls.	X	
33. Provide services in conformance to firewall policies and requirements.	X	
34. Provide reporting on security testing results.	X	
35. Provide initial review of security Incidents and the determination if escalation, including to County Information Security, is warranted.	X	
36. Provide standardized End-User operations and also custom reports regardless of the End-User's location and/or department.	X	
37. Identify and remove from the network any malicious-code infected System.	X	
38. Identify and provide countermeasures for malicious code attacks (i.e., both prevention and remediation).	X	
39. Block unauthorized party access and provide notification of unauthorized access attempts.	X	
40. Encrypt (and prioritize) all County traffic that uses public MPLS network transport facilities (such as OPT-E-MAN or DSL) through the engineering and implementation of generic routing encapsulation (GRE) VPN tunnels (e.g., 256-bit Advanced Encryption Standard (AES) key).	X	
41. Provide technical expertise for security reviews.	X	
42. Collect all logs and review all Incidents reported by all other security Services (e.g., NIPS, HIPS, penetration testing, and firewall).	X	
43. Maintain log files in accordance with County policies and Service Levels.	X	

Network Security Service: Plan, Build and Operate Roles and Responsibilities		
44. Provide security reporting.	X	
45. Provide fraud prevention, detection and reporting.	X	
46. Provide, control, monitor, and maintain security encryption interface at the data network level.	X	
47. Provide security devices on supported PBXs, Voice Mail systems, and other appropriate adjunct remote administration ports.	X	
48. Implement security violation notification.	X	
49. Conduct security perimeter vulnerability assessments and annual penetration testing.	X	
50. Provide Cloud Access Security Broker (CASB) capability.	X	
51. Provide CASB reporting.	X	
52. Provide CASB connectivity to Contractor SIEM service.	X	

5.9. Video Conferencing Services

5.9.1. Overview

Video Conferencing Services Framework Component of the Network Services Framework consists of the activities and functions of providing two-way video transmission between different entities within the County as well as outside of the County.

Services provided by this Framework Component include, but are not limited to, the following:

- Enable closed-circuit video conference
- Point-to-point communications within County network connected Sites
- Point-to-point to external State or Federal facilities
- Multi-point hosting of meetings
- Desktop integration into Video Conferencing Services
- External multi-point integration into Video Conferencing Services
- Develop two types of Video Conferencing systems: room and personal.

5.9.2. High Level Requirements

5.9.2.1. Contractor shall provide a reliable and secure Video Conferencing Services that enables County End-Users and authorized external Users to participate.

5.9.2.2. Contractor shall identify and correct, with County approval, any single point failures with Video Conferencing Services.

5.9.2.3. Contractor shall integrate Unified Communications Services into Video Conferencing Services.

5.9.2.4. Contractor shall plan and implement, as requested by the County, Town Hall Services for internal County use.

5.9.2.5. Contractor shall apply County approved security policies to all Video Conferencing Services hardware, software and services.

5.9.2.6. Contractor shall provide End-User authentication, as needed, for all Video Conferencing Services.

5.9.2.7. Contractor shall continuously provide architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Video Conferencing Services.

5.9.2.8. Contractor shall continuously develop and update training documentation and End-User tip sheets and post on the Service Portal for County End-Users on the use of Video Conferencing Services.

5.9.2.9. Contractor shall continuously develop, update and maintain help desk scripts and processes for Video Conferencing Services End-User support.

5.9.3. Environment

The following further describe and scope Video Conferencing Services elements supported by Contractor and with which Contractor shall comply.

5.9.3.1. Hardware and Software

Contractor shall own, provision, install, manage, maintain, and support all Hardware, Software, licenses, tools needed in the delivery of Video Conferencing Services

5.9.3.2. Technology Refresh

Contractor shall refresh Video Conferencing Services Hardware and Software on a 4-year refresh schedule unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

5.9.4. Roles and Responsibilities

The following table identifies the roles and responsibilities associated with Video Conferencing Services.

Video Conferencing Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations for video conferencing standards annually.	X	
2. Review and approve recommendations for video conferencing standards.		X
3. Publish video conferencing standards in the Standards and Procedures Manual on the Service Portal.	X	
4. Produce and submit plans for new, replacement and upgrades to Video Conferencing Services.	X	
5. Produce and submit plans for infrastructure systems (Gatekeeper and Border Controller) and network capacities to support IP based VTC systems.	X	
6. Review and approve plans for new, replacement and upgrades to Video Conferencing Services, infrastructure/network systems.		X
7. Provide Project Management for the installation of new VTC systems.	X	
8. Conduct site review to determine the installation time period (the installation interval is targeted to be 30 days or less, the actual installation period shall be determined after a site review is conducted for that particular system).	X	

Video Conferencing Services: Plan, Build and Operate Roles and Responsibilities		
9. Review and approve site review report.		X
10. Make recommendations to the County for new Video Conferencing Services strategy as new devices, infrastructures and protocols emerge.	X	
11. Review and approve recommendations for new Video Conferencing Services strategy as new devices, infrastructures and protocols emerge.		X
12. Provide a selection of Video Conferencing Services optional items via the OIC.	X	
13. Select Video Conferencing Services optional items via the OIC.		X
Build Roles and Responsibilities	**Contractor**	**County**
14. Design and implement new, replacement or upgrades to Video Conferencing Services.	X	
15. Design and implement infrastructure systems to support IP based VTC systems.	X	
16. Review and approve design changes and implementation plans to Video Conferencing Services, infrastructure and network systems/circuits.		X
17. Provide infrastructure systems that monitors and maintains the QOS of the IP network (Gatekeeper) and supports secure off-net IP based video conferences (Border Controller).	X	
18. Provide basic installation which includes the assembly and placement of any furniture (roll-about cart), component or option provided as part of the new VTC system; along with the placement, connecting, configuration and testing of any electronics provided as part of the new VTC system and any other activities.	X	
19. Review and approve the installation activities.		X
20. Test and deploy approved changes to Video Conferencing Services including infrastructure systems and network Services.	X	
21. Develop and provide training related to the implementation of new products and Services.	X	
22. Provide training to County department personnel for proper operation of hardware and software components and scheduling tool.	X	

Video Conferencing Services: Plan, Build and Operate Roles and Responsibilities		
23. Provide network access to new systems by trained and qualified video engineers and technicians to enable remote diagnostics and efficient triage of trouble reports.	X	
24. Provide Users access to the VTC Third-Party Supplier's management system scheduling tool so that County End-Users can schedule their own video conferences.	X	
25. Provide project management including coordinating with and providing support to Third-Party.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
26. Provide support and maintenance, including break-fix, for new Video Conferencing Services, and limited break-fix for legacy Video Conferencing Systems (excluding parts replacement for legacy Video Conferencing Systems).	X	
27. Provide IMAR Services.	X	
28. Provide and support infrastructure Services for point-to-point, multipoint video conferencing, and Presentation features, Quality of Service and on-net/off-net video conferencing security.	X	
29. Support Video Conferencing Assets.	X	
30. Provide point-to-point, multi-point and ISDN to IP video conferencing Services to the County, both inside and outside the County's network.	X	
31. Provide and maintain the network security infrastructure to support external video conferences for all County departments.	X	
32. Provide video bridging service for County's use to facilitate IP and multipoint video conferences.	X	
33. Provide single point of contact for Incident call handling.	X	
34. Provide access to manufacturer's customer service technical support center to assist County End-Users on equipment operation and any other questions they may have about the systems.	X	
35. Provide software patches and version updates as recommended by equipment for Video Conferencing Services Assets.	X	
36. Provide parts and device warranty, repair and/or parts replacement of all components for systems of Video Conferencing Services.	X	

Video Conferencing Services: Plan, Build and Operate Roles and Responsibilities		
37. Provide multi-cast record/archive service.	X	
38. Integrate teleconferencing into video conference meetings upon request.	X	
39. Monitor and support calls in progress.	X	
40. Maintain and manage video conference calendar and scheduling.	X	
41. Manage and maintain video room calendar and coordinate reservations.	X	
42. Provide miscellaneous video support and advice as required by County.	X	
43. Provide video conferencing service support through County Service Desk.	X	

5.10. Video Streaming and Archiving Services

5.10.1. Overview

This section pertains to the Video Streaming and Archiving Services Framework Component within the Network Services Framework.

Services provided by this Framework Component include, but are not limited to, the following:

- providing live or archived video data or content via a web page to the County Intranet or the external public
- archiving such video data or content to be available for public viewing for one year

County currently uses Granicus Services to provide the Video Streaming and Archiving Services.

5.10.2. High Level Requirements

5.10.2.1. Contractor shall provide and maintain live video streaming broadcast, of Board of Supervisors meetings, over the Internet to worldwide audiences and to End-Users.

5.10.2.2. Contractor shall deliver and distribute video streaming broadcasts of high quality video to all End-Users.

5.10.2.3. Contractor shall provide and maintain video streaming across the County network.

5.10.2.4. Contractor shall optimize Video Streaming and Archiving Services across the County network to maximize End-User performance.

5.10.2.5. Contractor shall identify and correct and single point issues with the Video Streaming and Archiving Services to ensure maximum reliability and performance.

5.10.2.6. Contractor shall archive video streamed broadcasts and store such archives for twelve months and provide public access, via the Internet, to and viewing of such archives.

5.10.2.7. Contractor shall provide the Board of Supervisors with a solution to automate and easily manage the entire legislative process. In particular this solution will allow the elected officials to submit Board Letters, compiling and generating agendas, and creating Minute Orders.

5.10.2.8. Contractor shall provide a web-based service to collect feedback from citizens on specific items associated with upcoming Board of Supervisor's meetings. Contractor shall also provide an online solution that promotes and facilitates community engagement by allowing constituents to share opinions, submit questions, create polls and surveys.

5.10.2.9. Contractor shall provide a custom web page for collecting the feedback and such web page activated by a link dropped on the County's existing Board of Supervisors agenda page.

5.10.2.10. Contractor shall provide a touch-voting solution to the Board of Supervisors, which will include the following functionalities:

5.10.2.10.1. Real-time meeting voting and recording via touch-screen device such as the VoteCast Classic and an iPad or Android voting machine.

5.10.2.10.2. Viewing of full agendas and supporting materials via touch-screen.

5.10.2.11. Elected officials can make or second a motion, cast a vote, review previously cast votes, and request to speak on items using touch-screen devices.

5.10.2.12. Contractor will provide hosting services sufficient to enable use of, and access to, the application. Contractor will also provide maintenance and support of all hardware, firmware, software, and telecommunications equipment and facilities necessary for the delivery of the services.

5.10.2.13. Contractor shall continuously provide architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Video Streaming and Archiving Services.

5.10.2.14. Contractor shall continuously develop and update training documentation and End-User tip sheets and post on the Service Portal for County End-Users on the use of Video Streaming and Archiving Services.

5.10.2.15. Contractor shall continuously develop, update and maintain help desk scripts and processes for Video Streaming and Archiving Services End-User support.

5.10.3. Environment

The following further describe and scope Video Streaming and Archiving Services elements supported by Contractor and with which Contractor shall comply.

5.10.3.1. Hardware and Software

Contractor shall provide all Hardware and Software to support Video Streaming and Archiving Services.

5.10.3.2. Technology Refresh

Contractor shall refresh Video Streaming and Archiving Services Hardware and Software on a 4-year refresh schedule unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

5.10.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate requirements, roles and responsibilities associated with Video Streaming and Archiving Services.

Video Streaming and Archiving Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit annual plans and recommendations for new, replacement and upgrades to Streaming and Archiving Services based on market evaluation and emerging technologies.	X	
2. Review and approve annual plans and recommendations		X
Operate Roles and Responsibilities	**Contractor**	**County**
3. Provide support, including break-fix, for Video Streaming and Archiving Services.	X	
4. Provide and maintain internet video and audio streaming broadcasts, including broadcasts of Board of Supervisors meetings.	X	
5. Provide archiving and public viewing and retrieval of broadcasts of Board of Supervisors meetings for twelve (12) months following the date of such meetings.	X	
6. Provide broadcast feed of County of San Diego Board of Supervisors meetings to the Cox (or the applicable successor) cable television distribution network.	X	

5.11. Mobility Infrastructure Services

5.11.1. Overview

This section pertains to the Mobility Infrastructure Services Framework Component within the Network Services Framework.

Services provided by this Framework Component include, but are not limited to, the following:

- Mobile device management

- Centralized mobile device management platform
- Manage mobile device configurations
- Provision device security policies
- Mobile device authentication services
- Mobile application store
- Application gateways
- Mobile VPN services

5.11.2. High Level Requirements

5.11.2.1. Contractor shall provide a reliable and secure Mobility Infrastructure Services for mobile County End-Users and authorized bring your own device (BYOD) Users.

5.11.2.2. Contractor shall design, deliver, for County approval, and implement a mobile device management platform.

5.11.2.3. Contractor shall continuously identify and correct, with County approval, any single point failures with Mobility Infrastructure Services.

5.11.2.4. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Mobile Infrastructure Services.

5.11.2.5. Contractor shall enable the central management and control all mobile devices (including BYOD), platforms and applications from a single unified console.

5.11.2.6. Contractor shall implement, County approved, device policies for security and data protection using the Mobility Infrastructure Services on all mobile devices (including BYOD).

5.11.2.7. Contractor shall deploy and manage developed or acquired mobile applications within the Mobility Infrastructure Services application store.

5.11.2.8. Contractor shall provide continuous updated documentation that details operation and use Mobility Infrastructure Services and post them on the Service Portal.

5.11.2.9. Contractor shall recommend, for County approval, standards on a yearly basis for all Mobility Infrastructure Services.

5.11.2.10. Contractor shall recommend, for County approval, mobile devices standards including hardware and operating system.

5.11.2.11. Contractor shall facilitate and enable application gateways services for developed or acquired applications, with County approval, to internal County resources from mobile devices using Mobility Infrastructure Services.

5.11.2.12. Contractor shall maintain a continuous timeline/roadmap of all Mobility Infrastructure Services Hardware versions and Software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

5.11.2.13. Contractor shall reference the Standards and Procedures manual for standard Mobile Devices to be supported.

5.11.3. Environment

The following further describe and scope Mobility Infrastructure Services elements supported by Contractor and with which Contractor shall comply.

5.11.3.1. Hardware and Software

Contractor shall provide all Hardware and Software to support Mobility Infrastructure Services.

5.11.3.2. Technology Refresh

Contractor shall refresh Mobility Infrastructure Services Hardware and Software on a 4-year refresh schedule unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

5.11.4. Roles and Responsibilities

The following table identifies the roles and responsibilities associated with Mobility Services.

Mobility Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Provide centralized, secure Mobile Device Management and Support Services for iOS, Android and Windows Phone devices (smartphones or tablets).	X	
2. Perform management and support of mobile devices management application including MDM application updates, configuration and troubleshooting, point releases and fixes as required.	X	
3. Maintain certificates and password resets as required	X	
4. Perform and provide over-the-air (OTA) self-provisioning, policy setting on device and connection configuration, including the ability to set encryption, VPN configuration and Wi-Fi settings with verification to streamline activations and eliminate the need for IT involvement.	X	
5. Provide an Enterprise Mobile Device Application store which can be used for application publishing to devices, through a push by User group (labor for the creation or modification of applications for the Application Store shall be provided through Application Service Requests). The Application Store accessed from all supported devices.	X	
6. Perform and submit operational planning for Mobile Device Management and Support capacity and performance purposes.	X	
7. Review and approve operational planning for Mobile Device Management and Support capacity and performance purposes.		X
8. Design operational views and status reports for the Service Portal.	X	
9. Review and approve operational views and status reports.		X
10. Design operational reports per County request.	X	
11. Review and approve operational reports.		X
12. Produce and submit Mobile Device Management and Support operational policies and procedures including escalation.	X	

Mobility Services Roles and Responsibilities		
13. Review and approve Mobile Device Management and Support operational policies and procedures.		X
Build Roles and Responsibilities	**Contractor**	**County**
14. Develop and improve Mobile Device Management and Support build as appropriate to improve performance.	X	
15. Provide all test Services and produce documentation required to support Mobile Device Management and Support Services.	X	
16. Produce and submit all test documentation to County.	X	
17. Review and approve all test documentation.		X
18. Provide all deployment Services required to support Mobile Device Management and Support Services.	X	
19. Produce and submit to County all Mobile Device Management and Support Services deployment documentation.	X	
20. Review and approve all Mobile Device Management and Support Services deployment documentation.		X
21. Produce and submit plans to apply Mobile Device Management and Support Services application releases and patches as required.	X	
22. Review and approve Mobile Device Management and Support Services application releases and patches plans.		X
23. Enforce security to continuously review all connected devices and quarantine or revoke service for unmanaged or compromised devices.	X	
24. Deliver simplification of mobile application deployment with an enterprise-specific over-the-air (OTA) catalog of mandatory, recommended and available applications, without requiring the use of a commercial Application Store such as Google Play or iTunes Store.	X	

Mobility Services Roles and Responsibilities		
25. Provide security management, including the general functionality described in this Resource Unit. The specific settings are defined by County policy as: • Require passcode • Wipe device after too many passcode attempts • Restrict/Permit applications • Restrict/Permit content • Enforce application blacklist/whitelist • Manage device configurations • Manage Exchange and Active sync E-Mail configurations • Provide the ability to manage application sets and tie them to Active Directory • In the event of lost or stolen assets, the asset shall be wiped of all County Data	X	
Operate Roles and Responsibilities	**Contractor**	**County**
26. Perform routine database maintenance and backups to maintain optimal performance of the Mobile Device Management and Support Services Platform.	X	
27. Maintain the Mobile Device Management and Support Services Platform configuration per engineering build documents and County policy.	X	
28. Maintain all Mobile Device Management and Support Services certificates for the platform and the devices.	X	
29. Perform all device specified Services through the Mobile Device Management and Support Services console (e.g., remote wipes and password resets).	X	
30. Provide continuous monitoring of all connected devices for security Incidents.	X	
31. Quarantine or revoke service for any unmanaged or compromised mobile device.	X	
32. Manage mobile devices through Active Directory group membership.	X	
33. Manage County approved BYOD devices to specific applications authorized by the County.	X	
34. Utilize the Service Portal to monitor system performance.	X	
35. Provide operational reports as requested.	X	

Mobility Services Roles and Responsibilities		
36. Manage Enterprise Application Store to add and delete mobile applications.	X	
37. Provide security protection to maintain control of County information and selectively wipe only County Data and applications, or all data, from managed devices with review of successful completion.	X	
38. Provide County required reporting on Mobile devices usage, billing and invoicing Services.	X	
39. Coordinate between User, Service Desk and Third-Parties such as Mobile/Wireless Carrier or device manufacturer to manage all User and device related Incidents and Service Requests as needed.	X	
40. Provide a single point of contact for the mobile device environment including coordination with Third-Parties as needed.	X	
41. Provide ability to securely access authorized enterprise content from any authorized mobile device.	X	
42. Provide ability to enforce County security and policy through role-based models.	X	
43. Provide for personal and corporate data to securely coexist on the same device.	X	
44. Enable employee self-activation of corporate and personal devices.	X	
45. Provide authorized End-Users access to Service Portal.	X	
46. Provide the ability to monitor device usage and enforce security from a single global console.	X	
47. Provide Services to secure data, applications, communication, and network access from authorized mobile devices.	X	
48. Pre-configure device settings and policies based on ownership models.	X	
49. Provide Services that protect devices from unauthorized use.	X	
50. Provide ability to control specific device features and applications.	X	
51. Provide the ability to enforce authorized Wi-Fi and VPN networks on mobile devices.	X	

Mobility Services Roles and Responsibilities		
52. Provide Services to secure devices, data, applications, communication, and network access.	X	
53. Provide Services that implement secure data leakage prevention.	X	
54. Provide Services that protect against malware and unauthorized access via custom profiles.	X	
55. Support County in performing security and compliance reviews on mobile devices as needed.	X	

5.12. Wireless Network Access Services

5.12.1. Overview

This section pertains to the Wireless Network Access Services Framework Component within the Network Services Framework. The Wireless Network Access Services Framework Component applies to the Wireless Local Area Network (WLAN) located throughout various County Sites. The WLAN allows County End-Users and authorized users to establish a secure connection to the County internal network or an unsecured connection, taken directly to the Internet, for visitors.

Services provided within this Framework Component include, but are not limited to, the following:

- Accessibility to County resources for wireless connected End-Users
- Security from unauthorized users
- Central management of Wireless Network Access Hardware and Software
- Performance better or equal to wired network for secure network access
- Secure network integration
- Network access control
- Network capacity and performance monitoring
- Network engineering
- Transformational activities to improve overall service
- Technical refresh

5.12.2. High Level Requirements

5.12.2.1. Contractor shall maintain technical currency on Wireless Network Access Services Hardware and Software.

5.12.2.2. Contractor shall ensure that all devices attached to the secure network WLAN are valid and authorized.

5.12.2.3. Contractor shall continuously identify and correct, with County approval, any single point failures within the Wireless Network Access Services.

5.12.2.4. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Wireless Network Access Services.

5.12.2.5. Contractor shall deploy WLAN to the secured network for all County authorized, wireless End-Users using appropriate device and user authentication.

5.12.2.6. Contractor shall deploy WLAN to the unsecured network for all County visitors.

5.12.2.7. Contractor shall provide End-User authentication for all interaction with the secure WLAN.

5.12.2.8. Contractor shall deploy device authentication for secure WLAN access using County PKI infrastructure.

5.12.2.9. Contractor shall ensure that the Wireless Network Access Services network is secure by implementing County security policies and using Network Access Control.

5.12.2.10. Contractor shall deploy a guest access portal and splash screen to unsecured WLAN for County visitors.

5.12.2.11. Contractor shall make available two types of Wireless Access Points interior mounted and exterior mounted.

5.12.2.12. Contractor shall continuously maintain a timeline/roadmap of all Wireless Network Access Services Hardware and Software life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

5.12.3. Environment

The following further describe and scope Wireless Network Access Services elements supported by Contractor and with which Contractor shall comply.

5.12.3.1. Hardware and Software

Contractor shall provide all Hardware and Software to support Wireless Network Access Services.

5.12.3.2. Technology Refresh

Contractor shall refresh Wireless Network Access Services Wireless Access Points (WAPs) on a 3-year refresh schedule and all other Wireless Network Access Services Hardware and Software on a 4-year refresh schedule unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

5.12.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Wireless Network Access Services.

Wireless Network Access Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendation for Wireless Network Access Services architecture.	X	
2. Review and approve Wireless Network Access Services architecture.		X

Wireless Network Access Services Roles and Responsibilities		
3. Produce and submit Wireless Network Access Services refresh plan on a yearly basis.	X	
4. Review and approve Wireless Network Access Services refresh plan on a yearly basis.		X
5. Produce and submit Wireless Network Access Services policies and procedures.	X	
6. Review and approve Wireless Network Access Services policies and procedures.		X
7. Produce and submit Wireless Network Access Services security architecture.	X	
8. Review and approve Wireless Network Access Services security architecture.		X
Build Roles and Responsibilities	**Contractor**	**County**
9. Design, test and implement approved Wireless Network Access Services architecture.	X	
10. Deploy, manage, communicate and report on activities related to Wireless Network Access Services refresh.	X	
11. Review and approve Wireless Network Access Services refresh report.		X
12. Develop and implement Wireless Network Access Services policies and procedures.	X	
13. Design, test and implement approved Wireless Network Access Services architecture.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
14. Provide support, including break-fix, for all Wireless Network Access Services Assets.	X	

5.13. Third-Party Network Access Services

5.13.1. Overview

This section pertains to the Third-Party Network Access Services Framework Component within the Network Services. The Third-Party Network Access Services Framework Component applies to security services, network transport and bandwidth required for Third-Party access to the County network.

Services provided within this Framework Component include, but are not limited to, the following:

- Protection from unauthorized network access
- Firewall services
- Intrusion protection
- Detection and reporting
- Security monitoring
- Data protection
- Network management
- Network capacity and performance monitoring
- Third-Party network to County network connectivity
- User authentication services

5.13.2. High Level Requirements

5.13.2.1. Contractor shall establish and maintain Third-Party Network Access Services to the County secure network.

5.13.2.2. Contractor shall monitor, log and report all activity related to Third-Party Network Access Services.

5.13.2.3. Contractor shall ensure necessary bandwidth and capacity are in place for all Third-Party Network Access Services.

5.13.2.4. Contractor shall ensure all appropriate County security policies are in place and that the County secure network is maintained as safe from compromise.

5.13.2.5. Contractor shall identify and correct, with County approval, any single point failures with Third-Party Network Access Services.

5.13.2.6. Contractor shall provide architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Third-Party Network Access Services.

5.13.3. Environment

The following describes the scope for Third-Party Network Access Services elements supported by Contractor.

5.13.3.1.Hardware and Software

Contractor shall provide all Hardware and Software to support Third-Party Network Access Services.

5.13.3.2.Technology Refresh

Contractor shall refresh Third-Party Network Access Services Hardware and Software on a 4-year refresh schedule unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

5.13.3.3.Security Services

Security Services include all the Hardware, Software, and services to ensure secure and authorized access to the County secure network

5.13.3.4.Network Services

Network Services include all the Hardware, Software, and services needed by a Third-Party access to the County secure network. The three (3) categories are private network circuits or connections, Private Circuit/Connection, IPSEC Tunnels and Virtual Access Connections. The circuit connecting to the County is the responsibility of the Third-Party.

5.13.3.4.1. Private Circuit/Connection

- Category 1 — any circuit or connection less than T1 speed (1.544mbps)
- Category 2 — any circuit or connection equal to T1 speed
- Category 3 — any circuit or connection greater than T1 speed

5.13.3.4.2. IPSEC Tunnels Connection

- IPSEC Tunnel 5Mbs
- IPSEC Tunnel 10Mbs

5.13.3.4.3. Virtual Access Connection

- Virtual Access 1Mbps
- Virtual Access 2Mbps
- Virtual Access 3Mbps
- Virtual Access 4Mbps
- Virtual Access 5Mbps
- Virtual Access 5Mbps – Microsoft Teams Rooms (MTR)
- Virtual Access 10Mbps
- Virtual Access 20Mbps
- Virtual Access 30Mbps
- Virtual Access 40Mbps
- Virtual Access 50Mbps

5.13.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Third-Party Network Access Services.

Third-Party Network Access Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations for Third-Party Network Access Services architecture.	X	
2. Review and approve recommendations for Third-Party Network Access Services architecture.		X
3. Produce and submit plans for monitoring and managing access to the County network from Third-Party entities.	X	
4. Review and approve plans for monitoring and managing access to the County network from Third-Party entities.		X
5. Produce and submit recommendations on firewall policies that comply with County policy.	X	
6. Review and approve firewall policies.		X
7. Produce and submit recommendation of Third-Party Network Access Services Assets refresh or upgrade plan on a yearly basis.	X	
8. Review and approve recommendations on Third-Party Network Access Services Assets refresh or upgrade plan.		X

Third-Party Network Access Services Roles and Responsibilities		
9. Produce and submit plans for Third-Party Network Access Services Asset updates or patches.	X	
10. Review and approve plans for Third-Party Network Access Services Asset updates or patches.		X
Build Roles and Responsibilities	**Contractor**	**County**
11. Design, test and implement approved Third-Party Network Access Services architecture.	X	
12. Design and implement monitoring and managing access plans as approved.	X	
13. Design, test and implement approved firewall policies.	X	
14. Design, test, implement and report Third-Party Network Access Services Assets refresh or upgrade.	X	
15. Review and approve reports for Third-Party Network Access Services Assets refresh or upgrade.		X
16. Design, test and implement updates or patches approved for Third-Party Network Access Services Assets.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
17. Provide support, including break-fix, for all Third-Party Network Access Services Assets.	X	
18. Provide services in conformance to firewall policies and requirements.	X	
19. Support Third-Party Network Access Services refresh.	X	
20. Manage network interfaces between the County and Third-Parties.	X	
21. Produce and submit network utilization, capacity and performance reports.	X	
22. Provide initial review of security Incidents and the determination if escalation, including to County Information Security, is warranted.	X	
23. Provide standardized End-User operations and also custom reports regardless of the End-user's location and/or department.	X	
24. Identify and remove from the network any malicious-code (malware) infected System.	X	

Third-Party Network Access Services Roles and Responsibilities		
25. Identify and provide countermeasures for malware attacks (i.e., both prevention and remediation).	X	
26. Collect all logs and review all Incidents reported by all other security Services (e.g., NIPS, HIPS, penetration testing, and firewall).	X	
27. Maintain log files in accordance with County policies and Service Levels.	X	
28. Provide security reporting.	X	
29. Provide fraud prevention, detection and reporting.	X	

5.14. External DNS Management Services

5.14.1. Overview

This section pertains to the External DNS Management Services Framework Component within the Network Services Framework. The External DNS Management Services Framework Component applies to a cloud-based DNS solution that is available 24/7/365.

Services provided within this Framework Component include, but are not limited to, 24/7/365 DNS availability, improved DNS responsiveness, Web Application Firewall, Geo blocking, Security Monitor, Client Reputation, IP Whitelists / Blacklists, Bot Management, Dynamic Site Accelerator (CDN), defense against DDoS or similar type attacks, distributed Anycast network, primary and secondary DNS services and interface to internal DNS services.

Akamai Fast DNS Service along with Kona Security Service and Bot Management Service are used to provide External DNS Management Services.

5.14.2. High Level Requirements

5.14.2.1. Contractor shall leverage current Akamai Fast DNS Service for External DNS Management Services.

5.14.2.2. Contractor shall support and manage all aspects of External DNS Services including integration to internal DNS services, as needed.

5.14.2.3. Contractor shall maintain DNS to reduce orphan or bad records.

5.14.2.4. Contractor shall continuously identify and correct, with County approval, any single point failures within the External DNS Management Services.

5.14.2.5. Contractor shall facilitate a quarterly meeting with Akamai, Contractor resources and County to review roadmaps, support status and emerging services.

5.14.2.6. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to External DNS Management Services.

5.14.2.7. Contractor shall leverage "Web Application Firewall" component from Kona Security Services to inspect application traffic and block suspicious or known exploits.

5.14.2.8. Contractor shall leverage "Geo Blocking" component from Kona Security Services to block traffic originating from specific geographical locations.

5.14.2.9. Contractor shall leverage "Security Monitor" component from Kona Security Services to provide real-time visibility into network- and application-layer attacks.

5.14.2.10. Contractor shall leverage "Client Reputation" component from Kona Security Services to block attackers proactively when they're detected elsewhere on the Akamai Platform.

5.14.2.11. Contractor shall leverage "IP Whitelists / Blacklists" component from Kona Security Services to define list of IP addresses to allow or block for positive and negative security.

5.14.2.12. Contractor shall leverage "Bot Manager Standard" from Akamai to identify and manage bots targeting the County websites.

5.14.2.13. Contractor shall continuously maintain a timeline/roadmap of all External DNS Management Services Hardware and Software life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

5.14.3. Environment

The following further describe and scope External DNS Management Services elements supported by Contractor and with which Contractor shall comply.

5.14.3.1. Hardware and Software

Contractor shall provide all Hardware and Software to support External DNS Management Services.

5.14.3.2. External Service

Contractor shall own and manage all contracts with cloud based Third-Parties supporting External DNS Management Services.

5.14.3.3. Technology Refresh

Contractor shall refresh External DNS Management Services Hardware and Software on a 4-year refresh schedule unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

Excluded from technology refresh are all cloud based External DNS Management Services. Cloud based Third-Parties update per product release cycles.

5.14.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with External DNS Management Services.

External DNS Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit a solution design on External DNS Services.	X	

External DNS Management Services Roles and Responsibilities		
2. Review and approve the solution design for External DNS Services.		X
3. Produce and submit External DNS Services operational procedures.	X	
4. Review and approve External DNS Services operational procedures.		X
Build Roles and Responsibilities	**Contractor**	**County**
5. Produce and maintain an authoritative record of externally-visible County services and of internally-visible County services.	X	
6. Produce and maintain an authoritative record of the County's public network address ranges and the physical networks.	X	
7. Develop and submit a continuously emerging architecture to ensure that External DNS Services are highly available during normal operations and that they failover during any unplanned event.	X	
8. Review and approve External DNS documentation and technical architecture.		X
Operate Roles and Responsibilities	**Contractor**	**County**
9. Configure and maintain External DNS Services.	X	
10. Configure and maintain DNS records on external DNS Services provided by Akamai.	X	
11. Maintain domain names for External DNS.	X	
12. Submit any recommended changes to External DNS records for County approval.	X	
13. Review any proposed changes to External DNS records.		X
14. Produce monthly reports showing External DNS records and domains.	X	

5.15. IP Address Management Services

5.15.1. Overview

This section pertains to the IP Address Management Services Framework Component within the Network Services Framework. The IP Address Management Services

Framework Component applies to the single console management of all IPv6 addresses and all IPv4 public and private addresses within the County network.

5.15.2. High Level Requirements

5.15.2.1. Contractor shall allocate IPv4 and IPv6 address ranges within the County.

5.15.2.2. Contractor shall provide Internet routing to all IP address ranges assigned unless otherwise approved by the County Contractor shall provide robust reporting capability that enables detailed tracking of IP address utilization trends.

5.15.2.3. Contractor shall implement and allocate fixed and dynamic IP addresses to the appropriate network-attached device.

5.15.2.4. Contractor shall assign and maintain IP address ranges for all County Locations.

5.15.2.5. Contractor shall provide integrated management of dynamic and static IP address space.

5.15.2.6. Contractor shall provide detection and management of conflicts, overlaps, and duplicates in address space.

5.15.2.7. Contractor shall provide automated discovery of IP address ranges from DHCP scopes.

5.15.2.8. Contractor shall provide continuous synchronization with internal DNS services.

5.15.2.9. Contractor shall provide continuous alignment with Active Directory "Sites and Services" for all in use IP Address ranges.

5.15.2.10. Contractor shall continuously identify and correct, with County approval, any single point failures within the IP Address Management Services.

5.15.2.11. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to IP Address Management Services.

5.15.2.12. Contractor shall continuously maintain a timeline/roadmap of all IP Address Management Services Hardware and Software life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

5.15.3. Environment

The following further describe and scope IP Address Management Services elements supported by Contractor and with which Contractor shall comply.

5.15.3.1. Hardware and Software

Contractor shall provide all Hardware and Software to support IP Address Management Services.

5.15.3.2. Technology Refresh

Contractor shall refresh IP Address Management Hardware and Software on a 4-year refresh schedule unless otherwise agreed by the County in writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

5.15.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with IP Address Management Services.

IP Address Management Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit a documentation p allocation of network address ranges for new networks, the assignment of addresses and device names for new servers for DHCP Services.	X	

IP Address Management Services Roles and Responsibilities		
2. Identify an IP Address Management (IPAM) tool that is used for managing and reporting IP address allocations and DHCP configurations.	X	
3. Review and approve an IPAM tool that is used for managing and reporting IP address allocations and DHCP configurations.		X
Build Roles and Responsibilities	**Contractor**	**County**
4. Produce and submit IP Address Management design to ensure that DHCP Services are highly available during normal operations and that they failover during any unplanned event.	X	
5. Review and approve IP Address Management design.		X
6. Implement IP Address Management design.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
7. Allocate network address ranges for new networks and assign addresses.	X	
8. Submit any recommended changes to DHCP configuration for County approval.	X	
9. Review and approve any proposed changes to DHCP configuration for approval.		X
10. Configure and maintain IPAM tool.	X	
11. Maintain an accurate record of network numbers and physical networks to which they are assigned.	X	
12. Produce reports showing network range allocations and device name and address assignments as requested by the County.	X	

5.16. New Site Installation Services

5.16.1 Overview

This section pertains to the New Site Installation Services Framework Component within the Network Services Framework. The New Site Installation Services Framework Component applies to the Plan and Build tasks needed for a new, networked County Site.

New Site Installation is composed of two distinct sets of tasks:

1. New Site Install Fixed Component is determined by Site Type. The activities within this component allows the Site to connect to the County network. This Fixed Component is required for the establishment of any New Site and will include, but not limited to:

- Establishing design standards and design for the new Site
- Ordering and coordinate all circuits necessary for the new Site
- Conducting all planning and engineering required to ensure site functionality
- Installing network Hardware and Software
- Provisioning of the New Site

2. New Site Install Variable Component, as set forth in Appendix 1 to Exhibit 16.1-1, is determined by infrastructure of the site and Site Type. Included in the Variable Component are activities that include, but are not limited to:

- Setting up of MDF/IDF
- Installing intra building cable plant including all wall jacks, labels, patch panels, testing and certification of cable plant
- Project management for the installation of these components

The County may choose to contract directly with Third-Party vendors to perform some or all of the New Site Install Variable Component activities.

Site Types are based on the number of Cable Drops that will be installed at the New Site. A Cable Drop is defined as the copper horizontal cable which reaches from the Intermediate Distribution Frame (IDF) to the wall jack. The table below outlines the Cable Drop thresholds for each different Site Types.

Site Type	Minimum Cable Drops	Maximum Cable Drops
I	1,000	or more
II	501	999
III	250	500
IV	50	249
V	11	49
VI	1	10

5.16.2 High Level Requirements

5.16.2.1 Contractor shall establish and maintain a Fixed Component based on Site Type for New Site Installation.

5.16.2.2 Contractor shall establish and maintain Variable Component (e.g. MDF, IDF, backbone cable, etc.) based on Site Type.

5.16.2.35.16.2.3 If the County elects to procure cabling installation services outside the Agreement: 1. Contractor shall receive certification stating that a full test of all Cable Drops have been performed and that the installation meets the provided standards. 2. Contractor shall perform IMARs on the New Site as of the Turnover Date, as defined in the Standards and Procedures Manual. 3. Contractor shall not be held responsible for any defect in workmanship or materials discovered within six months of the Turnover Date. Correction of such defects by the Contractor shall be performed under a Service Request.

5.16.3 Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with New Site Installation Services.

New Site Installation Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Submit Service Request to initiate New Site Installation indicating Site Type.		X
2. Produce and submit plans for New Site Installation including breakdown of variable components.	X	
3. Review and approve plans and scope of work for New Site Installation.		X
4. Produce and submit procedures for New Site Installation.	X	
5. Review and approve procedures for New Site Installation.		X
Build Roles and Responsibilities	**Contractor**	**County**

New Site Installation Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
6. Design and implement New Site Installation.	X	
7. Implement County approved policies and procedures for New Site Installation.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
8. Support New Site Installation policies and procedures.	X	

5.17. Interactive Voice Services

5.17.1. Overview

This section pertains to the Interactive Voice Services (Interactive Voice Response (IVR) within the Network Services Framework. The Interactive Voice Services Framework Component applies to the Hardware and Software needed to operate the service within the County.

Interactive Voice Services shall be defined as an IVR system which provide one or more of the following capabilities:

- Call Recording
- Call Management Reporting
- Speech Recognition Application
- Computer Screen POP
- Wallboard (Physical/Virtual)
- Data Integration (Data Dip)
- Work Force Optimization
- Outbound/Predictive Dialer
- Agent Softphone
- Speech Enabled Customer Surveys

5.17.2. High Level Requirements

5.17.2.1. Contractor shall develop plan, implement and integrate a consolidation, modernization and improvement in overall reliability and failover for all County IVS Services.

5.17.2.2. Contractor shall recommend a plan for County approval, and execute the approved plan for changes to continuously reduce County usage costs for Interactive Voice Services.

5.17.2.3. Contractor shall deploy and maintain Interactive Voice Services to meet service requirements.

5.17.2.4. Contractor shall develop and maintain three (3) categories of IVS: Small, Medium and Large.

5.17.2.5. Contractor shall continuously provide and update documentation that details operation and use of Interactive Voice services and post them on the Service Portal.

5.17.2.6. Contractor shall recommend, for County approval, technology and architectural standards on a yearly basis for all Interactive Voice Services.

5.17.2.7. Contractor shall provide the following changes to Interactive Voice Services systems:

- Additions, changes or deletions to existing call flow/menu prompts
- Additions, changes or deletions to existing routing or transfer points
- Professional voice recording of changes
- Implementation of existing/available/already purchased licenses

5.17.2.8. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Voice Services.

5.17.3. Environment

The following further describes Interactive Voice Services refresh and the three categories to be provided that shall include technical design, licensing, hardware/software maintenance and support and initial user training.

5.17.3.1. Technology Refresh

Contractor shall refresh Interactive Voice Services Hardware and Software on a 5-year refresh schedule unless otherwise agreed by the County in

writing, and at a County-approved deployment schedule that minimizes disruption and reduces risk.

5.17.3.2.Small IVS

- Automated Call Distribution (ACD)
  - Distributes calls to customer facing agents
  - Supports the total contact center agent population at all County network locations
  - Includes trunking infrastructure to support the routing of calls
  - Can be used as a stand-alone component or in conjunction with an Auto Attendant
- Auto Attendant (AA)
  - Supports Touch-tone input to route calls across the County voice network
  - Includes the professional recordings both English and Spanish menus and prompts
  - Includes trunking infrastructure to support the routing of calls
  - Can be used as a stand-alone component or in conjunction with an ACD
- Call Management System (CMS)
  - Provides reports of contact center agent metrics such as abandoned calls, average talk time, etc.
  - Used in conjunction with an ACD to manage contact center performance
  - CMS is the additive feature which initiates the Small IVS RU category vs. the right-to-use ACD and/or AA capability associated with the Voice RUs

5.17.3.3.Medium IVS

- Automated Call Recording (ACR)
  - Provides for up to 90 days of customer agent recorded calls for both compliance and quality purposes

- Virtual Wallboards
  - Provides ACD statistics and messages displayed on contact center agent and supervisor desktops
- Agent Softphone
  - Provides IP softphone via a desktop client that will provide County contact center agents full functionality whether they are working at their primary County facility, a remote/alternate County site or at home

5.17.3.4.Large IVS

- Interactive Voice Response (IVR)
  - Platform for custom applications such as outbound predictive dialing, multi-language support, voice recognition and County data integration
- Computer-Telephony Interface
  - Customizable interface between IVR and Desktop components to provide database information to a contact center agent when a constituent call
- Short Message Service (SMS)
  - Provides up to 200,000 outbound text messages to specifically defined County client lists
  - Requires the manual upload of a County file of customer contact information to the hosted platform
- Work Force Management
  - Centralized platform of work force scheduling, forecasting and adherence of contact center agents
  - Provides long term strategic forecasting of agent resource requirements based on historical data
  - Integrated with CMS for agent call statistics
- Physical Wallboards
  - Provides ACD statistics and messages displayed on physical monitors in County call centers
  - Includes the controller infrastructure and supporting software to County provided monitors

5.17.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with IVS Services.

IVS Service Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit plans for IVS Services.	X	
2. Review and approve plans for IVS Services.		X
3. Produce and submit procedures for IVS Services.	X	
4. Review and approve procedures for IVS Services.		X
Build Roles and Responsibilities	**Contractor**	**County**
5. Design and implement IVS Services.	X	
6. Implement County approved policies and procedures for IVS Services.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
7. Support IVS Services policies and procedures.	X	

5.18. Mobility Services

5.18.1. Overview

This section pertains to the Mobility Services Framework Component within the Network Services Framework.

Services provided by this Framework Component will include some or all of the following:

- Unlimited voice and data carrier plans
- Standardized mobile devices
- FirstNet mobile network access
- Free calling to Mexico and Canada
- Mobile device tethering
- Mobile WiFi Hotspot

5.18.2. High Level Requirements

5.18.2.1. Contractor shall provide voice, data and text mobile plans.

5.18.2.2. Contractor shall recommend standard mobile devices and hotspot routers for County review and approval using the established EA process.

5.18.2.3. Contractor shall offer for purchase, via the OIC, standard mobile devices and hotspot routers. The specifications of these devices shall be listed in the Standards and Procedures Manual.

5.18.2.4. Contractor shall provide the County with access to the FirstNet nationwide, high-speed, broadband network dedicated to public safety.

5.18.3. Environment

The following further describe, and scope Mobility Services elements supported by Contractor and with which Contractor shall comply.

5.18.3.1. Hardware and Software

Contractor shall provide all, voice and data plans, mobile devices, and mobile hotspots.

5.18.3.2. Technology Upgrade and Refresh

Mobile devices supported within Mobility Services are eligible for replacement or upgrade through purchases from the OIC (leveraging subsidized offers) at the end of its two-year support cycle.

5.18.4. Roles and Responsibilities

Mobility Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Provide mobile device recommendations and specifications.	X	
2. Review and approve mobile device recommendations and specifications.		X
3. Provide mobile plan features and capabilities.	X	
4. Develop IMAR and Break Fix Helpdesk scripts for Mobility Services.	X	
5. Develop OIC plans for approved mobile device.	X	

Mobility Services Roles and Responsibilities		
6. Provide OIC information for mobile device and RU ordering.	X	
7. Review and approve plans for mobile carrier plans and mobile device processes.		X
Build Roles and Responsibilities	**Contractor**	**County**
8. Build Help Desk Scripts for both mobile devices and carrier plans.	X	
9. Implement Help Desk scripts for mobile carrier and device issues	X	
10. Deploy OIC offerings for mobile devices and carrier plan.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
11. Provision mobile carrier plans as ordered by the County.	X	
12. Ship mobile devices to County end users as ordered thru the OIC.	X	
13. Provide IMAR and Break Fix Helpdesk services for Mobility Services.	X	

6. DATA CENTER SERVICES

6.1. Overview

Data Center Services include the Hardware, Software and services to support County business applications and data in a secure, consolidated, physical Tier 3 or Tier 4 data center. This includes public cloud environments and services if approved by the County. The data center must be capable of providing hybrid services to County approved cloud based applications and services, be a highly virtualized environment with respect to network, storage and servers and must maintain its own installed and secure Internet connection.

Data Center Services Framework consists of the Plan, Build and Operate services that include the Hardware, Software, Locations and services associated with centralized, shared computing environment.

Data Center Services Framework is composed of the following Framework Components:

- Security Services
- Mainframe Services
- Application Infrastructure Services
- Infrastructure Services
- Development and Test Services
- E-Mail Services
- Unified Communications Infrastructure Services
- Storage Services
- Backup and Recovery Services
- Managed Print Services
- Public Key Infrastructure (PKI) Services

6.2. High Level Requirements

6.2.1. Contractor shall recommend, for County approval, qualified Data Center Service Manager as Contractor Key Personnel to manage Data Center Services.

6.2.2. Contractor shall meet the County needs for highly available, reliable, scalable, up-to-date, agile and secure Data Center Services

6.2.3. Contractor shall maintain a stable, reliable infrastructure to support business applications and services throughout the County.

6.2.4. Contractor shall provide a reliable, scalable, responsive, technically current and secure data network within Data Center Services.

6.2.5. Contractor shall provide redundant, secure, Internet connections for County data center operations within the physical data centers.

6.2.6. Contractor shall maintain Data Center Services network so there is not a single point failure thereby assuring County business continues to operate during any unplanned event.

6.2.7. Contractor shall provide architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Data Center Services.

6.2.8. Contractor shall continuously investigate emerging technology and services that improve the overall data center efficiencies, lowers overall data center costs and improves End-User performance and security when interacting with data center services.

6.2.9. Contractor shall continuously incorporate technology security improvements for business requirements without compromising the security, integrity, and performance of the County enterprise and information resources.

6.2.10. Contractor shall continuously refresh and consolidate Data Center Services Hardware and Software to ensure operability supportability and cost optimization.

6.2.11. Contractor shall continuously identify and correct, with County approval, any single point failures found within Data Center Services.

6.2.12. Contractor shall perform centralized management and performance monitoring of Data Center Services.

6.2.13. Contractor shall continuously ensure that all Data Center Services Hardware and Software are operating at optimal and maximum performance.

6.2.14. Contractor shall report performance, capacity results monthly on all Data Center Services.

6.2.15. Contractor shall deliver and review with County on an annual basis all standards, plans, support tools, version changes, infrastructure changes, refresh, or any matter related to the Data Center and used in the Data Center. This may include future efforts by the Contractor to change services within the Data Center that may or may not affect the County.

6.2.16. Contractor shall continuously review, implement and manage software licensing for Data Center Services assuring best value, non-duplicative installs, inventory, consolidated and documented.

6.2.17. Contractor shall maintain a timeline/roadmap of all Data Center Services Hardware versions and Software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

6.2.18. With County approval, Contractor shall provide, integrate, and support public cloud-based environments and services. Specific functional requirements for these services are defined in the relevant Service Framework requirements below based on the solution design for Infrastructure as a Service (Iaas) and/or Platform as a Service (PaaS), e.g., servers, storage, firewalls, databases.

6.3. Environment

6.3.1. Scope of Environment

Data Center Services shall provide Services to all County Locations for all County business functions and external users of County services.

6.3.2. Hardware and Software

Contractor shall provide all Hardware, Software, licenses, tools needed in the delivery of Data Center Services. Contractor shall own, license, provision, install, manage, maintain, and support such Assets.

6.4. Roles and Responsibilities

The following table identifies the Plan Build and Operate roles and responsibilities associated with Data Center Services.

Data Center Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations for Data Center Services Framework solutions that best meet County business needs.	X	
2. Review and approve recommendations for Data Center Services Framework solutions that best meet County business needs.		X
3. Produce and submit operational planning for Data Center Services Framework capacity and performance purposes.	X	
4. Review and approve operational planning for Data Center Services Framework capacity and performance purposes.		X
5. Produce and submit recommendations for establishing standards, defining architecture and new project initiatives in the Data Center Services Framework.	X	
6. Review and approve recommendations for establishing standards, defining architecture and new project initiatives in the Data Center Services Framework.		X
7. Recommend architectural components and designs to support the approved data center digitization initiatives.	X	
8. Review and approve architectural components and designs to support the approved data center digitization.		X
9. Develop data center architectural transformation roadmaps in support of any digitization activities.	X	
10. Review and approve data center architectural transformation roadmaps in support of any digitization activities.		X
11. Customize technology architecture taxonomy to meet the evolving business needs of the County.	X	
12. Review and approve the technology architecture taxonomy to meet the evolving business needs of the County.		X
13. Produce and submit recommended Data Center Services administration policies and procedures.	X	
14. Review and approve Data Center Services administration policies and procedures.		X

Data Center Services Roles and Responsibilities		
15. Produce and submit operational documentation on system functions, change management, and Incident management processes.	X	
16. Review and approve operational documentation on system functions, change management, and Incident management processes.		X
17. Produce and submit recommendations on hardware standards for Data Center Services Assets.	X	
18. Review and approve hardware standards for Data Center Services Assets.		X
19. Produce and submit recommendation on software standards for Data Center Services Assets.	X	
20. Review and approve software standards for Data Center Services Assets.		X
21. Produce and submit recommendation for upgrades to Data Center Services Assets as needed to meet business needs.	X	
22. Review and approve upgrades to Data Center Services Assets as needed to meet business needs.		X
23. Produce and submit plans for security updates to Data Center Services Assets.	X	
24. Review and approve plans for security updates to Data Center Services Assets.		X
25. Produce and submit yearly Data Center Services asset consolidation strategy.	X	
26. Review and approve yearly Data Center Services asset consolidation strategy.		X
27. Comply with County policies, standards and regulations applicable to County including information systems, personnel, physical and technical security.	X	
28. Develop a single, consolidated data center for production operations.	X	
29. Develop a technology refresh, redundant systems and improved application architecture design.	X	
30. Collaborate with County to provide technology assistance and support with planning and standard setting activities.	X	

Data Center Services Roles and Responsibilities		
31. Develop a secure flexible Services model when and where appropriate so that the County shall have the flexibility to quickly grow or reduce consumption, including (but not limited to): • Mainframe processing • Storage Area Network (SAN) and Network Attached Storage (NAS) • Centralized backups • Centralized monitoring	X	
32. Create all appropriate project plans, project time and cost estimates, technical specifications, management documentation and management reporting in a form/format that is acceptable to County.	X	
Build Roles and Responsibilities	**Contractor**	**County**
33. Provide all design and engineering required to support Data Center Services Framework.	X	
34. Produce and submit to County all design and engineering documentation.	X	
35. Review and approve all design and engineering documentation.		X
36. Provide all test Services required to support Data Center Services Framework.	X	
37. Produce and submit to County all test documentation.	X	
38. Review and approve all test documentation.		X
39. Implement the approved architectural roadmaps and technology architecture taxonomy across the data centers.	X	
40. Manage deployment efforts using formal project management tools, methodologies and standards (e.g., ITIL change and configuration management practices).	X	
41. Deploy code and content using automated tools which include publishing, promoting, and rolling back code and content.	X	
42. Conduct deployment reviews and provide results to County.	X	
43. Review and approve results of deployment reviews.		X
44. Install security patches and security products.	X	
Operate Roles and Responsibilities	**Contractor**	**County**

Data Center Services Roles and Responsibilities		
45. Publish all Data Center Services asset standards on the Service Portal.	X	
46. Provide support, including breakfix, for all Data Center Services Assets.	X	
47. Perform maintenance activities during nonpeak hours (shall be determined in coordination with the County).	X	
48. Provide the County with a system software upgrade list as it becomes available from software suppliers in the form of a technology roadmap that has a timeline based on version life cycle.	X	
49. Measure, monitor, and adjust data center system and network parameters to make certain the required level of performance is maintained.	X	
50. Analyze performance management information of current and expected capacity to make recommendations for server upgrades, load balancing, and functional splitting. Evaluate trend data and factor it into the overall system requirements.	X	
51. Manage event and workload processes across all platforms.	X	
52. Provide technical support for all hardware/equipment of the Data Center computing infrastructure.	X	
53. Support Data Center infrastructure System software (e.g., operating systems, utilities, databases, Middleware).	X	
54. Provide and support Data Center Networks (e.g., LAN, WAN connection) and related operations (e.g., procure, design, build, systems monitoring, Incident diagnostics, troubleshooting, Resolution and escalation, security management, and capacity planning/analysis) as required to meet County computing requirements.	X	
55. Provide and support Data Center-related environmental elements (e.g., HVAC, dual redundant UPS, power, cable plant, fire detection and suppression systems, temperature and humidity controls, and controlled physical access with 24/7/365 manned security).	X	
56. Support applications test-to-production migration activities infrastructure.	X	

Data Center Services Roles and Responsibilities		
57. Implement and coordinate all changes to the Data Center infrastructure including those that affect the Service Levels of any other Framework and Third-Parties.	X	
58. Maintain and provide all appropriate project plans, project time and cost estimates, technical specifications, management documentation and management reporting in a form/format that is acceptable to County.	X	
59. Provide threat scanning services on files uploaded by public to County servers. Monitor and reports threats.	X	

6.5. Security Services

6.5.1. Overview

The Security Services Framework Component of the Data Center Services Framework includes the Hardware, Software, and services needed to maintain overall managed security for the Services. Security Services provided by this Framework Component include, but are not limited to, the following:

- Monitored or managed firewalls or intrusion prevention systems (IPSs)
- Monitored or managed intrusion detection systems (IDSs)
- Monitored or managed multifunction firewalls, or unified threat management (UTM) technology
- Managed or monitored security gateways for messaging or Web traffic
- Security analysis and reporting of events collected from infrastructure logs
- Reporting associated with monitored/managed devices and incident response
- Managed vulnerability scanning of networks, servers, databases or applications
- Distributed denial of service (DDoS) protection
- Monitoring or management of customer-deployed security information and event management (SIEM) technologies
- Monitoring and/or management of advanced threat defense technologies, or the provision of those capabilities as a service
- Transformational activities to improve the overall security, increase performance and lower costs
- Security architecture services

6.5.2. High Level Requirements

6.5.2.1. Contractor shall control physical access to the Data Center.

6.5.2.2. Contractor shall establish secure zones, with County approval, in the Data Center network.

6.5.2.3. Contractor shall lock down all servers (physical or virtual) and storage within the Data Center.

6.5.2.4. Contractor shall scan all applications, prior to release into production, for vulnerabilities.

6.5.2.5. Contractor shall increase visibility into all data communications and data flows between applications within the Data Center and cloud-based applications.

6.5.2.6. Contractor shall ensure necessary throughput for perimeter protection and internal security methods that are fast enough to deeply scan and remediate threats at wire speed.

6.5.2.7. Contractor shall ensure that Data Center architecture is built with a security first mindset.

6.5.2.8. Contractor shall implement a "single pane of glass" approach to management and monitoring Security Services.

6.5.2.9. Contractor shall ensure all Hardware and Software used for the delivery of Security Services is virtual environment aware.

6.5.2.10. Contractor shall provide management, refresh, support, reporting and logging of all firewalls used in the delivery of the Services.

6.5.2.11. Contractor shall provide information event logging, analysis, reporting and management of all Hardware and Software used to provide Security Services.

6.5.2.12. Contractor shall provide log management on cloud-based applications used by the County.

6.5.2.13. Contractor shall provide intrusion detection and prevention systems within the Data Centers.

6.5.2.14. Contractor shall provide unified threat management.

6.5.2.15. Contractor shall update all Hardware and Software used for Security Services to the latest patch, service packs, or other updates promptly to ensure operational integrity.

6.5.2.16. Contractor shall refresh all Hardware and Software used for Security Services on a 4-year cycle unless otherwise approved by the County.

6.5.2.17. Contractor shall ensure that all Hardware and Software used in the delivery of Security Services is identified whether it is leveraged across multiple accounts or dedicated to the County.

6.5.2.18. Contractor shall maintain all Hardware used in the delivery of Security Services to maximize performance with high-speed network operations.

6.5.3. Environment

6.5.3.1. Hardware and Software

Contractor shall provide all Hardware, Software, tools, knowledge databases, logging and analysis and used in the delivery of Security Services. Contractor shall own, provision, install, manage, maintain, and supported such Assets.

6.5.3.2. Facilities

All Data Center based applications, data, services and cloud-based applications managed by the Contractor for Security Services.

6.5.4. Roles and Responsibilities

The following table identifies the Plan Build and Operate roles and responsibilities associated with Security Services.

Security Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit a Security architecture for Data Center Services.	X	
2. Review and approve Security architecture for Data Center Services.		X
3. Develop and submit plans for pre-release of Portfolio Applications or any other data center changes scan and vulnerability analysis.	X	
4. Review and approve plan for scan and vulnerability analysis.		X
5. Develop and submit annual operational procedures for data center Security Services.	X	
6. Produce and submit methodology and performance tools to assess and remediate data center security Incidents.	X	
7. Review and approve methodology and performance tools to assess and remediate data center security Incidents.		X
8. Develop and submit design and plans for SIEM tool.	X	
9. Review and approve design and plans for SIEM tool.		X
10. Produce and submit monitoring and managing of all Security Services Hardware and Software.	X	
11. Review and approve monitoring and managing of all Security Services Hardware and Software.		X
12. Produce and submit annual refresh plans for Security Services.	X	
13. Review and approve submit annual refresh plans for Security Services.		
14. Produce and submit security plan for cloud-based services used in hybrid mode.	X	
15. Review and approve security plan for cloud-based services used in hybrid mode.		X
16. Produce and submit lock-down scripts for Data Center Services.	X	

Security Services Roles and Responsibilities		
17. Review and approve lock-down scripts for Data Center Services.		X
18. Develop process to continuously post all documentation developed and maintained in Security Services to the Service Portal.	X	
Build Roles and Responsibilities	**Contractor**	**County**
19. Implement and maintain security architecture in Data Center Services.	X	
20. Develop monthly reports on SIEM and other Incidents affecting security in Data Center Services.	X	
21. Implement single pane management console for Security Services.	X	
22. Perform refresh according to the approved annual refresh plans for Security Services.	X	
23. Implement and monitor security plan for cloud-based services used in hybrid mode.	X	
24. Implement lock-down scripts for Data Center Services.	X	
25. Design, test and implement all policies needed to provide Security Services.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
26. Review and analyze SIEM activity and report findings monthly.	X	
27. Recommend changes based on operational experiences to the security architecture supporting Security Services.	X	
28. Support all Data Center Services Incidents.	X	
29. Support all Severity 1 Incidents.	X	
30. Continuous review data center for vulnerabilities and recommend corrections promptly.	X	
31. Update Security Services with patches or other updates promptly to assure operational integrity.	X	

6.6. Mainframe Services

6.6.1. Overview

The Mainframe Service Framework Component of Data Center Services applies to the services and support for the Mainframe and AS/400.

6.6.2. High Level Requirements

6.6.2.1. Contractor shall develop, for County approval, and execute plans to retire the Mainframe from the Services.

6.6.2.2. Contractor shall develop, for County approval, and execute plans to retire the A/S400 from the Services.

6.6.2.3. Contractor shall measure Mainframe usage in CPU hours and must correlate CPU hours directly to End-User processing for specific application.

6.6.3. Environment

6.6.3.1. Hardware and Software

6.6.3.1.1. Contractor shall provide all Hardware, Software and utilities to support Mainframe Services.

6.6.3.1.2. All licensing shall be the responsibility of the Contractor for all Hardware and Software used to provide Mainframe Services.

6.6.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate requirements, roles and responsibilities specific to Mainframe Services.

Mainframe Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit plans to retire the Mainframe and AS/400 upon Service Request.	X	
2. Review and approve plans to retire the Mainframe and AS/400.		X
3. Produce and submit recommendations for standards on production jobs and Job Control Language (JCL).	X	
4. Review and approve recommendations for standards on production jobs and Job Control Language (JCL).		X
Operate Roles and Responsibilities	**Contractor**	**County**
5. Continue to support mainframe and AS/400 operationally.	X	

6.7. Application Infrastructure Services

6.7.1. Overview

This section pertains to the Application Infrastructure Services Framework Component within the Data Center Framework. The Application Infrastructure Services Framework Component applies to all Hardware and Software needed to maintain and support County Portfolio Applications.

The Application infrastructure is a platform of integrated technologies that can manage multiple hosted applications. The Application infrastructure is comprised of application servers, web servers, and database servers and is a core applications architecture component. The Application infrastructure will deliver high performance application services to End-Users, Third-Parties and constituents of the Services. Some of the key functionality of the Application infrastructure includes, but is not limited to, transaction management, clustering, application-to-application messaging, system management, advanced application development tools, proprietary access, and interoperability with legacy technologies. Application infrastructure provides a powerful platform to support and extend a broad range of County Portfolio Applications.

Building a multi-tier architecture is foundational for the Application infrastructure. Example for multi-tier architecture is as follows:

- A first-tier, front-end, browser-based presentation layer
- A middle-tier business logic application or set of applications
- A third-tier, back-end, database and transaction server

Application Infrastructure Services Framework Component include, but are not limited to, Server refresh, operating system update and support, management of server resources, monitor and analyze network performance, overall application performance, server performance and capacity tuning and analysis.

6.7.2. High Level Requirements

6.7.2.1. Contractor shall ensure that County Portfolio Applications are hosted exclusively in the Application Infrastructure Services.

6.7.2.2. Contractor shall provide continuous operating system updates, patches and security hot fixes for Application infrastructure.

6.7.2.3. Contractor shall deploy County preferred and standard virtual servers, virtual storage and virtual network.

6.7.2.4. Contractor shall gain approval by the County for any exception to the virtual first standards.

6.7.2.5. Contractor shall provide annual refresh plans for all virtual services.

6.7.2.6. Contractor shall provide annual server consolidation recommendations.

6.7.2.7. Contractor shall continuously monitor and correct performance Incidents or system degradation for all application servers.

6.7.2.8. Contractor shall maintain Application infrastructure storage on centralized, shared storage environment.

6.7.2.9. Contractor shall provide server hardening across Application infrastructure.

6.7.2.10. Contractor shall implement a data backup strategy to meet County Applications' requirements.

6.7.2.11. Contractor shall support and assist in Third-Party application installation and configuration.

6.7.2.12. Contractor shall improve overall architecture of the Application infrastructure with consideration of cloud and increased virtualization techniques.

6.7.2.13. Contractor shall continuously improve demand levels across the Application infrastructure.

6.7.2.14. Contractor shall continuously improve and reduce costs with integrated tools that provide better security and control of the Application infrastructure.

6.7.2.15. Contractor shall deploy and use standard operating systems on all Hardware used to provide Application Infrastructure Services.

6.7.2.16. Contractor shall continuously improve speed of delivery for new Applications and Services in Application infrastructure.

6.7.2.17. Contractor shall continuously deliver to business objectives while reducing overall Application infrastructure costs across all environments.

6.7.2.18. Contractor shall provide centralized support and tools for Application servers located outside the data center.

6.7.2.19. Contractor shall maintain a timeline/roadmap of all Application Infrastructure Services Hardware versions and Software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

6.7.2.20. Contractor shall maintain and be responsible for all components needed to provide Application Infrastructure Services.

6.7.2.21. Contractor shall maintain Application Infrastructure Services so there is not a single point failure thereby assuring County business applications continue to operate during any unplanned event.

6.7.2.22. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Application Infrastructure Services.

6.7.2.23. Contractor shall continuously investigate emerging technologies and services that improve the overall Application infrastructure

efficiencies, lowers overall costs and improves business application performance and security.

6.7.2.24. Contractor shall provide Low Code Application Platform Services.

6.7.3. Environment

6.7.3.1. Hardware and Software

6.7.3.1.1. Contractor shall provide all Hardware, Software and utilities to support Application Infrastructure Services.

6.7.3.1.2. All licensing shall be the responsibility of the Contractor for all Hardware and Software used to provide Application Infrastructure Services.

6.7.3.2. Wintel Application Infrastructure Services

WINTEL Application Infrastructure Services are the Microsoft Server operating system based virtual and physical servers supporting Application Infrastructure Services.

6.7.3.2.1. Contractor shall recommend, for County approval, annual standards for virtual and physical hardware.

6.7.3.2.2. Contractor shall deploy annual, County approved, virtual and physical hardware standards.

6.7.3.2.3. Contractor shall publish all County approved standards in the Standards and Procedures Manual on the Service Portal.

6.7.3.2.4. Contractor shall develop hardware standards shall be set for three classes of physical server types: Small, Medium, Large, and X-Large.

6.7.3.2.5. Contractor shall maintain, with sufficient capacity, a server farm to host all virtual servers.

6.7.3.2.6. Contractor shall develop, install and maintain all storage for Application Infrastructure Services using centralized Storage Area Network (SAN).

6.7.3.2.7. Contractor shall recommend, for County approval, annual standards for Windows Operating Systems for virtual and physical servers.

6.7.3.2.8. Contractor shall maintain operating system currency on all Application Infrastructure Services.

6.7.3.2.9. Contractor shall refresh all physical servers at a rate of 25% per year. No physical server shall be in service longer than 4 years without County written approval.

6.7.3.2.10. Contractor shall perform refresh activities using a straight-line methodology throughout the Contract Year.

6.7.3.2.11. Contractor shall maintain and update, for County review, timeline/roadmap of all Hardware and Software product life cycles for Application Infrastructure Services.

6.7.3.2.12. Contractor shall responsible for all activities related to virtual or physical server refresh, including business application reinstall and configuration.

6.7.3.3. UNIX Application Infrastructure Services

UNIX Application Infrastructure Services are the UNIX operating system based virtual and physical servers supporting Application Infrastructure Services.

6.7.3.3.1. Contractor shall recommend, for County approval, annual standards for virtual and physical hardware.

6.7.3.3.2. Contractor shall deploy annual, County approved, virtual and physical hardware standards.

6.7.3.3.3. Contractor shall publish all County approved standards in the Standards and Procedures Manual on the Service Portal.

6.7.3.3.4. Contractor shall develop hardware standards shall be set for three classes of physical server types: Small, Medium, Large and X-Large.

6.7.3.3.5. Contractor shall develop, deliver, for County approval, and implement an infrastructure to support virtualization of UNIX servers.

6.7.3.3.6. Contractor shall maintain, with sufficient capacity, a server farm to host all UNIX based virtual servers.

6.7.3.3.7. Contractor shall develop, install and maintain all storage for UNIX Application Infrastructure Services using centralized Storage Area Network (SAN).

6.7.3.3.8. Contractor shall recommend, for County approval, annual standards for UNIX Operating Systems for virtual and physical servers.

6.7.3.3.9. Contractor shall maintain, potentially, different sources for UNIX operating systems.

6.7.3.3.10. Contractor shall maintain operating system currency on all UNIX Application Infrastructure Services.

6.7.3.3.11. Contractor shall refresh all physical servers at a rate of 20% per year. No physical server shall be in service longer than 5 years without County written approval.

6.7.3.3.12. Contractor shall perform refresh activities using a straight line methodology throughout the Contract Year.

6.7.3.3.13. Contractor shall maintain and update, for County review, timeline/roadmap of all Hardware and Software product life cycles for Application Infrastructure Services.

6.7.3.3.14. Contractor shall responsible for all activities related to virtual or physical server refresh, including business application reinstall and configuration.

6.7.3.4. Virtual Application Infrastructure Services

Virtual Application Infrastructure Services are the requirements for supporting Windows Application Infrastructure Services and UNIX Application Infrastructure Services.

A Virtual Guest Server is a logical instance of an operating system and applications environment based on the use of virtualization software on a physical host server (Virtual Host). Virtualization software permits the virtualization of a computing environment to support multiple virtual environments.

6.7.3.4.1. Contractor shall recommend, for County approval, annual standards for Virtual Application Infrastructure to support

Windows Application Infrastructure Services and UNIX Application Infrastructure Services.

6.7.3.4.2. Contractor shall deploy annual, County approved, Virtual Application Infrastructure standards.

6.7.3.4.3. Contractor shall determine the number of virtual guest per virtual host server to ensure maximum efficiency and zero service impact due to performance.

6.7.3.4.4. Contractor shall configure and deploy virtual guests to the same standards, or better to physical servers.

6.7.3.4.5. Contractor shall refresh virtual guest servers based on current operating system standards.

6.7.3.4.6. Contractor shall develop and deliver self-service and policy based infrastructure provisioning to the Virtual Application Infrastructure.

6.7.3.4.7. Contractor shall extend the Virtual Application Infrastructure to include software-defined storage platform (Hyper-Converged Infrastructure) integration as standard methodology.

6.7.3.4.8. Contractor shall extend the Virtual Application Infrastructure to integrate and operate in a heterogeneous or hybrid cloud environments.

6.7.3.4.9. Contractor shall design, deliver (for County approval) and implement software-defined storage that can scale for capacity and performance simultaneous as part of virtual guest provisioning.

6.7.3.4.10. Contractor shall design, deliver and implement high availability, fault tolerance and other similar techniques to minimize or eliminate downtime in the Virtual Application Infrastructure.

6.7.3.4.11. Contractor shall deploy tools to ensure all County Portfolio Applications are virtualized and operating in the Virtual Application Infrastructure as standard practice.

6.7.3.4.12. Contractor shall implement management for the Virtual Application Infrastructure that allows the creation, sharing, deployment and migration of virtual guest servers.

6.7.3.4.13. Contractor shall develop, deliver (for County approval), and implement a centralized content library for virtual templates, virtual appliances, ISO images, and scripts.

6.7.3.4.14. Contractor shall develop and implement cloud management platform for purpose-built hybrid cloud applications.

6.7.3.4.15. Contractor shall develop, deliver (for County approval) and implement capacity and performance tools specifically designed for the Virtual Application Infrastructure environment.

6.7.3.4.16. Contractor shall develop the Virtual Application Infrastructure on Industry standard server virtualization platform.

6.7.3.4.17. Contractor shall build and manage virtualization to optimize infrastructure, automate service delivery and provide high availability to virtual guest servers.

6.7.3.4.18. Contractor shall design, deliver, for County approval and implement the virtual farm required to operate the Application Infrastructure Services.

6.7.3.5. Oracle Exadata Services

6.7.3.5.1. Oracle Exadata Services are the compute and storage system for running Oracle Database software supporting Application Infrastructure Services.

6.7.3.5.2. Contractor shall recommend, for County approval, annual standards for hardware.

6.7.3.5.3. Contractor shall deploy annual, County approved, physical hardware standards.

6.7.3.5.4. Contractor shall publish all County approved standards in the Standards and Procedures Manual on the Service Portal.

6.7.3.5.5. Contractor shall develop hardware standards for Eighth Rack server.

6.7.3.5.6. Contractor shall refresh all Oracle Exadata based Application Servers every 5 years. No physical server shall be in service longer than 5 years without County written approval.

6.7.3.5.7. Contractor shall perform refresh activities using a straight-line methodology throughout the Contract Year.

6.7.3.5.8. Contractor shall maintain and update, for County review, timeline/roadmap of all Hardware and Software product life cycles for Oracle Exadata Services.

6.7.3.5.9. Contractor shall responsible for all activities related to Oracle Exadata based Application servers refresh, including business application reinstall and configuration, except for County-approved remediation of application software.

6.7.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate requirements, roles and responsibilities specific to Application Infrastructure Services.

Application Infrastructure Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations for hardware standards of Application Infrastructure Services Assets on a yearly basis.	X	
2. Review and approve hardware standards for Application Infrastructure Services Assets.		X
3. Produce and submit recommendations for operating system standards for Application Infrastructure Services Assets on a yearly basis.	X	
4. Review and approve operating system standards for Application Infrastructure Services Assets.		X
5. Produce and submit Application Infrastructure Services refresh plan on a yearly basis.	X	
6. Review and approve Application Infrastructure Services refresh plan.		X
7. Produce and submit Application Infrastructure Services storage migration and consolidation plan on a yearly basis.	X	

Application Infrastructure Services Roles and Responsibilities		
8. Review and approve Application Infrastructure Services storage migration and consolidation plan.		X
9. Produce and submit backup/recovery policies and procedures.	X	
10. Review and approve backup/recovery policies and procedures.		X
11. Produce and submit recommendations for Application Infrastructure placement into County Locations.	X	
12. Review and approve recommendations for Application Infrastructure placement into County Locations.		X
13. Produce and submit recommendations for Application Infrastructure Services consolidation plan on a yearly basis.	X	
14. Review and approve Application Infrastructure Services consolidation plan.		X
15. Produce and submit Application Infrastructure Services Assets plans for updates or patches as needed for reliable operations and to maintain security.	X	
16. Review and approve Application Infrastructure Assets Services plans for updates or patches as needed for reliable operations and to maintain security.		X
17. Produce and submit recommendations for monitoring and exceptional conditions procedures.	X	
18. Review and approve monitoring and exceptional conditions procedures.		X
19. Produce and submit recommendations for job scheduling requirements, interdependencies, County contacts, and rerun requirements for all production jobs.	X	
20. Review and approve job scheduling requirements, interdependencies, County contacts, and rerun requirements for all production jobs.		X
21. Recommend replacement or upgrade of County utility software programs with commercially available software to support processing operations.	X	
22. Develop Low Code Application Platform solution design document including but not limited to architecture, functions, data models, design features, configuration, performance requirements (e.g., security, extensibility, maintainability, scalability, availability, and reliability).	X	

Application Infrastructure Services Roles and Responsibilities		
23. Review and approve a Low Code Application Platform solution design document including but not limited to architecture, functions, data models, design features, configuration, performance requirements (e.g., security, extensibility, maintainability, scalability, availability, and reliability).		X
24. Develop standards and governance processes for the Low Code Application environment, including but not limited to release management, code reviews, application specification documentation, and code promotion, under the Low Code Center of Excellence.	X	
25. Review and approve standards and governance processes for the Low Code Application environment, including but not limited to release management, code reviews, application specification documentation, and code promotion, under the Low Code Center of Excellence.		X
Build Roles and Responsibilities	**Contractor**	**County**
26. Provide all design and engineering required to deploy, refresh and support Application Infrastructure Services Assets.	X	
27. Design, test and implement hardware standards for Application Infrastructure Services Assets.	X	
28. Design, test and deploy operating system standards for Application Infrastructure Services Assets.	X	
29. Deploy, manage, communicate and report on activities related to Application Infrastructure Services refresh.	X	
30. Review and approve reports on Application Infrastructure Services refresh.		X
31. Design, test and execute Application Infrastructure Services storage migration and consolidation plan.	X	
32. Implement approved backup/recovery policies and procedures.	X	
33. Design, test and deploy approved Application Infrastructure Services consolidation plans.	X	
34. Test and deploy approved updates or patches to Application Infrastructure Services Assets.	X	
35. Implement the Low Code Application Platform based on the approved solution design document.	X	

Application Infrastructure Services Roles and Responsibilities		
36. Update Low Code Application Platform architecture documents as needed (e.g., enhancements).	X	
37. Review and approve updates to Low Code Application Platform architecture documents.		X
Operate Roles and Responsibilities	**Contractor**	**County**
38. Provide support for Application PreProduction and Application Test Servers.	X	
39. Conduct data and Application migration that is necessary due to any Application Infrastructure refresh or breakfix activity.	X	
40. Monitor, operate, maintain and support the Third-Party Applications running on Application servers.	X	
41. Provide automated event monitoring tools that notify Applications Team for immediate response if there is an applicationrelated Incident.	X	
42. Provide support, including breakfix, for all Application Infrastructure Services Assets.	X	
43. Provide support for Application Infrastructure located in County Locations.	X	
44. Provide support for Application Infrastructure Services storage migration and consolidation plan.	X	
45. Perform backups on Application Infrastructure Services Assets as defined.	X	
46. Conduct data and Application migration that is necessary due to any Application Infrastructure refresh or breakfix activity.	X	
47. Support send and receive electronic data transmissions (e.g., EDI, FTP).	X	
48. Perform upgrades, updates, and security patching to Application Infrastructure Service Assets.	X	
49. Monitor, operate, maintain and support OS (Operating Systems) installed on Application Infrastructure.	X	
50. Monitor, operate, maintain and support the Third-Party Applications running on Application Infrastructure.	X	
51. Execute standard operating procedures at scheduled times.	X	

Application Infrastructure Services Roles and Responsibilities		
52. Startup and shutdown County online/interactive systems according to defined schedules or upon approved requests.	X	
53. Coordinate and manage Third-Party hardware and software maintenance to meet County requirements.	X	
54. Ensure that System management and monitoring tools do not impact County operations.	X	
55. Provide automated event monitoring tools that shall notify Applications Team for immediate response if there is an applicationrelated problem.	X	

6.8. Infrastructure Services

6.8.1. Overview

This section pertains to the Infrastructure Services Framework Component within the Data Center Framework. Infrastructure Services refers to the agnostic, Hardware, Software, network resources and services required for the existence, operation and management of the County IT and Telecommunications enterprise. Infrastructure Services shall deliver the Services to County End-Users, Third-Parties, and constituents.

The objective is the continuous improvement in the overall availability of Infrastructure Services to meet the requirements of County business needs. This covers the evaluation, design, implementation, measurement and management of Infrastructure Services availability from a component and an end-to-end perspective including new or modified service management methodologies and tools, as well as technology modifications or upgrades to infrastructure systems and components.

Infrastructure Services provided within this Framework Component include, but are not limited to, server/OS management, server refresh, server/OS tuning, storage and backup management, mainframe services, production operations, performance analysis, capacity analysis and monitoring, and Systems management.

Additional Services within this Framework Component include, but are not limited to, DNS, DHCP, End-User Authentication, directory services, software distribution, print services, FTP and file services, certificate services, proxy services, load balancers, application and network acceleration, network services, task/job scheduling, web and

content filtering and any Contractor internal servers/services needed to fully support the delivery of the Services.

6.8.2. High Level Requirements

6.8.2.1. Contractor shall develop, deliver (for County approval), and implement on an annual basis currency of software across all Infrastructure Services.

6.8.2.2. Contractor shall determine critical business impact to component or system failures in Infrastructure Services.

6.8.2.3. Contractor shall continuously analyze, identify and remediate single point failures in Infrastructure Services.

6.8.2.4. Contractor shall design, deploy and maintain software distribution for Desktop Computing Services and shall integrate and perform software delivery for County mobile devices.

6.8.2.5. Contractor shall continuously monitor and perform maintenance on all load balancers to ensure optimal operational performance.

6.8.2.6. Contractor shall recommend, for County approval, annual standards for Infrastructure Services.

6.8.2.7. Contractor shall deploy and support current standards within Infrastructure Services.

6.8.2.8. Contractor shall provide centralized and standardized system that automates network management of End-User data, security, and distributed resources.

6.8.2.9. Contractor shall automate software distribution including delivering applications, images, and patches to the environment using industry standard tools.

6.8.2.10. Contractor shall perform comprehensive infrastructure testing for all components in an integrated environment for compute, storage, network, database in a physical or virtual environment.

6.8.2.11. Contractor shall ensure County Public Library private network is included in all Infrastructure Services.

6.8.2.12. Contractor shall provide refresh on all Infrastructure Services Hardware and Software on a four (4) year refresh cycle.

6.8.2.13. Contractor shall ensure the Infrastructure Services storage is not comingled with County End-User or Portfolio Application storage.

6.8.2.14. Contractor shall develop Infrastructure Services to include provisions for hybrid-computing and ensure the complete integration of all County cloud based services.

6.8.2.15. Contractor shall ensure that Infrastructure Services are not comingled with County Applications Infrastructure Services.

6.8.2.16. Contractor shall continuously perform capacity planning, utilization analysis for all Infrastructure Services, including the virtual environments.

6.8.2.17. Contractor shall manage and certify OS images used to support Infrastructure Services.

6.8.2.18. Contractor shall ensure Infrastructure Services must be designed and maintained to support County business strategy and County Portfolio Applications.

6.8.2.19. Contractor shall continuously monitor, report and remediate performance Incidents with Infrastructure Services.

6.8.2.20. Contractor shall ensure end-to-end infrastructure, to include mobile, for all County End-User interaction with the Services.

6.8.2.21. Contractor shall ensure Infrastructure Services includes data centers, Locations, colocation facilities, or hosting/cloud services.

6.8.2.22. Contractor shall deploy and maintain application and network acceleration in the delivery of the Services.

6.8.2.23. Contractor shall continuously improve Infrastructure Services performance, speed and decrease overall latency in the delivery of the Services.

6.8.2.24. Contractor shall continuously deliver to meet County business objectives while reducing overall Infrastructure Services costs.

6.8.2.25. Contractor shall provide centralized support and tools for Infrastructure Services located with the data center or outside the data center.

6.8.2.26. Contractor shall maintain a timeline/roadmap of all Infrastructure Services Hardware versions and Software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

6.8.2.27. Contractor shall maintain and be responsible for all components needed to provide Infrastructure Services (e.g. load balancers, firewalls, IPS).

6.8.2.28. Contractor shall maintain Infrastructure Services so there is not a single point failure thereby assuring County business applications continue to operate during any unplanned event or outage.

6.8.2.29. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Infrastructure Services.

6.8.2.30. Contractor shall continuously investigate emerging technologies and services that improve the overall efficiencies, lowers overall costs and improves business application performance and security.

6.8.2.31. County may request, on a Service Request, network and application acceleration for a specific County site.

6.8.3. Environment

6.8.3.1. Hardware and Software

Contractor shall provide all Hardware and Software to support Infrastructure Services.

6.8.3.2. Facilities

Infrastructure Services Hardware or Software placed in County Locations, with County approval, in order to meet the Service Levels and maintain operational efficiencies.

6.8.4. Roles and Responsibilities

The following table identifies the Plan Build and Operate roles and responsibilities associated with Infrastructure Services.

Infrastructure Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations for improvement to Infrastructure Services.	X	
2. Review and approve improvement to Infrastructure Services.		X
3. Produce and submit recommendations for Infrastructure Server placement into Locations.	X	
4. Review and approve recommendations for Infrastructure Server placement into Locations.		X
5. Produce and submit recommendations for hardware standards of Infrastructure Server Services Assets on a yearly basis.	X	
6. Review and approve hardware standards for Infrastructure Server Services Assets.		X

Infrastructure Services Roles and Responsibilities		
7. Produce and submit recommendations for operating system standards for Infrastructure Server Services Assets on a yearly basis.	X	
8. Review and approve operating system standards for Infrastructure Server Services Assets.		X
9. Produce and submit Infrastructure Server Services refresh plan on a yearly basis.	X	
10. Review and approve Infrastructure Server Services refresh plan.		X
11. Produce and submit recommendations for Infrastructure Server Services consolidation plan on a yearly basis.	X	
12. Review and approve Infrastructure Server Services consolidation plan.		X
13. Produce and submit Infrastructure Server Services Assets plans for updates or patches as needed for reliable operations and to maintain security.	X	
14. Review and approve Infrastructure Server Services Assets plans for updates or patches as needed for reliable operations and to maintain security.		X
Build Roles and Responsibilities	**Contractor**	**County**
15. Provide all design and engineering required to deploy, refresh and support Infrastructure Server Services Assets.	X	
16. Design, test and implement approved improvements to Infrastructure Services.	X	
17. Design, test and implement hardware standards for Infrastructure Server Services Assets.	X	
18. Design, test and deploy operating system standards for Infrastructure Server Services Assets.	X	
19. Deploy, manage, communicate and report on activities related to Infrastructure Server Services refresh.	X	
20. Review and approve reports on Infrastructure Server Services refresh.		X
21. Design, test and deploy approved Infrastructure Server Services consolidation plans.	X	
22. Test and deploy approved updates or patches to Infrastructure Server Services Assets.	X	

Infrastructure Services Roles and Responsibilities		
Operate Roles and Responsibilities	**Contractor**	**County**
23. Manage Infrastructure Server Services to meet performance Service Levels.	X	
24. Maintain and support the Public Library public infrastructure web filtering.	X	
25. Manage bandwidth and latency constraints and minimize impacts during automated software deployment.	X	
26. Provide deployment Services using automated tools for remote access/VPN Users.	X	
27. Provide deployment reports to include success and failure statistics of scheduled distributions — such as patches or upgrades.	X	
28. Provide support, including break-fix, for all Infrastructure Server Services Assets.	X	
29. Provide support for Infrastructure Servers located in Locations.	X	
30. Conduct data and Infrastructure migration that is necessary due to any Infrastructure Server Services refresh or break-fix activity.	X	
31. Perform upgrades to Infrastructure Server Services Assets.	X	
32. Monitor, operate, maintain and support OS (Operating Systems) installed on Infrastructure Server Services Assets.	X	
33. Manage Infrastructure Server Services to meet performance Service Levels.	X	
34. Maintain and support the Public Library public infrastructure web filtering.	X	
35. Manage bandwidth and latency constraints and minimize impacts during automated software deployment.	X	
36. Provide deployment services using automated tools for remote access/VPN users.	X	
37. Provide deployment reports to include success and failure statistics of scheduled distributions — such as patches or upgrades.	X	

6.9. Development and Test Services

6.9.1. Overview

This section pertains to the Development and Test Services Framework Component within the Data Center Framework. Development and Test Services are the activities associated with ensuring that all individual technical components configured with or added to the Services work together cohesively to achieve the intended results prior to release to the Production environment.

The activities associated with these Services delivered virtually.

6.9.2. High Level Requirements

6.9.2.1. Contractor shall develop, deliver, for County approval, and implement a private cloud based/hybrid Development and Test Services.

6.9.2.2. Contractor shall build and maintain the Development and Test Services Infrastructure to all standards and in close alignment with the production environment.

6.9.2.3. Contractor shall support in-flight projects, planned projects, maintenance projects and new application releases.

6.9.2.4. Contractor shall manage existing test environments, build new test environments and provide additional capacity on demand via the cloud or other approved County solution.

6.9.2.5. Contractor shall establish the processes and controls that are required to place a County Portfolio Application Development and Test environment in the cloud.

6.9.2.6. Contractor shall develop automation in the management, provision and support of the Development and Test Services Infrastructure to maximize overall system efficiencies.

6.9.2.7. Contractor shall ensure Development and Test Services Infrastructure is integrated into Run Book automation.

6.9.2.8. Contractor shall develop, deliver and maintain cloud orchestration for Development and Test Services Infrastructure.

6.9.2.9. Contractor shall continuously improve overall test environment builds to achieve high efficiencies and accurate test environments.

6.9.2.10. Contractor shall develop the Development and Test Services Infrastructure with a high level of reuse and maximize investments in current tools and technology.

6.9.2.11. Contractor shall continuously develop and implement improvements to overall availability of the Development and Test Services Infrastructure.

6.9.2.12. Contractor shall develop, deliver and implement proper scheduling techniques to maximize the use of the Development and Test Services Infrastructure.

6.9.2.13. Contractor shall develop, deliver and implement processes to ensure the Development and Test Services Infrastructure is not underutilized.

6.9.2.14. Contractor shall ensure sufficient capacity in the Development and Test Services Infrastructure to meet County demand.

6.9.2.15. Contractor shall develop an on-demand Development and Test Services Infrastructure that scales up or down to meet demand.

6.9.2.16. Contractor shall develop, deliver and implement process to cold store virtual and unused workload not currently needed in the Development and Test Services Infrastructure.

6.9.2.17. Contractor shall develop, deliver, for County approval, and implement a fully virtual Development and Test Services Infrastructure.

6.9.2.18. Contractor shall not use any physical servers for the Development and Test Services Infrastructure, without prior County approval.

6.9.2.19. Contractor shall develop, deliver and maintain interfaces to production environment as needed to meet business needs.

6.9.2.20. Contractor shall implement and integrate Identity Access Management Services in the Development and Test Services Infrastructure.

6.9.2.21. Contractor shall replicate production security architecture, to the extent possible, in the Development and Test Services Infrastructure.

6.9.2.22. Contractor shall ensure Development and Test Services Infrastructure duplicates production to the extent possible.

6.9.3. Environment

6.9.3.1. Hardware and Software

Contractor shall provide all Hardware and Software to support Development and Test Services Infrastructure Services.

6.9.3.2. Licenses

Contractor shall provide all licenses for all cloud based Development and Test Services.

6.9.4. Roles and Responsibilities

The following table identifies the Development and Test Services roles and responsibilities that Contractor and County shall perform.

Development and Test Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Develop and submit design for Development and Test Services.	X	
2. Review and approve design for Development and Test Services.		X
3. Develop and submit procedures for managing Development and Test environment to closely align with production.	X	
4. Review and approve procedures for managing Development and Test environment.		X

Development and Test Services Roles and Responsibilities		
5. Develop and submit management plan for capacity and moving workloads on and off.	X	
6. Review and approve management plan.		X
7. Develop and submit plans and design for hybrid cloud integration for Development and Test Services.	X	
8. Review and approve plans and design for hybrid cloud integration for Development and Test Services.		X
9. Design and submit a Development and Test Environment that is all virtual.	X	
10. Review and approve all virtual design.		X
Build Roles and Responsibilities	**Contractor**	**County**
11. Implement design for Development and Test Services.	X	
12. Implement procedures for managing Development and Test environment to closely align with production.	X	
13. Implement management plan for capacity and moving workloads on and off.	X	
14. Implement automated provisioning tools.	X	
15. Implement security architecture, as closely as possible, in the Development and Test environment.	X	
16. Implement full Identity Management Access for Development and Test Services.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
17. Manage all break-fix and Incidents in the Development and Test environment.	X	
18. Manage all workloads in the Development and Test environment for only work in progress is hosted	X	
19. Manage cold storage of virtual images not currently in use.	X	
20. Manage and support process to copy current production environment applications into the Development and Test Environment.	X	
21. Manage and provide all updates to Runbooks and other documentation for Portfolio Applications.	X	

Development and Test Services Roles and Responsibilities		
22. Manage all licenses needs to fully operate the Development and Test Environment.	X	
23. Manage the Development and Test Environment to ensure all work can be accomplished on schedule.	X	
24. Develop, manage and post the schedule for all work to be performed in the Development and Test Environment.	X	
25. Produce monthly reports on usage in the Development and Test Environment.	X	
26. Produce monthly reports on images and applications active and in cold storage in the Development and Test Environment.	X	

6.10. E-Mail Services

6.10.1. Overview

This section pertains to the Electronic Mail (E-Mail) Services Framework Component within the Data Center Framework. E-Mail is a critical service used by all County End-Users as a daily business, must-have productivity tool. E-Mail Services must ensure the safe and reliable uninterrupted delivery of E-Mail to County End-Users and external entities.

The E-Mail Services Framework Component applies to all Hardware, Software, services and policies needed to maintain and support E-Mail Services.

6.10.2. High Level Requirements

6.10.2.1. Contractor shall develop, for County approval, plans to migrate and upgrade E-Mail Services during Transition.

6.10.2.2. Contractor shall design, and deliver, for County approval, and implement a highly reliable, high redundant E-Mail Services platform that ensures zero data loss.

6.10.2.3. Contractor shall provide perimeter services that protect against SPAM and E-Mail Worms or malicious software of any sort.

6.10.2.4. Contractor shall design, deliver (for County approval) and implement secure E-Mail remote access (e.g. Outlook Web Access).

6.10.2.5. Contractor shall implement Microsoft Exchange for E-Mail Services.

6.10.2.6. Contractor shall maintain and upgrade Microsoft Exchange software versions within 12 months of major releases and within 3 months for minor releases.

6.10.2.7. Contractor shall establish and maintain global directory and synchronize E-Mail directories with all County Departments (e.g. Sheriff, District Attorney, SDCERA) or as specified by the County.

6.10.2.8. Contractor shall recommend a plan for County approval, and execute the approved plan for e-discovery services authorized by a Service Request.

6.10.2.9. Contractor shall integrate fax capabilities into E-Mail Services for End-Users.

6.10.2.10. Contractor shall recommend a plan for County approval, and execute the approved plan for DLP protection per County policies for E-Mail Services.

6.10.2.11. Contractor shall ensure and continuously update for each mailbox protection against any anti-malware and anti-spam or any other malicious product or vulnerability.

6.10.2.12. Contractor shall ensure that secure mobile access to E-Mail Services is provided to County-furnished or approved BYOD mobile devices.

6.10.2.13. Contractor shall apply County retention policy across all mailboxes without exception.

6.10.2.14. Contractor shall apply and provide unlimited mailbox storage for each mailbox.

6.10.2.15. Contractor shall recommend a plan for County approval, and execute the approved plan for in-place archiving on all mailboxes as an alternate storage location for historical messaging data (eliminate PST).

6.10.2.16. Contractor shall provide in-place hold to selected mailboxes, via Service Request, to preserve all mailbox items immutably for a specified period of time.

6.10.2.17. Contractor shall recommend a plan for County approval, and execute the approved plan for integrated digital signing to all mailboxes leveraging County PKI platform.

6.10.2.18. Contractor shall recommend a plan for County approval, and execute the approved plan for integrated encryption services on all mailboxes based on leveraging the County PKI platform.

6.10.2.19. Contractor shall ensure through continuous review and report that all End-User mailboxes comply with the County's E-Mail retention policy.

6.10.2.20. Contractor shall recommend a plan for County approval, and execute the approved plan for a more secure OWA solution that protects County Data and maintains simplified End-User interaction and authentication.

6.10.2.21. Contractor shall recommend a plan for County approval, and execute the approved plan to send encrypted E-Mails to E-Mail addresses outside of the County network.

6.10.2.22. Contractor shall recommend a plan for County approval, and execute the approved plan for the ability of external recipients of encrypted E-Mails with access to encrypted content via an authentication.

6.10.2.23. Contractor shall enable End-Users an expiration date for sent encrypted E-Mail messages.

6.10.2.24. Contractor shall provide self-help password administration for recipients of encrypted E-Mails that permit passwords to be established and reset.

6.10.2.25. Contractor shall ensure high delivery of cloud based E-Mail Services and complete End-User integration.

6.10.2.26. Contractor shall provide centralized support and tools for E-Mail Services hosted within the data center or hosted outside the data center.

6.10.2.27. Contractor shall maintain a timeline/roadmap of all E-Mail Services Hardware versions and Software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

6.10.2.28. Contractor shall maintain and be responsible for all components needed to provide E-Mail Services (e.g. load balancers, firewalls, IPS).

6.10.2.29. Contractor shall maintain E-Mail Services so there is not a single point failure thereby assuring County daily use continues to operate during any unplanned event or outage.

6.10.2.30. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to E-Mail Services.

6.10.2.31. Contractor shall continuously investigate emerging technologies and services that improve the overall efficiencies, lowers overall costs and improves business application performance and security.

6.10.2.32. Contractor shall provide a Virtual Fax solution, which offers inbound fax capabilities to a group O365 mailbox, together with outbound fax capabilities from a group O365 mailbox.

6.10.2.33. Contractor shall also provide set up and porting services, when porting the analog number is possible, together with maintenance and break/fix.

6.10.3. Environment

6.10.3.1. Hardware and Software

Contractor shall provide all Hardware and Software to support E-Mail Services

6.10.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with E-Mail Services.

E-Mail Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit E-Mail Services operational and computing procedures.	X	
2. Review and approve E-Mail Services operational and computing procedures.		X
3. Produce and submit E-Mail Services architecture.	X	
4. Review and approve E-Mail Services architecture.		X
5. Produce and submit recommendations for E-Mail application standards on a yearly basis.	X	
6. Review and approve E-Mail application standards.		X
7. Produce and submit backup/recovery policies and procedures.	X	
8. Review and approve backup/recovery policies and procedures.		X
9. Produce and submit defining policies and procedures for functions including E-Mail, calendaring and mail messaging delivery components.	X	

E-Mail Services Roles and Responsibilities		
10. Review and approve policies and procedures for functions including E-Mail, calendaring and mail messaging delivery components.		X
11. Produce and submit plans to update and patch E-Mail Services to maintain reliability and security.	X	
12. Review and approve plans to update and patch E-Mail Services to maintain reliability and security.		X
13. Produce and submit procedures for directory synchronization with County departments.	X	
14. Review and approve procedures for directory synchronization with County departments.		X
15. Produce and submit plans and procedures to protect County End-Users from SPAM, E-Mail Worms or malicious software.	X	
16. Review and approve plans and procedures to protect County End-Users from SPAM, E-Mail Worms or malicious software.		X
17. Produce and submit End-User tip sheets on use of E-Mail Services.	X	
18. Develop procedures for E-Mail.	X	
19. Review and approve plans and procedures to allow County End-Users to encrypt E-Mails to external addresses.		X
20. Produce and submit End-User tip sheets on use of E-Mail Services including encryption.	X	
21. Review and approve for distribution End-User tip sheets on use of E-Mail Services.		X
22. Produce and submit plans for E-Mail integrated Fax solution.	X	
23. Review and approve E-Mail integrated Fax solution.		X
Build Roles and Responsibilities	**Contractor**	**County**
24. Design and implement E-Mail Services operational and computing procedures.	X	
25. Design, test and implement approved changes to the E-Mail application.	X	
26. Design, test and deploy E-Mail server refresh according to the approved plan.	X	

E-Mail Services Roles and Responsibilities		
27. Design and implement policies and procedures for functions including E-Mail, calendaring and mail messaging delivery components.	X	
28. Design, test and implement approved updates and patches to E-Mail Services.	X	
29. Design, test and implement directory synchronization with out-of-scope County departments.	X	
30. Design, test and implement approved plans and procedures to protect County End-Users from SPAM, E-Mail Worms or malicious software.	X	
31. Design, test and implement approved plans and procedures used by Data Center in order to allow County End-Users to encrypt E-Mail being sent to external addresses.	X	
32. Provide encryption plug-ins for Outlook clients.	X	
33. Deploy and install encryption profiles to E-Mail encryption End-Users.	X	
34. Implement approved backup/recovery policies and procedures.	X	
35. Distribute End-User approved tip sheets.	X	
36. Implement E-Mail retention policies.	X	
37. Design and implement E-Mail integrated Fax solution.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
38. Provide support, including break-fix, for all E-Mail Services Assets.	X	
39. Manage and support E-Mail Services to meet operational and computing procedures.	X	
40. Manage and support the E-Mail application.	X	
41. Support and provide E-Mail accounts to End-Users.	X	
42. Provide and support migration of End-User mailboxes in support of E-Mail server refresh or break-fix activity.	X	
43. Manage and support directory synchronization operations.	X	
44. Manage and support SPAM Services and other specific Services needed to protect End-Users.	X	

E-Mail Services Roles and Responsibilities		
45. Manage and maintain E-Mail accounts and E-Mail SMTP addresses.	X	
46. Manage and maintain E-Mail URL filtering Services to protect End-Users.	X	
47. Manage and support E-Mail encryption Services.	X	
48. Manage and maintain E-Mail Services to Service Levels.	X	
49. Perform backups on E-Mail Services Servers Assets as defined.	X	
50. Support E-Mail retention policies per County policy.	X	
51. Manage and support integrated Fax Services.	X	
52. Produce encryption resource unit reports monthly.	X	
53. Manage and Maintain E-Mail encryption accounts for End-Users.	X	

6.11. Unified Communications Infrastructure Services

6.11.1. Overview

This section pertains to the Unified Communications Infrastructure Services Framework Component within the Data Center Services Framework. The Unified Communications Infrastructure Services offering includes all the Framework Components needed to ensure enhanced, mobile, flexible, and more collaborative working environment through a single unified experience for County End-Users.

These Services include:

- Software deployment/management Services
- Management of distribution lists (DLs) and Unified Communication Integration Services (for example, presence management for User availability, voice/IM communications across multiple End-User devices, etc.)
- Acquisition, installation, upgrades, maintenance, support and tuning of collaborative computing Services (e.g., MS Exchange, Audio/Video and Web Conferencing etc.)
- Dedicated Real-Time Collaboration Services
- Synchronous Text Exchange
- Presence Awareness

- Peer-to-Peer Collaboration
- Audio/Video
- MS Lync
- Web Conferencing (Live Meeting)
- Mobile Support
- Utilization Reporting
- Federated Services shall be provided to external agencies approved by the County

The County currently uses Microsoft Office 365 Skype for Busines to provide Unified Communications Infrastructure Services

6.11.2. High Level Requirements

6.11.2.1. Contractor shall provide End-Users the ability to exchange text messages in real time (chat).

6.11.2.2. Contractor shall ensure the logging of any activity in Unified Communications Infrastructure Services shall be administratively disabled.

6.11.2.3. Contractor shall provide End-Users with presence capability.

6.11.2.4. Contractor shall provide End-User with the ability to share text, files, whiteboards and presentations.

6.11.2.5. Contractor shall provide all Unified Communications Infrastructure Services to County mobile devices.

6.11.2.6. Contractor shall provide scheduling of live meetings, web conferences, presentations for internal End-Users and external entities.

6.11.2.7. Contractor shall provide monthly utilization reports of all activity posted on the Service Portal.

6.11.2.8. Contractor shall integrate Unified Communication Infrastructure Services with Identity Access Management Services for all End-User authentication.

6.11.2.9. Contractor shall federate, per Service Request, any external entity into Unified Communication Infrastructure Services.

6.11.2.10. Contractor shall maintain and upgrade Unified Communication Infrastructure Services software versions within 12 months of major releases and within 3 months for minor releases.

6.11.2.11. Contractor shall provide integration for all Unified Communication Infrastructure Services with the E-Mail Services distribution lists.

6.11.2.12. Contractor shall maintain a timeline/roadmap of all Unified Communication Infrastructure Services Hardware versions and Software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.

6.11.2.13. Contractor shall maintain and be responsible for all components needed to provide Unified Communication Infrastructure Services (e.g. load balancers, firewalls, IPS).

6.11.2.14. Contractor shall maintain Unified Communication Infrastructure Services so there is not a single point failure thereby assuring County daily use continues to operate during any unplanned event or outage.

6.11.2.15. Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to Unified Communication Infrastructure Services.

6.11.2.16. Contractor shall continuously investigate emerging technologies and services that improve the overall efficiencies, lowers overall costs and improves business application performance and security.

6.11.3. Environment

6.11.3.1. Hardware and Software

Contractor shall provide all Hardware and Software to support Infrastructure Services

6.11.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Unified Communication Infrastructure Services.

Unified Communication Infrastructure Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Develop Unified Communications Infrastructure Services administration policies (including standards and procedures (new and/or updates) and review with the County.	X	
2. Produce and submit Unified Communications Infrastructure Services architecture.	X	
3. Review and approve Unified Communications Infrastructure Services architecture.		X
4. Review and approve/modify recommended/updated policies, standards and procedures.		X
5. Develop and document final operating procedures for all Unified Communications Infrastructure Services that meet the County requirements and adhere to defined policies and standards.	X	
6. Review and approve/modify final operating procedures documentation.		X
7. Define and submit collaborative computing services procedures.	X	
8. Review and approve collaborative computing services procedures.		X

Unified Communication Infrastructure Services: Plan, Build and Operate Roles and Responsibilities		
9. Provide the County a briefing on upcoming trends in Unified Communications solutions on a regular basis.	X	
10. Identify process improvements to the Unified Communications service management function.	X	
11. Develop a failover plan for Unified Communications Infrastructure Services.	X	
12. Review and approve/authorize improvement recommendations		X
Build Roles and Responsibilities	**Contractor**	**County**
13. Procure and provision Unified Communications Infrastructure Services.	X	
14. Work with appropriate service delivery personnel to perform the installation, testing, and tuning of all technical environment hardware, software, peripherals and interfaces related to supporting Unified Communications Infrastructure Services platform.	X	
15. Deploy and manage Unified Communications Infrastructure Services, including post-deployment support and warranties.	X	
16. Perform end-to-end Incident determination and resolution for all Unified Communications Infrastructure Services related Incidents.	X	
17. Provide and support Remote Access Services for Unified Communications Infrastructure Services.	X	
18. Ensure that all activities affecting the Unified Communications Infrastructure Services environment(s) are coordinated and communicated through defined change management/change control processes and procedures.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
19. Support and participate in any upgrades or migrations and provide applicable services to upgrade infrastructure relating to Unified Communications Infrastructure Services platform.	X	
20. Manage, implement and coordinate all changes to the Unified Communications Infrastructure Services infrastructure.	X	

Unified Communication Infrastructure Services: Plan, Build and Operate Roles and Responsibilities		
21. Create, maintain and provide all appropriate project plans, project time, technical specifications, management documentation and management reporting in a format that is acceptable to the County.	X	
22. Define monitoring requirements for Unified Communications Infrastructure Services.	X	
23. Develop and document monitoring procedures that meet requirements.	X	
24. Review and approve monitoring procedures.		X
25. Provide proactive and scheduled console monitoring of Unified Communications Infrastructure Services infrastructure and systems (e.g., Servers, Network and backups), respond to messages and take corrective action as required.	X	
26. Coordinate with technical support, Incident & Problem Management and Third-Parties in Incident & Problem resolution.	X	
27. Prepare reports on Unified Communications Infrastructure Services performance and review with the County.	X	
28. Administer the day-to-day interfacing with Third-Parties authorized by the County.	X	
29. Provide troubleshooting, repair and escalation of Incidents in the Unified Communications Infrastructure Services platform environment.	X	
30. Verify the integrity of all messaging backups/monthly restore tests.	X	
31. Ensure stability of the current environment is maintained during deployment of minor upgrades and software release maintenance, emergency software and/or hardware fixes/patches.	X	
32. Provide and utilize scheduling tools and processes for managing mailbox moves, archiving, and Unified Communications Infrastructure Services administration.	X	
33. Review and approve retention/backup/recovery requirements.		X

Unified Communication Infrastructure Services: Plan, Build and Operate Roles and Responsibilities		
34. Evaluate, coordinate and install patches as required to all Unified Communications Infrastructure Services (e.g., Hotfixes).	X	
35. Install service pack releases, as applicable.	X	
36. Check messaging logs, server logs and event monitoring.	X	
37. Provide and support Instant Messaging (IM) that utilize the Messaging system infrastructure and include a "Presence" status, application sharing, desktop sharing, and remote access functionalities.	x	
38. Provide technical assistance and subject matter expertise support as required by the County staff and Third-Party solution suppliers.	X	
39. Deploy software and systems that provide Unified Communications Infrastructure Services Services.	X	
40. Maintain (e.g., update to new releases, apply patches and fixes, etc.) Unified Communications Infrastructure Services software and systems. Perform activities or coordinate with appropriate parties.	X	
41. Perform break-fix support activities as required, remotely or on-site as needed.	X	

6.12. Storage Services

6.12.1. Overview

This section pertains to the Storage Services Framework Component within the Data Center Services Framework.

Storage Services is a Third-Party agnostic set of storage infrastructure based on the following three primary categories:

- Attached Storage – applies to direct attached storage, considered non-standard, used to meet Service Levels or to meet performance expectations
- SAN Storage - applies to a standard, centralized and consolidated storage environment

- Immutable Storage - applies to dedicated storage environment for maintaining a legal copy of records that are not modifiable or changeable

Storage Services includes, but are not limited to, End-User access, recovery (via backup and replication) of all Storage Services, data protection, storage availability, storage performance, storage reporting to the Business Group, low org or End-User, storage capacity analysis, and storage management. In addition, Storage Services includes, but are not limited to, storage consolidation, tiered storage, performance monitoring, archiving and replication.

Listed below are the specific tiers of storage definitions:

- Primary Tier –High Performance SAN used for Application Infrastructure Services
- Secondary Tier – Lower performing tier used for End-User data, replicated data (applications) and Infrastructure Services
- Archive Tier – archive storage based on age and inactivity Shared Storage Environment using low cost network storage devices .as approved by the County
- Immutable Tier –Immutable Storage using the replicated immutable storage devices as approved by the County
- Attached – direct connect storage
- Document Processing Center 1 – consists of two dedicated storage systems with 17TB Tier 1 Storage and 23 Tier 2 Storage, to support high throughput, imaging applications and will be located at a County Site
- Document Processing Center 2 – consist of two dedicated storage systems with 8TB Tier 1 Storage and 11 Tier 2 Storage, to support high throughput, imaging applications and will be located at a County Site

6.12.2. High Level Requirements

6.12.2.1. Contractor shall deliver dedicate Immutable Tier to the County.

6.12.2.2. Contractor shall develop plans, for County approval, and implement migration any attached storage used in the Application Infrastructure Services to SAN Storage.

6.12.2.3. Contractor shall support, manage and refresh DPC storage located at specific County Sites.

6.12.2.4. Contractor shall ensure all Application Infrastructure Services are integrated into SAN Storage.

6.12.2.5. Contractor shall develop and maintain a centralized, integrated, Storage Service solution for all County Data.

6.12.2.6. Contractor shall eliminate storage underutilization and avoid "islands of storage".

6.12.2.7. Contractor shall continuously decrease overall recovery times in Storage Services.

6.12.2.8. Contractor shall perform centralized management for Storage Services and in storage administration.

6.12.2.9. Contractor shall design, deliver, for County approval and implement separate storage environments for County Data and backup, replicated or mirrored data.

6.12.2.10. Contractor shall deliver dedicated, for County use only, Immutable Storage as part of the Storage Services.

6.12.2.11. Contractor shall measure and report Storage Services by installed, usable capacity.

6.12.2.12. Contractor shall not include any replicated, backup or DR data in the measurement of installed and usable capacity.

6.12.2.13. Contractor shall retain responsibility for storage related to backup and recovery.

6.12.2.14. Contractor shall maintain replication of Immutable Storage.

6.12.2.15. Contractor shall develop, deliver, for County approval, and implement processes to manage and control data growth across Storage Services.

6.12.2.16. Contractor shall develop, deliver, for County approval, and implement processes and controls for the elimination of unmanaged data growth.

6.12.2.17. Contractor shall increase storage, with County approval, in order to meet County business needs.

6.12.2.18. Contractor shall produce monthly Storage Services reports by storage tier down to the Business Group, department and End-User.

6.12.2.19. Contractor shall provide End-User self-service reporting and self-service management for Storage Services.

6.12.2.20. Contractor shall design, deliver, for County approval, and implement centralized control and management for Storage Services.

6.12.2.21. Contractor shall continuously implement plans, approved by the County, to lower storage costs to the County for Storage Services.

6.12.2.22. Contractor shall develop, deliver, for County approval, and implement plans to reduce down time due to data loss for Storage Services.

6.12.2.23. Contractor shall provide secure and bonded transportation and offsite storage of backups.

6.12.2.24. Contractor shall refresh Attached storage on the same cycle as the associated physical server.

6.12.2.25. Contractor shall refresh the Primary, Secondary and Archive tiers of storage on a five (5) year.

6.12.2.26. Contractor shall maximize the efficient use of storage throughout the Data Center Services to minimize and eliminate underutilization.

6.12.3. Environment

County Data included in the Storage Services environment shall be the following:

- County Portfolio Application
- End-User data

6.12.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Storage Services.

Storage Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Produce and submit recommendations on Storage Services architecture.	X	
2. Review and approve recommendations on Storage Services architecture.		X
3. Produce and submit plans on Shared Storage Services consolidation and Application Server migration to Shared Storage Service environment on a yearly basis.	X	
4. Review and approve plans on Shared Storage and Data Management Services consolidation and Application Server migration to Shared Storage Service environment on a yearly basis.		X
5. Produce and submit Storage Services policies/procedures.	X	
6. Review and approve Storage Services policies/procedures.		X
7. Produce and submit Storage Services reporting policies/procedures.	X	
8. Review and approve Storage Services reporting policies/procedures.		X
9. Produce and submit Storage Services policies and procedures.	X	
10. Review and approve Storage Services policies and procedures.		X

Storage Services Roles and Responsibilities		
11. Produce and submit Storage Services refresh plan on a yearly basis.	X	
12. Review and approve Storage Services refresh plan on a yearly basis.		X
13. Produce and submit plans for meeting storage demands.	X	
14. Review and approve plans for meeting storage demands.		X
15. Produce recommendations for process improvement in backup and recovery for Storage Services Assets.	X	
16. Recommend and submit recovery policies/procedures for Storage Services Assets.	X	
17. Review and approve recovery policies/procedures for Storage Services Assets.		X
18. Produce and submit recommendation on capacity management.	X	
19. Review and approve recommendations on capacity management.		X
20. Produce and submit plans to add additional Storage.	X	
21. Review and approve plans to add additional Storage.		X
22. Produce and submit a data management strategy that make certain that commonly used data has a defined minimum set of characteristics that include the following: • Definition of the data object (what is it?) • Reference (where and how is the data object used?) • Metadata (data object attributes, such as type, size, and range of values) • Ownership and governance (who owns data, definitions, content, and so on?)	X	
23. Review and approve data management strategy.		X
24. Implement that strategy using an Information Lifecycle Management (ILM) approach for storing County Data.	X	

Storage Services Roles and Responsibilities		
25. On an initial and ongoing basis, evaluate the County's data to identify redundancies, excess capacity, and opportunities for data consolidation using strategies such as data warehousing and data archiving and reduce data storage costs through the following: • Leveraging centralized hardware • Reducing administrative costs by reducing the number of databases • Providing centralized data repository • Reducing costs by reducing under-utilized storage • Reducing and eliminating autonomous backup and recovery solutions for centrally administered and managed backup and recovery	X	
26. Plan and schedule all storage-related software/driver/microcode/etc. patching and upgrades.	X	
Build Requirements, Roles and Responsibilities	**Contractor**	**County**
27. Design and Implement recovery processes based on approved policies/procedures.	X	
28. Design and Implement Storage Services management processes based on approved policies/procedures.	X	
29. Implement Storage Services Reporting.	X	
30. Design and Implement storage consolidation based on approved recommendations.	X	
31. Deploy, manage, communicate and report on activities related to Storage Services refresh.	X	
32. Review and approve Storage Services refresh report.		X
33. Design and Implement Storage Services provisioning and allocation processes based on approved policies.	X	
34. Design and implement capacity management.	X	
35. Implement approved Storage Services policies and procedures.	X	
36. Implement necessary physical and logical security to protect the County's data (e.g. through access controls, storage network, and host-based allocation controls, SAN zoning and host/array-level logical unit (LUN) masking).	X	
Operate Requirements, Roles and Responsibilities	**Contractor**	**County**

Storage Services Roles and Responsibilities		
37. Provide support, including break-fix, for all Storage Services Assets.	X	
38. Manage and affect the appropriate resolution of Incident events until the operation of the storage is returned to normal by following customized procedures as well as resolving Incidents upon an automated or manual detection of an event related to storage components.	X	
39. Manage and support the Storage Services.	X	
40. Produce and submit monthly Storage Services reports.	X	
41. Review and approve monthly Storage Services reports.		X
42. Support Storage Services refresh.	X	
43. Perform and support media management activities for Storage Services.	X	
44. Manage and support the media requests.	X	
45. Provide data storage Services (e.g., RAID groups, storage pools, LUNs; presenting — masking and zoning; reclamation; optimization — tiers, deduplication, thin provisioning, etc.).	X	
46. Perform tapes mounts as required.	X	
47. Perform special tape shipments as requested.	X	
48. Provide options for on-premises and offsite data backup storage.	X	
49. Provide backup and restore options such as the possibility to self-restore.	X	
50. Load and manage Third-Party media as required.	X	
51. Prepare and manage media for use by microfiche service.	X	
52. Manage and perform file transfers and other data movement activities related to break-fix or consolidation of Storage Services Assets.	X	
53. Perform data backups of Storage Services per approved policies and procedures.	X	
54. Perform recovery processes on Storage Services Assets.	X	
55. Perform storage utilization management.	X	
56. Manage and maintain all Storage Services Assets and Services.	X	

Storage Services Roles and Responsibilities		
57. Manage and maintain backup media library.	X	
58. Manage and maintain the Storage Services Assets.	X	
59. Produce and submit Storage Services Management Reports.	X	
60. Review and accept Storage Services Management Reports.		X

6.13. Backup and Recovery Services

6.13.1. Overview

Backup and Recovery Services are the activities associated with providing ongoing Backup and Recovery according to County schedules and requirements. Contractor must demonstrate that it consistently meets or exceeds County's ongoing Backup and Recovery requirements. All Hardware, all Software and all storage (online, near online, and offline) used for any backup and recovery Services are Contractor-provided.

6.13.2. High Level Requirements

6.13.2.1. Contractor shall perform backups on all County Data.

6.13.2.2. Contractor shall develop management plan that contains procedures for monitoring backup infrastructure, for ensuring successful backup and recovery job completion, for complying with change management process and for testing restore process.

6.13.2.3. Contractor shall maintain a complete inventory of all existing backup equipment including, backup servers and clients, automated libraries, backup media and storage networking components.

6.13.2.4. Contractor shall provide centralized backup and recovery policy management.

6.13.2.5. Contactor shall support disk-based backup target.

6.13.2.6. Contractor shall provide provision for auto discovery of virtual servers.

6.13.2.7. Contractor shall provide single-pass image backup of virtual servers.

6.13.2.8. Contractor shall provide integrated authentication and LDAP services.

6.13.2.9. Contractor shall support Oracle RMAN integration.

6.13.2.10. Contractor shall provide volume shadow copy service (VSS).

6.13.2.11. Contractor shall support full and incremental backups.

6.13.2.12. Contractor shall provide file and virtual server image restore capability.

6.13.2.13. Contractor shall provide ability to customize retention period by policy

6.13.2.14. Contractor shall support application quiesce.

6.13.2.15. Contractor shall support file include/exclude functionality.

6.13.2.16. Contractor shall support data that resides in cloud infrastructure Contractor shall provide point-in-time file and object recovery.

6.13.2.17. Contractor shall perform continuous capacity planning in the Backup and Recovery Services environment to address data growth.

6.13.2.18. Contractor shall implement a NetBackup solution for Tulsa and San Diego sites with replication of immutable copies in Colorado Springs for Disaster Recovery. The Netbackup solution shall also provide daily backup of the AWS West Commercial tennant, with daily replication to the AWS East Commercial immutable tenant for disaster recovery.

6.13.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Backup and Recovery Services.

Backup and Recovery Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Define Backup and Recovery schedules, requirements and policies.		X
2. Recommend standard practices for Backup and Recovery Services strategies, policies, and process and procedures.	X	
3. Develop, document and maintain in the Standards and Procedures Manual the Backup and Recovery schedules and procedures that adhere to County requirements and policies.	X	
4. Coordinate the Backup and Recovery Standards and Process and Procedure Manual with County Security and Legal teams.	X	
5. Review and approve Backup and Recovery schedules and process and procedures.		X
Build Roles and Responsibilities	**Contractor**	**County**
6. Define Backup and Recovery Monitoring and Reporting requirements and policies.	X	
7. Review and approve Backup and Recovery Monitoring and Reporting procedures.		X
Operate Roles and Responsibilities	**Contractor**	**County**
8. Provide and Manage backup media inventory (tape, disk, optical and other media type) including the ordering and distribution of media.	X	
9. Perform Framework Component backups and associated rotation of media as required.	X	
10. Identify and establish a secure off-site location for data media.	X	
11. Approve secure off-site location for data media.		X
12. Archive data media at a secure off-site location.	X	
13. Ensure ongoing ability to recover archived data from media as specified (backward compatibility of newer backup equipment).	X	

Backup and Recovery Services Roles and Responsibilities		
14. Test backup media to ensure incremental and full recovery of data is possible and ensure integrity, as required or requested by County.	X	
15. Recover files, file system or other data required from backup media, as required or requested by County.	X	
16. Provide recovery and backup requirements and updates as they change.		X
17. Provide County access to backup and recovery reporting and monitoring systems and data.	X	

6.14. Managed Print Services

6.14.1. Overview

This is the section pertains to the Managed Print Services Framework Component within the Data Center Framework. The Managed Print Services Framework Component applies to all the Hardware, Software and services needed to maintain and support managed print. Services provided by the Contractor are print and output facilities, print output operations, operating printer devices, distributing printed output, replenishing consumable materials, preparing and managing media for use by microfiche service and repairing printer devices

6.14.2. High Level Requirements

6.14.2.1. Maintain reliable Managed Print Operations that allows County business to continue uninterrupted.

6.14.2.2. Lower overall Managed Print cost by increasing overall efficiencies.

6.14.3. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with Managed Print Services.

Managed Print Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**

Managed Print Services Roles and Responsibilities		
1. Produce and submit output management requirements, policies, and procedures including transport, delivery locations and schedule requirements.	X	
2. Review and approve output management requirements, policies, and procedures.		X
3. Produce and submit automated output distribution requirements.	X	
4. Review and approve automated output distribution requirements.		X
5. Produce and submit recommendations for using distributed printing methodologies and technologies to update and modernize Managed Print Services.	X	
6. Review and approve recommendations for using distributed printing methodologies and technologies to update and modernize Managed Print Services.		X
Build Roles and Responsibilities	**Contractor**	**County**
7. Design and implement output management requirements, policies, and procedures including transport, delivery locations and schedule requirements.	X	
8. Design, test and implement approved automated output distribution requirements.	X	
9. Design, test and implement approved recommendations for modernizing the Managed Print Services.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
10. Provide support, including break-fix, for all Managed Print Assets.	X	
11. Provide print output (including both paper and microfiche) facilities for the County.	X	
12. Perform and manage print output (including both paper and microfiche) distribution and delivery to specified County locations.	X	
13. Separate and organize printed output materials (including both paper and microfiche) and place into designated bins at the designated delivery points.	X	
14. Store preprinted check stock in a secure document vault in Contractor secured print facility.	X	

Managed Print Services Roles and Responsibilities		
15. Ensure that output devices are functioning, including performing or coordinating maintenance and meet or exceed Service Levels.	X	
16. Store and manage consumables, such as paper, special forms, check stock, print ribbons, ink, tapes, etc. Ensure that special forms and check stock are current and adequately stocked every Month. Coordinate acquisition of additional materials as needed.	X	
17. Provide microfiche Services.	X	

6.15. Public Key Infrastructure (PKI) Services

6.15.1. Overview

This section pertains to the Public Key Infrastructure (PKI) Services Framework Component of the Data Center Services Framework. PKI Services infrastructure supports and manages all the keys and certificates, the distribution and identification of public encryption keys, enabling End-Users and devices to both securely exchange data, securely connect to the County internal network, digital signatures and verify identity. The PKI Service consists of Hardware, Software, policies and standards to manage the creation, administration, distribution and revocation of keys and digital certificates.

County currently uses Symantec Managed PKI Service to deliver the PKI Service.

6.15.2. High Level Requirements

6.15.2.1. Contractor shall develop additional use cases for the expansion of PKI Services.

6.15.2.2. Contractor shall develop and implement device authentication strategies based on PKI Services.

6.15.2.3. Contractor shall develop and implement End-User authentication methodologies based on PKI Services.

6.15.2.4. Contractor shall use PKI Services for all applications of digital signature.

6.15.2.5. Contractor shall maintain currency on PKI Services.

6.15.2.6. Contractor shall deploy enterprise self-enrollment for PKI Services hosted on the Service Portal.

6.15.2.7. Contractor shall act as the Policy Authority for PKI Services.

6.15.2.8. Contractor shall be responsible for Certificate Practices Statements in the operation of PKI Services.

6.15.2.9. Contractor shall manage the root CA as a public PKI.

6.15.2.10. Contractor shall manage the entire lifecycle of all certificates used in the PKI Service.

6.15.2.11. Contractor shall establish monthly reporting methodology to track usage of certificates across the entire lifecycle.

6.15.2.12. Contractor shall maintain and establish integration with infrastructure supporting the Services (e.g. mobile device management, software distribution, authentication services).

6.15.2.13. Contractor shall maintain a browser agnostic solution for PKI Services.

6.15.2.14. Contractor shall ensure PKI Services is a valid and certified certificate authority externally.

6.15.2.15. Contractor shall maintain an accurate and up-to-date inventory of PKI Services.

6.15.2.16. Contractor shall design and standardize, with County approval, PKI Services.

6.15.2.17. Contractor shall maintain public key certificates for End-Users and devices.

6.15.2.18. Contractor shall maintain a certificate repository.

6.15.2.19. Contractor shall implement certificate revocation procedures and provide key backup and recovery.

6.15.2.20. Contractor shall maintain support for non-repudiation of digital signatures

6.15.2.21. Contractor shall maintain currency on PKI Services to the latest versions and releases.

6.15.2.22. Contractor shall implement automatic update of key pairs and certificates.

6.15.3. Environment

6.15.3.1. Support

The following is a list of items currently supported or future support by PKI Services:

6.15.3.1.1. Secure Remote Access – strong authentication for Remote Access

6.15.3.1.2. Secure network access - transparent authentication to Wi-Fi access points

6.15.3.1.3. Secure E-Mail – digitally signed, encrypted E-Mail Services

6.15.3.1.4. Strong web authentication – authentication services to web apps and pages via browser

6.15.3.1.5. Document signing – digitally signed Adobe PDF documents

6.15.4. Roles and Responsibilities

The following table identifies the Plan, Build and Operate roles and responsibilities associated with PKI Services.

PKI Services Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Develop and submit annually additional use cases for the expansion of PKI Services.	X	
2. Review the additional use cases.		X

PKI Services Roles and Responsibilities		
3. Develop and submit device and End-User authentication plans.	X	
4. Review and approve device and End-User authentication plans.		X
5. Develop, maintain and submit operational procedures and End-User instructions.	X	
6. Review and approve operational procedures and End-User instructions.		X
7. Develop and submit plans to integrate PKI Service into E-Mail Services.	X	
8. Review and approve plans to integrate PKI Service into E-Mail Services.		X
Build Roles and Responsibilities	**Contractor**	**County**
9. Implement designs and plans to PKI Services.	X	
10. Implement certificate lifecycle and self-service capabilities on the Service Portal.	X	
11. Implement integration of PKI Service into E-Mail Services.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
12. Develop and submit monthly reports on PKI Services.	X	
13. Manage CA Root.	X	
14. Support and maintain certificate lifecycle and self-service capabilities.	X	
15. Maintain CSP statements.	X	
16. Maintain currency of PKI Services.	X	
17. Support authentication of mobile devices.	X	
18. Support E-Mail Service use of PKI Services.	X	

7. APPLICATIONS SERVICES

7.1. Overview

Applications Services consists of three separate sets of requirements, roles and responsibilities:

- Applications Maintenance and Operations (M&O) Services – support for Applications in production
- Applications Development Services – development of new software
- Electronic Health Records (EHR) Program Management Services – support for existing EHR and implementation of additional EHR capabilities.

7.2. Application Maintenance and Operations Services

7.2.1. Overview

M&O Services consist of any one-time and ongoing maintenance, operations, support, planning, management, administrative support, oversight, tuning, planning, and any other Services that are either direct or incidental, ancillary, customary, or necessary to perform the activities described below. The Contractor is responsible to support and maintain all environments and systems required to support Portfolio Applications.

7.2.2. High Level Requirements

7.2.2.1. Contractor shall restore Services in accordance with Service Levels.

7.2.2.2. Contractor shall operationally maintain all Portfolio Applications in production with high availability and performance.

7.2.2.3. Contractor shall ensure all maintenance, development and integration activities are aligned with County architecture standards, guiding principles, architecture bricks and patterns.

7.2.2.4. Contractor shall be responsible for performing work on Incidents (e.g. development, test, training, etc.) and production environments, middleware or any needed components to provide M&O Services for Portfolio Applications.

7.2.2.5. Contractor shall maintain accurate and continuous prompt updates to asset and system documentation.

7.2.2.6. Contractor shall ensure cross Framework integration and communication is conducted for Application Incidents, outages, maintenance work, planning purposes and all changes.

7.2.2.7. Contractor shall provide Services in alignment with ITIL and CMMI standards to ensure predictable, repeatable and successful results.

7.2.2.8. Contractor shall implement new patches and versions (within the current release), prioritizing patches that address security vulnerabilities.

7.2.2.9. Reserved.

7.2.2.10. Contractor shall include all services (e.g., labor), software, hardware, and required system environments.

7.2.2.11. Applications M&O Services do not include programming any additional functionality beyond what is included in new patches and dot releases. Contractor shall perform maintenance Services that include Preventative, Adaptive and Perfective Maintenance as described below:

7.2.2.11.1. Preventive Maintenance

Contractor shall perform preventive maintenance Services to diagnose and correct latent defects and other known errors in the Applications. Contractor is required to provide preventive maintenance that covers events that, if not addressed proactively, may affect Applications in production.

7.2.2.11.2. Adaptive Maintenance

Contractor shall perform adaptive maintenance Services so that Application performance is not affected by changes to interfacing Applications or new Applications or packages and infrastructure

changes that, if not addressed proactively, have the potential to impact Applications in production.

7.2.2.11.3. Perfective Maintenance

Contractor shall perform perfective maintenance Services to optimize performance of the Applications, with particular focus on areas including: general performance tuning (e.g., to improve Application response time), database performance tuning (e.g., storage space, query refinement), etc. Tool and script development to make the Maintenance Services more productive or labor saving is also included in this category.

7.2.3. Roles and Responsibilities

Contractor shall perform the Applications M&O Services described in the overview, high level requirements, descriptions and tables in the sections below. The sections below describe in more detail the requirements, roles and responsibilities in the plan, build and operate format for each specific section.

Maintenance and Operations Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Define Application M&O Services requirements and policies.		X
2. Provide recommendations for archiving, performance tuning, patching, database administration, and Application onboarding/retirement.	X	
3. Provide recommendations for preventive, adaptive, and perfective maintenance.	X	
4. Provide recommendations on operational procedures.	X	
5. Review and approve Contractor recommendations on M&O processes, procedures, maintenance (preventive, adaptive, perfective), and Application onboarding/retirement.		X
6. Provide recommendations for upgrade, system changes, Applications architecture changes or anything else that can affect the operational integrity of the Applications.	X	

Maintenance and Operations Services: Plan, Build and Operate Roles and Responsibilities		
7. Provide annual portfolio analytics on production Applications, including technical obsolescence (at a component level, where applicable), defect rates, and costs by Application.	X	
8. Monitor technical trends through independent research; document and report on products and Services.	X	
9. Participate in annual technical and business planning sessions to establish standards, architecture and project initiatives.	X	
10. Define authorization requirements for End-Users, roles, schemas, etc. and approve change requests.	X	
11. Define job schedules for sequencing and run times.	X	
Build Roles and Responsibilities	**Contractor**	**County**
12. Perform pre-production execution simulation.	X	
13. Provide Services in alignment with ITIL, CMMI standards or other leading practices to result in predictable, repeatable, and successful results.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
14. Update the Standards and Procedures Manual with County-approved procedures and standards.	X	
15. Conduct periodic reviews of configuration documentation for accuracy.	X	
16. Provide a documented list of items to be addressed for consideration as part of future upgrades.	X	
17. Validate and provide Application-related Service Desk scripts are updated and accurate.	X	
18. Approve Service Desk script updates.		X
19. Provide planning and schedules for new Applications supported by M&O Services for a system or change placed into production. M&O shall perform M&O Services after the system is placed into production unless otherwise directed by the County.	X	
20. Approve M&O Services to support a new system or change in production.		X
21. Develop and maintain Application version and release Roadmap for all software and tools for each Portfolio Application.	X	

Maintenance and Operations Services: Plan, Build and Operate Roles and Responsibilities		
22. Provide portfolio report for County review of past month Incidents that impacted Application operations.	X	
23. Provide cost and labor hour information at the PA-ID level to facilitate annual portfolio rationalization and support monthly cost allocation to departments.	X	
24. Perform business planning for capacity and performance.		X
25. Provide input into defining requirements for all Applications Development projects to be transitioned to Applications M&O.	X	
26. Recommend potential improvements to Application security architecture.	X	
27. Identify possible product and software tool enhancement opportunities for improved performance and potential cost savings.	X	
28. Recommend potential improvements to Application security.	X	
29. Review and approve improvements to Application security.		X
30. Perform preventive, adaptive and perfective maintenance based on County-approved procedures.	X	
31. Perform archiving, performance tuning, patching, database administration based on County-approved procedures.	X	
32. Perform system log storage and management.	X	
33. Perform root cause analysis resulting from an Incident.	X	
34. Identify and resolve locking conflicts, latch contention, rollback requirements, etc. for all database instances as it pertains to maintenance activities.	X	
35. Retire Applications (performing tasks based on retirement procedures in the Standards & Procedures Manual) as approved by the County.	X	
36. Perform necessary tasks to remedy risks and Incidents identified in the weekly Application and database performance and capacity reports.	X	
37. Create/refresh development/test databases from production data to support O&M activities according to a pre-scheduled cycle.	X	

Maintenance and Operations Services: Plan, Build and Operate Roles and Responsibilities		
38. Monitor and execute production jobs and perform associated interventions (e.g., restarting jobs, re-running jobs.)	X	
39. Review and approve changes that alter or impact the production system and Application.		X
40. Restore Applications following an outage or Incident.	X	
41. Perform triaging and investigation of Incidents regardless of whether these result in an enhancement in the future or impact other Service Frameworks.	X	
42. Perform code fixes to resolve Incidents that stop, slow or hold-up Application processes.	X	
43. Perform general Application administration.	X	
44. Perform routine system patching (e.g., monthly/quarterly/annual) to keep the system current.	X	
45. Perform prompt updates of system documentation.	X	
46. Perform prompt updates of current code in source code repository.	X	
47. Track trends on Incidents to identify systemic Problems to be reported to the County and corrected by the Contractor.	X	
48. Maintain current non-production environments and keep the system operational for M&O requirements.	X	
49. Provide unplanned maintenance including activities to restore service as initiated by Incident tickets that have been initiated by County Users, or Contractor or Third-Parties.	X	
50. Perform analysis, design, coding, testing, data conversion, documentation, End-User coordination and communication, and production turnover activities and the management of these activities for restoration of service.	X	
51. Perform triage support by determining if the Incident is an Application Incident vs. another Framework or a Third-Party Incident.	X	
52. Support Incident and Problem management including RCAs.	X	
53. Coordinate with Third-Parties for patch installation and support for restoration of service.	X	

Maintenance and Operations Services: Plan, Build and Operate Roles and Responsibilities		
54. Provide updates to existing documentation regarding steps necessary to restore service.	X	
55. Provision and de-provisioning all and any accounts that are authorized to be created, changed or modified for Portfolio Applications authentication and authorization.	X	
56. Includes Third-Party patch installation and support to restore service, including all patches that address fixes to known defects and associated security vulnerabilities. If a patch only includes new functionality, it shall be installed under Applications Development Services. If a patch includes both known defects/security vulnerabilities and new functionality, it shall be implemented under Applications Maintenance and Operations Services.	X	
57. Participate in change review control board activities.	X	
58. Proactively evaluate, identify and recommend configurations or Changes to configurations to enhance performance.	X	
59. Update and maintain information and data in the Unified Asset Management System.	X	
60. Establish and maintain configuration and system parameters in a consistent manner across like server environments.	X	
61. Execute processes for the proper maintenance and functioning of Interfaces (e.g., initialization parameter, load balancing, tuning, configuration management).	X	
62. Coordinate communications with Third-Parties and manage the information exchange with interfaces.	X	
63. Perform upgrades to Third-Party software or tools, including operating systems or database software.	X	
64. Perform changes to ensure non-production environments are using same versions, updated code and system features as production.	X	
65. Perform regression testing of Application when an enhancement (e.g., service pack release) or change in code is performed.	X	
66. Conduct Application testing in non-production environments.	X	
67. Perform triage to engage Third-Party, troubleshooting, Application of patches and/or other types of fixes.	X	

Maintenance and Operations Services: Plan, Build and Operate Roles and Responsibilities		
68. Maintain and execute a release management schedule.	X	
69. Perform special testing for events, e.g., public holidays, end of financial year, end of calendar year, daylight savings time.	X	
70. Provide, maintain and update the Portfolio Application Identification (PAID) report of active, inactive and inactive-retain Applications.	X	

7.2.4. Application Programming

Application programming Services are the activities associated with the programming, scripting, configuring or customizing of Application modules to support Maintenance and Operations of the production Application Portfolio.

The following table identifies the Plan, Build and Operate requirements, roles and responsibilities associated with Application Programming as part of Applications M&O Services.

Application Programming Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Review County's existing technical standards (e.g., naming, JCL, etc.).	X	
2. Recommend programming (coding), development, and technical documentation policies, procedures, and standards for inclusion in the Standards and Procedures Manual.	X	
3. Review and approve overall programming, development, and technical documentation in the Standards and Procedures Manual.		X
Build Roles and Responsibilities	**Contractor**	**County**
4. Create working directories to store source code in the enterprise code version manager or repository.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
5. Maintain all current versions of custom code in the approved code repository managed by the Contractor.	X	

Application Programming Services: Plan, Build and Operate Roles and Responsibilities		
6. Recommend modifications and performance-enhancement adjustments to system software and utilities based on County performance standards.	X	
7. Manage all programming and development efforts using industry-standard project management tools and methodologies.	X	
8. Perform all software engineering activities using industry best practices.	X	
9. Employ standard software engineering practices to promote consistency and maintainability.	X	
10. Conduct planned status reviews and provide written report on results to County.	X	

7.2.5. Application Integration and Testing

Application integration and testing are the Services associated with the confirmation that the individual Application Framework Components work together properly and, as a whole, perform their specified functions. This includes Interfaces to other Applications already in production at, or developed by, County or Third-Parties as stated in the applicable requirements documents.

The following table identifies the Application Integration and Testing Services that the Contractor shall perform.

Application Integration and Testing Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Develop, document and maintain in the Standards and Procedures Manual integration and testing procedures that meet County requirements and adhere to policies defined by County.	X	
2. Review and approve changes to the Standards and Procedures Manual for testing.		X
3. Develop an overall test plan that documents the test strategy, coverage, scenarios, test bed, test data, methods, schedule and responsibilities to accomplish integration and testing.	X	
4. Approve test plan.		X
Build Roles and Responsibilities	**Contractor**	**County**

Application Integration and Testing Services: Plan, Build and Operate Roles and Responsibilities		
5. Provide a test bed with real-time production data.	X	
6. Mask sensitive information in tests that use production data.	X	
7. Create test cases with appropriate use of County-provided data for generating test data to perform all appropriate testing, e.g., unit testing, end-to-end testing, stress testing, regression testing.	X	
8. Create test scenarios to test end-to-end business cases.	X	
9. Create test environment and data where required for support, enhancements or projects, including demonstration of requirements traceability to verify requirements have been satisfied.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
10. Conduct testing per test plan requirements.	X	
11. Facilitate and support User acceptance test as agreed-upon with the County, e.g., establish adequate test environment based on User acceptance criteria, prepare data to support test scenarios within modified system, manage the relationship with all interfaced systems necessary to conduct test, perform troubleshooting, simulate interfaces or working with integrated systems to conduct end-to-end testing, support batch processing, exercise functionality and report results.	X	
12. Conduct User acceptance test.		X
13. Manage the County functional, Integration test, and Regression Testing environments and associated test data, including creation and maintenance during the testing period.	X	
14. Provide shared access to the mutually agreed-upon defect tracking tool for the purpose of allowing County to initiate, track, and report County-identified defects (e.g., User acceptance testing).	X	
15. Correct defects found as a result of testing efforts.	X	
16. Stage systems before implementation into production.	X	
17. Support County for functional and non-functional testing of Applications to confirm systems are functioning as expected after infrastructure changes have been implemented.	X	
18. Maintain software release matrices across development, quality assurance and production environments and networks.	X	

Application Integration and Testing Services: Plan, Build and Operate Roles and Responsibilities		
19. Conduct Integration test and security testing for all new and upgraded Application software, including the associated equipment and networks to include Unit testing, system, Integration test and Regression testing based on requirements defined in requirements and design documents.	X	
20. Assess and communicate the overall impact and potential risk to components prior to implementing Changes.	X	
21. Stage new and upgraded software or services to seamlessly transition into existing environment based on requirements defined in requirements and design documents.	X	
22. Perform Configuration Management and Change Management activities related to integration and testing.	X	
23. Review and approve test results.		X
24. Manage and support software and test data in test environments.	X	
25. Ensure testing results are in compliance with policies, procedures, plans, and test criteria and metrics (e.g., defect rates, progress against schedule).	X	
26. Define test-to-production turnover requirements and instructions for each Project or release.	X	
27. Approve test-to-production turnover requirements and instructions.		X
28. Produce and submit reports on results from test-to-production activities if applicable.	X	
29. Review and approve reports on test-to-production results.		X
30. Perform software support to migrate code from test to production as approved by the County.	X	
31. Track migration status and notification.	X	

7.2.6. Application Implementation and Data Migration

Application implementation and data migration Services are the activities associated with the installation and migration of new or upgraded components to the production environment. In addition, these include Services to localize new or upgraded components so that they adhere to local business practices as well as legal, regulatory and statutory needs.

The following table identifies the Plan, Build and Operate requirements, roles and responsibilities associated with Applications that receive patches, version upgrades, or other changes.

Application Implementation and Data Migration Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Create an implementation plan outlining the scope, approach and execution planned for the deployment of new/enhanced Applications and/or the migration of Applications into M&O Services.	X	
Build Roles and Responsibilities	**Contractor**	**County**
2. Perform data migration from existing systems to new systems, by either electronic or manual methods.	X	
3. Produce and submit operations and administration procedures related to code migration (e.g. CRCB documents, code version check in, etc.).	X	
4. Review and approve operations and administration procedures related to code migration.		X
Operate Roles and Responsibilities	**Contractor**	**County**
5. Coordinate and assist with deployment and support activities with County and/or its designees as directed by County.	X	
6. Develop data migration plans and scripts for use or execution by County, whether from existing systems to new systems, by either electronic or manual methods as required.	X	
7. Execute data migration plan by moving data into the production environment.	X	
8. Develop, document and maintain in the Standards and Procedures Manual implementation and migration procedures that meet requirements and adhere to policies defined by County.	X	
9. Coordinate and review all implementation and migration plans, in accordance with Change Management policies.	X	
10. Upon County request and approval install new or enhanced components (e.g., software, middleware, utilities, configurations) within the development environment.	X	

Application Implementation and Data Migration Services: Plan, Build and Operate Roles and Responsibilities		
11. Upon County approval, within the development environment, perform Application Services Framework Component upgrades as a result of new and enhanced architectures and County upgrade plans and requirements (e.g., Hardware, Software, middleware, utilities, networks, peripherals, configurations).	X	
12. Coordinate implementation and migration support activities with County.	X	
13. Within the development environment, perform Application and/or data migration and conversion by electronic or manual methods (e.g., upgraded databases, address tables, management information bases).	X	
14. Attend and seek change control review board approval, or any other procedures required to obtain approval to implement a change into production environment.	X	
15. Create "go-live" checklist and conduct the "go/no-go" meetings	X	
16. Approve production implementation, go-live checklist and "go/no-go" decisions.		X
17. Deploy system.	X	

7.2.7. Application Documentation

Contractor shall develop and maintain documentation for all Applications, including:

- System specifications and documentation
- Solution design documentation
- System security plans
- End-User documentation
- Updates and release notes
- Run-book data and documentation

The following table identifies the Plan, Build and Operate requirements, roles and responsibilities associated with Applications Documentation.

Application Documentation Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**

Application Documentation Services: Plan, Build and Operate Roles and Responsibilities		
1. Recommend specifications and documentation format and content per County requirements.	X	
2. Approve documentation format and content.		X
3. Provide system specifications and technical documentation.	X	
4. Provide operational processing flow.	X	
5. Provide system installation, support, configuration and tuning documentation.	X	
6. Provide Application hardware and system Software requirements documentation.	X	
7. Provide documentation for Applications on patches, updates and release notes.	X	
8. Provide solution design documentation.	X	
9. Review and approve all Applications documentation.		X
Build Roles and Responsibilities	**Contractor**	**County**
10. Maintain, and provide County access to, physical and logical on-line libraries of all deliverables and documentation produced in the course of performing Applications work (e.g., specifications, process flows, User manuals, operating manuals).	X	
11. Prompt update documentation to be current and accurate in all relevant system of records (e.g., AppsManager, Service Desk Scripts, Solution Design Documents).	X	
12. Prompt update of code version manager tool set with updated code that is created or changed. The code repository managed by the Contractor must be accurate and current.	X	
13. Validate documentation is promptly updated and coding standards are followed.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
14. Provide system and Application security procedures.	X	
15. Provide standard operating procedures in support of Application characteristics and features.	X	
16. Prepare updates and release notes.	X	
17. Document version control for all documentation.	X	

Application Documentation Services: Plan, Build and Operate Roles and Responsibilities		
18. Assist County in developing an Application Disaster Recovery process and the associated documentation.	X	
19. Approve documentation.		X

7.2.8. Application Training

Following Transition and after each implementation, Contractor shall conduct all the necessary training programs for Contractor Personnel to preserve and enhance the knowledge and understanding of the Applications. It is the Contractor's responsibility to maintain this proficiency for replacement Contractor Personnel at no additional cost to the County. Contractor shall provide base training to key County personnel when Contractor develops a new functionality.

Contractor shall share with County the experience that Contractor has gained from daily Incident handling via knowledge sharing sessions, best practices sessions, training programs, etc., to improve the overall knowledge base of the Applications. Contractor shall provide County with copies of all instructor manuals and other training materials created or used by Contractor Personnel in conducting such training.

The following table identifies the Plan, Build and Operate requirements, roles and responsibilities associated with Application Training.

Application Training Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Develop training plan.	X	
2. Approve training plan.		X
Build Roles and Responsibilities	**Contractor**	**County**
3. Update technical training materials.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
4. Provide technical training assistance and knowledge transfer to existing County support personnel, during deployment as requested.	X	
5. Provide training materials related to the technical aspects of Applications to County as applicable.	X	

Application Training Services: Plan, Build and Operate Roles and Responsibilities		
6. Support County's training of its Service Desk agents, including supporting County's development of dialogue scripts.	X	
7. Develop, document and maintain in the Policies and Procedures Manual Training and knowledge transfer procedures that meet County's requirements and adhere to policies defined by County.	X	
8. Develop and deliver training program to instruct County personnel on the provisions included within the Services (e.g., "rules of engagement," how to request Services).	X	
9. Develop and implement knowledge transfer procedures so that key County staff understand key components of the Enhancements and/or Deliverables.	X	
10. Develop, document and deliver training requirements that support the ongoing provision of the Services, including refresher courses as needed and instruction on new functionality.	X	

7.2.9. Application Quality Assurance Services

Contractor shall provide the Quality Assurance (QA) Services with respect to all Applications created or enhanced as part of this Agreement. QA Services are a systematic, planned set of actions necessary to provide confidence that the Software update/development processes conform to established functional technical requirements as well as with the managerial requirements of keeping the schedule and resources within budgetary confines. Contractor shall provide County with appropriate visibility into the QA Services processes that Contractor uses and of the results as related to the Application being worked upon.

Contractor shall support and suggest improvements for all QA Services conducted and processes adopted by County.

Contractor shall perform the QA Services throughout the entire Software Development Life Cycle (SDLC). QA Services include the following:

- A quality management approach
- Effective software engineering technology (methods and tools)
- Formal technical reviews applied throughout the SDLC process
- A multi-tiered Application integration and testing strategy, and implementation
- Control of software documentation and associate changes

- A procedure to measure compliance with software development standards
- Measurement and reporting mechanisms

The following table identifies the Plan, Build and Operate requirements, roles and responsibilities associated with Application Quality Assurance.

Application Quality Assurance Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Create and submit a quality management approach to be updated in the Standard and Procedures Manual.	X	
2. Review and approve quality management approach.		X
Build Roles and Responsibilities	**Contractor**	**County**
3. Perform formal technical reviews applied throughout the SDLC process.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
4. Provide QA measurements and reporting.	X	

7.2.10. Database Administration

Database Administration Services are the activities associated with the maintenance and support of production databases. This includes responsibility for managing data, monitoring the database, routine maintenance, database log file reviews, dataset placement, database performance, and data recovery and integrity at a physical level.

The following table identifies the Plan, Build and Operate requirements, roles and responsibilities associated with Database Administration.

Database Adminstration Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Define Database administration requirements and policies including authorization requirements for End-Users, roles, schemas, etc., and approve Change requests.		X
2. Develop and document in the Standards and Procedures Manual Database Administration procedures that meet requirements and adhere to defined policies.	X	

Database Adminstration Services: Plan, Build and Operate Roles and Responsibilities		
3. Review and approve Database Administration procedures.		X
4. Develop and provide database roadmaps for version releases for planning and Portfolio Management.	X	
Build Roles and Responsibilities	**Contractor**	**County**
5. Provide security administration including managing role and End-User database permissions in accordance with County policies.	X	
6. Perform database restores from export dumps or backups.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
7. Create/refresh development/test/QA databases from production data.	X	
8. Execute authorization Service Requests.	X	
9. Define and provide database creation, configuration, upgrade, patches and refresh requirements.		X
10. Execute database creation, configuration, upgrades, patches and refresh.	X	
11. Execute all database system-level changes (e.g., initialization parameters).	X	
12. Execute all schema changes for all instances.	X	
13. Execute database data definition requirements for Applications (IMAR for tables, triggers, attributes, etc.).	X	
14. Maintain documentation for all database instance parameters and system settings.	X	
15. Maintain consistent database parameters and system settings across all like instances; consistency must be maintained according to established development to QA to production life cycle.	X	
16. Execute database data definitions for Applications and developer schemas.	X	
17. Define and execute database performance and tuning scripts, and keep database running at optimal performance for County's workload.	X	

Database Adminstration Services: Plan, Build and Operate Roles and Responsibilities		
18. Implement and administer appropriate database management tools across all database instances. Performance metrics and historical data must be available for trending and reporting over a minimum of 6 months.	X	
19. Identify and resolve locking conflicts, latch contention, rollback requirements, etc., for all database instances.	X	
20. Provide technical assistance and subject matter expertise to County Application developers and Third-Party support.	X	
21. Provide data dictionary expertise, End-User data assistance, Data Warehouse Metadata definition, data mapping functions.	X	
22. Monitor database and generate automatic Service Desk trouble tickets for Incidents.	X	
23. Patch database software as needed according to established development to QA to production life cycle.	X	
24. Manage database communication software configuration, installation and maintenance.	X	
25. Provide database storage management and cleanup activities.	X	
26. Define database backup schedules, retention periods, levels (i.e., full, incremental or differential).		X
27. Execute County's database backup and recovery policies.	X	
28. Deliver backup and restore activities for support and/or as requested via Service Request.	X	
29. Provide database capacity management and availability management. Examples of activities include failover testing, monitoring, performance planning, etc.	X	
30. Maintain storage allocation, file systems and current usage, file system and capacity management.	X	
31. Provide database installation, de-installation and administration, testing, copying, and security and User management.	X	
32. Provide administrative account support.	X	
33. Provision and de-provision all and any accounts that are authorized to be created, changed or modified.	X	
34. Provide system monitoring and documentation	X	
35. Maintain transactional logs and backup upon set schedule.	X	

Database Adminstration Services: Plan, Build and Operate Roles and Responsibilities		
36. Provide operational support of County's public or private cloud databases.	X	

7.3. Application Development Services

7.3.1. Overview

Application Development Services shall apply to functional changes within the existing Application portfolio and any new Application development activities.

7.3.2. High Level Requirements

7.3.2.1. Contractor shall perform all development and integration activities in alignment with the County IT Strategic Plan and strategic roadmaps.

7.3.2.2. Contractor shall ensure integration with existing data or Applications is scoped and delivered per the requirements.

7.3.2.3. Contractor shall ensure all development activity follows the County's Information Technology standards, guiding principles, architecture bricks and patterns.

7.3.2.4. Contractor shall provide technology assistance and support to the County in planning and standard setting activities.

7.3.2.5. Contractor shall create and maintain accurate and continuous prompt updates to be added to the asset and system documentation.

7.3.2.6. Contractor shall ensure cross Framework integration and communication is conducted for Application development requiring cross Framework integrations.

7.3.2.7. Contractor shall provide Services in accordance with ITIL and CMMI standards to ensure practices result in predictable, repeatable, and successful results.

7.3.2.8. Contractor shall review and comply with all County existing technical standards (e.g., naming, JCL, etc.).

7.3.2.9. Contractor shall provide Application integration and testing to confirm that the individual Application Framework Components work together properly and, as a whole, perform their specified functions.

7.3.2.10. Contractor shall provide integration and testing of Interfaces to other Applications already in production at, or developed by, County or Third-Parties as stated in the applicable requirements documents.

7.3.2.11. Contractor shall provide Application data migration associated with the installation and migration of new or upgraded components to the production environment.

7.3.2.12. Contractor shall provide base training to key County personnel when Contractor develops a new functionality.

7.3.2.13. Contractor shall validate that all the activities necessary to design, develop and implement any development or changes are not only effective and efficient for quality assurance and control but geared toward continuous quality improvement.

7.3.2.14. Contractor shall perform QA Services throughout the entire Software Development Life Cycle (SDLC). QA Services include the following:

- A quality management approach
- Effective software engineering technology (methods and tools)
- Formal technical reviews applied throughout the SDLC process
- A multi-tiered Application integration and testing strategy, and implementation
- Control of software documentation and associate changes
- A procedure to measure compliance with software development standards

- Measurement and reporting mechanisms

7.3.2.15. Contractor shall ensure and meet all requirements to transition from Applications Development into Applications Maintenance and Operations support when placed into production status.

Contractor shall perform the Applications Development Services described in the overview, high-level requirements, descriptions and tables in the sections below, as well as the Applications Common Services described below. The sections directly below describe in more detail the requirements, roles and responsibilities in the Plan, Build and Operate format for each specific section.

Application Development Services: Plan, Build and Operate Roles and Responsibilities		
Plan Roles and Responsibilities	**Contractor**	**County**
1. Develop Application architecture and future roadmap.	X	
2. Create and deliver high-level Application solution design document, including architecture, functions, data models, design features, configuration, performance requirements (e.g., security, extensibility, maintainability, scalability, availability, and reliability).	X	
3. Identify requirements for Disaster Recovery and Business Continuity Planning.	X	
4. Identify security requirements, risks or vulnerabilities in any solution provided as part of Applications Development and provide plans to address or mitigate.	X	
5. Develop plan and approach to migrate developed Application to M&O Services, including warranty services (if applicable).	X	
6. Review and approve plan and approach to migrate developed Application to M&O Services.		X
7. Participate in periodic technical and business planning sessions to establish standards, architecture, and project initiatives.	X	
Build Roles and Responsibilities	**Contractor**	**County**
8. Review project scope of work to assess alignment with architecture standards, provide recommendations.	X	
9. Assess impacts and linkages to other Applications.	X	

Application Development Services: Plan, Build and Operate Roles and Responsibilities		
10. Develop detailed solution design documentation, including environment configuration, integration requirements and technical details.	X	
11. Review and approve detailed solution design documentation.	X	
12. Recommend implementation alternative approaches.	X	
13. Review and approve implementation approach.	X	
14. Provide updates to Application architecture documents based on as-built development activities.	X	
15. Provide Budget Estimates upon request by the County.	X	
16. Provide Service Request Project Estimates upon request by the County.	X	
17. Review and approve Service Request Project Estimates.		X
18. Assist with development of business requirements as requested by the County.	X	
19. Assist with development of technical statements of work for Application systems as requested by the County.	X	
20. Review and approve business requirements and Applications technical statements of work.		X
21. Assess capacity, availability, and performance impacts for recommended solutions.	X	
22. Identify and communicate any impacts to the Service Request project cost and schedule estimate.	X	
23. Review and approve revised Service Request project cost and schedule estimate.	X	
Operate Roles and Responsibilities	**Contractor**	**County**
24. Alert County to exceptions in architecture standards.	X	
25. Review and approve architecture standard exceptions.		X
26. Identify and document risks/challenges with recommended solution.	X	
27. Monitor technical trends through independent research, and document and report on products and services with applicability to the County.	X	

Application Development Services: Plan, Build and Operate Roles and Responsibilities		
28. Recommend SDLC process improvements, and document in Standards & Procedures Manual if approved by the County.	X	
29. Support market scans upon request to explore Third-Party solutions.	X	
30. Conduct/coordinate Application evaluations of new products/services.	X	
31. Evaluate and recommend upgrade process for new Application system versions.	X	
32. Develop and communicate risk assessment for development efforts and implementation.	X	
33. Develop project plan, including cost and schedule estimates.	X	
34. Review and approve project plan, including cost and schedule estimates.	X	
35. Develop logical and physical data models.	X	
36. Develop and maintain requirements traceability matrix.	X	
37. Develop prototype Applications to evaluate functionality, requirements.	X	
38. Ensure updates are made to Applications repositories, Configuration Management, and Asset Management.	X	
39. Adhere to Release Management policies/procedures.	X	
40. Develop Application functional requirements documents and conceptual data models.	X	
41. Review and approve functional requirements and conceptual data models.		X

7.4. Electronic Health Records (EHR) Program Management Services

7.4.1. Overview

7.4.1.1. EHR Program Management Services support the use of existing EHR and implementation of additional EHR capabilities to meet operational needs. EHR Program Management Services shall have

a designated EHR Program Manager under the Agreement and will be staffed accordingly.

7.4.1.2. EHR Program Management Services shall be provided to various Health and Human Services Agency (HHSA) programs including but not limited to HHSA Information Technology Services (ITS) and staff and contractors involved in the implementation and/or support of clinical systems in HHSA.

7.4.2 High Level Requirements

7.4.2.1 Contractor shall engage a qualified EHR Program Manager.

7.4.2.2 The EHR Program Manager shall work with HHSA Director, ITS and/or other leader(s) designated by the HHSA Director.

7.4.2.3 The EHR Program Manager shall develop technical program/project management best practices/templates and provide training/mentoring to project teams.

7.4.2.4 The EHR Program Manager shall monitor dependencies across multiple interrelated technical projects.

7.4.2.5 The EHR Program Manager shall gather and report consolidated technical project status and financial information to HHSA leadership.

7.4.2.6 The EHR Program Manager shall assist a central governing body to review/audit adherence to methodologies, budgets, and timing.

7.4.2.7 The EHR Program Manager shall assists HHSA leadership in managing EHR projects/programs.

7.4.2.8 The EHR Program Manager shall oversees short to mid-term (1-3 years) EHR strategy execution and operations in alignment with HHSA objectives.

7.4.2.9 The EHR Program Manager shall provide oversight of multiple concurrent clinical systems projects.

7.4.2.10 The EHR Program Manager shall makes decisions which have a serious impact on the overall success or failure on area of accountability.

7.4.2.11 The EHR Program Manager shall collaborate with project managers and business sponsors to ensure value delivery.

7.4.2.12 The EHR Program Manager shall provide recommendations, performance metrics, and measurements based on HHSA goals.

7.4.2.13 The EHR Program Manager shall monitor project portfolio reporting and provide program-level reporting to stakeholders.

7.4.2.14 The EHR Program Manager shall gather, manage, and prioritize high-level operational requirements to be leveraged in the development of solutions to meet HHSA business needs.

7.4.2.15 The EHR Program Manager shall advise and support HHSA stakeholders on Contractor's processes and standards.

7.4.2.16 The EHR Program Manager shall coordinate work request submissions.

7.4.2.17 The EHR Program Manager shall maintain list of HHSA clinical system projects and priorities.

7.4.2.18 The EHR Program Manager shall perform a monthly program review to include a summary of program management activities, relay HHSA requests, review active project log and status, and identify Contractor support needs for upcoming projects.

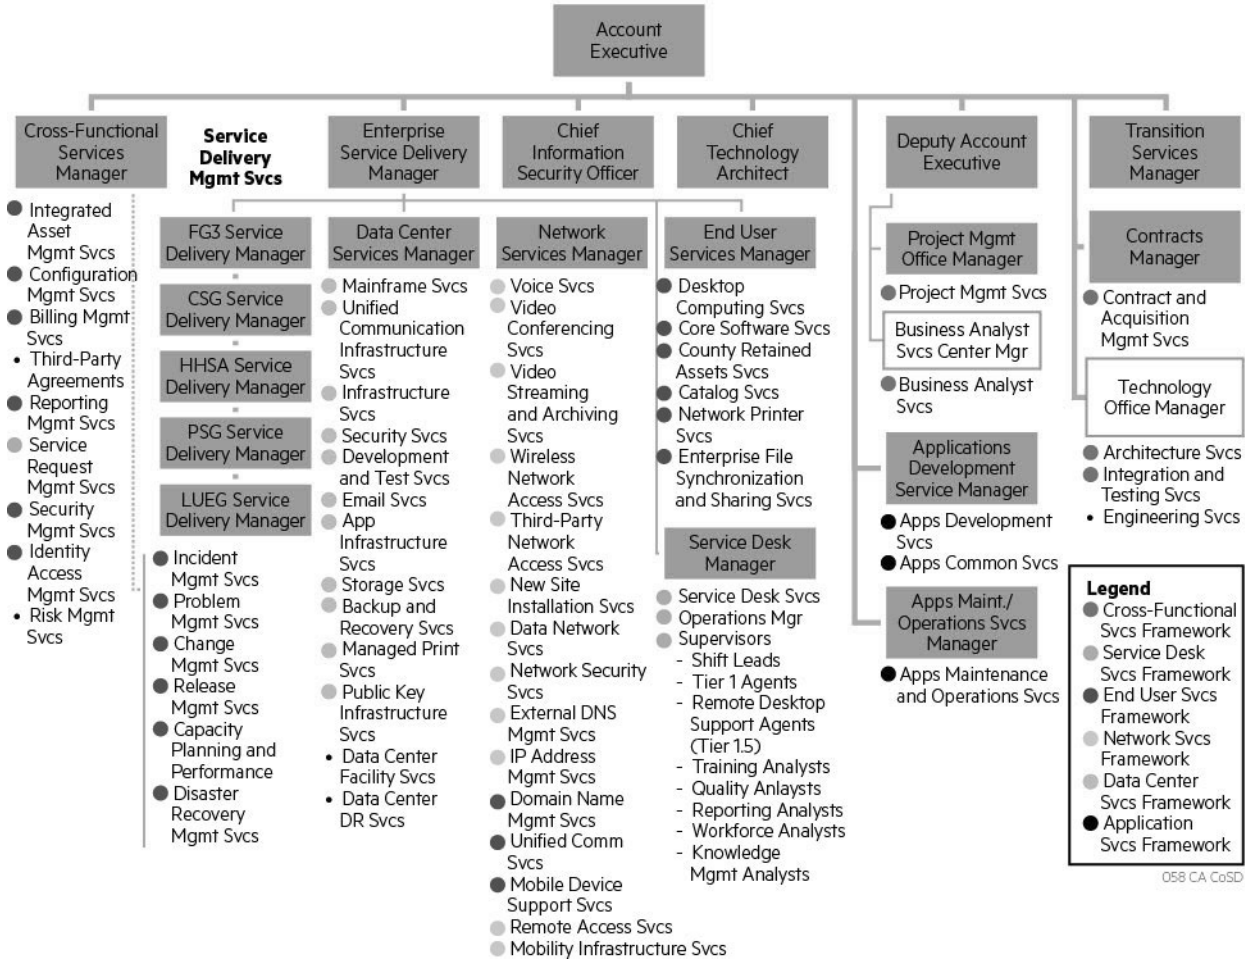
The following sets forth the Contractor's solution for its performance of the Services under this Agreement. Contractor represents that the solutions set forth below are intended to meet many of the requirements of the Agreement. Nothing in this *Contractor Solutions* shall relieve Contractor of its obligation to perform all Services under the Agreement and to perform the Services in accordance with the standards and requirements set forth in the Agreement.

1. OVERVIEW OF SERVICES

1.1.1. Organization and Staffing

The following organization chart shows Contractor's staffing at a role level and the reporting relationships, including Subcontractors, starting from Account Executive and broken down into Service Frameworks.



*The above org chart does not reflect the following positions EAA and Innovation Officer

Centers of Excellence

Geographic deployment of resources at a role level

The Contractor team shall provide services from mainly five (5) locations: County of San Diego; Pontiac, Michigan; Tulsa, Oklahoma, Colorado Springs, Colorado, and El Paso, Texas, with a few individual support

personnel at various sites within the United States (individuals who work from home). These sites shall house staff, equipment, and services needed to respond to inquiries over the telephone and by fax, email, and web-based media including web forms. Contractor shall provide support 24x7x365. The following table lists the percentages of services provided from each location.

Service Frameworks

LOCATION	SERVICE DESK SERVICES	END-USER SERVICES	NETWORK SERVICES	DATA CENTER SERVICES	APPLICATION SERVICES
County of San Diego	20%	100%	80%	10%	75%
Pontiac, MI	80%			5%	5%
El Paso, TX					10%
Tulsa, OK			10%	65%	
Colorado Springs, CO				5%	
Other resources			10%	15%	10%

Project Staff Selection and Replacement

Selection and replacement procedures for the project staff

Contractor's process for selection of personnel to support the County under this Agreement shall be as follows:

- Available positions are announced to the existing team
  - If a current employee is qualified and interested, they may post for the position
- Positions are posted on Contractor's websites and on Smart Buy
- Interested Contractor, third parties, and external candidates may apply
- Normal hiring process includes interviews by the account team to determine technical competency and fit within the account dynamic.

As relates to the County's request to maintain specific staffing assignments:

If a Contractor employee staffing an assignment under this Agreement requests to move to another position within Contractor's organization, the account team shall post the position, identify a suitable replacement, notify the County (if this person is County-facing), and develop a cross-training plan so that the new team member is ready to assume the duties on the outgoing employee, making for a smooth transition. Typically, an employee shall remain in his/her position for a minimum of 2 years before applying for other positions. To apply for open positions prior to the minimum time requirement, approval of the employee's manager is required.

If a Contractor employee staffing an assignment under this Agreement leaves unexpectedly, the account team shall immediately assign a temporary backfill to review in-flight projects and minimize disruption to the County. In parallel, the account team shall post the position, identify a suitable replacement, notify the County (if this person is County-facing), and develop a training plan to make certain that the new team member has the tools necessary to perform the required functions.

Key Positions / Key Personnel

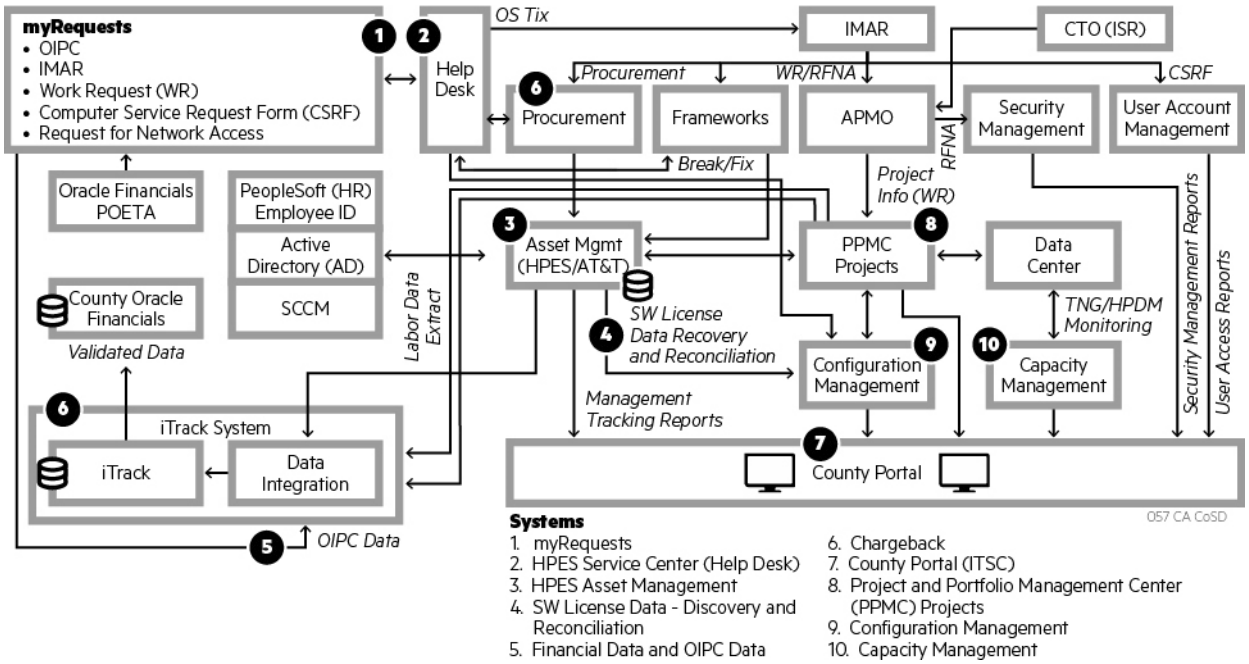
Named Position	Key Positions
Cathy Varner	Account Executive
Laura Floyd	Deputy Account Executive
Kathleen Barghols	Enterprise Service Delivery Manager (SDM)
John Steed	FG3 Service Delivery Manager (SDM)
Frank Krone	CSG Service Delivery Manager (SDM)
Sandra Messina	HHSA Service Delivery Manager (SDM)
Albert Hatcher	PSG Service Delivery Manager (SDM)
David Pugh	LUEG Service Delivery Manager (SDM)
Max Pinna	Contracts Manager
Marcelo Peredo	Chief Information Security Officer (CISO)
Thif Iruthayarajah	Chief Technology Architect (CTA)
Jayaprakash Boreddy	Enterprise Application Architect (EAA)
Mark Morin	Cross Functional Services Manager
Curtis Yancey	Service Desk Manager
Hector Vaquedano	End User Services Manager
Jeff Williams	Network Services Manager
Michael Boscarino	Data Center Services Manager
Tina Terlecki	Application Maintenance and Operations Services Manager
Mark Roehr	Applications Development Services Manager
Nelson Diaz	Project Management Office (PMO) Manager
Chris Spanka	Transition Services Manager
<TBD>	Innovation Officer

2. CROSS FUNCTIONAL SERVICES

2.1. Overview

Contractor shall reliably manage the County's IT environment through a consistent and standardized Cross Functional Services model, illustrated in the figure below.

Contractor Cross-Functional Services Model



Delivering centrally managed, cross-functional uniformity of County cross-functional IT services.

Contractor's Information Technology Infrastructure Library (ITIL)-aligned service management practices shall support all Contractor-delivered IT services, making certain that its service delivery meets or exceeds County requirements and expectations. Contractor shall employ industry best practices, processes, and methodologies, optimally combining people and technology to fulfill the County's IT objectives. Contractor shall coordinate and collaborate with County leadership, limiting or preventing misunderstanding and miscommunication through full and open transparency.

Service Now is also under review as an alternate solution for the Standard Reference Architecture (SRA) stack and its functionality. Details of the specific tool used shall be discussed and documented to prepare a notice of decision (NOD) during Transition planning.

2.3. Contract and Acquisition Management Services

2.3.1. Process and Procedures

Contract and Acquisition Management

- Description of solution to meet the requirements

Solution: The Contractor solution shall include an experienced, full-time contracts manager to serve as the single point of contact for the County on all contractual matters, including subcontracts and third-party vendor relationships. Responsibilities shall encompass all contractual issues between Contractor and the County, including contract interpretation, service requests, estimates and pricing discussions, and contract changes and disputes.

The contracts manager shall establish contractor oversight responsibility and provide recurring status reports to the County contracts manager on contractual matters and shall work with County counterparts to respond to unscheduled requests for information. In addition, the contracts manager shall interact with subcontractors and vendors to audit and verify the timely provision of the requested services.

Contractor's contract management activities shall build performance evaluative criteria to assist the County contracts manager in determining compliance with the Agreement.

- Deployment plan for resources and use of facilities

The Contractor's contracts manager shall oversee the delivery of the contract management services. The contracts manager shall be knowledgeable about the County's business and services. A subcontracts manager, procurement specialists, and Contractor's Global Procurement organization shall provide acquisition management. The contracts manager shall be co-located in the County Technology Office, with a satellite office in Rancho Bernardo.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's methodology shall include performance-based management and includes periodic assessments of Contractor's key performance indicators (KPIs). Contractor shall continually assess these indicators to identify negative trend lines. Contractor shall conduct root cause analysis, where necessary, and take appropriate remediation steps to improve the KPIs and positively influence performance trends—thereby facilitating year-to-year continuous improvement.

Adherence to County procurement policies and procedures when engaging, selecting, and contracting with Third-Parties, including ensuring pricing is fair and reasonable.

Contractor's Global Procurement organization shall be responsible for making certain that all procurements corporate-wide are performed in accordance with all federal, state, and local laws and policies and that goods and services are purchased at fair and reasonable prices. Contractor's procurement team shall maintain active and historical records of trusted and vetted third-party vendors from whom Contractor solicits proposals and/or quotations for County goods and services. Additionally, Contractor shall verify that goods and services provided were delivered in accordance with Agreement requirements and County expectations. Moreover, Contractor's sourcing and procurement team shall flow down all relevant terms and conditions to third parties to verify that all of the County's requirements are met.

Approach for conducting market scans to purchase Assets from Third-Parties.

The Contractor procurement team shall submit requests for quotations (RFQs) to a subset of vendors identified by Global Procurement as best-in-class providers in their database-based Dunn and Bradstreet (D&B) ratings and other factors as a starting point. Contractor shall continually update this database of vendors to provide a large pool of vendors who offer competitively priced goods and services. Contractor shall use the County – Vendor and Product Assessment Process for vendor and product assessment projects requests. Additionally, Contractor's account subject matter experts (SMEs) shall assist in market scans by attending conferences and staying abreast of the latest technologies and products and making the Contractor procurement team aware of them. Contractor's

procurement specialists shall work closely with County personnel to make certain that Contractor captures and understands their needs. Contractor shall routinely follow up with them to verify their ongoing satisfaction.

Management, maintenance and publication of the Optional Item Catalog (OIC).

The Contractor desktop catalog manager shall be responsible for managing, maintaining, and publishing the OIC. Contractor shall publish and manage the OIC via the Contractor Service Portal.

Contractor shall issue quarterly requests for quotation (RFQs) for the entire hardware catalog to multiple top-tier suppliers. Contractor shall publish the lowest price obtained for each item in the OIC. If an item is not available during the 3-month period from the low-price vendor, then Contractor shall notify the County and request permission to purchase at the current price.

End-Users shall place acquisition requests through the Service Portal for acquisition of items from the OIC.

Relationships and existing agreements Contractor has with Third-Party developers of government and commercial software products, and how these can be leveraged and accessed by the County.

Contractor has negotiated master service agreements and strategic alliances with a number of IT and enterprise solution vendors, such as Oracle, EMC, Microsoft, Palo Alto, and so forth. Where these negotiated master service agreements and strategic alliances provide expedited access for technical support specific to the third-party vendor's product or software ("reach-back"), Contractor shall provide reach-forward and reach-back to leverage the Contractor leveraged organization for on demand technical support and services. Contractor shall contract with third-party developers on behalf of the County to use Contractor's volume discounts, terms, and conditions.

Managing the County's Desktop Applications Directory (DAD)

After the review team approves the addition to the OIC Catalog for new Desktop Applications Directory (DAD) software, then the Contractor's desktop catalog manager shall add the software to the OIC Catalog (updates to Service Portal OIC Catalog are posted on the 20th of each month). This shall include purchasing software, verifying County-owned software, and transferring software requests to Desktop Engineering. After this is complete and the software is posted to the OIC, the Contractor's desktop catalog manager shall take the licensing documentation and input the data into Contractor's asset database as new DAD entry(ies) updating the Asset Management Database. To manage the DAD item volume, Contractor shall periodically produce and review with the County a report showing the last order date of all DAD items, as well as the number of instances installed. Contractor shall remove items from the DAD that are no longer being ordered to remain within the DAD limits.

Description of how hand off and touch points are managed to be seamless to the County End-User requesting the Service (e.g., Contract Management Services, Applications M&O Services, Applications Development Services, Service Desk Services, Network Services)

Contractor, in cooperation with County stakeholders, shall maintain policies, procedures, and best practices to enable the seamless provision of IT services as projects or service requests transition from point to point through instantiation or implementation.

When the End-User requests a project, then he or she shall fill out a form with the required fields and a Statement of Work (SOW) describing what he or she is trying to accomplish. After the service request form is finished and approved by the County, then the request shall be sent to Contractor as a request for a Budgetary Estimate (BE). The Contractor PM and technical team shall prepare the BE with scope, requirements, assumptions, and a cost estimate for the requested work. Once approved, the project shall proceed to the scope execution phase. Changes in scope shall be evaluated within the change management review and approval process. After the scope is completed, the project shall be formally closed down. The Contractor PM shall prepare a Project Closure

Agreement (PCA), and the Contractor project support office (PSO) shall send it to the County for approval. If not approved, the Project Closure Agreement shall be sent to the Contractor PM for updates and then returned to CTO Contracts for approval. If approved, the project shall be officially closed, and the data in the PCA shall be legacy data for the project. These Contractor and County tailored policies and best practices shall be continually refined to minimize End-User impact and disruption—enabling seamless implementation of the requested services.

Evaluating security to ensure the County is aware of the risks or issues in cloud-related services to enable the County to make an informed decision based on Contractor recommendations.

To provide adequate evaluation of risks and issues in cloud-related services, Contractor shall follow the County Cloud Service Provider Request procedures, as well as Contractor's Global Procurement organization's cloud service provider review process. The Contractor Global Procurement processes shall include reviews of liability, data protection and security, termination rights, location of services, location of jurisdiction of services, control/visibility of subcontracting, rights to suspend service, and unilateral/provider amendments to service features. Contractor shall develop policies, architectures, and solutions necessary to facilitate confidentiality, integrity, and availability of the County's data and systems. Contractor shall analyze evolving County architectural landscapes along with security and privacy controls, backup and continuity requirements, and user access and permissions. In addition, Contractor shall factor these and other considerations into its cloud recommendations and governance guidance for presentation to the County. Contractor shall apply the right level of logical and physical monitoring and management of County data center operations and cloud-based assets.

Contractor's security experts shall be well versed in cloud selection, migration considerations, and End-User accessibility as well as denial of service to unauthorized or outside sources. Contractor shall closely monitor these operations to facilitate strict security compliance and security risk mitigation.

2.4. Integrated Asset Management Services

2.4.1. Process and Procedures

- Description of solution to meet the requirements

Solution: Contractor shall provide an Integrated Asset Management System (IAMS) that reduces the amount of manual intervention required to verify, check, and fulfill requests while adhering to governing policies and standards.

It is important that Contractor answer five fundamental questions to demonstrate the scope and dimensions of effective asset management:

- What do you have?
- Where is it?
- How well is it working?
- How much does it cost?
- How well does it support your business?

IT asset management (ITAM) shall address these questions by providing processes, tools, data, and people across the entire life cycle. ITAM shall manage the legal obligations associated with vendor warranties and support commitments, entitlements, and asset disposal.

Contractor's solution is based on an upgrade to HPE's Asset Manager from Asset Center. Asset Manager influences IT operations and decision making in the following ways:

- Aligns services to their supporting assets and contracts
- Effectively manages contracts, license agreements, and warranties

- Streamlines the fulfillment of goods and service requests from the service catalog
- Effects complete asset and project audit tracking
- Proactively identifies license compliance issues
- Evaluates opportunities on license maintenance
- Reharvests and reallocates unused software licenses.

As demonstrated in the table below, benefits to the County include productivity, cost control, and risk mitigation.

Benefits Provided to the County

	PRODUCTIVITY	COST CONTROL	RISK MITIGATION
Hardware Asset Management	• Centralizes information and reporting to give the County a "single source of truth." • Organizes required data and provide reporting for compliance with privacy, security, and environmental regulations. Minimizes the risk of noncompliance with software contracts and auditing costs and potential penalties. • Improves asset repository accuracy by highlighting any unauthorized install, move, add, removal (IMAR) to assets.	• Maximizes use of existing hardware assets across the enterprise	
Software Asset Management	• Centralizes information and reporting to give the County a single source of truth.	• Maximizes use of existing software assets across the enterprise • Verifies the number of licenses in use and determines future licensing requirements based on business demands. • Assists in maintaining compliance with license agreements.	• Assists in detecting unauthorized software and enforces software restriction policies relating allowable software that is allowed to run in the County environment.
Hardware Logistics	• Provides reliable system integration facilitating correct configuration and staging of new and replacement devices so that employees are up and running with minimal downtime.		

- Deployment plan for resources and use of facilities

The following resources are required to implement the Contractor solution:

- IT asset manager
- IT SW asset manager

- Warehouse lead
- End-User HW asset analysts
- End-User SW asset analysts
- Server SW asset analysts.

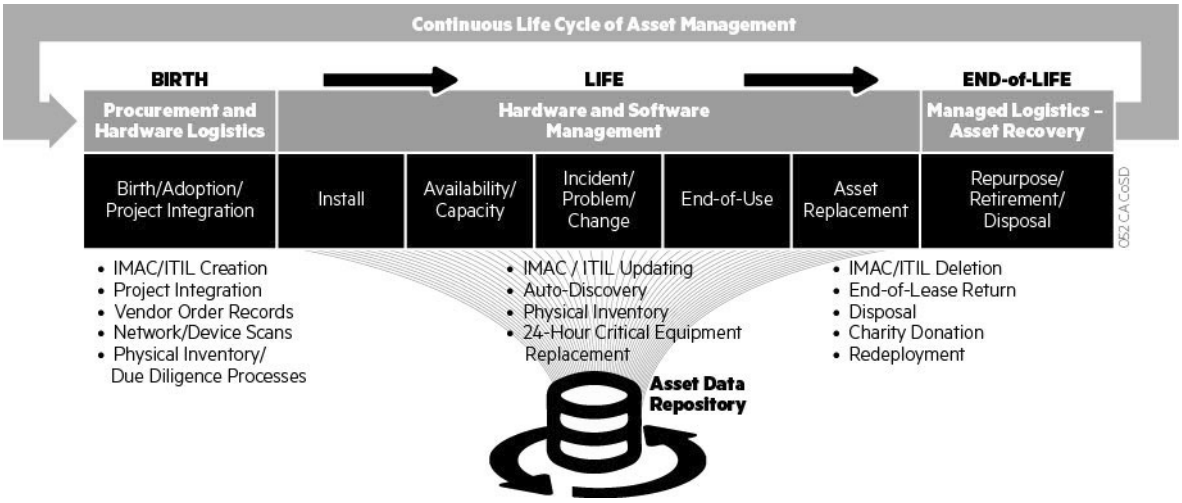
The IT asset manager and warehouse lead shall operate from the Contractor's Rancho Bernardo facility. Contractor shall also leverage resources located at its Tulsa data center the asset management team shall process assets into Asset Manager and provide site support technicians based out of the Rancho Bernardo facility during IMARs, break-fix, and refresh projects for deployed desktop assets.

Contractor shall use a facility approach for stocking the asset inventory, employing two levels of warehouse stocking to speed delivery of equipment in support of IMARs and refresh, while mitigating both inventory and manufacturer disruption risks. County-specific inventory shall be held first at the Contractor's Rancho Bernardo facility and secondly at its partner locations.

- Key methodologies and processes in solution including year-to-year continuous improvement

The Contractor's asset management process shall track all facets of IT assets, from request (procurement) to problems or changes to the asset during its useful life, to disposal (end of life). The life cycle of County asset process is depicted in the figure below.

Contractor Asset Life Cycle Management Process



Providing complete visibility of all County assets throughout their entire life cycle.

Hardware Asset Management

Hardware asset management shall include asset tracking and lease contracts, providing an asset repository that includes records of all hardware assets. Contractor shall track, report on, and analyze the assets from the asset repository.

By tracking assets through the asset repository (database) using various methods and toolsets, Contractor shall capture and report the asset configuration information at the device level (for example, desktop, network, and server). Contractor shall manage the accuracy of the information through cross-checks with other systems and through process links from other services such as Service Desk, site support, and workplace server management services.

The table below identifies the County's high-level deliverables for hardware asset tracking.

High-level Deliverables

DELIVERABLE	ACTION
Asset Repository	• Populates the asset repository with inventory records established during implementation
Asset Record Creation	• Ongoing – as new assets are procured, records are created and added to the asset repository
Asset Tracking	• Updates asset records in repository to reflect the IMAR work process while it takes place • For servers, a discovery tool remotely accesses devices and provides a channel for validating asset records • Reviews and resolves conflicts or exceptions and mediates them in the asset inventory
Reporting	• Creates standard reports documenting the current inventory • Documents inventory asset data elements specified in the table below • Documents data elements for assets that have gone through IMAR or other change processes • Records and reports on listings of noted discontinued hardware
Monthly Evaluation of Asset Accuracy	• Performs audits on approximately 10 percent of the in-scope asset records to confirm continued asset accuracy • Uses various tools to cross-check accuracy of asset data and records
Asset Exceptions Review and Resolution	• Identifies and remediates exceptions

Hardware Lease Contract Tracking

Contractor's lease contract tracking increases awareness of all applicable hardware lease agreements for the hardware assets including desktop, midrange, and mainframe platforms provided as a Service. This service synthesizes basic asset data with information from leasing company sources to enable tracking of all assets under lease and of those that are imminently scheduled for lease expiration.

Maintenance Contract Tracking

Through this service feature, Contractor shall compile data and aggregate it into reports detailing the general contract terms for all Assets covered under warranty, including scheduled contract expirations. From this data, Contractor shall prepare a monthly expiration report highlighting potential renewal or replacement actions.

Contractor shall track maintenance contracts to produce the following benefits:

- Provides a single database for easy access to all warranty and maintenance contracts
- Fully uses warranty and maintenance contracts and avoids expenditures for costly third-party maintenance
- Ensures ongoing warranty and maintenance coverage, where applicable.

Data collected for Warranty and Maintenance Contract Tracking and Lease Tracking is shown in the table below.

Data Collected

FIELD NAME	FIELD DESCRIPTION
End Date	Lease or maintenance contract end date

FIELD NAME	FIELD DESCRIPTION
Expiration Date	Warranty end date
External Reference Number	External reference number (contract number)
Maintenance Contract	Number of maintenance contracts associated with an asset
Purpose	Purpose of contract
Start Date	Contract start date for lease or maintenance

Software Asset Management

Contractor shall provide software asset management to effectively manage, control, and protect the licensed software assets throughout their life cycle. Coverage shall include all in-scope desktop, midrange, and mainframe software that meets registration requirements and has the base data fields required for tracking. This includes both Desktop Applications Directory and Portfolio Applications.

Contractor shall employ standard processes to track and maintain records for:

- Auto-discovered software found during environment scans
- Any transferable details from prior hardware asset tracking discovery
- COTS applications
- Contractor-procured, -owned, and -managed COTS software, as applicable
- County-retained and Contractor-managed COTS software

Software asset management shall include the following services for in-scope software publishers and titles:

- Software license entitlement reporting
- Software installation reporting
- Software license and maintenance tracking
- License compliance management services

Software asset management for desktop and Portfolio Applications shall follow the same high-level lifecycle processes. Creation of the asset record in the IAMS shall occur upon purchase and receipt of the software. The attributes of the assets and associated procurement transactions (ex. vendor, products, license metric, quantity, term, acquisition date) shall be populated in the system and represent the entitlement. Installation records in the IAMS shall be created either through automated discovery or direct entry into the IAMS. Updates to asset records shall be made to reflect IMARs as required.

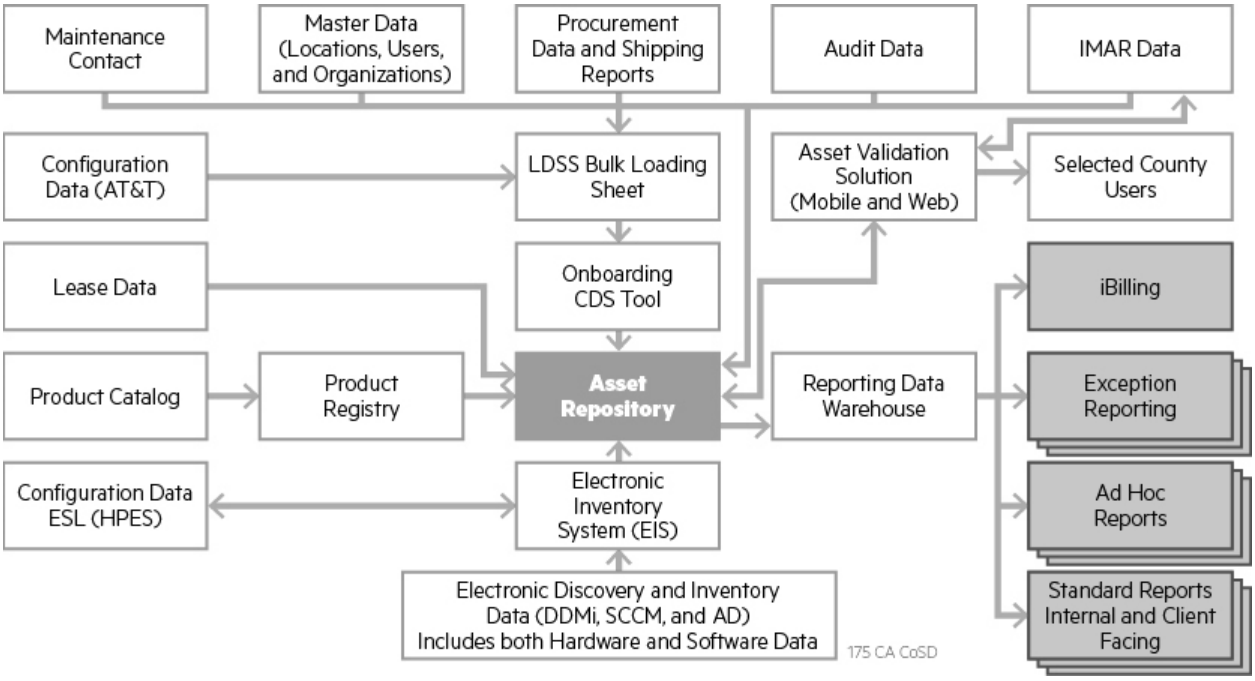
As part of software asset management, Contractor shall maximize use of existing assets through re-harvesting and reallocation of existing software licenses. When there is a requirement for additional software licenses, Contractor shall check whether the current entitlement quantity exceeds the current quantity consumed and, if so, uses the excess licenses to fulfill the requirement. Contractor shall also facilitate workstation/End-User license transfers. Licenses assigned to employees who have left the County shall be reassigned to new hires; also, existing licenses may, from time to time, be reallocated to employees with a current need for that application.

Asset Retirement/Charitable Donation

For retired personal computers, laptop computers, tablets, and associated peripheral assets that were used by the County, Contractor shall donate these assets to the San Diego Futures Foundation (SDFF), at no additional cost to the County.

The figure below depicts Contractor's IAMS. It receives data updates from the Contractor's configuration management database (CMDB), the AT&T CMDB, auto-discovery and inventory tools such as HPE's Discovery and Dependency Mapping Inventory (DDMI), System Center Configuration Manager (SCCM), and Active Directory) as well as bulk load updates and manual updates by asset analysts. Asset data in the IAMS shall be viewable by approved County personnel using the Asset Validation System (AVS) tool, which has a link on the Service Portal.

Contractor Integrated Asset Management System



Automated system to facilitate transparency and accuracy of all software and hardware assets.

Approach to ensure that all Assets Contractor procures for the County are procured in the most cost-effective manner possible, so that the potential reacquisition of such Assets by the County in the event of a disentanglement is favorable to the County.

Contractor's account team shall provide dedicated support from the Contractor's leveraged supply chain practice to source all products and services to ensure Contractor provides the best value for the County. This resource shall be fully aware of Contractor's product needs, shall have leveraged contacts with all Contractor OEM providers, and shall assist Contractor in procuring items in a competitive format.

Contractor shall employ an economic order quantity model to make sure that it is holding the minimum required inventory to be deployed to the County in the case of a disentanglement while still meeting the required refresh and IMAR commitments. This shall include:

- Contractor stocking a supply of desktop and laptop RU hardware units in the Rancho Bernardo warehouse against a 6-month rolling forecast based on the customer-agreed refresh plan and a buffer against IMAR estimates.
- To lessen production disruptions, maintaining agreements with Contractor's value added resellers (VARs) to hold additional supplies of County-specific configured assets in their warehouses.

Integrated Asset Management systems and procedures

The Contractor solution for Integrated Asset Management is based on Contractor's toolset called Standard Reference Architecture (SRA). Integrated Asset Management is a component within SRA. The core software application and repository used for Integrated Asset Management is Asset Manager.

Updates to the SRA toolset shall be made available on a regular basis. Contractor shall conduct reviews of the systems on a semi-annual/annual basis, depending on the tool, to determine whether major upgrades or replacements of systems are required to make certain that Contractor is using the right technology to support the County's needs and remain in supported status.

The primary interfaces into Asset Manager shall include direct use of the client software application, the Load Data Spreadsheet (LDSS) tool for bulk loading of data from spreadsheets, and the Electronic Inventory System (EIS) for electronic discovery data.

The following list contains the Integrated Asset Management systems, data sources, and their integrations:

- **Configuration Data (Contractor)** – ITIL-based Configuration Item (CI) data and Asset Management data shall be integrated. The tool used to manage CI data (ESL) shall be integrated with the tool used for Asset Management data (Asset Manager). Changes in CI data shall be passed to Asset Manager via the EIS system. EIS shall also handle integration of discovery tools including DDMI, SCCM, and Active Directory.
- **Configuration Data (AT&T)** – AT&T configuration data shall be integrated with Asset Manager via the LDSS interface.
- **Product Catalog –**. Contractor shall update the product catalog on a regular basis. It can also be updated with County specific applications. The product catalog shall allow users of Asset Manager to work with a normalized set of asset names.
- **Lease Data** – For those assets that Contractor leases, lease contract data is entered directly into Asset Manager's Contract Module as "lease contracts." Assets are associated with the lease contract under which they were acquired.
- **Maintenance Contracts** – The management of maintenance contracts shall be a standard feature of Asset Manager. Contract data shall be entered either directly into Asset Manager via the client software application or via the LDSS bulk load tool.
- **Master Data –** Master data, such as County locations, shall initially be loaded via the LDSS bulk load tool and maintained on an ongoing basis via the client software application.
- **Procurement Data** – Tracking procurement data for assets shall be a standard feature of Asset Manager. Procurement data shall be entered either directly into Asset Manager via the client software application or via the LDSS bulk load tool upon receipt of the assets.
- **Audit Data –** Tracking audits of assets shall be a standard feature of Asset Manager. Audit data shall be entered either directly into Asset Manager via the client software application or via the LDSS bulk load tool.
- **IMAR Data** – Updating assets in response to IMAR changes (ex. an asset move) shall be performed via the client software application, LDSS bulk load too, or Asset Validation Solution (AVS), described below. AVS shall allow field technicians to directly update Asset Manager in the field.
- **IBilling** – Exports of asset data from Asset Manager shall be imported by the IBilling system for the purposed of billing asset-based Resource Units**.**
- **Reporting** – As part of the SRA toolset, a Reporting data warehouse shall provide support for standard reports, ad hoc reports, and exception reporting.

Contractor's IAMS, described above, shall be accessible to the County. Contractor shall provide a subset of the County manager's direct access to asset manager data using the AVS via the Service Portal. AVS is a web user interface directly reading live asset data.

Ongoing management of the Asset inventory and configuration data.

The Contractor's IAMS shall receive feeds from DDMI (auto-discovery for server) and SCCM and AD (desktop) and be compared to the CMDB and asset repository for accuracy. Asset records shall be updated to reflect that data as necessary, and reports shall be provided to be actioned against when an asset has not been discovered after a set period of time.

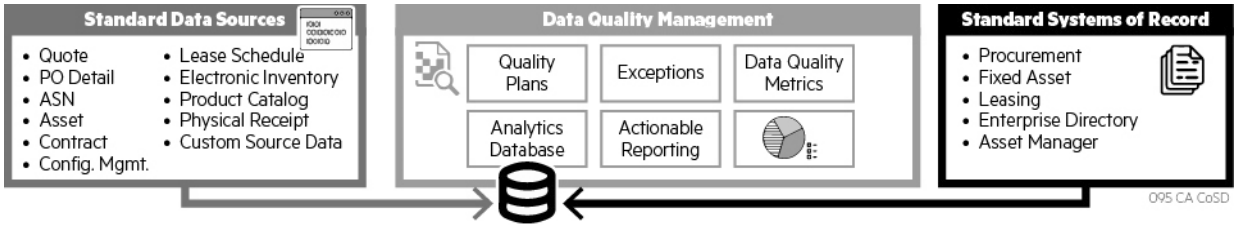
All changes to CI's shall be managed through Contractor's ITIL-based change management process. No changes to assets shall be allowed unless previously approved.

Contractor's CMDB (Enterprise System List - ESL) and Asset Manager shall be housed in a secure, U.S-based network segment on the Contractor's internal network that houses only State and local government data.

Additionally, a comprehensive review of IMAR tickets and refresh project updates shall be undertaken at the beginning of the billing cycle to make sure the asset data is accurately reflected in the files submitted to the iTrack system.

Contractor shall use a data quality management process to validate the accuracy of data in Contractor's database. That process is shown in the figure below.

Data Quality Management Process



Proven process to ensure the integrity of all Asset Management Data.

Contractor shall validate asset accuracy through the following processes:

- Electronic Discovery – validate Asset Manager assets against assets discovered/active as reported in SCCM, DDMI, AD, and SEP.
- Lease Comparison – HP Financial Services asset lease database is compared to Asset Manager.
- Contractor Fixed/Leased Audit – a randomly selected asset sample is validated via auto-discovery or, if required, manual inventory.
- IMAR – Support technicians validate assets when working on machines.
- Onsite Refresh Pre-Field Inspections – desktop and laptop asset data is validated one month prior to a scheduled refresh.
- Contractor Data Center Asset IMACD processes – all parent assets have an affixed RFID tag, which is scanned as the asset enters or leaves the data center floor, updates are passed to ESL, which updates Asset Manager.

Integration of all asset repositories across the Service Frameworks.

The system shall integrate across service frameworks starting with the HPE Asset Manager asset repository containing and receiving updates to:

- Physical servers

- Virtual servers
- Storage frames
- Network appliances
- Discoverable server software
- Desktops
- Laptops
- Workstations
- Tablets
- Network printers
- Discoverable End-User asset software
- AT&T managed network devices

Updates to this data shall be made via bulk loads (for example, refresh projects, move projects, new assets), nightly feeds of Contractor's CMDB data (ESL), AT&T data, auto-discovery and inventory data, and manual updates as requested by service manager tickets submitted to the asset management queue (for example, IMARs).

Integrated reporting across Assets to show useful information relating to departments, hardware, software, licenses, versions, etc.

Deployed and billable server and End-User data shall be pushed to iTrack on a monthly basis. In addition, Contractor shall upload monthly Schedule 5 reports to the Service Portal. These shall include, but are not limited to, the following reports:

- End-User status changes, deployed End-User assets, static access assets report
- Monthly report of installed End-User software titles
- Monthly End-User refresh report

Contractor shall deploy Enterprise Services Asset Analytics (ESAA) data analysis and statistical reporting engine as part of the SRA toolset. This tool shall analyze data stored in Asset Manager and generate standardized reports for analysis and action including the following:

- Asset record completeness (against pre-defined fields)
- Discoverable devices not discovered
- Discovered devices not showing in Active status
- Assets reaching end-of-life
- Devices approaching end-of-lease
- Devices updated in the last month
- Counts of tracked installed software titles versus entitlement counts

Reports shall be provided to the appropriate desktop or server personnel for research, corrective action, and data updates to the source systems if needed.

2.5. Billing Management Services

2.5.1. Process and Procedures

- Description of solution to meet the requirements

The County chargeback application, iTrack, combined with the Contractor billing data consolidation application (IBilling), shall comprise the tools and associated processes for Billing Management.

The iTrack End-User community, County CTO team, and Contractor have identified specific opportunities for incremental improvements. As an example, managing and communicating County low org changes has been a focus area. Contractor is increasing the integration between IBilling and iTrack in support of improved Low Org management by enhancing IBilling to use Low Org data directly from iTrack for data validation. Additional enhancements that Contractor plans to pursue with the County include integration with PeopleSoft HR for employee-related chargeback data and general chargeback data normalization.

- Deployment plan for resources and use of facilities

Contractor shall use the following resources for its billing management services:

- **Billing Manager** – Responsible for the successful delivery of all billing management services
- **Billing Team** – Technical resources to support the IBilling application and the Framework owners responsible for providing monthly billing data and responding to billing disputes.

The billing manager shall be based in the Contractor's Rancho Bernardo facilities.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's methodology shall include performance-based management as well as periodic assessments of Contractor's Key Performance Indicators (KPIs). As an integral component of Contractor's quality assurance management program, Contractor shall continually assess these KPIs to identify negative trends. Contractor shall conduct root-cause analyses where necessary and take appropriate remediation steps to improve the KPIs and positively influence performance trends, facilitating year-over-year continuous improvement.

- Automated systems and tools involved in solution

Contractor shall use the following tools in support of billing management:

- IBilling: Contractor's billing data consolidation application based on SQL Server and SQL Server Integration Services (SSIS).
- iTrack: The County's customized implementation of Nicus' M-PWR commercial off-the-shelf (COTS) chargeback application
- Billing Source Data Tools:
  - AssetManager
  - ServiceManager
  - PPMC
  - Active Directory
  - myRequests (myRequests will be replaced with Service Catalog and Request Manager during the Cross Functional Transition, as described in Transition Services Framework)
  - AppsManager
  - CSRFs
  - Service Requests

Approach to coordinate and reconcile detailed billings and usage on a monthly basis.

The Contractor billing team shall collect input data from the authoritative source systems by the 5th day of each month for each framework: Application Services, End-User Services, Network Services, Data Center, Cross Functional Services, Special Requirements, Catalog Items, and Other. During this initial data collection phase, framework owners shall review both summary reports and rule-based exception reports to verify data completeness and quality.

Following collection of the framework input data, the data shall be aggregated in a format that can be imported into the County iTrack chargeback system by the IBilling application. IBilling applies rule-based billing logic as

well as data lookup from reference systems. Additional summary, trending, and exception reporting shall be performed on the aggregated data.

By the 9th of each month, Contractor shall review a summary invoice with the framework owners, billing team, and account management. Contractor shall explain any variances and, if needed, make corrections in the billing system and rerun the processes.

After Contractor management approval, Contractor shall create an invoice in Excel— "Base Services Invoice"— and deliver it to the CTO and the office of Auditor and Controller (A&C) no later than the 10th of the month.

Interface of Contractor billing system to County iTrack, and billing data transfer the County iTrack

By the 10th of each month, Contractor shall load detailed billing data into iTrack from IBilling, the Contractor billing data consolidation application, using automated Structured Query Language (SQL) scripts.

County staff shall process the data using iTrack and notify their staff that the data is ready for their review. Contractor shall load detailed telecommunication records by the 10th of the month. Contractor shall archive all billing data, including source files, for audit purposes.

Processes to ensure a high level of billing accuracy each month.

The Contractor billing team and framework owners shall research and address anomalies in trending and exceptions to facilitate a closed loop feedback review and continuous improvement. Contractor shall maintain monthly metrics to track responsiveness to County change requests; Contractor shall monitor and remediate these when necessary as part of its ongoing performance-based management methodology.

Billing corrections

The Change Request process in iTrack shall be used to make billing corrections. The County has until the 22nd of each month to create a Change Request in iTrack to dispute a charge or to request a name, location, low org, or other change to a billing record. On the 23rd of each month, the Contractor billing manager shall generate a report from iTrack of all approved Change Requests for that period and shall distribute it to all framework owners. The Contractor billing team shall investigate, correct, adjust, or explain all disputes and corrections by the next billing cycle. Contractor shall make corrections in the source systems to provide accuracy in subsequent billing periods.

Credits and adjustments for disputed charges, once validated, shall appear as a credit in the next billing period.

Contractor's billing manager shall enter comments in iTrack stating the resolution of each dispute. Contractor shall monitor and follow up on unresolved disputes and track them through closure.

After each billing period, by the 15th of the month, the Contractor billing manager shall compare the Change Requests approved to the latest billing file and shall follow up with framework owners on any differences to verify chargeback billing accuracy.

2.6. Security Management Services

2.6.1. Process and Procedures

- Description of solution to meet the requirements

Contractor's security management shall be comprised of a set of policies and procedures for systematically and quickly reacting to incidents or events that affect the County's information infrastructure, systems, and sensitive data. Contractor shall minimize risk and facilitate continuity of County IT operations by proactively preventing and limiting the impact of security breaches, whether internal or external. Using its expertise and experience, Contractor shall work closely with security counterparts and stakeholders to effectively and efficiently improve County information security. Contractor's solution includes multiple factors that at a minimum include:

- Chief Information Security Officer (CISO)
- Risk management program (framework)
- Evaluation and recommendation for tech controls
- Security governance program/board
- Security and risk management awareness training program
- System categorization for information ownership, classification, accountability and protection
- Incident/threat management and response plan
- Security Information and Event Management (SIEM)
- Continuous improvement

Solution: Contractor's approach to security management shall adhere to the National Institute of Standards and Technology (NIST) Computer Security Resource Center (CSRC) and its Special Publication 800 series, which shall act as a guide for delivery and compliance for the protection of systems and providing security services to the County. Overseen by the Contractor CISO, Contractor shall leverage this guidance to methodically assess systems and the organization for gaps and vulnerabilities based on the threat landscape, which may pose a level of risk to the organization.

Contractor shall also use a second approach that coexists with NIST standards, the NSA defense-in-depth model, which emphasizes the use of layers and multiple defense mechanisms across the infrastructure to protect data, systems, networks, and users. In the event that one defensive measure is attacked and exploited, there are additional layers and measures protect the assets.

Additionally, Contractor uses Gartner's Security Process Maturity Model to assess and report the "State of Security" and the progress of various security efforts that contribute to the overall security posture of the County. This model scores areas of security based on scale of 1 to 5 scale—the larger the number, the more mature the security aspect being modeled. Gartner provides a score for "peer" values derived from organizations with similar profiles. This maturity model is useful for comparison over time on how well the County is doing in relation to its peers. Moreover, it provides actionable intelligence for use in Contractor's continuous improvement practices.

The Contractor CISO shall have overall responsibility for all aspects of security (with County CISO). In support of Contractor CISO initiatives, strategies, roadmaps, and transformation, the Security Operations Manager shall be responsible for day-to-day operations and activities.

The following are descriptions of each role and their areas of responsibility:

- IS Security Manager – Responsible for all aspects of compliance, applications security reviews, overall information systems (IS) security, data classification, NIST-based guidance, continuous monitoring of controls, and Security Awareness and Training.

- Security Architect – Responsible for security infrastructure and product roadmaps, strategic participation with other frameworks, establishment of secure zones, and infrastructure security.
- Risk Assessor – Responsible for IS risk assessments, strategic risk guidance, compliance support, vulnerability management support, and vulnerability mitigation support.
- Identity Manager/Analyst – Identity and access management, maintain federated identities, monitors and maintains automated access request workflows, End-User provisioning coordination, monthly IAM reports, yearly attestation process, annual update of IAM plan.
- PKI Administrator – Responsible for use case development in coordination with Security Architect, public key infrastructure (PKI) services delivery, facilitate upkeep of CPS document, manage certificate lifecycle, monthly reporting, PKI inventory, and maintenance of public key certificates.
- Vulnerability Manager – Responsible for continuous scan of the perimeter, vulnerability and risk assessment support, vulnerability mitigation, threat management plan/remediation, application scans, coordinate security operations center (SOC) activities, event log analysis and reporting, intrusion detection system/intrusion prevention system (IDS/IPS) management, data loss prevention support, incident management plan/response/handling, and forensic activities. In the event of a data breach, Contractor shall engage the Security Incident Response Team (SIRT) as necessary to assist in the investigation. This team, in collaboration with the Contractor CISO, shall use its experience and SOC capabilities to ensure that all existing information that aid during a forensic investigation is readily available to authorized individuals. This information shall include log files, SIEM activity, data files, and anything else that may be considered digital evidence. Handling such information must follow proper procedures such as chain of custody and preserving evidence.
- Leveraged SOC – Event log monitoring, single pane of glass, unified threat management, incident response, and IDS/IPS monitoring and analysis.
- AT&T Security – Responsible for providing protection from unauthorized use, access, physical access to County hardware/software (HW/SW), firewall management, event logging, analysis, reporting, IDS/IPS in the communications infrastructure, hardware maintenance, identify and correct single point of failures, architecture and management services, roadmap maintenance for network security services, incident response, data loss prevention support, web content filtering, and hardware maintenance to maximize performance.
- IS Security Officer – Responsible for overall security posture of applications, coordination with application owners, and security documentation.
- HPE Leveraged Services – Forensic services, IDS/IPS service, antivirus services, SIEM services, firewall rule implementation, and PKI support.

- Deployment plan for resources and use of facilities

The Contractor security team shall use multiple locations in support of this Agreement. This team shall work closely with the County CISO, CIO, CTO, and other IT personnel, enabling direct communication and the ability to reach out directly to the Contractor team at any time.

The HPE Rancho Bernardo facility shall be the center of support for Contractor staff assigned to support the County. This facility shall provide centralized meeting spaces for engagements between the County contractors and Contractor personnel. It shall also include test environments, training room, video conferencing, and Contractor executive offices.

HPE Tulsa Data Center shall provide the majority of County IT infrastructure and core IT services, including web, application, DB servers, data storage, and data management.

HPE Orlando data center shall host the leveraged ArcSight SIEM solution from which the county's IT infrastructure is monitored 24x7x365.

HPE Colorado Springs Data Center shall serve as the disaster recovery site for the County IT services.

HPE U.S. Public Sector (USPS) headquarters in Herndon, VA shall serve as the primary location for senior Contractor executives and the Enterprise Security Operations Center (ESOC), a service that monitors the SIEM service.

- Key methodologies and processes in proposed solution including year-to-year continuous improvement

Contractor shall use the NIST CSRC information security tools, practices, standards and guidelines to support the County. The CSRC is the primary source of information for security related standard publications that provide computer/cyber information guidelines, recommendations, and reference materials. In addition, Contractor shall rely on NIST Special Publication 800-53 and 800-37, focusing on the Risk Management Framework (RMF) and the County implementation. The RMF is currently in use by all Federal agencies to comply with FISMA requirements. Contractor understands that the County currently does not have a Federal mandate to comply with FISMA. However, there are some systems in the law enforcement community and healthcare systems that require a proven standard to protect those Federal systems as well as systems that may have interfaces to them. Following is a high-level description of each methodology and key processes that are relevant to the County.

Risk Management Framework – RMF shall be the framework for the County's risk management program and shall provide a standard to measure systems critical to the ever-changing threat landscape in today's County IT infrastructure and systems future hybrid cloud environments. Measuring security controls against an established standard enables best-case resource use and an optimal security posture in which the discovery of vulnerabilities and the time it takes to mitigate them takes as little time as practicable. By following and adhering to the RMF, Contractor is able to minimize potential security oriented exploitation and reduce the risk/impact to the County. The RMF implementation shall continuously look for ways to automate and benefit from technology throughout the duration of the Agreement. The essence of the RMF is its simplicity and its versatility to align and integrate with other frameworks. It employs data visualization technology using dashboards influenced by users and graphical representations to reduce the complexity and improve the accuracy of reporting. The risk-based approach to security control selection and testing provides effective and efficient applicability to the laws and regulations that the County must follow. The steps in the RMF Model are:

- **Step 1: Categorize -** Categorize the information system for ownership, classification, accountability, impact analysis and protection; information is processed, stored, and transmitted by that system.
- **Step 2: Select -** Select an initial set of baseline security controls for the information system based on the security categorization, tailoring and supplementing the security control baseline as needed based on the County's assessment of risk and local conditions.
- **Step 3: Implement -** Implement the security controls and document how the controls are deployed within the information system and environment of operation.
- **Step 4: Assess -** Assess the security controls using appropriate procedures to determine the extent to which the controls are implemented correctly and operating as intended, to meet the security requirements for the enterprise.
- **Step 5: Authorize -** Authorize information system operation based on the risk to the County's operations and assets, individuals, third-party vendors; the County determines acceptable risk.
- **Step 6: Monitor -** Monitor and evaluate selected security controls in the information system on an ongoing basis including assessing security control effectiveness, documenting changes to the system or environment of operation, conducting security impact analyses of the associated changes, and reporting the security state of the system to appropriate County officials such as the CISO, CIO, and CTA.

The Contractor security services team shall provide the requisite knowledge and understanding of each control to take advantage of the expanded set of security and privacy controls. This facilitates integration with other frameworks and other County groups that may be considering the implementation of cloud-based solutions with other vendors. In addition to managing complexity, the Contractor security team shall leverage the concept of

common controls and control inheritance to optimally secure each system in the environment. This results in streamlined operations, testing, and more robust application security in already existing traditional and forthcoming cloud hybrid environments.

The tailored RMF roadmap shall make sure that its transition and evolution is low risk, non-disruptive, adaptive, and flexible to meet County demands, as the adoption of cloud-based and hybrid solutions continue to evolve. Security and the RMF are integral to any new IT initiative and avoid the stigma of "delaying" or "preventing" IT projects from moving forward by making sure every stakeholder is informed, educated, and understands the broader and bigger goal of building IT solutions faster and more secure where all frameworks have win-win paths forward.

As more hybrid cloud-based solutions are introduced to solve business needs, Contractor shall rigorously test and enhance the controls surrounding third-party vendors to minimize risk and avoid delays. Controls designed to monitor ingress and egress of data, data flows, audit and accountability, security monitoring, and many others shall be the focus of Contractor when interacting with third-party vendors.

Defense-in-depth –Contractor shall implement the defense-in-depth approach to goal of delaying the attack and buying time to detect and respond in an effort to mitigate or eliminate the consequences of a breach. Elements of defense-in-depth include antivirus, identity management, biometrics, demilitarized zones, data centric security measures, encryption for data at rest and in transit, firewalls, hashing of passwords, intrusion detection systems, logging of events for auditing, multifactor authentication, vulnerability scanning, physical security, access controls, awareness and training, virtual private networks, sandboxing, intrusion prevention systems, and others.

IT Maturity Model – Contractor and the County use a Gartner IT maturity model that assesses the County's information security program and helps provide recommendations for areas of improvement based on the areas identified. It also provides recommendations, technical and non-technical, to address issues. The results shall be presented to the CIO on a monthly basis or as required.

The security roadmap areas of focus shall include but not be limited to:

- **Governance, Organization and Personnel***:* How the County's information security function is organized and governed, and what the scope of the information security program is. How the County staff organizes its information security function, where it gets support from within, where it is supplemented using third-party service providers, and what areas require investment in training and hiring.
- **Policies, Standards, Procedures and Documentation:** How the County articulates and communicates its policies for information security to the business, and how these policies are supported by clearly defined standards and operational procedures. How the County stores and manages the documentation relevant to its information security environment, including as-is state, in-flight projects, assessments, audit findings, and other related materials.
- **Information Classification:** How the County classifies information and critical systems to determine appropriate information security measures based on the organization's appetite for risk.
- **IT Risk Management and Compliance:** Describes the County's risk posture, and how it assesses whether to accept, transfer, mitigate, or avoid certain risks. How the County manages its responsibilities with respect to legal, regulatory, and audit compliance.
- **Identity Management:** How identity management technologies and processes are used to create and manage identities of the various County constituents (e.g., employees, vendors, contractors, etc.)
- **Runtime Access Control:** Determines what technologies and processes are used to manage permissions and access to the County's networks and applications.
- **Software Development and Testing:** Describes how a security mind-set is integrated with software development life cycles, secure coding practices, outsourced software development, and infrastructure deployments. Describes how systematic testing of code, applications, and infrastructure components is integrated in life cycle processes.

- **Applications and Information Repositories:** How security implications relevant to applications, application development, portals, communication and collaboration platforms, file storage and transfer are reviewed.
- **Encryption:** Describes how the County uses encryption for protecting data in transit, data at rest, strong authentication, and digital signing?
- **Security Awareness and Training***:* How the County communicates the importance of information security to the business at large.
- **Change and Release Management:** How the County controls changes in their hardware, software, and supporting infrastructure while maintaining suitable and appropriate information assurance.
- **Incident Response:** How the County responds and escalates responses during critical security incidents.
- **Threat Response:** How the County responds and escalates responses during critical security threats.
- **Resilience Processes:** How the County implements business continuity management and IT disaster recovery planning and testing to protect the resiliency of its infrastructure.
- **Audit Processes:** How regular internal and external audits verify compliance with corporate policies, standards, and procedures.
- **Network Perimeters and Zones:** Determines what network perimeter mechanisms are used by the County to enforce zone boundaries and protect sites, systems, and users across a distributed infrastructure. How zones of trust used by the County to protect their IT resources on communications networks. How the County detects and responds to security incidents on their network.
- **System Zone Placement:** How the County places systems in security zones.
- **Endpoint Admission:** What approaches the County uses to control client endpoint admission to zones and resources.
- **Host Security:** What management and protection postures the County takes with regard to host system security.
- **Vulnerability and Patch Management:** How the County manages and remediates data, software and configuration vulnerabilities.
- **Anti-Malware:** What mechanisms and approaches the County uses to mitigate malicious software such as viruses, spyware, and Trojan horses.
- **Data Loss Prevention:** What approaches the County uses to prevent the unauthorized exfiltration of company confidential information.
- **Security Information and Event Management:** How the County monitors the network and critical systems, including audits of critical system access and logs.

Methodology to protect the security and confidentiality of data and information that is proprietary to the County or subject to special statutory protection

Contractor shall maintain a robust flexible set of risk-based security methodologies to protect the County's information systems and assets. Contractor shall use the NIST RMF, Defense-in-depth, and the Gartner's IT Maturity Model. Additional guiding principles shall include the minimization of the use, collection, and data protection of what is strictly necessary to accomplish county's business. Contractor shall support the County-classified data each system is processing or storing and appropriately determine the levels of protection based on the data classification and impact to the County. Contractor shall then implement the appropriate levels of safeguards based on the data classification. Additionally, a robust set of processes and procedures shall be in place to handle incidents involving the compromise of the data.

The NIST-based RMF fundamental tenets of security include controls that are specifically designed to protect the confidentiality and integrity of data. At a high level, the controls include the creation of policies and procedures, awareness and training, conducting Privacy Impact Assessments (PIA), identifying and classifying sensitive information, and record retention and disposal of information. Other control specifics include:

- **Access Enforcement** – The County controls access to confidential data through access control policies and access enforcement mechanisms. At the enterprise level, employees are part of role-based Active Directory (AD) groups which are determined using a Change Services Registration Form with approval and consent of a

direct employee supervisor. Other non-enterprise systems control access with local management capabilities. As part of the roadmap, a full enterprise identity management capability shall be in place to better secure and manage access controls.

- **Least Privilege** – Contractor shall enforce the most restrictive set of rights and privileges for each End-User in a specific role. For confidential information, Contractor makes sure that users only have access to the minimum about of data needed to perform their job.
- **Auditable Events** – Contractor shall monitor events of systems that contain confidential information and shall make sure there are regular reviews and analysis of system records that indicate inappropriate or unusual activity affecting this data. Investigations shall occur when suspicious activity is detected and violations are reported.
- **Identification and Authentication** – County users shall be uniquely identified and authenticated before accessing confidential information.
- **Media Access** – Contractor shall restrict access to media containing confidential information, often through encryption. Media includes CDs, USB flash drives, backup tapes as well as non-digital media such as paper.
- **Media Transport** – Contractor shall protect digital and non-digital media including confidential data transported outside the organization. A data transfer request process shall be used to scrutinize the data (often encrypted) that leaves County premises.

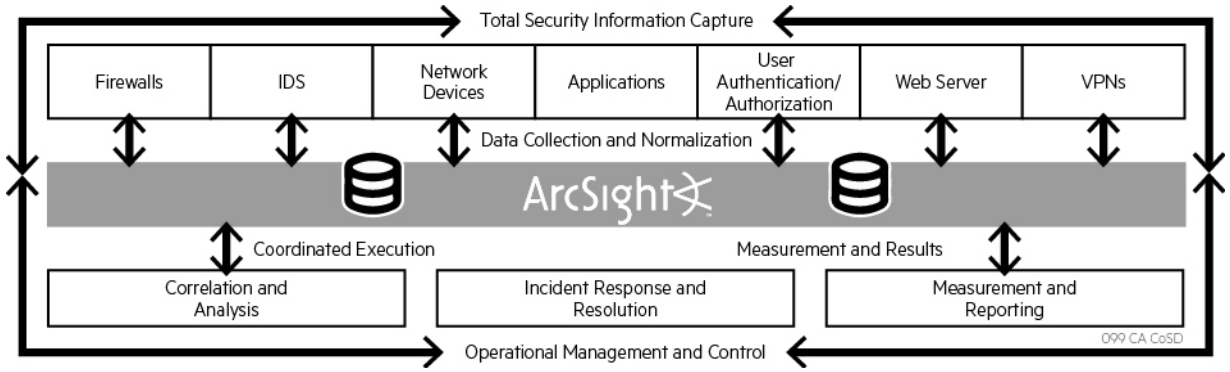
All of these sets of controls shall be implemented at the infrastructure level and on applications that process confidential information. The visibility of how effective controls are being on the lookout for new threats, identifying vulnerabilities, and having a sound mitigation strategy to eliminate or minimize risk results in an optimally protected enterprise.

Approach to data analysis of SIEM information and remediation of identified risks or vulnerabilities.

The major components that comprise the Contractor's SIEM solution shall be: monitored endpoints that generate security events, security data collection servers that collect and normalize events from disparate endpoints, a security information event manager backend that correlates and analyzes collected events and a web portal that presents processed events and alerts. Finally, the SIEM solution shall include security incident response processes to coordinate analysis and resolution of security issues.

Contractor shall use the ArcSight platform, illustrated in the figure below, to perform the aggregation and correlation of security events generated by different data collection points. Palo Alto logging (traffic, threat, and URL) shall be collected by the Palo Alto centralized managed server platform, Panorama. All SSLVPN logging, as well as DHCP logs shall be gathered by the Juniper JSA device. These two devices shall then forward their logs to both the Contractor's SIEM (ArcSight) collector, as well as the AT&T managed SOC group. Data center logging (IPS sensors and firewalls) shall also feed to the Contractor SIEM. Contractor shall analyze and resolve issues to provide an additional layer of security. An event alert from either group shall trigger a collective investigation effort between Contractor and AT&T.

ArcSight Platform



The ArcSight Platform provides tool information security capture, coordination, management, and reporting

At a high level, the process to escalate and respond incidents shall be as follows:

- The Contractor security team shall investigate alerts, determine criticality and, if the criticality is severity one or severity two, shall notify the County and Contractor security about the event. If the event does not meet critical criteria, HPEs shall follow the Contractor's internal procedure for noncritical incidents and shall report to the County in the monthly security reports.
- In the event of a severity one or two, Contractor shall initiate the investigation and contact the County CISO and Contractor operations or any support team requested to alert them of the incident per the Severity Escalation Matrix.
- Contractor shall investigate the incident and activate an incident response team (IRT) as needed. If the documented preapproved, incident containment strategy exists to mitigate threat, the IRT shall immediately execute plans to resolve incident.
- The IRT shall determine resolution strategies for County approval. If required, the team shall initiate the change management process by submitting requests for change (RFC).
- The IRT shall execute a containment strategy upon approval of an RFC, if required. The strategy shall include plans for the prevention of further damage caused by the incident and shall be reviewed by the County CISO.
- The IRT shall execute eradication strategies when the RFC is approved and reported to the County CISO.
- The IRT shall execute recovery strategies upon approval of RFC by the County CISO.
- Contractor shall document the incident and close the incident.
- Contractor shall conduct a lessons learned meeting to update strategies, as needed.

Each process of the SIEM incident response shall be included in the yearly review process, which contributes to the maturity of security services. Any areas of improvement or lessons learned shall be incorporated in the updated process and teams shall be aligned accordingly.

Approach to assess the County's security environment.

Contractor shall continuously monitor in real-time mail threats, inbound and outbound network traffic, and discrete data formats in which information leaves County's networks. Additionally, Contractor's ESOC shall respond to any possible threat by investigating whether it is a true incident or if it is a false positive. False positives shall be used to constantly fine tune IPS/IDS and the heuristic engine for data analysis.

Contractor shall conduct vulnerability scans for a maximum of 3,000 IP addresses in the Front DMZ zone as well as the library network. The plan is to increase the number of servers to include all critical servers based on function and data classification they store or process.

Additionally, Contractor shall conduct scans of servers before they go into production, which results in identification of vulnerabilities in servers before they go live. Contractor shall mitigate high and moderate vulnerabilities before any server goes into the production environment.

Contractor shall conduct policy compliance scans on all production servers on a monthly basis. Contractor shall make sure County servers are compliant with Contractor security policies and are up-to-date with patches.

Contractor shall also execute an annual network penetration test restricted to the DMZ. The Contractor network penetration testing process shall include actions that reduce the risk of exposure to the County's most critical online assets and, detailed descriptions for quickly managing or eliminating security exposures. This streamlined, granular approach to risk management enables security policy compliance to become an integral part of the overall security process.

As part of the RMF, Contractor shall document and test environment controls on a predefined efficient schedule. Contractor shall assess the security controls using appropriate procedures to determine the extent to which they are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security requirements for the County. The ongoing monitoring of security controls in the environment shall also include documenting changes to the system or environment of operation, conducting security impact analyses of the associated changes, and reporting the security state of the system to appropriate County officials such as the CISO, CIO, and CTA.

Contractor and the County CISO shall conduct monthly self-assessment using Gartner's IT Maturity Model and report to the County via CIO briefings. This provides independent validation to the County of Contractor's performance.

Approach to assess the County's application vulnerabilities and security risks, and approach for analyzing and assigning classifications to County Data.

Checklist Based Approach

Contractor shall use an application checklist to identify areas in which the application under review is not compliant with specific security requirements. The application checklist shall be a documented set of questions based on County security policies. The requirements on which the application checklist shall be based are documented in the County Security Management Plan.

The compliance questions shall be categorized into the following security areas:

- Authentication
- Audit
- Nonrepudiation
- Host security
- Enclave
- Access Control
- Confidentiality
- Physical Security
- Application Security
- NIST
- Support
- Integrity
- Network Security
- Data security

Application team members shall respond to an extensive set of questions at different stages of the project, and the list shall then be reviewed by the security team. A scorecard shall then be derived from the questionnaire that

shall be rolled up to a dashboard for all applications going through this process. The dashboard facilities identifying trends within specific security categories across multiple applications.

RMF-Based Approach

Applications shall go through the RMF, as described at the beginning of this section. All applicable controls shall be determined by the data classification and take into account factors such as compliance with HIPAA, Privacy, PCI, and other applicable laws and regulations.

Encryption Requirements for Data Security and Protection

Contractor shall provide the following encryption to protect data in transit, at rest, and the PKI Enterprise implementation:

- Data in transit
  - Transport Layer Security (TLS) – Web servers use TLS with digital certificates provided by Entrust.
  - Secure Sockets Layer (SSL) – Web servers use SSL with digital certifications provided by Entrust.
  - Server Message Block (SMB) – Applied to Windows shares (NAS) and files in transit.
  - Virtual Private Networks (VPN) – Junos VPN uses IPsec tunnel. Traffic between the two points is encrypted.
  - Wireless Encryption – Wireless Access Protocol provides encryption on all wireless data exchanges.
  - Email Encryption – TLS to all inbound connections and to trusted outbound domains. Cisco IronPort Office message encryption.to be replaced with Exchange Online Protection (EOP)
  - Mobile Devices – SSL encryption for all communications with County network when using Pulse VPN. Email is encrypted using TLS inbound and outbound when accepted by both parties.

- Data at rest
  - Endpoint Encryption – Symantec Endpoint Encryption provides maximum protection by encrypting each hard drive sector by sector.
  - Database Encryption – Transparent Data Encryption is used in some SQL databases.
  - Removable Media Encryption – Thumb drives ordered from the catalog use AES 256-bit encryption.
  - Password Hashing – New applications or modified during refreshes that store passwords use hashing algorithms to prevent storage in clear text.
  - Mobile Devices – Devices are encrypted using the Operating System default encryption capabilities where appropriate. Additionally, devices shall use a digital certificate to authenticate to AirWatch.

- PKI
  - User Authentication – Symantec Digital Certificates in Active Directory.
  - Device Authentication – Symantec Digital Certificates in all devices.
  - Digital Signature – Self Signed Digital Certificates by ARX and CoSign.
  - Other use cases shall leverage the current Enterprise PKI Symantec solution.

Contractor shall continue to implement solutions with encryption where technology allows for it. Opportunities to improve in this area include technical refreshes and new implementations.

2.7. Service Delivery Management (SDM) Services

2.7.1. Process and Procedures

- Description of solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches

The Contractor approach shall include repeatable, ITIL compliant, delivery of County IT services that consistently provide high-quality IT service delivery across all frameworks.

Contractor's Service Delivery Management services shall be applied and enforced by its enterprise service delivery manager (ESDM) along with the individual service delivery managers (SDMs) assigned per business group. Contractor shall continue its delivery of these services through proactive communication and collaboration with all affected stakeholders. In addition, Contractor shall provide timely guidance and measure results accordingly as required. Contractor shall document its efforts and make this documentation available on the Service Portal. Contractor shall routinely solicit County and End-User feedback as input into its continuous improvement processes.

Solution: Contractor shall assign a single service delivery manager (SDM) to be the point person for each business group. SDMs shall perform the following, at a minimum:

- Incident management
- Problem management
- Change management
- Release management
- Escalation management/Service Request status
- Communication
- Billing management
- Availability and capacity management
- On-call rotation

The on-call rotation in which the SDMs shall participate is critical to facilitate centralized after-hours support to the County for issue resolution as well as making sure each SDM has appropriate amounts of time off and vacation as required. Contractor shall provide five SDMs who shall rotate on-call every five weeks. During business hours (Monday through Friday 6:00 a.m. to 6:00 p.m.), each SDM shall be responsible for their own business group. After hours and on weekends, the on-call SDM shall take primary responsibility for any issue and works it to resolution. If an enterprise issue emerges during business hours, the on-call SDM shall take point for this issue initially—and possibly to completion, depending on the scope of the issue. If an issue arises during this time within the business group for that on-call SDM that requires their focus and attention, another SDM shall be assigned to take over the new issue. All SDMs from each business group shall be required to work any/all enterprise related issues/disasters that require a shift rotation. The on-call SDM shall verify that the correct customer from the business group is notified and that the SDM assigned to that business group is aware if anything has occurred in their space so they can address it. Problem management is a day-to-day responsibility for the SDMs, and they shall be assigned activities to work whether it be proactively or through tickets, escalations, and so forth. Contractor's enterprise problem manager shall report, track, and communicate all problem management issues worked by the team and the account as required in the weekly CTO Operations meeting. Each SDM shall also report any problems being worked by them through this process that impact their business group or the enterprise in the monthly portfolio review meetings that they shall be required to attend.

For capacity management, each SDM shall be responsible for using report-based findings and data to facilitate the health of their servers and applications for that particular framework. The SDMs shall operate proactively to make certain this health is sustained, reliable, and predictable. They shall work closely with the capacity manager on the

account who owns the activities and verifies that Contractor is resolving alerts as well as reviewing trends to implement the right steps to prevent alerts and to make recommendations to County stakeholders.

Contractor shall have a single point of contact on the account responsible for Root Cause Analysis (RCA), making sure that all RCAs meet the required deadlines and service level agreements (SLAs). As issues are worked—for those that require an RCA or for which an RCA has been requested—the SDM for each business group shall make sure that they are completed within the SLA timeframe and they are ready for customer review and approval.

Each business group shall have regularly scheduled meetings that the SDM shall be required to attend and report status as needed for all things operational and that fall within the scope of their duties. Because the SDM acts as a point of escalation, they shall assist the client with answers and resolutions by establishing the proper points of contact and making sure the issue is being worked or obtaining and providing the information required.

If an emergency or disaster occurs in a specific business group, the SDM for that unit shall take primary responsibility as needed to support the customer. They shall handle the requests, communications, and so forth required for these events. If the event is something that requires 24x7 support, Contractor shall provide the necessary resources to cover shifts and see that the SDM has adequate support. If an emergency is declared that impacts the entire County and the Office of Emergency Service (OES) activates, the SDM for the Public Safety Group (PSG) shall begin the rotation along with the enterprise service delivery manager to establish required communication and coordination, and the SDMs shall enter that rotation along with Contractor account management to support the effort until Contractor is notified to stand down.

The ESDM shall be responsible for leadership of all SDMs and shall provide continuity across the business groups and the account. The ESDM shall have a direct interface with the County Technology Office (CTO) to make sure that all parties are aware of anything that is going on in the environment and to make process changes/suggestions as needed for continuity of operations. The ESDM shall be embedded with the customer three days per week in the CTO and shall attend all business group meetings as requested. The ESDM shall be responsible for all delivery aspects and SLAs associated with each area for the account on the operational side: service delivery management, Service Desk, End-User, infrastructure services (data center and local), print center, network services, release management, change management, problem management, incident management, and configuration management.

The SDMs shall be responsible for understanding all service frameworks and how they impact their business group as well as for making certain that proper communication and discussions for that framework take place and that resources are available to support all service delivery initiatives. The SDMs shall be familiar with and facilitate adherence to County requirements and information infrastructure.

- Deployment plan for resources and use of facilities

The SDMs are required to have face-to-face interaction with their business groups in addition to email, phone, etc.

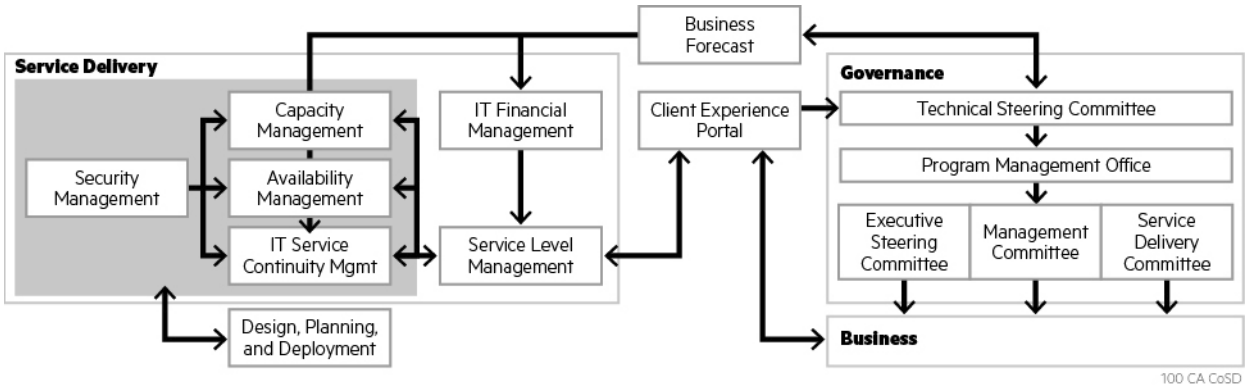
- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's approach to service delivery, illustrated in the figure below, shall enhance the stability and integrity of the services environment through proactive service-level management and governance, transparent service visualization, and analytics that support cost-effective service improvements through integrated availability, capacity, IT service continuity, and financial management. They shall include the following key service delivery disciplines:

- **Availability Management** – The mission of availability management is to understand the availability requirements of the County and to plan, measure, monitor, and continually strive to improve availability of the services and the County's IT infrastructure.

- **Capacity** – Contractor performs capacity planning regularly as well as when new business and application growth are anticipated, when changes to the existing business are anticipated or occur, or when configuration changes are performed within the systems. As part of Contractor's ongoing capacity review and planning process, Contractor shall coordinate with the County regarding future business plans and computer resource requirements.
- **IT Service Continuity Management** – Contractor's business continuity professionals shall collaborate with the County to keep its IT Service Continuity Management (ITSCM) plans current, relevant, and executable and to see that they support County operational continuity plans.
- **Service Level Management (SLM)** – The County and Contractor establish a shared view of the services, service-level achievement, and analytics through regular service delivery reviews and IT Service Management (ITSM) Client Portal dashboards. Contractor's account leadership team shall collaborate with County stakeholders through service delivery reviews and frequent direct dialog to continually review SLAs to make sure that services remain cost-justified and aligned to the County's business needs. The ITSM Client Portal provides continual "Voice of the Client" feedback to Contractor and relays performance feedback at any time, with top-level visibility to Contractor's senior leaders.

Contractor's Service Delivery Model



Service delivery integrates availability, capacity, IT service continuity, IT financial, and SLM to enhance the stability and integrity of the services environment.

The following sections provide additional detail about the service delivery processes depicted in the diagram and summarized in the figure above.

Availability Management

Availability management shall contain the following key activities:

- Assess availability requirements
- Develop and maintain the Availability Plan
- Analyze current availability
- Maintain availability

Capacity Management

Contractor shall perform capacity planning regularly when new business and application growth are anticipated and when changes to the existing business are anticipated or occur, and when configuration changes are implemented in the systems. Capacity management shall meet the following key objectives:

- Verify that optimum IT capacity exists always

- Proactivity
- Reliability
- Outage prevention
- Provide clients with sufficient capacity to support agreed levels of service
- Forecast future requirements for IT resources.

Service Continuity Management

Contractor's business continuity professionals shall work with the client to be sure that ITSCM plans are current, relevant, and executable and that they support the County's business continuity plans. The ITSCM process shall be comprised of the following key elements:

- **Define, Implement, and Maintain the ITSCM Plan –** Contractor collaborates with client business continuity teams to define, implement, and maintain an ITSCM plan that is based on Disaster Recovery Institute International (DRII) and Business Continuity Institute (BCI) standards. The plan is continually updated and assessed through scheduled reviews, as changes are made to the IT environment and as improvement opportunities are identified through testing and execution of the plan.
- **Exercise and Execute the ITSCM Plan –** Contractor's IT service continuity staff shall support the client when conducting required testing and activating plans during a disaster. Contractor shall document and maintain the Contractor staff's IT service continuity procedures to restore the hardware and operating system and the subsystem environment. Contractor operations shall support application recovery testing, such as loading tapes or initializing data storage devices. Joint testing of the IT service continuity plans is conducted through a disaster simulation process based on established test schedules. Contractor closely monitors and document test objectives and actual test activities. Contractor reviews the results of each test and enter any problems encountered in the problem-tracking tool for follow-up and implementation of corrective action. This process enables continual improvement of the recovery plans. Retests shall be performed for tests that do not meet predetermined objectives unless mutual agreement deems retest to be unnecessary.
- **Manage Service Continuity Escalation –** Throughout a service continuity event, Contractor shall manage the agreed escalation procedures to keep the client and Contractor leaders informed, obtain required approvals, and restore service operations in accordance with service levels, thereby minimizing the impact to business operations.
- **Supplemental Assets –** Available for use on the County's program, Contractor has ITSCM-based templates for documenting the following: Business Impact Analysis, Gap Analysis, Continuity Planning Checklist, Threat Analysis, ITSCM Plan, and ITSCM Exercise Workbook.

Service Level Management

Contractor shall work with the client to verify that the levels of service Contractor delivers meet County business objectives.

Security Management

Contractor shall complete a Security Management Plan (SMP) modified from its proven template to identify those security-critical items whose failure could lead to a breach of system security. Contractor shall document a security assurance strategy to minimize or eliminate the potential for system security breaches. Contractor shall review and update the SMP as necessary throughout the program life cycle.

Approach to the role of the Service Delivery Manager (SDM), including SDM operational authorities across Service Frameworks, key functional activities, and metrics to measure the effectiveness of the SDM role.

The SDM shall work closely with counterparts from the County team, outside vendors, and Contractor teams to facilitate a successful initial and ongoing services delivery engagement. This role—essential to managing a small team of technical and business people—shall require varied expertise in the areas of technology, business

processes, communications, service provider, and enterprise IT industry knowledge and experience. SDMs shall serve as the face of Contractor services on an ongoing basis for the County in all aspects from supporting pre-design activities and design to delivery, process improvement, and escalation management."

SDM responsibilities and deliverables shall include the following:

- Serves as primary interface for all client contact related to the Contractor services, involved in pre-design and post implementation interface with County and Contractor services leadership teams
- Responsible for County relationship management and total customer experience
- Works closely with senior management and across functional groups to develop effective strategies and programs to meet service delivery goals, including tracking and reporting key milestones
- Responsible for making certain that Contractor complies with agreed services scope and quality
- Provides compliance with established policies, practices, and processes defined by Contractor and County personnel for delivering converged infrastructure related services
- Provides work direction and strategic direction to reporting managers and employees
- Works closely with Contractor lead partners in ensuring a successful services delivery engagement

Metrics to measure SDM effectiveness shall include the following:

- County leadership evaluations—the GITM and ESDM shall meet quarterly at a minimum to discuss how the SDM is providing the services required
- Project performance to goals and objectives
- Meeting scheduled reporting and communication deadlines
- Maintaining agreed certifications
- Annual Performance Reviews by the ESDM
- Customer relationship management skills and meeting objectives
- Identifying opportunities for improvement within their respective business group

2.8. [Reserved]

2.9. Project Management Services

2.9.1. Process and Procedures

- Description of solution to meet the requirements

The Contractor Enterprise Project Management Office (EPMO) is an organizational body that shall be assigned to centrally coordinate the management of in-flight programs and projects across all towers of the Agreement.

Solution: The EPMO shall be responsible for aligning its activities with the County's mission and maintaining an outcome-focused and metric-centric program management organization. To accomplish this, Contractor shall incorporate measured steps to retain situational awareness of the budget, schedule, and risks as well as opportunities for continual improvement throughout the program's life cycle. The EPMO strengthens day-to-day communications and prepares detailed recurring reporting to promote the highest level of transparency and collaboration between the County and Contractor.

Contractor shall use industry-standard practices as set forth by the Project Management Institute (PMI's PMBOK), Software Engineering Institute (SEI's CMMI), and Information Technology Infrastructure Library (ITIL). Contractor has its own Enabling Delivery and Global Excellence (EDGE) process, which is its overall framework for enhancing effective planning, execution, tracking, and reporting of projects. The Contractor team shall use one or more of these best practice standards to create procedures that enable each framework to efficiently perform project management activities appropriate for the nature of its work.

Contractor EPMO guiding policies shall include:

- Identify and use global best practices as a framework for creating tailored, relatable, and customer-centric procedures that provide the best fit to meet Contractor's customers' evolving needs, while driving quality and expedience into Contractor's delivery model.
- Provide frequent, accurate updates to the County Project Sponsor
- Make sure of thorough and timely communication across all framework projects and procedures
- Apply the principle of delivering projects on time and within budget that fulfill the approved requirements
- Promote an environment of continuing education for Project Management Professional (PMP)-certified PMs and for those who aspire to be PMP certified
- Work with Contractor's County partner on continuous improvement processes and initiatives.

These policies are designed to influence and determine decisions and actions when tailoring the processes for the County and ensuring that Contractor's processes conform to PMBOK, CMMI, and ITIL.

The Contractor EPMO person shall chair weekly meetings to make certain that cross-framework coordination, integration, and communication occur for projects and processes. Communication between all frameworks is critical to successful delivery of products and services.

The EPMO shall be committed to coordinating multi-framework projects between the frameworks, and to certifying that there is a lead project manager and project status is reported in a timely and consistent manner. EPMO shall provide a central point for managing processes and standards across all frameworks to enable consistent delivery.

Contractor shall use a formal process change board to identify and implement process improvements that drive quality and expedience throughout the project life cycle. The HPE EPMO shall chair these efforts and support documentation, training, and process reengineering that may be identified through these efforts.

In addition to the standard project management solution described above, Contractor shall consolidate Infrastructure Project Management efforts into its project management service. This provides value to the customer while continuing to facilitate Contractor's goal to integrate all project management services under one set of best practices.

Rationale:

The EPMO shall drive the standards for project management across all portfolios, but shall remain agile where necessary to meet the needs of the specific project/client.

- Deployment plan for resources and use of facilities

The EPMO and project management staff shall be centrally located at the Contractor's Rancho Bernardo facility. Contractor shall join the County at its facilities when necessary to drive successful communication at the program and project levels. This facility approach enables interaction between the project management staff and all customer and Contractor portfolio towers, including:

- County Technology Office (CTO)
- County Group IT Management (GITM)

- County Department IT Coordinators
- County Project Sponsors
- Contractor Account and Operation Management
- Contractor Applications Portfolio Management
- Contractor Infrastructure Operations
- Contractor Account Security
- Contractor Technology Office
- Contractor Business Management
- Contractor Contracts Management

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's proven methodology for effective program management support, EDGE, includes all information needed for Enterprise Services (ES) to deliver and excel in the global marketplace. EDGE shall support all individuals in each ES business unit by providing best practices that they can leverage and use in their daily work.

The EDGE environment shall cover multiple life cycles that can be selected, customized, and integrated as needed for each program. Project and program management shall be integrated through their own life cycles, which conform to PMI PMBOK industry standards, as well as CMMI and ISO. Engineering practices, such as Infrastructure, COTS, and other Enterprise application areas, shall integrate seamlessly with the Project/Program Management areas for project success. EDGE has been customized to the County's needs and processes. EDGE shall be regularly updated to provide End-Users with the most current industry best practices, as well as continually aligning processes and assets with changes in industry standards of PMI, CMMI, ITIL and ISO.

Using the aligned HP/County organizational structure, Contractor shall implement formal communication procedures that engage internal and County stakeholders. Examples of interactions include the following:

- Establishing communication strategies for the specific needs of the CTO and County business groups
- Developing enterprise communication procedures and templates
- Auditing program and project communication plans
- Creating EPMO announcements followed up by direct communication with impacted stakeholders
- Developing and maintaining communication vehicles such as the EPMO SharePoint
- Creating and executing communication plans for EPMO initiatives
- Preparing presentation material for internal and external reporting.

Standardization and optimization of Project Management practices across a diverse environment such as the County

The Contractor EPMO and County CTO partner shall be responsible for the integration of these processes across the County enterprise so that service performance can be managed seamlessly. Contractor's EPMO personnel shall facilitate the development of processes, manage the deployment, and provide oversight and management for process execution. Contractor's EPMO personnel shall also establish key roles for ownership and governance of each process, working collaboratively with the County to speed delivery of services focused on quality and adherence to standards.

Internally, the project management team shall meet regularly to escalate issues and to discuss project management measurements and trends. They shall receive training on updates to client processes, industry best practices, and new tools. Contractor additionally shall monitor and meet with subcontractors to make sure they comply with County and project requirements. Contractor shall make certain that subcontractors are aware of and participate in issue and risk management, and that they provide timely accurate status reports.

Contractor shall provide training for project managers, including acceleration programs for the PMP, CAPM, SPI, and other disciplines. Project managers and business analysts shall be encouraged to join and participate in global, regional, and Community of Practice (CoP) groups, including the USPS PPM Community, the State/Local

Government / Education (SLED) Community of Practice, and the USPS Business Analyst Community of Practice, for additional training and shared understanding of best practices across the community.

PMI chapter and PMI/PPM event participation shall also be encouraged across the organization.

Contractor's PPM Academy shall provide regular opportunities for learning.

The EPMO shall share in-house opportunities for PM training sessions or vendor sessions, or PM-specific conferences in San Diego, and inform the County that it may participate.

Contractor shall leverage the best practices of Project Management Plan development and right-size the project for specific County needs. Project Management Plans shall contain one or more of the following sections:

- Scope Statement
- Known Risks and Issues
- Assumptions and Dependencies
- Stakeholder Matrix
- Milestones
- Cost/budget Baselines used in calculating SLs and project success
- All Project Deliverables
- Preliminary Risk Log
- Phased Implementation Approach.

Project schedule templates shall be maintained in the Program and Project Management Center (PPMC). Each framework shall have one or more templates that meet the needs of their particular project tasks.

Contractor shall conduct risk analysis and planning early in the project life cycle with the help of all stakeholders. Monitoring risk and updating the risk matrix shall occur continually during the project life cycle.

For the Applications and Infrastructure frameworks, change management shall follow the formal change request process that flows through CTO and is signed by County and Contractor.

County-facing project status reports shall be made available so that authorized County users and Contractor team members can view the status of a particular work request. Status reports for projects shall be posted on a weekly basis.

All PM work products, status reports, processes, and templates shall be centrally located/managed and shared using DocVault.

Each project manager shall be responsible for establishing and conducting project meetings with his/her customer.

Third-party vendors working with Contractor to implement solutions shall be treated as project team members and held to the same process standards required by the County and Contractor. From the point of project kickoff, the Contractor project manager shall be responsible to direct County vendors on their roles and responsibilities for supporting County projects and required deliverables. These responsibilities shall include following County-approved methodologies and processes and any project status reporting requirements.

In addition to requiring all vendor project participants to follow County-approved project process, Contractor shall also identify potential project risks as part of the upfront project risk assessment and shall include specific mitigation plans for issues that may arise when operating a project that uses third-party vendors. Those risks shall be managed and monitored for risk triggers throughout the project lifecycle.

Measuring and analyzing trend data related to the effectiveness and timeliness of Project Management processes and methodologies.

The Project Management Office shall work directly with County representatives to recommend and identify the critical performance indices that provide useful project trends and status. Project trends shall be calculated and reported on a regular basis by the Project Management Office and discussed as part of weekly project review meetings. Trends related to project schedule, budget, and other key performance indicators shall be monitored on active projects in Contractor's Project and Program Management system. If Contractor identifies unfavorable trends, it shall perform a root-cause analysis to isolate new causes of trends, and provide coaching assistance to project managers to understand the root-cause and provide corrective and preventive action.

The County has designated two critical SLAs around the KPIs of Schedule Performance Index (SPI) and Cost Performance Index (CPI) on Discretionary Standard projects. Contractor shall support these KPIs throughout the project lifecycle, measuring progress and reporting on earned value. Contractor shall constantly manage to these metrics throughout the project lifecycle.

Contractor shall implement the following or as otherwise stated in the Standards and Procedures Manual:

- KPIs for Project Estimate Accuracy and Response
- KPIs for Impact, Priority, and Mitigation of Risks/Issues
- KPIs for Project Change Management
- KPIs for Projects Opened, Closed, Delivery Times, etc.
- KPIs for Defect Management
- KPIs for Project Schedule Management/Milestone Comparisons

Contractor shall continue to identify additional KPIs best suited for the project management organization. The County and the Contractor PMO shall meet regularly to discuss overall objectives, issues, and improvement items, which can be incorporated into ongoing KPI development and improvements.

The Project Management Office shall use tools to collect and measure the effectiveness of estimates against actuals for all standard projects from initiation to closure. Contractor shall review trend reports regularly, along with individual reporting per project. The data collected shall include estimates at initiation, actuals by role at closure, total project CPI/SPI, number and type of change requests, and cost impacts. Contractor shall also collect data to determine the effectiveness of ROM estimates for project management and engineering project activities and continuously update the Basis of Estimate process and provide more accurate and predictable ROM estimates.

Relationship between project managers and Service Framework resources

Where possible, the same project resources engaged for creating project ROM estimates shall also be responsible for delivering the end product. This approach drives a high level of accountability and quality for Contractor's solutions.

Starting with the project's initial estimate, Contractor shall engage the solution frameworks to provide rough estimates for the project's proposal. Once a project is approved by the County, Contractor shall initiate an internal kickoff with the team, and the project manager shall engage the framework leads to determine the level of resources and effort needed from the initial requirements gathering through deployment. Requirements Development and Planning shall engage the framework resources to refine the solution and further refine the estimate of resources needed to deliver. During execution, testing, and deployment, the various frameworks shall be actively engaged in providing and testing the solution, and positioning for, executing, and supporting deployment. At project closure, the framework resources shall continue their involvement to make certain that warranty-period support is available, turnover to production is successful, and project close-down ends with a

final collection of effort and lessons learned. These touchpoints shall be embedded in the standard project plan templates and reflected in the project management life cycle.

Throughout this processes, Contractor shall identify framework SMEs from operational support when needed to advise and provide critical product information and input to the project team while supporting the operational needs of the product.

Use of Tools

Project and Portfolio Management Center (PPMC) shall be Contractor's Primary Project and Portfolio Management (PPM) tool suite. Contractor shall use PPMC for the development and ongoing management of project schedules, small project work, LOE-based work, operational support work, budget tracking, and status reporting. Contractor shall also use it to track program-level, high-visibility initiatives with multiple projects, and at the portfolio level to manage and track projects with competing resource needs within a business group.

- Contractor shall use SharePoint as a storage repository for project artifacts, enabling easy access of project standards, methodologies, processes, and procedures; storage and access of project templates; and storage and access of project-specific documentation such as specifications, project plans, etc.
- Basis of Estimate: Contractor has developed a unique Rough Order of Magnitude (ROM) tool that the EPMO shall use to support expedited and thorough estimates that the County needs to secure funding for its initiatives. This tool is based on PMBOK-defined procedures for estimating while accounting for County-specific processes when developing an estimate. It enables the project manager to define the project work in terms of complexity/risk and a standard list of deliverables and tasks which follow the development methodology selected and client requirements at the early stages of a project. It provides ranges of estimates based on the input and historical estimates and actual effort from past projects. This customized tool takes into account client and Contractor processes and life cycles, and documents decisions and assumptions made for planning. This tool is managed internally, and automates the creation of client-facing deliverables, including the Budgetary Estimate Cover (an authorizing document). The EPMO team tracks performance of estimates to actuals on projects and uses that data to further inform and improve the BOE tool and improve the quality of Contractor's estimates to the County client.

The following table shows additional Contractor automated tools and methodologies.

Contractor Automated Tools and Methodologies

MANAGEMENT TOOLS AND METHODOLOGIES	FUNCTION	
Service Portal	Acts as the single, virtual, and centralized source of information for all County stakeholders and HP. The Portal shall provide access to the following:	
	• Consolidated program reporting • Service levels reporting	Contractual information Contractual deliverables and plans
Project and Portfolio Management Center (PPMC)	• Consolidated project management tool • Budget management and labor billing source • Schedule management • Resource management • Risks and issues management • Project status reporting	

MANAGEMENT TOOLS AND METHODOLOGIES	FUNCTION
County Document Repository (DocVault)	Workspace and final repository for all project-related deliverables and account-wide policies and procedures
Program and Project Management Methodology	Includes templates that outline scope, risk, quality process, personnel, cost, schedule, communication, and procurement management responsibilities
Service Delivery Dashboard and Voice of the Client (VoC)	Provides clients with program performance and enables them to provide direct feedback to Contractor executive leadership

For internal tools such as the above that are used to the support the County's business, Contractor shall conduct reviews of the systems on a semi-annual/annual basis, depending on the tool, to determine whether major upgrades or replacements of systems are required to make certain that Contractor is using the right technology to support the County's needs and remain in supported status.

2.10. Integration and Testing Services

2.10.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall use a comprehensive testing framework that includes the structure, processes, tools, and templates to enable consistent, high-quality testing services and deliverables. Contractor's testing framework shall verify compliance with the application development process and shall validate the quality of the application to address the commitments outlined in the SOW. Contractor shall achieve maximum integration testing efficiency by grouping testers separately from developers.

Contractor shall first work with the County to determine the level of strategy that best meets its needs. Contractor shall review the current strategies, testing requirements, business needs, and priorities to develop the most efficient and cost-effective testing strategy for the SOW project.

Contractor shall supplement and support the project life cycle with the following testing-specific information:

- Testing roles and responsibilities
- Testing methodology
- Test levels to be performed
- Test coverage to be performed for each test level
- Test deliverables
- Test management and measurement approach
- Required testing environments and tools.

Based on the priorities identified in the test strategy, Contractor shall develop a Test Plan that covers each required test level and provides tactical guidance by specifying the following factors:

- **Test Scope** – Scope of Contractor's testing services to be provided, including test types
- **Test Schedule** – Schedule for all phases of testing, integrated with the overall project schedule (test development, test execution, testing metrics collection, and testing reporting)
- **Test Roles and Responsibilities** – Test roles/responsibilities for all participants, including the Contractor team, County staff, and third-party vendor staff; responsibility for test environments and tools
- **Test Design/Methodology** – Test case design techniques/strategy for each test level

- **Test Procedure/Execution** – Test-level execution tasks, including participants, to conduct execution; entry, exit, pass/fail, suspension, and resumption criteria for each test level
- **Test Tracking and Reporting** – Test results data collection requirements, documentation, and reporting; test progression tracking and error/deficiency management/resolution process; risks specific to a test level that require mitigation.

The Contractor Test Plan shall also outline the recommended testing tools and testing management and measurement.

Contractor shall apply and adapt the processes, techniques, and templates of its testing method to effectively manage and control the planning, execution, and completion of all testing activities. Testing management and measurement shall involve the following actions:

- Establishing and maintaining detailed estimates, a test schedule, resource plans, and procedures for all testing phases
- Managing preparation of test plans, scenarios, and test cases for each test level
- Establishing acceptance criteria
- Managing the execution of test cases, tracking and resolving defects, and verifying completion of tests, including regression testing
- Managing testing close-down, including reporting.

To make sure the application is ready to move into production, Contractor shall apply comprehensive metrics, supported by standard testing management tools. Contractor shall generate reports to provide insight into the status of testing throughout the project. With this information, Contractor shall confirm that tests are mitigating risks on high-priority requirements. These metrics shall support timely corrective action and informed decision-making by all project stakeholders, particularly "go/no-go" decisions to progress through project phases.

System testing shall involve testing both an application and its supporting infrastructure. Contractor shall provide system testing to establish confidence in End-User acceptance of the system and that the system is functionally and structurally stable, reliable, secure, and interoperable. System testing shall encompass an integrated system or a logical subset of application functions. It shall verify compliance with functional and nonfunctional system requirements and specifications. The process normally involves creating test conditions for evaluating the application and its infrastructure.

Contractor shall prepare and perform system tests based on approved requirements documents, the application architecture, and the application design specified by the development team. Contractor shall create tests to exercise the specific business functions selected and submit them for County approval. This approach helps to validate that the system performs according to the County's requirements.

System testing shall include testing interfaces with external entities and with batch and online software. All parts of the system shall be available for system testing to succeed. Data shall enter through normal interfaces so Contractor can test interaction between various subsystems. If the County does not have an appropriate testing environment available to accept transactions or files, Contractor may use emulators to simulate interactions with external systems. System test activities shall include the following:

- Test cases, standard and ad hoc
- Test data management
- Requirements Traceability Matrix (RTM)
- Performance benchmarks when applicable
- Summary report.

Contractor shall use automated life cycle management (ALM) tools and techniques as it develops system test cases based on functions and roles. Function-based tests validate the application's functional requirements and

data flows. Role-based tests shall verify access to the application, menus, submenus, buttons, and icons; verify a complete and correct process flow for each defined role; and validate that access covers only specified areas.

The following table describes Contractor's high-level input criteria, activities, and deliverables for test cases.

Contractor Test Criteria and Deliverables

INPUT CRITERIA	• Baselined test scope, strategy, and plan • Baselined effort estimation and schedule • Baselined defect, change, configuration, communication plan, and risk management plan • Baselined and updated Test Traceability Matrix (TTM) Baselined design, business requirements/specifications, and use cases documents
ACTIVITIES	• Identify functional and technical test scenarios • Update affected test case and script • Design new test cases and scripts: review, sign off, and baseline • Define success criteria and expected outcomes • Design test data: review, sign off, and baseline • Collect metrics Update test traceability, arrive at test coverage, and sign off
DELIVERABLES	• Baselined test cases, scripts, and test data • Baselined smoke test suite • Baselined test traceability Sign-off by stakeholder

Contractor shall implement the database approach to test data management.

The RTM shall trace downstream work products of the requirements, such as design, code, and test cases. If an RTM exists, the Contractor testing team shall update it when the initial test design is complete, to map requirements to test cases. If an RTM was not developed, Contractor shall establish one while developing test cases, linking each test case back to the original requirement.

As Contractor executes test cases, it shall document and map any defects it encounters to the corresponding requirements in the matrix. The updated matrix shall provide a running record of how testing has addressed and met each requirement, revealing gaps the testing team needs to fill and opportunities to consolidate redundant tests.

The County shall receive a complete overview of system testing results in a system test summary report, which shall include an overview of the approach, tools, test cases, activities, results, and any outstanding defects.

System integration testing shall confirm that the necessary communications and setup exist to perform functional testing and shall address the need to assess whether the system interfaces smoothly with other applications or systems.

After the development team provides the testing team with the interface code, Contractor shall perform system integration testing. This testing is often the most complex because it normally involves communication and security layers and requires coordination with outside organizations.

Certain applications may involve providers external to the individual SOW. When testing with an external organization, Contractor shall provide that group a copy of all test cases to review to support test coordination and data synchronization. To support external interface testing, Contractor shall work closely with the County project manager to coordinate and cooperate with third-party interface owners.

In conducting performance testing, Contractor shall 1) understand the performance requirements; 2) determine the types of performance tests and the test volumes that best meet those requirements; 3) test the system performance; and 4) ensure the new change does not impact existing functions or systems. Contractor shall also assist the County with performance tuning recommendations to help fix performance-related issues. Contractor's methodology shall include the following actions:

- Identify and scope requirements
  - Performance test requirement analysis, review of volume metrics and performance goals
  - Performance test strategy and planning
  - Arrive at scope effort, cost, and timeline
- Determine performance testing type
  - Load testing
  - Stress testing
  - Volume testing
  - Scalability
  - Failover testing
  - Regression testing
- Review and provide recommendations of performance test scenarios and volume metrics performance goals provided by the project team
- Develop performance test strategy, test plan, and scripting standards
- Set up and maintain the test environment, including build and deployment activities
- Prepare test data for project owner's review before baseline
- Design, execute, and analyze performance test for approximately four performance test scenarios identified and provided by the project team
- Provide required support for the performance tuning team, such as re-execution of scripts to identify replicating issues.

The following table presents detailed performance and load-test strategy.

Contractor Performance Testing

PHASE	INPUT/ENTRY CRITERIA	ACTIVITIES	DELIVERABLES
Discovery Phase (Requirements Analysis and Performance Test Planning)	• Application non-functional requirement specifications (SRS, design specifications, and so forth) • Business scenarios, performance test scenarios, use cases • Performance goals and volume metrics • Release scope • Production environment details	• Conduct requirements study • Determine test scenarios and impact analysis • Identify test scenarios for performance testing • Develop performance test strategy/plan • Derive test environment specifications • Conduct performance test scenarios, test strategy/ plan, traceability, review, and approval	• Performance test strategy/plan • Identified test scenarios for performance testing

PHASE	INPUT/ENTRY CRITERIA	ACTIVITIES	DELIVERABLES
Performance Test Environment Preparation/ Readiness	• Performance test strategy, plan • Tools and licenses • Application builds • Performance test environment • Functional test cases • Performance test scenarios, test cases and test data, sample test data • SRS, design, other specifications	• Set up and configure test environment • Deploy and configure application build • Identify performance testing tools, monitors, installation, and setup/configuration • Test data preparation, review, and baseline • Test environment and build validation through sanity testing	• Performance test environment with latest build • Performance test data • Performance test tools installed and configured
Performance Test Design/ Development	• Performance test scenarios • Identified performance business scenarios • Performance test plan • Test environment with latest stable build • Performance test data • Performance test tools installed and configured • Baselined performance business and test scenarios	• Develop performance test scripting standard • Develop performance test framework • Develop test scripts/test suite (integration of test scripts) • Develop test data files • Identify and review performance test metrics • Review and baseline all above test artifacts	• Performance test framework/ harness • Baseline performance test scripts and test suite(s) and associated test data and configuration files
Performance Test Execution, Analysis, and Reporting	• Performance test strategy and test plan • Test environment with latest stable build deployed • Baseline test scripts • Non-functional requirements (performance goals and volume metrics) • Test environment sanity test and all test entry criteria	• Validate test entry criteria • Execute performance test • Validate test exit criteria • Analyze and report performance test results • Collect performance test metrics • Log and track defects	• Performance test execution status reports • Performance test results, performance issues, bottlenecks, metrics reports • Sign-off report
Performance Tuning Support and Post-Tuning Testing	• Performance test results and reports • Performance test results analysis report and recommendations for tuning • Performance goals and volume metrics • Test entry/exit criteria	• Validate test entry/exit criteria • Provide performance-tuning support • Provide post-tuning retesting of scripts • Conduct result analysis of post-tuning tests • Provide performance test reporting for post-tuning tests	• Post-tuning test results • Post-tuning performance test reports • Final sign-off on performance test report

To identify and correct vulnerabilities before the application goes into production, Contractor shall provide Security Testing Services, which shall make sure the County's applications are protected against exposure to hackers or other threats to their integrity, availability, or confidentiality. Security Testing Services shall help the County achieve the following goals:

- Improve coding and security practices
- Identify and eliminate or mitigate security vulnerabilities in web applications
- Comply with regulatory and reporting requirements
- Test existing applications and quickly address major vulnerabilities
- Cut overall project costs by identifying problems early.

To address security risk levels associated with unique applications, Contractor shall provide vulnerability code scanning and application security testing. Contractor shall work with the County to assess the application risk level, then recommend the types of security testing required.

Contractor shall provide vulnerability code scanning for medium-security-risk applications. First, Contractor shall scan the code to identify critical vulnerabilities, then Contractor shall assist the development team with remediating issues and applying regression testing code fixes to address these vulnerabilities.

Contractor shall provide application security testing in the testing environment for high-risk web applications to uncover security vulnerabilities before moving the application into the production environment. Contractor shall assist the development team with remediation and regression testing of code fixes to address the vulnerabilities uncovered.

Regression testing shall involve selectively retesting previously tested functions and running selected test cases to make sure that new development and defect fixes have not introduced or revealed new faults. Regression testing can occur throughout testing and shall be executed whenever the build changes. It shall occur at all test levels of Contractor's Enterprise Testing Methodology and throughout development.

During test case development, Contractor shall identify candidates for regression testing. Contractor shall then use these cases to test future application releases. The following changes shall typically require regression testing:

- Addition of new business functionality (new modules or sub modules, new business transactions, new business processes)
- Modifications to current functionality (enhancements, defect fixes) for a release
- Implementation of the current application to new locations
- Upgrades to more recent versions of the application or operating system
- Hardware upgrades.

Business regression testing shall focus on the critical, high-volume business processes for all business functions introduced, up to or including the previous software release. Contractor shall build on previous regression tests by adding new scripts with tests based on the last release's functions. Contractor shall focus specifically on known high-risk areas.

Contractor shall provide the option to perform regression testing after completing a major type of testing (such as system testing) but before releasing the application to the next test level.

- Deployment plan for resources and use of facilities

Contractor's key facilities shall be in Rancho Bernardo, CA; El Paso, TX; Pontiac, MI, depending on skillset required.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's testing methodology shall align with the industry-accepted Testing V-Model.

Contractor's risk-based, requirements-driven testing approach includes the following components:

- **Ambiguity Analysis** – While performing requirements validation, Contractor shall systematically analyze ambiguities in the requirements that drive application design, development, and testing to minimize

inconsistencies and maximize clarity. This process helps to meet users' expectations; gives the project team a targeted and complete plan; and builds common understanding of requirements for project managers, developers, testers, and users.

- **Risk Analysis** – Risk-based testing shall focus on analyzing risks to reduce misdirected or incomplete test coverage. Contractor shall systematically analyze requirements to determine the priorities that guide the testing strategy. All stakeholders, including third-party interface owners, are engaged in these analyses. Contractor shall define test environment requirements early in the life cycle.
- **Systematic Test Design** – Through methodical activities focused on managing and mitigating risks, Contractor shall apply test design techniques to plan, choose, and develop the most effective tests to deliver the required amount of testing.
- **Requirements Traceability** – Throughout test development and execution, Contractor shall update the RTM to comprehensively depict test coverage and to keep testing focused on high-risk, high-priority requirements. Because each test case inherits priority from its requirement, the RTM helps the team analyze the testing impact of any requirements changes.
- **Testing Metrics Collection/Reporting** – Contractor shall use testing reports to gain ongoing insight into the progress of tests and defect resolution, and Contractor shall offer timely opportunities for mitigation of a risk before it causes harm to the County's environment – or to the application itself.
- **Testing Close-Down Activities** –Contractor shall focus on satisfying high-risk, high-priority functionality first through risk-based testing, leaving as the last priority tests and defects for only low-risk, low-priority requirements as agreed to by the County. As part of project close-down, Contractor shall either transition the work to the County, as outlined in the SOW, or continue providing maintenance and support.

2.11. Incident Management Services

2.11.1. Process and Procedures

- Description of solution to meet the requirements

As a part of this process, all incidents shall receive prioritized attention, depending on severity, Service Level Agreement (SLA), or the immediate service restoration needs of the County.

Solution: Contractor shall use an IM process that includes ITIL methodology.

Contractor's focus shall be:

- Restoration of service operations as quickly as possible using repeatable streamlined processes and escalation points
- Frequent, clear, and concise communications to End-Users and CTO through resolution
- Minimizing the adverse impact of incidents on the business
- Providing departments and End-Users with a single point of contact (POC) for all incidents reported
- Maintaining portal-based visibility into incidents and trouble tickets with drill down to detailed information.

Contractor shall provide full life cycle IM through its Service Desk and IM functions. The Contractor Service Desk shall act as the initial POC for the identification, categorization, and tracking of all County incidents in its service management system. This system shall provide the efficient assignment of incidents for resolution by the responsible teams and direct access to incident status by County personnel. The system shall also objectively measure accountability for all aspects of the IM process.

- Deployment plan for resources and use of facilities

Incident management shall be supported by the following groups:

- Service Desk
- Service Delivery Managers
- Applications SMEs
- Datacenter SMEs (network, storage, exchange, BUR)
- Local account server team/Infrastructure SMEs
- Desktop and Remote Support Technicians, as needed
- AT&T
- Engineering and Architecture

The majority of the services provided by this process shall be supported by the account team at Contractor's Rancho Bernardo site; AT&T shall provide services from Trade Street site.

Supplemental support for datacenter and other areas supported by leveraged frameworks shall be provided by the account team in Rancho Bernardo. The Service Desk shall provide support from Pontiac, MI.

- Key methodologies and processes in solution including year-to-year continuous improvement

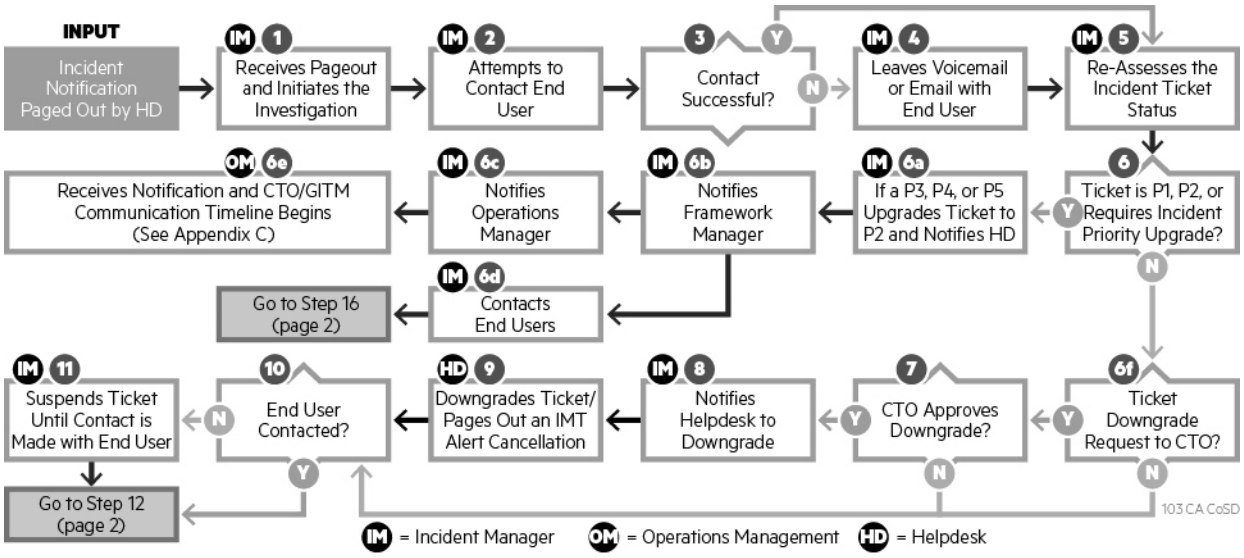
The Service Desk shall serve as the primary point of contact and owner for the identification, categorization, monitoring, and tracking of all County incidents within Contractor's service management system, providing efficient assignment of incidents for resolution by responsible resolver teams and direct access to incident status by County personnel. The system shall also objectively measure accountability for all aspects of the IM process.

The Contractor SDM team shall continually monitor incidents, responses, escalations, and resolution activities through the ticketing system for compliance with procedures and performance objectives. The Contractor SDM shall provide key configuration items (CI) for incident components. During major (high severity/scope) incidents, the SDM team shall actively facilitate status notifications and escalations to all appropriate levels in customer and vendor organizations. Contractor shall provide the right people, processes, and tools to perform comprehensive IM for the County, who shall receive timely responses to questions and issues as they occur and progress through the incident life cycle.

The Service Desk and SDM team shall refine a mature process for full life cycle IM. Each sub-process and step is described in the figure below. This process shall assign Level 1 support responsibility to the Contractor Service Desk, which shall also be responsible for incident recording, categorization, and assignment. The Enterprise SDM shall act as an escalation point and operations orchestrator, helping the County achieve continued high levels of service and End-User satisfaction.

The Contractor enterprise SDM shall be responsible for verifying prioritization and categorization standards for IM processes in collaboration with the County, validating that Contractor records these standards in the policies and procedures and continuously monitor other service providers' compliance with these standards. The Contractor team shall also be responsible for verifying procedures and mechanisms for handling, expediting, and communications of high-priority incidents. These procedures and mechanisms shall be recorded in the Standards and Procedures Manual and also be continually monitored for compliance.

Incident Management Flowchart



The Contractor SDMs shall continually monitor and review incidents within the ticketing system for completeness, accuracy, proper categorization, and timeliness of resolution activities as established by the County and Contractor and defined within the policies and procedures within their respective business groups. Each SDM shall provide operational data and information related to outages and issues, among others, for their respective Business Group. The SDM shall, on a weekly basis, provide reporting of this review to the County Technology Office, operational POCs during the existing weekly Operations status meeting.

Contractor shall continue to document and provide procedures for enhancements related to incident resolution. Scripts, techniques, and step-by-step actions shall be recorded in the knowledge management system, subject to change management processes, for future use by support personnel and End-User access for self-help.

Contractor's IM process shall assign initial responsibility for the identification of problems to the resolving service providers in the problem management process description. If an incident is the result of a change, Contractor shall record the information and refer it to the change management process. If Contractor determines an incident qualifies as a problem, Contractor shall record it in the incident record for referral to the problem management process. Contractor's SDMs shall be responsible for IM and problem management for the business group, and shall verify evaluations performed in this step and escalate incidents to the change and/or problem management process as required.

SDMs shall be responsible for monitoring and managing the entire life cycle of incidents to comply with resolution, status, and notification processes as well as procedure requirements of the Service Desk. As part of Contractor's performance-based management approach to quality assurance, Contractor shall actively monitor and remediate underperforming KPIs and incorporate them into Contractor's continuous improvement process. Contractor shall prepare a quarterly action plan to address service improvement objectives and activities for County review and implementation approval.

Staff and respond to Priority 1 Incidents.

As documented in the County Standards and Procedures, when a Priority 1 incident is received, Contractor shall log it into Service Manager and an electronic alert shall be sent out along with an eNote page to the appropriate

support staff. The SDM on point shall receive the page with the incident ticket number and immediately ensure the frameworks are engaged and have begun work on the issue and preps for customer notification. If services cannot be restored within 30 minutes, a bridge line shall be stood up with all frameworks on the call until resolution of the issue. The SDM shall send the first status to the County End-User and CTO within 60 minutes and the status shall continue every hour until service is restored.

The SDM shall monitor and track the incident ticket to closure and provide all required status communications during the incident life cycle. When a change in the status of the request occurs, the SDM shall determine if the ticket issues have been resolved or if the status change is valid. If issues have not been resolved, the SDM shall continue to monitor and track the request until resolution.

If the ticket issues have been resolved, the SDM shall send out final communication and status and proceeds with next steps based on ticket priority. If the ticket is Priority 1 or 2, the SDM shall make sure that an RCA has been created. When the problem ticket has been completed for Priority 1 or 2 issues or a permanent solution has been implemented for non-Priority 1 or 2 issues, the SDM shall document all the actions taken in the activity fields of the ticket and changes the ticket status to Resolved.

Trend analysis of Incidents to identify and correct recurring Incidents.

The Contractor enterprise problem manager shall be responsible for analyzing quality and reporting trends related to incidents. This analysis shall provide recommendations of appropriate actions to mitigate any negative findings and to propose improvements to drive improved effectiveness and efficiency. As part of the analysis, once a trend is identified, action shall be taken to correct, improve the outcome, or prevent future outages from occurring. These reports shall be provided on a periodic basis. Contractor's proactive method shall include performance-based management and periodic assessments of Contractor KPIs within the IM framework and shall include capturing underperforming mission-critical KPI and SLA metrics, escalating them as necessary, and displaying them on the EPMO status dashboard. Contractor shall also use this data to identify and substantiate trends relating to similar incidents or contributing to problem recurrence, and developing solutions to address chronic issues. Contractor shall continually assess these indicators to identify negative trends. Contractor shall continue to conduct RCAs where necessary and take appropriate remediation steps to improve the KPIs and positively influence performance trends; thereby ensuring year-to-year continuous improvement.

RCAs

Contractor shall implement the following:

- Once Priority 1 and Priority 2 incidents are resolved, the RCA manager shall enter information into an RCA Submittal Form and submit it to the appropriate SME and framework manager.
- Once received, the Contractor technical SME shall:
  - Gather additional data from other framework SMEs as needed
  - Determine the chronology of events and causes
  - Determine any underlying root and contributing causes and how they manifest
  - Complete the RCA and develop corrective action items/recommendations
  - Complete the RCA Submittal Form and submit findings for Peer and Tower Management Review
  - , submits the findings to the RCA manager once the SME findings have passed Peer and Tower Management Review
- After receiving the findings, the RCA manager shall schedule a formal review by the Contractor RCA team.
- The Contractor team shall then determine if the RCA is complete and, if so, shall address all concerns. The RCA manager shall conduct a final Quality Review and submit it to the RCA team for their final review. On final approval, the RCA shall be submitted to the CTO RCA representative for final disposition.
- This process shall be completed within 6 business days of the final resolution of an incident ticket or receipt of an ad hoc RCA request from the CTO.

- For RCAs related to an outage that is business group specific, the SDM shall make sure all required information is gathered and provided.

Corrective action items that are not completed as a part of the incident resolution in the RCA shall be documented in the Problem Management SharePoint site with an owner and date of completion assigned. This system shall have automatic email alerting assigned to it for the POC to make sure items are completed as required. The Enterprise Problem Manager shall be responsible for validating and verifying that all items are completed on the site within the timeframe that is documented. The HPSM (HPE Service Manager) system shall provide a problem case number for all corrective action items and problems being worked that do or do not have a RCA as a requirement. These Problem cases shall make sure that Contractor has complete tracking and a connection between the incident and the change records required to act on the items that need to be addressed. These cases shall not be closed until all activities are completed and documented.

Detailed processes shall be documented in the Standards and Procedures Manual.

2.12. Problem Management Services

2.12.1. Process and Procedures

- Description of solution to meet the requirements

Problem management shall require the investigation of root causes to memorialize occurrences in the Contractor knowledge repository and eliminate future occurrences wherever possible. The process shall also make sure that corrective actions and resolutions are implemented through the appropriate control procedures, such as change and release management. Active incidents and problems shall be documented at every step and the status shall be accessible for End-User review through the Service Portal.

As Contractor has in place today, problem management systems shall also maintain information about problems and the appropriate workarounds and resolutions, so that the organization is able to reduce the number and impact of incidents over time. Although incident management (IM) and problem management are separate processes, they are closely related and typically uses many of the same tools and data points.

Solution: Contractor is assigning a single service delivery manager (SDM) per business group to act as a single point of escalation and communication. Moving forward, Contractor shall take steps that further enhance the ITIL framework, putting more formalization around this process in an effort to continue improvement and to maintain environmental stability.

Problem management shall be under the purview and responsibility of SDMs who shall make sure that all problems are resolved, including root cause determination when necessary. Contractor shall additionally make certain that all problem-related activities be reported and recorded, archived, and made available to County stakeholders.

Rationale:

Problem management shall be a daily responsibility for the SDMs and shall be assigned activities to work—whether it be proactively or through tickets, escalations, or other similar activities. Contractor has an enterprise problem manager who shall report, track, and communicate all problem management issues worked by the team and the account via the weekly CTO operations status meeting.

- Deployment plan for resources and use of facilities

The majority of the services provided by this process are supported by the account team at Contractor's Rancho Bernardo site.

Data center and other areas supported by leveraged frameworks shall provide supplemental support.

The Service Desk provides support from the Pontiac, MI facility.

AT&T provides services from Trade Street site.

- Processes in solution including year-to-year continuous improvement

For Contractor, a problem is any event that has the potential to inhibit the County's ability to perform a business function. Contractor shall provide well-defined processes, key performance indicators, and mature IT tools to alert Contractor's integrated delivery teams when conditions indicate the potential for a problem to occur. Contractor's main goal is to minimize or prevent service degradation to the County's end so the County can continue to perform its duties and service the public unimpeded. Contractor shall train all program team members of these processes, best practices, and lessons learned are shared to maximize effectiveness, promote reuse of knowledge, and optimize project timelines.

Problem Management Techniques and Controls

As a standard practice, Contractor shall conduct enterprise-level delivery reviews weekly to share experiences across the IT services and cross-functional frameworks to identify and mitigate risks.

Recognizing Problems - Contractor uses a methodology-based approach to recognize, address, and correct problems that may arise throughout the IT organization. Contractor's approach combines proven problem management methods and processes, such as root cause analysis, with open communications, transparency, and continuous/iterative feedback. Contractor shall proactively analyze, measure (through leading indicator KPIs), and monitor performance through these multiple channels to increase the probability of identifying and mitigating risks and issues early, before they manifest as incidents or problems.

Correcting Problems – The appropriate SDM shall oversee corrective investigations and problem remediation by designated support representatives. Contractor shall use incident or trouble ticket input as well as procedure manuals, knowledge databases, and other tools to resolve the problem. The SDM shall determine if a workaround can be provided or identify a permanent solution to the problem. Once a workaround or permanent solution is determined, the SDM shall decide on the change needed to implement the workaround or solution. If a Request for Change (RFC) is required, the SDM shall create an RFC. If an RFC is not needed, or after the RFC has been approved, the SDM shall determine whether the implementation of the workaround or solution requires infrastructure support. If needed, the SDM shall create an Infrastructure RFC in Service Desk and link it to the incident.

Resolving Problems among Team Members. If an identified problem threatens the program quality or cost, Contractor shall address the subcontractor directly responsible for the area of nonperformance. In situations where overall contract performance is at risk, Contractor shall issue the subcontractor a written notice specifying the areas of nonperformance.

Subcontractors and the Contractor management team shall meet regularly to discuss overall contract performance. These meetings serve as important forums to identify and resolve potential problems. Open and extensive communication among team members fosters a cooperative atmosphere in which Contractor can jointly resolve problems at an early stage.

Proactive Communications. Contractor's SDM shall maintain transparency with the County through regular communication, reporting on problem progress, and facilitating meetings. The SDM shall be accountable for

maintaining the relationships, monitoring subcontractor performance, identifying training needs, and escalating issues that require higher levels of attention.

Staff, address, and remediate systemic and/or recurring problems.

Contractor shall assign an SDM—and an enterprise problem manager—to be responsible for addressing and remediating systemic/chronic or recurring problems. If necessary, this shall be preceded by an in-depth analysis of an issue such as trends associated with tracking Service Desk tickets. Actions can include the use of Cascade to isolate an issue, or creation of a pan-framework tiger team to address chronic or recurring problems.

Trend analytics to identify and correct recurring problems.

The Contractor enterprise problem manager shall be responsible for analyzing quality and reporting trends. This analysis provides recommendations of appropriate actions to mitigate any negative findings and to propose improvements to drive improved effectiveness and efficiency. As part of the analysis, once a trend is identified, action shall be taken to correct, improve the outcome, or prevent future problems from occurring. Contractor proactive method includes performance-based management and periodic assessments of Contractor's KPIs within the problem management framework. Contractor efforts shall include capturing underperforming mission-critical KPI and SLA metrics, escalating them as necessary, and displaying them on the Enterprise Project Management Office (EPMO) status dashboard. Contractor shall use this data to identify and substantiate trends relating to similar problems or contributing to problem recurrence, and develop solutions to address chronic issues. An integral component of Contractor's continuous improvement process, Contractor continually assesses these indicators to identify negative trends. Contractor shall continue to conduct root-cause analysis where necessary and take appropriate remediation steps to improve the KPIs and positively influence performance trends; thereby ensuring year-to-year continuous improvement.

Root cause analyses (RCAs) to remediate identified Incidents and Problems.

Contractor shall use problem-oriented RCAs to determine underlying causes, identify appropriate resolutions, document findings, and provide recommendations to prevent recurrence of the problems.

5 Whys and the Fishbone Process

The 5 Whys can be used individually or as a part of the fishbone (also known as the cause and effect or Ishikawa) diagram. The fishbone diagram helps Contractor explore all potential or real causes that result in a single defect or failure. Once all inputs are established on the fishbone, Contractor can use the 5 Whys technique to drill down to the root causes.

Steps to Complete the 5 Whys

- Write down the specific problem. Writing the issue helps you formalize the problem and describe it completely. It also helps a team focus on the same problem.
- Ask why the problem happens and write the answer down below the problem.
- If the answer you just provided doesn't identify the root cause of the problem that you wrote down in Step 1, ask why again and write that answer down.
- Loop back to Step 3 until the team is in agreement that the problem's root cause is identified. Again, this may take fewer or more times than five Whys.

2.13. Change Management Services

2.13.1. Process and Procedures

- Solution to meet the requirements and the rationale

The change management process itself is the sequence of steps or activities required to implement County-approved changes into the environment and verify the outcomes are as intended. ITIL methodology is the foundation that Contractor shall provide for change management. Overall, Contractor is an advocate and champion of successful change management as an integral component of Contractor's cross-functional management processes and best practices.

Solution: The foundation of Contractor's change management approach shall be its ITIL certified processes, of which change management is an integral component. A key element of the approach shall be assigning a single service delivery manager (SDM) per business group to act as a point person and to monitor changes that may impact that space. SDMs shall be responsible for making sure that proper communication and discussions for that framework take place and that resources are available to support the RFC owner for testing/validation.

- Deployment plan for resources and use of facilities

Operating out of its Rancho Bernardo facility, the Contractor Change Manager shall implement and sustain repeatable, methodically driven change management processes and best practices. Timely, accurate, available stakeholder documentation is an integral part of the change manager's activities, which Contractor shall coordinate with County counterparts.

- Key methodologies and processes in solution including year-to-year continuous improvement

The Contractor IT Change Management Suite and Services shall support multiple types of change requests and mitigate the risks associated with potential requests. The Change Management Suite shall integrate change processes into the broader ecosystem in a cost-effective way, providing full and open transparency and progress reporting. Contractor's Change Management Suite tool shall assist in the continuous improvement needed in this framework, shall greatly enhance configuration visibility and stability, as well as monitoring the type and frequency of upgrades that may be required.

Contractor IT Change Management shall be part of an integrated set of ITSM process modules for Service Manager.

The Contractor IT Change Management Suite shall come with embedded, out-of-the-box IT Infrastructure Library (ITIL)-based best practices. It shall create mechanisms for measuring change process workflows, automate impact analysis, and enhance Change Request Control Board (CRCB) virtualization. Additional efficiencies include reduction in total time needed to process changes, a benefit provided by enabling the changing of approvers via smart phone. This feature shall facilitate approval of changes anytime, anywhere.

The Contractor IT Change Management Suite shall provide the County the option to create standardized and repeatable workflows. The suite shall include built-in best practices with associated industry-standard workflows, forms, and documentation. The suite shall create, modify, and reuse change processes, enabling continuous service improvements. With the Contractor IT Change Management Suite, different change types shall follow different paths. Pre-approved changes for standard requests shall be expedited while others follow a normal/conventional completion process. Scriptable and repeatable processes, including release management, provide the foundation for reducing risk and enhancing the benefits associated with change.

To help County visualize the end-to-end process, the Contractor IT Change Management solution shall provide a graphical workflow interface. The County shall be able to design, modify, and visually monitor multi-level

processes. The solution shall expose every element of a change process—people, assets, timeframes, tasks, phases, and notifications—in clear, visual terms.

Through the Contractor IT Change Management Suite, the County shall be able to coordinate change activities across users and CRCB members, decision-makers, and other stakeholders involved with the change process. The County shall also be able to enable the suite to send automatic notifications to parties regarding potential changes affecting their respective systems.

The County shall additionally be able to assign, execute, and track CRCB action items, discussion threads, impact assessments, and voting. The Contractor IT Change Management Suite shall also automate potential collision detection, impact analysis, and risk assessments of change to the business. Moreover, the County shall be able to virtualize CRCB functions to enable decisions outside of actual meetings, increasing meeting effectiveness.

The Suite shall also include a global forward schedule of change that brings change requests together into a unified common view, providing improved visibility and planning. Change calendars shall be based on multiple views—including an Outlook-style calendar with timelines by month/week/day/hour, by application, and by implementer. This feature shall provide insight into the impacts, collisions, and comments of every change request. In addition, the Contractor IT Change Management Suite shall assign and track change windows, freeze periods, and business events, giving the County better control over when changes are implemented.

Contractor Service Manager solution and the Contractor IT Change Management Suite shall share configuration and dependency information found in an ITIL-aligned configuration management system (CMS) built on the Contractor's Universal Configuration Management Database (uCMDB). The Suite shall automatically and continually perform impact analysis, risk assessment, and collision detection on all change requests. Impacts and collisions shall be based on infrastructure and application relationships, but they can also reflect timing conflicts in personnel schedules (for example, the people responsible for implementing changes).

The Suite shall flag all impacted configuration items, potential applications, and associated business services using dependency mapping information. It shall also compare new change requests to all other pending requests within the same timeframe, and shall identify potential collisions that could result in downtime and rework. The Suite shall calculate a score based on multiple criteria—including historical outcomes of similar changes—for more accurate risk assessment.

As part of the overall Contractor's Service Manager solution, the Contractor IT Change Management Suite shall be tightly integrated with other ITSM processes and modules—from the logging of change requests through implementation, evaluation, and closure. This shall include integration with catalog, request, incident, problem, configuration, and service-level management components of Contractor Service Manager.

The companion Service Manager Service Catalog and Request Management modules shall provide integrated front ends into the change process.

Contractor Service Manager shall provide dashboards and reports that shall be easily customizable to provide managers and County leaders with quick and concise views into the overall status of the change process while enabling drill-down access to more detailed information.

The complete change process—from assembling requests through implementation and execution of change—shall be automated to speed the delivery time for standard change requests. Contractor shall integrate Contractor Operations Orchestration to enable faster RFC creation, change execution and provisioning, and closed-loop validation.

The Contractor Service Manager knows the "managed" state of configuration items (CIs)—or the state in which a CI is expected to be. The Contractor Universal CMDB with discovery and dependency mapping information shall maintain the "actual" states. After a change has been implemented, the managed and actual states shall be compared to validate that a change was successfully completed. In a similar manner, when a configuration item

changes, the Contractor IT Change Management Suite shall compare this actual state of a CI against the record of change requests. Any change that does not have a corresponding change record shall be identified and addressed appropriately—by methods such as creating an incident or a new RFC.

The Contractor IT Change Management Suite shall enable Contractor and the County to establish effective IT process controls for change and configuration management. The built-in best practices based on ITIL shall align with common auditing frameworks such as Control Objectives for Information and related Technology (COBIT).

County involvement in the Change Management process.

All changes shall go through a formal change approval process as follows:

- When a change is desired, the change initiator shall complete an RFC ticket.
- The RFC shall be reviewed in the internal Technical Approval Board (TAB) review before it is released to County stakeholders.
- The RFC is submitted to the CRCB, which consists of both Contractor subject matter experts (SMEs) and County CTO representatives.
- The CRCB shall review the RFC and approve or disapprove the change.
- If the change is approved, the change initiator shall be notified as well as County end-users, and a Change Release shall be initiated.
- The Change Release shall be monitored through implementation and closure.
- A Post Implementation Review (PIR) shall be completed for each change at the completion of the RFC.

Metrics to measure the effectiveness of changes and conduct continuous improvement of the change management process.

Contractor shall continually assess these KPIs to identify negative trend lines. Contractor shall conduct root-cause analysis where necessary and take appropriate remediation steps to improve the KPIs and positively influence performance trends, thereby facilitating year-to-year continuous improvement.

2.14. Release Management Services

2.14.1. Process and Procedures

- Description of solution to meet the requirements

In practicing release management, Contractor shall combine the general business emphasis of traditional project management with a detailed technical knowledge of the system development lifecycle (SDLC) and ITIL practices. Contractor shall operate release management services in accordance with these practices, in complete transparency and collaboration with County stakeholders.

Solution: While the enterprise release manager on the account shall be responsible for tracking and logging all releases, the SDM for each business group shall perform this critical role. The SDM shall be responsible for understanding, monitoring, and assisting in the communication of these releases as they are completed in their respective business group.

In addition to the release review meeting that the release manager shall hold with the Contractor and County stakeholders, releases shall be reported in regularly scheduled meetings that the SDM shall be required to attend that fall within the scope of their duties. The SDM shall understand all information related to releases affecting their respective business group, bringing in SMEs if additional information is required.

Release management shall fall under the governance of the CRCB, which shall consist of both Contractor SMEs and County CTO representatives. All configuration items distributed into production shall use a formal release management process. Contractor shall develop a Release Plan that outlines the release schedule, content of the release, and back-out plans. Release management shall work with configuration management to make certain that the Definitive Software Library master IT configuration items remain current.

Rationale: The enterprise release manager shall be responsible for continuous improvement and shall work in collaboration with the County to facilitate the continued effectiveness of the process. Contractor's SDMs shall be responsible for understanding the releases and how they impact their respective business group. Contractor release managers shall be responsible for providing adherence to SDLC, ITIL, and Contractor best practices. They shall verify the completed release process is thoroughly documented and communicated to County stakeholders.

- Deployment plan for resources and use of facilities

The enterprise release manager shall work out of Contractor's Rancho Bernardo site.

- Key methodologies and processes in solution including year-to-year continuous improvement

The accuracy and diligence that Contractor provides in software configuration management (SCM) shall be realized by relatively issue-free releases, as Contractor moves into production and provide a stable, sustainable, and predictable release.

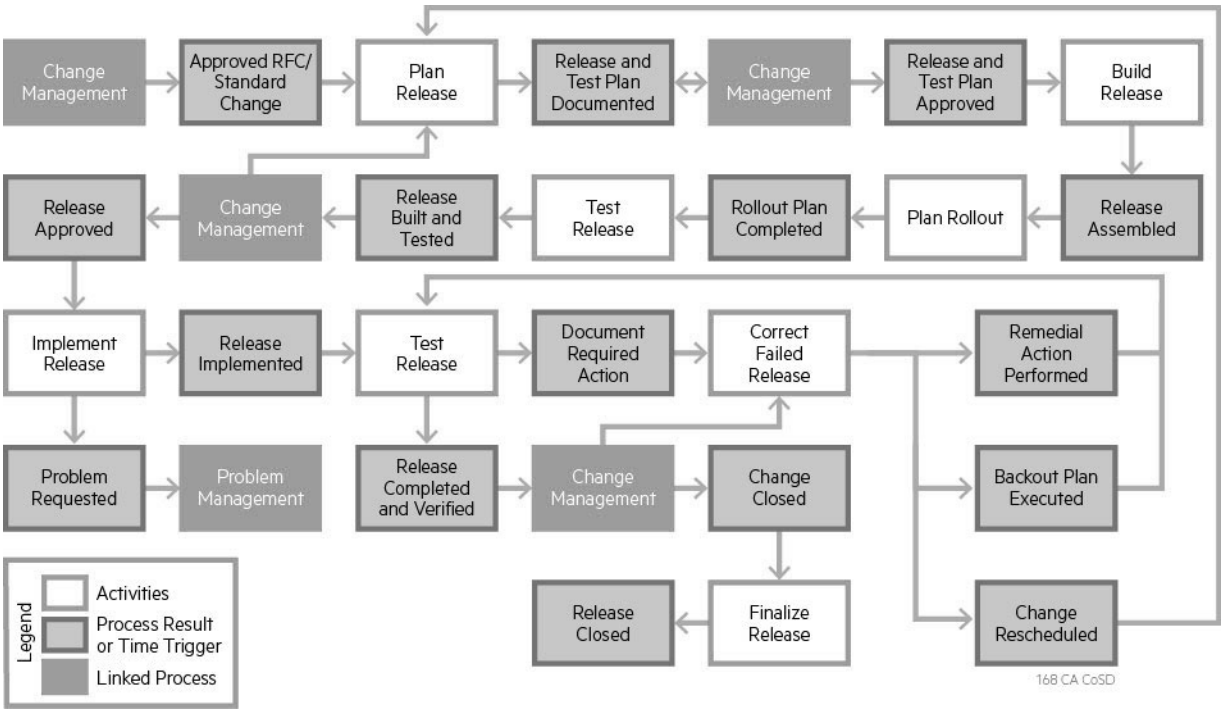
Release management is the process responsible for planning, scheduling, and controlling the movement of releases to test and live environments. Its primary objective is to protect the integrity of the live environment and to make sure that the correct components are released.

Deployment is the activity responsible for movement of new or changed hardware, software, documentation, and processes to the live environment. The term "rollout" is most often used to refer to complex or phased deployments or deployments to multiple locations. Specific objectives of the process shall be as follows:

- Aligning, coordinating, and communicating release and deployment plans with County projects.
- Successfully building, installing, testing, and deploying a release package to the target environment along with the necessary documentation and training.
- Making certain that the new or changed service and underlying infrastructure are delivered to the agreed service level, providing the service utility, warranty, and level.
- Keeping to a minimum the impact on production services, operations, and support staff and business in general.

The following figure illustrates the Contractor standard release process.

Contractor Release Management Process



Proven process makes sure changes are effectively communicated, properly tested, and configuration controlled.

Contractor shall bring the change management process and shall align with and embrace the County's release management policy.

2.15. Configuration Management Services

2.15.1. Process and Procedures

- Solution to meet the requirements

Configuration Management (CM) is the detailed recording and updating of information that describes an organization's hardware and software. The tools are as follows:

- Apps Manager – Application related information
- Enterprise Server List (ESL) – data center hardware information (severs/storage/network/etc.)
- Asset Manager – Desktop-related asset information
- Endevor – Mainframe
- Serena – Archived source code related to applications
- Team Foundation Server (TFS) –Current source code solution
- AT&T data

Contractor shall adhere to the current Contractor-provided Configuration Management Plan, which supports/requires close customer collaboration and governs Contractor's activities related to CM.

Solution: Contractor shall provide a Configuration Management System (CMS) and multiple CMDBs, accessible through the Service Portal that supports activities associated with recording, tracking, updating, and disseminating the County's configurations for all assets, including network assets. The CMS integrated across the organization and service frameworks shall support all logical configurations of hardware and software for the services. The CMS contains mappings to physical configuration, inventory data of hardware and software; Contractor shall use it to analyze trends as well as manage and reduce incidents and problems. The Service Portal shall display all information related to all assets from each tool mentioned above.

Contractor shall continue to provide software configuration management (SCM) via Apps Manager for the County of San Diego portfolio applications. Contractor shall make available the version control history as well as current versions of portfolio code and artifacts, including application code, software tools, and artifacts. Application SCM is part of the program CM and conforms to those policies and procedures.

Discrete item identifiers shall be associated with all configuration items (CIs). Applications' CIs include source code, compiled and/or linked code, packaged code, development environment tools, and any related documentation such as End-User manuals, test scripts, test results, project management documentation, architectural drawings, run books, and helpdesk scripts. Contractor SCM shall provide physical and logical online libraries for the CM of all software CIs. Contractor shall provide hardware-related information from ESL, which is where data center related equipment is tracked and controlled, and Asset Manager, which includes desktop-related hardware items. Contractor SCM is integrated with hardware configuration management data via a feed from ESL to Apps Manager.

Contractor SCM shall provide three libraries for applications code: two based on platform and one for vendor-delivered media. While Mainframe code resides in the legacy Endevor library on the mainframe, Windows and midrange code reside in TFS. More than a version control system, TFS uses a SQL Server database as a means of scaling to large environments and infrastructures. TFS shall be the key component in the life cycle platform, which enables third parties, customers, and solution providers to extend the base functionality with new features and customize the tool for unique County requirements and initiatives.

Contractor SCM shall manage third-party vendor code to include contracted code, public domain, purchased, and commercial off-the-shelf (COTS) packages. Third-party vendors shall use TFS for development of all applications CIs, unless a program-approved provision is in place for offsite development for that application. Third-party vendors shall make certain all code and artifacts are delivered in accordance with the Agreement. Contractor SCM shall review the third-party SCM practices and place the vendor deliverables under configuration management for the program.

Contractor and County-contracted third-party vendor code developed or maintained offsite shall follow County security and Contractor SCM standards. Purchased, public domain, and COTS software packages shall be implemented following County security requirements.

Rationale: Contractor's cross-functional configuration managers shall be responsible for understanding the interrelated and complementary CM requirements and best practices, and how they impact different frameworks and the greater IT organization. Cross-functional configuration managers shall be additionally responsible for making sure that proper communication and discussions for framework take place and that resources are available to manage and support all CM activities including reporting and portal accessibility by County stakeholders.

- Deployment plan for resources and use of facilities

CM personnel shall operate out of the Contractor's facility in Rancho Bernardo. AT&T personnel shall operate out of their facility on Trade Street.

- Key methodologies and processes in solution including year-to-year continuous improvement

Central to IT Service Management is a CMS and a set of core Service Management tools and databases that provide data to other ITIL or IT Service Management processes to deliver and support IT services throughout the County. The CMS comprises one or more CMDBs that collect and consolidate data from multiple sources into an aggregated view critical for timely and accurate decision-making.

TFS, for example, is a commercial software product specifically designed for CM administration that has been deployed at the County. All types of events that result in software or environment configuration changes shall be documented and tracked from initiation to closure.

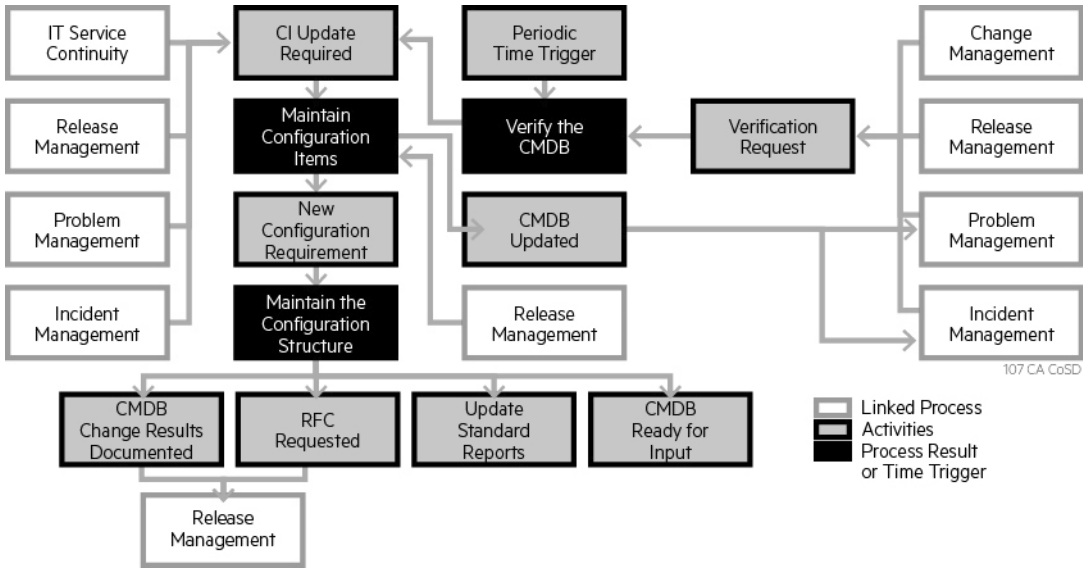
The primary purpose of CM at the County shall be to make certain that product attributes and technical baselines of all software and systems in use by the County—collectively known as configuration items (CIs)—conform to the documented design for each released software version. This shall include the means to document, track, and audit all design decisions and design modifications as well as software and environment build processes that verify the as-built software and host environments exactly match the intended design. CM is an activity that spans many groups across the organization, including management, requirements, process controls, tracking data, development, software tools, archival records, audits, and testing.

County CM shall include two primary teams that handle the bulk of the day-to-day CM tasks. Contractor shall perform this function and is primarily responsible for verifying that development proceeds according to the organization's documented CM rules. This group, with responsibility for the customized controls and rules, shall document and implement CM processes in a manner that is visible to all personnel; this group shall also make certain that released versions of County software products match the required and scoped content planned for that release. This group shall handle most CM status accounting functions and audit report functions, which are heavily automated through TFS. The second group is a development support team, whose duties shall include maintaining a fully versioned source code repository for each of the major County systems; developing automated build processes; building automatic installation packages; and providing software deployment across development, test, and production environments.

All modifications to this plan must obtain signoff by the County before going into effect. Additionally, quarterly quality reviews shall be conducted on the enterprise CM process, and results shall be reported to the County. Process End-User feedback and technology enhancement shall be used to continually improve the process.

The following figure depicts Contractor's standard CM process.

Figure 1. Contractor's Standard Configuration Management Process



Delivering quality ITIL-based CM processes that the accuracy, currency and visibility of CIs

Solution for the integrated configuration management database that covers all Service Frameworks.

Contractor's integrated CMDB shall record various CIs along with their attributes and relationships on behalf of the cross-functional service frameworks. Comprised of various framework CMDBs, the integrated CMDB and View shall be organized by framework and other key attributes. This shall enable individual CMDB CM administration as well as composite or service-wide CM. The Contractor configuration manager shall be responsible for the integrated databases.

Processes to maintain currency and accuracy of the integrated CMDB.

Contractor shall deploy auto-discovery tools to maintain accurate and current CMDB CI information.

Contractor shall proactively engage at all levels to make sure that the IT services it provides and sustains are optimal to meet the County's current and evolving needs. Contractor shall collaborate with the County to provide and respond to the "over-the-horizon" view, which shall include at a minimum vigilantly monitoring asset inventories and software upgrades. Contractor shall make sure all iterations are captured and stored in CMDB and that County stakeholders are made aware of any anomalies or issues.

2.16. Capacity Planning and Performance Management Services

2.16.1. Process and Procedures

- Description of solution to meet the requirements

Solution: Contractor's capacity planning and performance analysts shall collaborate with appropriate stakeholders in determining the resources required and make sure the performance or availability constraints shall not

adversely affect County business. Response times and quality of services for End-Users shall be used as input and relevant data points to these decisions and performance assessments.

Contractor shall provide hardware, software, and configuration updates to servers, storage, desktops, and network so that the capacity maintenance and management is performed. The process shall involve the assembly of accurate reports of shortfalls, analysis of those shortfalls, and development of a solution to solve any capacity items that do not meet the goal. Contractor shall employ a cross framework process for ongoing proactive anomaly detection that involves representatives from all frameworks. The solution shall be implemented using existing data center procedures that may include County change approval. Virtual server implementation requires reconfiguration and can be done quickly, while implementation of physical servers may require the installation of new hardware, software, and/or configuration items. Changes recommended and approved shall be processed through the change process for implementation. After implementation, the responsible framework shall verify the effectiveness of the solution.

Contractor shall develop the Annual Capacity Management Procedures (ACP) as a key component of the Contractor solution. The purpose of ACP shall be to forecast County IT capacity and performance requirements on an annual basis and reaching forward. The ACP shall balance needs over the long term to optimize the resource workload expected in coming years. The primary inputs to the ACP process shall be historical performance information during the past year and the CTO technical roadmap, so that the forecast encompasses all data needed to meet immediate and extended future capacities and all service levels.

The output from this process shall be the projections for the next 2 years of IT capacity necessary to support the forecast, including identification of OS upgrades required to support the forecasted capacity.

The initiation of the ACP for report delivery to the County for review and approval shall begin during the mid-October timeframe.

The cross-functional capacity and performance management process shall assemble the prior year's historical information, including business forecasts, and shall generate the forecast during the planning period, including identifying OS upgrades if required.

The ACP shall be used to tune the performance management process for the new workload, and to selectively identify problems/opportunities that are to be undertaken as projects to mitigate some of the workload. The performance management process shall collect current system capacity and/or performance data and perform predictive analysis to identify the current capacity limits. This data shall be stored and used in annual capacity planning as historical information.

New desktop hardware technology shall be reviewed annually by desktop engineering. Capacity and performance specifications for desktop hardware and desktop applications in use or planned shall be reviewed with vendors to accommodate current and future County requirements and expectations. A report of recommendations shall be presented and reviewed with the CTO. The information collected throughout the year shall be incorporated into the ACP, providing adequate desktop services to maintain service delivery.

Rationale: Contractor's capacity planning and performance analysts shall be responsible for understanding the interrelated and complementary requirements, and how they impact different frameworks and the greater IT organization. In addition to discovering and analyzing critical touch points and KPIs, Contractor analysts shall thoroughly document and report their findings and activities and make the information available to County End-Users through the Service Portal.

- Deployment plan for resources and use of facilities

The positions required to provide capacity planning and performance management services are capacity planning manager and IT capacity planner. These personnel shall reside in Contractor's Rancho Bernardo facility. Network capacity planning shall be augmented by AT&T operating out of its facility on Trade Street.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor capacity management shall be an ITIL-compliant service that helps prevent business disruptions by proactively managing system use and capacity.

Contractor shall proactively and continually monitor capacity so that availability does not fall below 75% and potentially result in degraded performance and a net-negative impact to the business. Contractor shall also monitor and identify capacity usage, possibly indicating architecture design or program configuration anomalies.

Capacity management shall make sure the County IT infrastructure is ready to meet the demands of users at agreed operational levels today and that IT services have the capacity to support future requirements. This shall be accomplished through collecting, analyzing, and reporting on capacity statistics and assessing the impact of County-planned projects. Contractor shall work closely with County to plan and budget IT capacity based on changing business requirements, as well as recommend improvements for optimization of infrastructure investments.

Contractor shall provide the County with data collected through automated reporting with an analysis of in-scope components' capacity consumption. A collection of reports shall display standard component utilization metrics, such as memory and CPU capacity.

Contractor shall group, and trend by day, all data for a single calendar month or monthly for the past 12 months.

County employees with access to the Service Portal shall be able to view the capacity reports at will, giving them the freedom to access data and reports as required. County employees shall be able to export reports to Adobe Acrobat, MS Excel, MS Word, or Rich Text format, enabling further analysis, combining with other data, or including in presentations and other documents.

Using automated scripts, Contractor shall extract use data monthly from data collection servers and load it into the capacity management application. On a monthly basis, Contractor shall produce a forecast report using historical data that is trended over 12 months. Graphs include installed, usable, and forecast capacity data points.

The capacity management process shall rely on the key concept of a capacity management plan, which is a calendar-based data store that keeps track of workload identities, forecasts, and resource access quality of service requirements; resources that are associated with a pool; and assignments of workloads to resources. As a calendar-based data store, the plan shall keep track of such information as a function of date and time and uses it to support capacity planning.

"Configure resource pool size" shall be used to reduce capacity fragmentation by periodically repacking or consolidating workloads in a pool. "Find placement" shall balance loads, dividing them evenly across resources. It has two stages—if no resource is able to support the resulting capacity requirements, then Contractor shall attempt a larger scale rebalancing of workloads, adjust workload quality of service requirements, or combine the two approaches. "Add workload" shall report whether a placement can be found for a new workload.

Monitor, analyze and optimize capacity and performance in a virtualized data center.

Contractor shall provide capacity planning and performance optimizations as follows:

- Virtualization involves a different level of abstraction, where the relationship between shared resources is in a constant state of flux. Although enterprises view the supply side of capacity planning as pools or clusters of virtual resources, they must also understand which cluster or pool to use for an application and the broad impact on a virtual environment. For example, Contractor's virtualization specialists shall determine which clusters or pools need more resources as well as how updating virtual resources affects other resources. They shall make recommendations on how to deal with virtual machine (VM) sprawl (a proliferation problem), and when to reduce VM resources if Contractor believes they may be needed soon, but not currently.

- Although capacity planners have always been concerned about waste (or how much oversupply to have in reserve), the concept takes on new meaning in virtual environments, where the ease with which VMs and applications can be created has led to VM sprawl. Depending on the environment, waste due to VM sprawl can be considerable. Without proper insight into consumption requirements, enterprises risk vastly overestimating the resources needed to support their virtual environment.
- VMs do not exist in isolation; they run complex (often multi-tiered) applications that support many lines of business. Being able to profile how applications and business departments use (or potentially waste) the underlying physical resources is key. Even without a formal chargeback process, organizations need to understand how resources are being consumed so budget considerations can be calculated and sensible use of resources can be encouraged to meet demand.

Contractor VM specialists are experienced in VM environments and demand nuances, and share this experience and expertise with Contractor's capacity planning and performance analysts to make sure County virtual environments are accurately planned, used, and measured. Contractor shall proactively and continuously monitor capacity so that availability in the virtual environment does not fall below 75% and potentially result in degraded performance and a net-negative impact to the business. Contractor shall also monitor and identify capacity usage, possibly indicating architecture design or program configuration anomalies. Should virtual capacity or performance require additional resources, Contractor shall immediately substantiate and initiate appropriate requests and notify appropriate stakeholders.

Once virtual environment considerations are factored in to the demand and use parameters of capacity planning and performance optimization, normal activities shall make sure the following occurs:

- Contractor shall use an ITIL-compliance capacity management service that helps prevent business disruptions by proactively managing system use and capacity. Making sure the right capacity is always available can mean increasing capacity based on County business and IT needs, or reducing or reallocating capacity so the County pays only for the hardware, software, and support needed.
- Capacity discovery shall occur through collecting, analyzing, and reporting on capacity statistics and assessing the impact of the County's planned projects. Contractor shall work closely with the County to plan and budget IT capacity based on changing business requirements, as well as recommend improvements for optimization of County's infrastructure investments, including people, processes, and tools.
  - Contractor shall extend this environment with sufficient capacity to accommodate increased workloads to include a new purpose-built Managed Private Cloud (MPC) environment. The MPC environment shall be a highly standardized environment with high-redundancy and scalability.
- Utilization reporting shall use data collected through automated reporting to provide an ongoing understanding and analysis of in-scope components' capacity consumption. A collection of reports shall display standard component utilization metrics, such as memory and CPU capacity. The lowest level of detail shall help with capacity planning and management.
- The capacity trend reporting feature shall provide more advanced reporting capabilities than the standard use report. Using automated scripts, Contractor shall extract use data monthly from data collection servers and load it into the capacity management application. On a monthly basis, Contractor shall produce a forecast report using historical data that is trended over 12 months. Graphs shall include installed, usable, and forecast capacity data points.

- Use of Tools

The automated tool Contractor shall use to provide capacity planning is Contractor's Global Delivery Capacity and Performance Management (GDCPM) tool. This is a data warehouse that shall include database, storage, telecom, and networks. Other types of infrastructure data include system/server capacity management (forecasting and trending) metrics, availability metrics, and Performance management data.

2.17. Disaster Recovery Management Services

2.17.1. Process and Procedures

- Description of solution to meet the requirements

Solution: Contractor's DR management services shall provide strategy, process, type, methodology, locations, documentation, and prompt restoration of services. Contractor's solution is a subscription model, based on the County's specified Recovery Time Objective (RTO) and Recovery Point Objectives (RPO). Applications with a 72-hour RTO shall be recovered from replicated Virtual Tape Library (VTL) backups. Applications with a 48-hour RTO shall have their DR servers mounted to a replicated SAN storage. Under a subscription model, the server hardware "subscribed" to by the County is leveraged, provisioned with County images and applications on an as-needed basis to support DR tests, or actual disaster events. However, if shorter recovery times are required in the future, Contractor can implement active/active and/or active/passive-solutions, using dedicated server hardware, for web, application, and data layer recovery. License costs for active/active-synchronous, active/passive-asynchronous and active/passive vault tools are not included in base services.

During transition, Contractor shall validate ongoing DR policies and procedures including:

- Portfolio application priorities and Recovery Time Objectives/Recovery Point Objectives (RTO/RPO) requirements including:
  - Validation that restoration times meets County requirements
  - The server strategy (subscription using replicated backups or SAN data, or one of the dedicated hardware options above)
  - Data synchronization and replication plans
  - Rationalization of licensing costs.

The DR environments for the virtual servers within the MPC shall be virtual servers that spin up with a copy of the MPC virtual server.

Contractor's solution is based on F5 Global Traffic Manager (GTM) and Akamai. In in the event active/active, is implemented, Contractor shall support a synchronization technology such as SQL server Always-on architecture and Oracle Data Guard architecture. Contractor's technology Continuity of Operations (COOP) professionals, whose primary mission is to build a robust DR program for the County, shall write a viable and executable DR plan and schedule and manage DR exercises. Upon declaration of a DR event, Contractor shall execute the County Disaster Recovery Plan (to be developed during transition) that shall include:

Recovering and resuming full operations including all supporting infrastructure and networks in accordance with SLAs.

Rationale: Contractor's enterprise service delivery manager shall be the County point person and the conduit for information flow between remote disaster recovery managers and the County. Contractor's enterprise service delivery manager (ESDM) and remote DR managers shall be responsible for communication, managing resources, and supporting all DR activities, including during and after the event, which shall include a complete report to the County.

- Deployment plan for resources and use of facilities

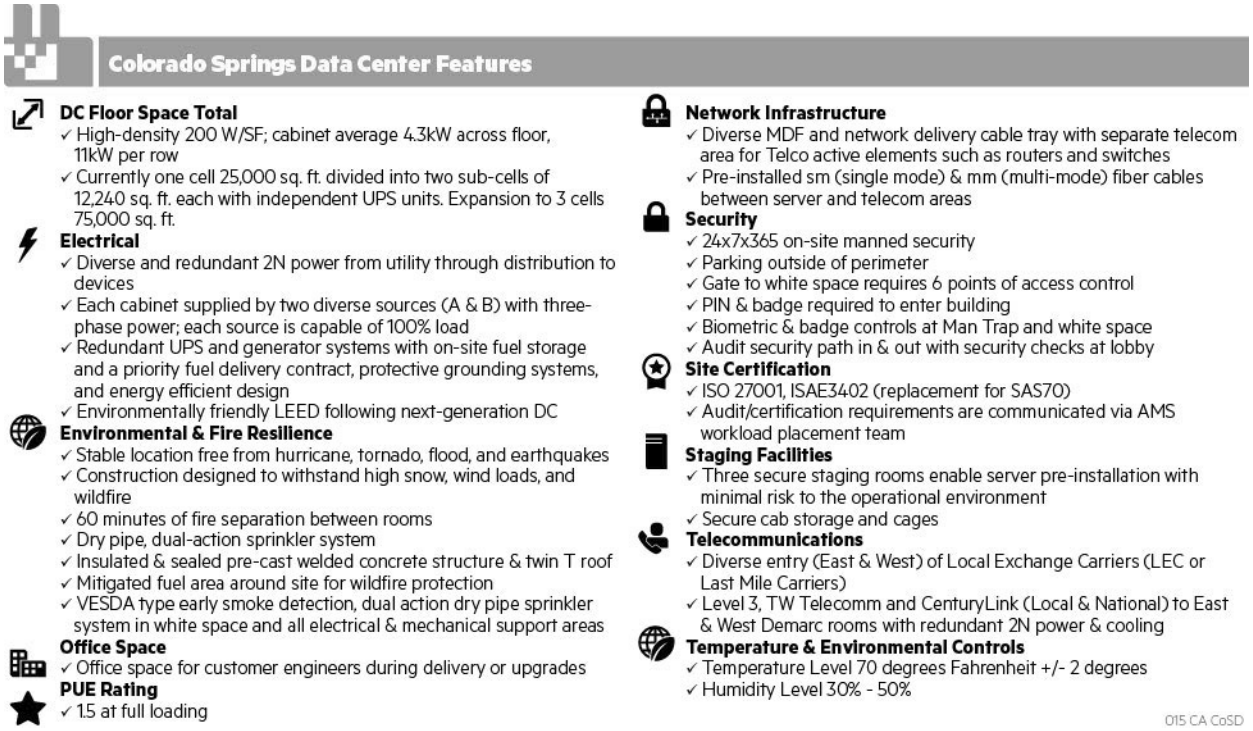
The County's recovery site shall be Contractor's Colorado Springs, CO Data Center (CSDC), connected via dedicated 10GB circuit, providing data replication. Contractor shall be able to provide a wide variety of disaster recovery services—dedicated to shared and/or hybrid solutions—at this central location.

Contractor shall write, maintain, and exercise County DR plans, and data center management professionals shall maintain the hardware, replication, and synchronization aspects of the solution. Connectivity and synchronization with CSDC shall include HPE's Tulsa production/development center and the County operations data center, as well as the AT&T POP, DR POP, Tower 9, Lemon Grove, and future sites as required. Coordination shall be managed by the Contractor ESDM.

The CSDC shall be a purpose-built, SSAE16-audited, data center. The Tier III data center design shall provide a completely redundant and continuously operating facility with infrastructure built with hot-swappable components, redundant power supplies and fans, compact flash, multi-boot support, and always-on management. Data synchronization and replication shall be determined by each application's RTO and RPO, and VM server versus physical server recovery methodology. Appliances shall be able to be deployed in traditional active/standby configuration or horizontal clusters (active/active) to achieve high availability and application-level failover. Contractor's CSDC MDRS facilities shall include locking cages, cabinets, and racks to meet County physical security requirements. This facility shall be used to provide DR and data backup services for Contractor's USPS clients as well as HPES Corporate.

Access to the CSDC shall be highly restricted. Access to network and Contractor computer equipment, storage media, critical support areas, and operations documentation shall only be granted to authorized personnel. Security consoles linked to alarm systems and closed circuit TV (CCTV) cameras shall be manned. Security cardkey readers shall protect all doors leading into the data center, and issuance of cardkeys for physical access to the facilities shall be controlled through a request and approval process. The following depicts features and capabilities of the CSDC.

CSDC Features and Capabilities



Providing comprehensive, full-service data center capabilities that facilitate continuous processing and operational stability.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's DR program shall be built on industry best practices and standards of the Disaster Recovery Institute International (DRII) and ITIL. This model shall define four phases in the DR life cycle of a business continuity program—Analysis, design, build and integrate, and manage and evolve. The DR program shall include periodic and short-notice drills to validate the processes.

This model shall be flexible and adaptable, enabling phased implementation for the overall continuity program and for the County to enter and exit the life cycle at any point within the methodology process path.

The design phase is an enhanced DR (EDR) solution and the subscription DR solution for the 48- and 72-hour RTO systems respectively.

Contractor's delivery team shall start with the build and integrate phase and stand-up the DR environment while Contractor continuity professionals begin the preliminary stages of drafting the DR plan. In this phase Contractor shall provision the replication circuit between the Tulsa data center and the CSDC recovery site. Contractor shall verify that data replication is occurring accurately and as planned. At the end of the phase, Contractor shall perform a tabletop exercise of the DR plan to validate its functionality and address any deficiencies found during the exercise.

At the conclusion of the tabletop exercise, the management and evolution phase of the DR program life cycle shall begin. In this phase Contractor and shall create and provide a master DR exercise calendar for County approval and work closely with the County to reflect the production changes into the DR environment in a methodical and timely manner. Contractor shall provide required training during this phase to make sure it is operating as expected.

In the analysis phase, Contractor shall work with County and assist in yearly undertakings such as a Business Impact Analysis (BIA) or identification of critical systems and apps. The following table outlines the features and benefits of Contractor's approach.

Critical System Features

FEATURES	BENEFITS
CSDC Tier III, HPE corporate DR services, Federal DR clients, and is highly redundant and secure	• Highly skilled and experienced engineering, operations, security and program management resources • Experienced testing and compliance personnel
Network design that is redundant and secure, with automated GTM and load balancing capabilities with multi-layered firewall design	• Uses the skills and experience of Contractor's network operations personnel • GTM automation works to reroute IP traffic in the event of a declaration • Automatic and transparent recovery and continuity of service

FEATURES	BENEFITS
Automated, continuous host-based replication for 48-hour RTO systems	• Automated, real-time maintenance of host images and data integrity • Near real-time RPOs • Can failover or fall back virtual-to-virtual or physical-to-virtual systems
Industry recognized DR PLANNING leader (Forrester-Traditional Disaster Recovery Service Providers)	• Highly skilled, trained, and BCM-certified personnel • Comprehensive development methodology • Experienced with Federal standards including NIST SP 800-34 Rev. 1
Continuous Process Improvement Loop	• Independent monitoring during exercises followed by after-action lessons learned to identify and integrate ways to improve DR processing

The DR plan shall be a cohesive document that includes an auditable overview, team structures, responsibilities, contact information, detailed recovery procedures, and recovery site activation aligned with NIST SP 800-34 Rev. Developed using Contractor templates, the plans shall be stored in a secure area of the Service Portal with access to authorized personnel only. Contractor shall design the plans to enable hand-off to County staff to complete its portion of the recovery and for data validation. Contractor shall also work with the County to create disaster definition and declaration processes relative to this proposal.

After approval, the DR plan shall be reviewed during an initial tabletop exercise. This exercise shall be conducted with County staff and operational leaders to fine-tune plan details and serve as a means to provide initial training to the County and Contractor. Additional training shall be provided to the County and Contractor delivery team as requested by the County.

As a standard operating procedure, Contractor shall incorporate client change management processes into the DR life cycle. Any change to the production environment shall be captured in the DR plan and the MDRS environment or it becomes impossible to maintain a viable and executable plan. Therefore, Contractor's lead continuity professional on the account shall be a member of the change control board.

Annual DR Exercises

Contractor shall schedule, plan, and lead one DR exercise annually in cooperation with the County. Contractor shall create and provide for County approval the strategy for the testing scope and a master schedule. Depending on various elements such as impact to the production environment or availability of the resources, exercises shall be live or table-top exercises. When possible, a DR exercise shall include an entire IT production site, or exercises shall be for all the applications in a given recovery tier or for a logical grouping of the applications. Contractor shall coordinate the following items:

- Laying out the entire exercise process with specific milestones, objectives, and metrics for each scheduled exercise
- Putting measures in place that track objectives

- Coordinating and preparing with the County application teams, users if desired, and any third-party vendors required
- During the exercise, measuring and tracking recovery timelines according to the County's RTOs and RPOs
- Documenting exercise results in a formal report, including comparison of the results to the measures and goals established, action items from the exercise, and recommendations on how the recovery process could be improved to be faster and more reliable
- Updates to plans as needed

County involvement with the Disaster Recovery plan.

County shall:
- Define RTO requirements
- Review/approve or disapprove DR plan
- Participate in drills and tests.

County Data recovery and restoration to meet the Service Levels.

For County data repositories restoration with no greater than a 28-hour data loss, Contractor shall provide data synchronization and replication that includes the County's immutable storage, live data, and virtual tape libraries.

For the systems and applications with a 48-hour RTO, Contractor shall use Contractor's EDR. This solution, which shall consist of replicating data center data asynchronously between the Tulsa production site and the CSDC recovery site, shall meet RTOs in as short as 4 hours.

For the systems and applications with a 72-hour RTO, Contractor shall:

- Deploy virtual tape libraries between the production and recovery sites, using the same replication circuit provisioned for EDR above. Contractor shall subscribe to physical or virtual servers for DR tests or during a true disaster event. Contractor continuity professionals shall stand up these servers within 12 hours of the disaster declaration, leaving 60 hours of the balance of the RTO to reconstitute the applications and data on the servers.

2.18. Identity Access Management Services

2.18.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall use IDAM technology to initiate, capture, record, and manage End-User identities and their related access permissions. Contractor shall make certain that access privileges are granted according to a singular interpretation of policy and that all individuals and services are properly authenticated, authorized, and audited.

Contractor's approach to provide IAM Services for the County shall be to:

- Enable the County to continue to execute its Identity Management Road Map
- Minimize risk and cost to the County by leveraging the County's current investment in Oracle IDAM platforms
- Build on the current Active Directory and Active Directory Federation Services (ADFS)
- Build on current PKI solution

All production servers, production storage, and Oracle licenses for the IDAM platform shall be provided through the applicable resource units and Third-Party Services.

The following table summarizes the billing approach for Identity Access Management Services (IAM):

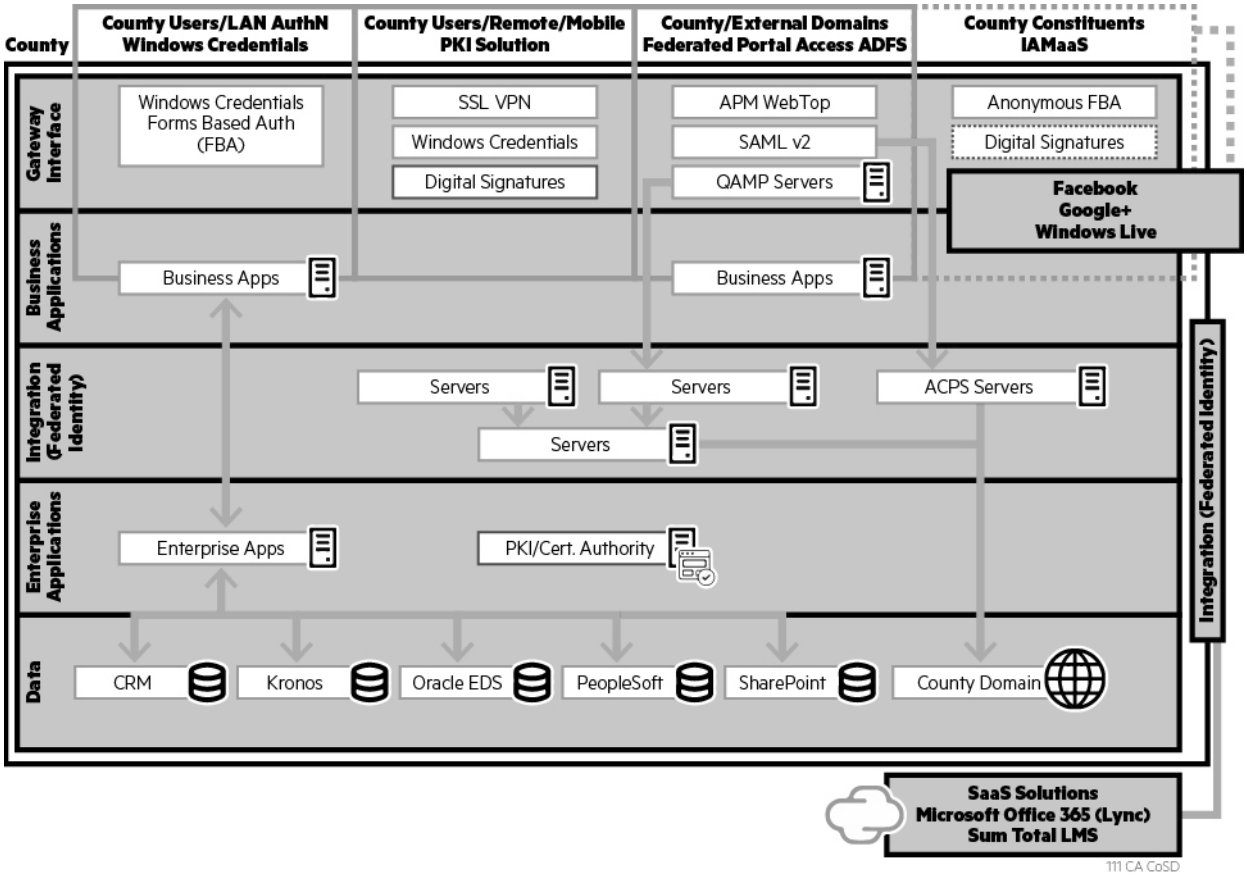
IAM Service	Hardware	Software	Support Labor
Active Directory (AD)	Infrastructure RU	N/A	IAM RU
Active Directory Federated Services (ADFS)	Infrastructure RU	N/A	IAM RU
Oracle Identity Access Management (IDAM)	Servers RU – Production Servers (County Responsibility)	Third Party Agreement (County Responsibility)	IAM RU
Public Key Infrastructure (PKI)	IAM RU (Luna Appliance Maintenance) Infrastructure RU (Servers)	IAM RU (certificate maintenance: 18,000 devices, 10 organizational, 16,400 user)	IAM RU
ID Provisioning	N/A	N/A	IAM RU

Solution: Contractor shall continue to evolve and improve the County's existing investments in PeopleSoft, Active Directory (AD), and Oracle Identity and Access Management Platform (IDAM) to provide an overall platform to protect and manage individual identities, their authentication, authorization and roles, and privileges. The starting point or foundational element of the solution shall be the Oracle IDAM platform, which is an industry-leading, end-to-end security solution—providing components that protect applications, data, documents, and cloud-based services through a combination of flexible authentication and single sign-on, identity federation, and risk-based authentication and authorization. The IDAM solution—starting with the Oracle platform and extending to the current County Active Directory, PeopleSoft, Public Key Infrastructure (PKI), and Active Directory Federation Services (ADFS), shall provide an integrated, modular architecture. This architecture shall provide the County with the flexibility to deploy a complete solution that enables the integration of current platforms, existing applications, and third-party security services into a single solution—offered at a single price point.

The high-level scope of this solution shall be to use Oracle Identity Manager as the basis to manage the End-User accounts across various applications and integrate identities within Active Directory, PeopleSoft, and third-party applications that contain County identities. The Oracle Identity Manager shall act as a single point of End-User management for the administrator to create users and authorize the End-User to access the relevant resources across the County, while allowing the other key platforms that contain identities to continue. The Oracle Access Manager solution shall secure the application access with respect to organization applications. The figure below shows the main elements of the County Identity Management solution, which shall make use of existing capabilities while expanding the solution to meet all of the requested functions for the County. Depicted in the figure below are the four main "kinds" of identities that the County must manage/administer. These identities are as follows: "classic" referring to County users that exist on the County network, County users that are remote or "off-premise," and County identities that require a federated relationship with external services such as County partners, residents or visitors.

By implementing the architecture illustrated in the figure below, each "kind" of County End-User shall be able to be managed in a low-risk, cost-effective, controlled, and secure manner so that management of the identities can be performed from a single point yet extend to each kind of End-User. Included in this solution shall be access to the County business applications, federation capabilities, enterprise applications, and County data sets.

- **San Diego County Functional Architecture**



Providing secure IT services through comprehensive IAM.

This approach leverages the County's investments in Oracle, PKI, Active Directory, and ADFS; lowers the technical and operational risk by expanding on existing platforms; and enables the County to continue to execute its Identity Management Road Map and Strategic Plan.

The following Oracle elements are currently implemented within the County's IDAM Platform 11g Suite – IDAM Platform integrating them with Active Directory, PeopleSoft, and Contractor IAMaaS. The table below details each of the main elements of the integrated solution and what specific function they provide.

- **Solution Integration Components**

PLATFORM	CURRENT BUSINESS USE CASE	FUTURE BUSINESS USE CASE
Oracle Identity Manager (OIM)	Integration with PeopleSoft	Onboarding for new employees Manage Health Care partners for Curam

PLATFORM	CURRENT BUSINESS USE CASE	FUTURE BUSINESS USE CASE
		Provisioning applications users (Curam, EDPP, EBS, OBI, and other applications) Manage privileged accounts in AD and UNIX
Oracle Access Manager (OAM)	Provides Single Sign On (SSO) to 25 applications to County employees as well as firewall department users Federation with firewall department organizations as Service Provider	Continue to integrate more County-owned applications. Federation with third-party vendors as Identity Provider. Future capability to provide SSO capability to third-party vendor applications like Adobe Cloud, Adobe Analytics, LexisNexis, ABC Legal, Accurint, Attorney's Brief, Empinfo, e-Oscar, Inverify, Past-Employ, The Work Number, Westlaw, and Pacer. Future capability to provide risk-based multi-factor authentication capability for IDAM protected applications. Future capability to provide SSO capability to State-owned applications like CSE (CCSAS), CA Central, CALWIN, ECSS (State IVR), KidStar, and SAT C3.
IDAM architecture	Provide High Availability within one data center	Future capability to provide IDAM architecture as a Zero Downtime Architecture (requires re-architecture of the environment.)
IDAM Infrastructure monitoring	Monitor software components manually	Leverage licensed Oracle monitoring tool, Oracle Enterprise Manager (OEM), to monitor IDAM infrastructure (both software stacks and data base).

Contractor shall provide the following Identity and Access Management (IAM) Services as a component of the Cross Functional Framework and included in the IAM RU:

- Active Directory Security: provisioning of privileged IDs, service accounts, group policy and organizational unit management, synchronization service for Skype for Business and role based access implementation
- Midrange Security: provisioning of UNIX, local Wintel IDs
- Active Directory Federated Services
- PKI: Symantec PKI services for device certificates for laptops and mobile devices. Other devices shall be covered and included at the completion of Transition, at no additional costs, as per the Transition.
- Oracle IDAM platform (11g Suite):
    - Identity Manager, Access Manager, Internet Directory, and Virtual Directory integration with Active Directory and PeopleSoft.
    - Oracle Identity Manager integration with PeopleSoft.
    - Oracle Access Manager: federation with "Firewall Department" End-Users as well as Single Sign On to 25 applications for County employees and 'Firewall Department' users.

  - Oracle Federation Manager: Service Provider capability which allows the "Firewall Department" Users to utilize their own AD ID and password to access County applications via an interface with ADFS.
  - Oracle IDAM architecture: support high availability infrastructure within the Tulsa Data Center, scalable centralized directory service, manual monitoring of software components.

- Participation in architecture and strategy sessions with the County to advance and maintain the IAM roadmap
- Maintain the Identity Access Management Services Management Plan
- Maintain the Service Desk for all End-User IAM related Service Requests. Actions performed by the Service Desk are covered by the Service Desk RU; actions performed by IAM personnel are covered by the IAM RU.
- Ensure maintenance of overall security of the IAM solution, including adhering to County policy in the provisioning of IAM services and compliance with any applicable regulatory process
- With the exception for the server and storage costs, which are not included in the IAM RU, for all IAM supporting infrastructure, Contractor shall provide labor for break/fix, maintenance, availability management, patching, and IDAM activities resulted from hardware refresh.
- For all IDAM supporting software, Contractor shall provide point releases (e.g. x.1, to x.2), upgrades, and system documentation as part of the IAM RU. Contractor may require a Service Request for any work efforts in excess of $500,000.

Contractor shall provide integration of the PeopleSoft and Oracle Identity Access Management (IDAM) as part of the project in progress as of the CED titled "Automated Interface to PeopleSoft Application for IDAM Services." Part 1 is funded in accordance with the applicable Work Request and it is currently scheduled for completion in June 2017. Ongoing support for Part 1 and Part 2 for the resulting integration is included in the IAM RU.

Exceptions

The following services and related support shall <u>not</u> be included as part of the IAM RU, Transition or Transformation services.
These are either dependent on the implementation of other requirements, requires an assessment of line of business application compatibility to utilize the functionality, or fulfilled in conjunction with other requirements. These shall be part of the IAM Roadmap and require funding to design, implement and support.

- Additional use cases or additional applications for Service Provider and Identity Provider capability
- Onboarding additional applications to use enterprise single sign on functionality
- Onboarding additional applications to be provisioned via automated workflow process
- Consolidation of disparate End User accounts into IAM Implementation and related support of roadmap activities
- New functionality or services identified as part of future roadmap activities not already scoped in Transition

- Resource and Facility Approach Summary – deployment plan for resources and use of facilities

The Contractor team supporting the County shall work closely with the County CIO, CTO, and supporting staff and provide a close-knit working environment that allows for direct communication, service, and for the County to be able to reach out directly to Contractor for quick resolution of any issues. Contractor's Rancho Bernardo facility is the center of support for staff specifically assigned to support the County, and is the initial point of contact for the County for service. Other subject matter experts within Contractor's Identity and Access Management practice and portfolio virtual teams shall also provide support and service as needed. The Contractor's Tulsa Data Center in Tulsa, Oklahoma shall host the majority of County IT infrastructure and core IT services. This shall include the infrastructure for ADFS, Oracle IDAM, and Active Directory. The Contractor Continuity Services center in Colorado Springs shall be the designated disaster recovery (DR) site.

- Methodology & Key Processes – Key methodologies and processes in solution including year-to-year continuous improvement

Key Processes

By incorporating the HP Global Method (HPGM) for Identity and Access Management, Contractor shall take an iterative approach, addressing issues and improvements in data quality and data management—in practice and in implementation. Through this process, Contractor shall work closely with the County data teams and other transformation, integration, and architecture (TIA) data architects to define and manage County IT outsourcing enterprise data semantics. HPGM for Identity Management advocates a rapid, incremental, and iterative approach that can be aligned with the County's hybrid development methodology of "AgileFall."

In addition to HPGM Contractor shall also use a standard TOGAF-based architecture approach to develop the solution artifacts and produce the required documentation to make certain that the solution is not only documented correctly, but also minimizes the overall implementation risk to the County. These methods shall be integrated with the County's current Architecture and Solution Reviews in conjunction with the County's CIO office and relevant County departments.

For the Oracle IDAM Suite, Contractor shall work with the current Contractor IDAM architect to make certain that the design, development, and deployment of the Oracle IDAM Suite follows standard Oracle design and deployment methods to make sure that the Oracle platform operates within the design parameters. Any significant design changes to the platform or changes to the Oracle Databases shall follow Oracle-mandated practices.

The Computer Services Registration Form (CSRF) and process shall be replaced to meet the County's requirement to develop automated workflows to manage access Service Requests. Contractor shall leverage the Oracle Identity Manager product to automate the Access Service Request process. Automation shall include the ability to create a request with all appropriate validations, route it for approvals, email notifications, and predefined reports. The Oracle access request feature shall integrate with the Service Portal as well as the automated provisioning capabilities that are specified in Schedule 4.3 Operational Services.

Any remaining requirements not in place at CED shall be included in the IAM roadmap.

Describe End-User account consolidation plan and End User Account Management Architecture.

Contractor shall develop a plan for account consolidation and management architecture as follows:

- Use the County Strategic Plan to provide the architecture vision for IDAM.
  - The County Strategic Plan is to build enterprise-grade identity and access. Re-architecting IDAM to become a Zero Downtime Platform to serve the application community is a future capability.
- Use the Oracle Identity Manager to manage all End-User accounts (expand existing capability via the "Automated Interface to PeopleSoft Application for IDAM Services" project stated above).

  - Currently, the County relies on the Computer Services Registration Form (CSRF) process and manual administration to manage End-User accounts. Contractor shall build a capability into Oracle Identity Manager that creates network and email accounts automatically when a new employee joins the County. It deactivates the accounts when an employee leaves, based on data fed from the County Human Resource System. Contractor shall build capability into Oracle Identity Manager so Contractor can manage Service Provider accounts.
- Contractor shall utilize End-User data within PeopleSoft to manage the life cycle within the Oracle Identity Manager (via the "Automated Interface to PeopleSoft Application for IDAM Services" project stated above).
  - Use PeopleSoft to determine the life cycle of an ID.

    When a new employee joins the County, the Human Resources system shall be the authoritative source for identity data. For the County, this is its PeopleSoft (PSFT) application, which shall have a record for each employee. Oracle Identity Manager (OIM) shall be integrated with PSFT, and when a record is provided for a new employee, then OIM shall create accounts automatically in the County's Active Directory and Exchange environment. When an employee leaves the County, PSFT shall indicate such activity, and OIM shall inactivate the corresponding accounts in AD, Exchange, and other End-User stores. When an employee transfers to another department or business organization, then OIM shall receive notification from PSFT and take action based on established business rules. As the authoritative source of identity information, PeopleSoft shall be the driver of any necessary actions by OIM, and the process shall be automated with little need for manual administration.

  - Actions taken on the County End-User accounts shall be based on business rules established within the County such as hire, termination, transfers, leave of absence (LOA)/return from leave, and re-hire.

    As described above, PeopleSoft shall be the driver of the actions taken by OIM. Although the actions taken by OIM are triggered from PeopleSoft updates, the actions themselves shall be directed based on business rules that can be integrated into OIM. For example, if the trigger from PeopleSoft is a transfer between one department to another within the County organizations then rules can be programmed into OIM that would disable access to one type of data and allow access to other data if that was the policy. In the case of a termination notification from PeopleSoft, OIM would disable Active Directory and Exchange accounts.

2.19. Reporting Management Services

2.19.1. Process and Procedures

- Description of solution to meet the requirements

Solution: Contractor shall develop, generate, and submit deliverables. Contractor knows the current reporting criteria and shall continue the current level of reporting without interruption upon Transition completion. Contractor shall identify necessary reporting additions and enhancements to be completed as part of the overall cross-functional transition timeline. As part of the transition process for each framework, Contractor shall develop that framework's new report set (as identified in the RFP), either as a new report, or as an update to an existing report, where applicable. As the new reports are completed, Contractor shall begin posting them on the Service Portal. During the Cross-Functional transition, Contractor shall also implement Microsoft SQL Server Business Intelligence to begin the process of the data warehouse development. The data warehouse shall provide a central repository that supports other analytic scenarios as determined by reporting and County/Contractor quarterly review. Contractor is committed to continuous improvement and, over time, Contractor shall work with the County to extend both the data contained in the data warehouse as well as the BI/Analytics platform to support a more complete IT Service Management Analytics capability. The benefit to the County can be measured through increased system availability, reduced system disruptions, predictive analysis of system changes, and optimizing staffing levels.

Specific areas of ITSM that can benefit from analytics:

- Service Strategy and Improvement Analytics: This area shall focus on analysis that supports recommendations to improve business outcomes and improve customer satisfaction. Analysis of available data sources can be used to assess; IT Infrastructure Health, IT Transformation alternatives, predictive analysis of customer satisfaction, and customer sentiment analysis

- Service Design Analytics: This is a way to use analysis to better understand capacity demands and service availability by predicting degradations, preventing outages and reducing downtime. Using ITSM data Contractor can forecast demand and utilization on the infrastructure, predict service degradation with the goal of reducing system downtime.

- Service Transition Analytics: These analytics address the correlation of incidents and events to root causes in order to speed recovery and to identify ways to reduce IT complexities.

Service Operations Analytics: Blending ITSM data and baseline IT performance data, Contractor shall conduct analyses to reduce business impact of events, incidents, and problems.

Post-transition, through a coordinated effort, Contractor shall identify specific subject matter experts for each reporting requirement and match them with a County counterpart to make certain that any new requirements are identified and supported for each of the Schedule 5 reports. In addition, Contractor shall demonstrate new and additional reports that the County finds valuable to manage their IT infrastructure, as well as streamline the reporting process as new transition and transformation tools are applied. The County shall have near-real-time reporting with fresh data to proactively monitor service performance and to take necessary actions. Service Manager provides 100+ out-of-box (OOB) reports; intuitive UI helps to create easily navigable role-based dashboards to show only what is applicable to a particular role. Each report shall have the option of printing and exporting (PDF, MS Excel, and HTML). Service Manager also has built-in reports for KPI reporting.

Rationale: Contractor shall have a well-documented and dynamic reporting management operation. Contractor's data analysts and Cross-Functional leadership shall be responsible for making certain that reports are generated accurately, on time, and in accordance with design or agreed-upon specifications.

- Resource and Facility Approach Summary –deployment plan for resources and use of facilities

The County shall continue to receive the current reports during the transition period. Contractor shall work with the County to consider new and improved reports through conducting workshops and meetings for the County to consider modifications to existing reports or to make new reports. These collaborative sessions shall be conducted by Contractor resources at its facility in Rancho Bernardo or at County sites identified by Contractor's customer.

- Methodology & Key Processes – Key methodologies and processes in solution including year-to-year continuous improvement

Contractor shall provide to the County all reports via the Service Portal. Contractor shall provide these reports and track the usage to provide feedback to the County on reports in high demand and those that potentially could be modified to provide additional value or possibly sunset.

Contractor shall create an analytics and reporting data warehouse during the transition period, based on MS SQL Server Business Intelligence, to facilitate ongoing automation and continuous improvement in efficiency and quality of Contractor's reporting capability.

- Use of Tools

Contractor shall use tools and data extract processes in the course of producing reports. The appropriate tools and products to be used in producing each report shall be finalized during the transition period, but shall consist of, at a minimum:

- Microsoft SQL Server Business Intelligence
- Microsoft SharePoint
- Contractor End User Access (Service Portal)
- EMC Documentum (DocVault)
- Various scripts and development tools, as appropriate

2.20. Domain Name Management Services

2.20.1. Process and Procedures

- Solution to meet the requirements and the rationale

Solution: The request for a new Domain Name (DN) and add-on DN services shall be initiated by the County point of contact (POC) via an IMAR request to the Contractor Service Desk or a project requirement. The Domain Name Administrator (DN Admin) treats either request as authorization to purchase the DN and DN services from an accredited registrar/vendor.

The Contractor Service Desk routes the IMAR request to the DN Admin, who takes the following actions:

- The DN Admin shall check the DN Portfolio for an existing account for the requesting department. If the requesting department has an account, then the DN Admin uses the existing account for purchase or creates a new account if one does not exist.
- The DN Admin shall save the confirmation receipt for future reference and adds DN and DN services to the DN Portfolio in the Integrated Asset Management System (IAMS).
- The DN Admin shall then email the County POC the confirmation of purchase and gives the County POC an initial username and password.
- If the requested DN is not available, the DN Admin shall email the requestor for an alternative DN.

The DN Admin shall be responsible for (1) actively monitoring the renewal of DN and associated DN services and (2) acquiring approval from the County POC for renewal. The DN Admin shall take the following steps for renewal:

- The DN Admin emails the County POC about DN renewal approximately 30 days before the expiration date. If there are DN services associated, then the DN Admin also requests DN services renewal.
- The County POC responds with approval to renew the DN. If there are DN services associated, the County POC also indicates whether or not to renew the DN services.
- The DN Admin pays renewal fees to the accredited registrar/vendor for the DN.
- The DN Admin updates the expiration date on the DN Portfolio accordingly and enters it into the IAMS.
- If the County POC decides not to renew the DN then the DN Admin updates the DN Portfolio in the IAMS.

The County POC may request cancellation of a DN and associated DN services prior to its expiration. The DN Admin shall treat these requests as authorization to release the DN and associated DN services. The following are the procedures for cancellation of a DN:

- The County POC submits an IMAR-Remove ticket in myRequests.
- The Service Desk routes the IMAR-Remove ticket to the DN Admin.
- The DN Admin cancels the DN and associated DN services with the registrar/vendor, removes the DN from the DN Portfolio, and saves the documentation in the IA.

The DN Admin minimizes the number of registrars/vendors from whom they purchase DNs for ease of management and transition of services. The DN Admin shall purchase/renew DNs for no more than a 1-year subscription to minimize the cost to the County in the event that a cancellation occurs. Contractor shall consolidate domain names to only accredited registrars, as each DN comes up for renewal.

The DN Admin shall create an Annual Domain Name Management Plan that details all DNs in the DN Portfolio, expiration dates of existing DNs, and any changes in DN management procedures. The DN Admin shall also create and post to the Service Portal a monthly report that shall include the following:

- Domain Name
- Total quantity of managed Domain Names
- Quantity of new Domain Names added in the last month
- Quantity of Domain Names retired in the last month
- Quantity of Domain Names retained by the County
- Summary data for each Domain Name:
  - Domain Name ID
  - Type/extension
  - Renewal date
  - High Org
  - Low Org
  - County POC name, email, and phone
  - Secondary County POC name, email, and phone.

Contractor shall provide Domain Name Management Services is for unlimited number of domain names.

- Deployment plan for resources and use of facilities

Domain Name management is performed by Contractor's Domain Name Administrator, who shall reside in Contractor's facility in Rancho Bernardo.

- Methodology & Key Processes – Key methodologies and processes in solution including year-to-year continuous improvement

Contractor shall conduct the Domain Name management in accordance with the agreed-upon Domain Change Management process with the County. Contractor shall implement continuous improvement in accordance with the Contractor's ISO 9000-certified processes and Contractor's adherence to ITIL processes for service delivery, including the review, analysis, prioritization, and recommended improvement opportunities.

The Domain Name Portfolio shall be stored and continually updated in the Integrated Asset Management System.

2.21. Business Analyst Services

2.21.1. Process and Procedures

- Description of solution to meet the requirements

Solution: Contractor shall establish a team of business analysts. These analysts shall create, gather, analyze, communicate, and validate requirements related to new IT projects or changes to existing applications, processes, or policies. The Contractor business analysts shall engage all County and Contractor stakeholders as well as contractor roles across the applications, engineering, testing, End-User support, and security towers. Contractor's solution recognizes the complexity of this role and provides tools for multifunctional teams.

Contractor shall work closely with the County business owners and users. Business analysts have an advanced level of knowledge and expertise within the particular industry or client they support. Contractor shall field a mix of experts who know the County's business well and are strong in eliciting and documenting requirements. This hybrid approach to staffing the Business Analysis Center (BAC) gives the County the optimal mix of knowledge of its business and functional/technical expertise from outside the County. The implementation of the BAC shall include:

- Flexibility in the business analyst staffing arrangement. - Analysts shall be available through a pool of resources the County can use on request or exclusively for specific projects or objectives.
- Shorter delivery time to meet customer demands. - As the County has direct contact with Contractor business analysts that can act as a bridge between requirements definition and solution development, it can improve and enhance service delivery to its employees and constituents.
- Experience in aligning the right resource to the right effort. –Contractor's solution for business analysis focuses on the identification, training, and development of experienced business analyst professionals.
- Quality and standardization in requirements identification and development. – As part of the BAC, each analyst benefits from a common set of industry standard best practices as defined by the BAC and approved by the County. These processes shall not only define behaviors and methodologies for assisting the county to develop the quality SOWs and requirements documents that are necessary to expedite project outcomes but also to create a smooth transition from identification of business needs through the project request process, requirements development, and beyond.
- Continued engagement throughout the project life cycle. - Business analysts shall participate in post-requirements phases, for example, guiding End-User acceptance testing and acting as training and documentation SMEs.

To support the solution, Contractor shall leverage its Enabling Delivery and Global Excellence (EDGE) methodology and toolset to develop the standard processes the team shall follow. EDGE is a repository of best multifunctional methods, tools, and processes that inform the creation of a custom, repeatable solution.

Rationale. Contractor's executive leaders are advocates of continued and expanded business analysis support.

Business analysis services shall meet the following objectives:

- Support the County by increasing the maturity, consistency, cost-effectiveness, and overall business value of business analysis services by developing a BAC
- Provide the right mix of County business knowledge, technology expertise, and business analysis expertise
- Provide a methodology and tools with flexibility for all types of projects, regardless of size or complexity
- Provide access to embedded business analysis resources via the BAC
- Provide portal-based access to a business analysis methodology tailored for the County
- Assist with business analysis training for County users via the BAC. This training shall be focused on project-specific needs
- Keep all processes lean and responsive to the County without creating too many procedures for business analysis to allow for expedited delivery
- Provide business analysts with the right aptitudes, certifications, and ongoing training.

- Deployment plan for resources and use of facilities

Contractor shall provide a pool of business analyst resources to be guided by common and flexible best practices and tools, which shall improve the quality standard for requirements gathering.

Contractor shall be flexible when assigning the work locations of all analysts to meet the needs of the projects and departments. Analysts shall be located in either the Contractor's Rancho Bernardo facility or an embedded location within the County. If a County department wants a dedicated resource, Contractor has that flexibility and shall work with the County to identify the best resource and solution.

Following Contractor's flexible, hybrid approach, Contractor shall provide an opportunity for current business analysts to gain more training and certifications as part of their professional development. Contractor shall develop talent and enhance staffing where necessary to meet the County's needs. In addition, Contractor requires specialized business analysis training, experience, and certifications when engaging new talent. Incoming business analysts shall demonstrate at minimum:

- Business- and technology-related education and experience
- Professional experience performing business analysis services
- Exceptional communications skills and strong interpersonal skills, including structured and unstructured facilitation
- Ability to understand and document functional business requirements and to translate business requirements into technical requirements and/or solutions
- Experience with formal business analysis methods and tools
- International Institute of Business Analysis (IIBA) Certified Business Analysis Professional™ (CBAP) certification or similar is a plus.

- Processes in solution including year-to-year continuous improvement

Contractor shall publish a County business analysis methodology on the Service Portal and use the BAC to help use and extend best practices throughout all County projects.

Enterprise-Level Best Practices

Contractor's first three best practices shall be implemented at the enterprise level. Through enterprise-wide standardization, a common language, and traceability, the County can create well-defined requirements that provide consistency throughout the application life cycle and become part of the County culture.

Enterprise-wide standardization - By standardizing requirements management at the enterprise level, the County can promote collaboration and eliminate silos between business analysts, development, and quality assurance (QA). A single system for complete requirements management provides the most up-to-date information for project teams. This is particularly important as requirements change over time, either because of changing business conditions or by design as part of an iterative development process such as Agile. A single requirements management system also enables better oversight.

Common language - Providing consistent guidelines for the language used for all requirements makes requirements easier to write and follow. This prevents both the overwork of adding more detail than necessary and the extra time needed to cycle back for more information when descriptions are too vague.

As a guideline these quality metrics include:

- **Lines of text**—the number of lines of text in the requirements document. When there is uniformity in the way requirements are described, this metric allows the End-User to estimate the functionality and degree of testing required for the software.
- **Imperatives**—the number of imperatives in different categories, such as "shall," "must," This number gives a rough estimate of the degree of design functionality required in the software. It also gives an estimate of the degree of testing required to satisfy these imperatives.
- **Weak phrases**—the number of weak phrases such as "large," "fast," "enough," etc. Weak phrases indicate vague design requirements that are non-testable.
- **Completeness**—the percentage of requirements that do not contain phrases such as "TBD" (to be determined) and "TBS" (to be specified). Requirements containing these phrases are considered incomplete.
- **Option phrases**—the number of phrases such as "can," "may," "I/we think," and so forth. These indicate requirements that might be difficult to satisfy in development.

Another best practice to encourage the use of a common language for requirements is to provide a template or set of templates for requirements definition.

Traceability - Contractor shall enable traceability throughout the application life cycle to determine whether a project meets requirements. The ability to bi-directionally trace links between requirements and testing.

Traceability metrics include:

- Requirements traced —number of requirements traced to or from each specification
- Requirements untraced—number of requirements that are not traced
- Requirements inconsistently traced—number of requirements inconsistently traced
- Linkages—number of upward and downward linkages for each requirement. This helps determine reuse and the impact of changes on the overall application
- Coverage—percentage of requirements traced to passed tests, failed tests, or tests not run.

Project-Level Best Practices

The next four best practices occur at the project level. Adopting these practices brings clarity to the requirements process and helps eliminate rework in application development and testing. In addition, these steps help eliminate overwork and rework in the requirements definition process itself.

Be lean. Do not create requirements assets unless they provide value to the application team. The assets with the most value are the ones that can be reused. A lean approach includes automating processes and eliminating waste. By systematically organizing requirements, it becomes easier to see which requirements are needed and which can be eliminated. Standardizing the content of requirements—with templates and a common language—helps make requirements easier to understand and eliminates rework.

Iterate. Create requirements iteratively to generate feedback, promote collaboration, and enable teams to identify defects early in the software development life cycle. A best practice is to start with a high-level business requirement by describing who needs the functionality for what purpose and why. Then, rather than working in isolation, the business analyst writing the requirement gathers feedback from major stakeholders on whether the high-level requirement adequately describes the business need. Developers also provide feedback on whether there is enough information to begin coding. If not, the business analyst drills down to add more detail. If there is enough information, the developers can get started.

Different requirements require different levels of detail. The County can save time and reduce complexity by providing just enough elaboration. There is no need to over-describe requirements that are easily understood.

Requirements assets that can be reused, such as business process models (BPMs) that can be used to generate requirements, provide the most value.

As a project goes through iterations of requirements definition, it is important to measure where and how requirements change over time. Change metrics include:

- **Volatility**— number of requirements added, deleted, and modified, classified by a reason for change.
- **Initial allocated requirements**—number of technical and nontechnical requirements originally provided by the customer. This metric, along with final allocated requirements and changes per requirement, describes how much requirements change.
- **Final allocated requirements**—number of technical and nontechnical requirements that were used to build the final software product.
- **Changes per requirement**—number of changes made to each requirement.
- **Changes over time**—number of changes per week, for example. This describes the degree of requirements volatility. This number decreases towards the end of the software life cycle, indicating convergence of requirements.

- **Cause of change**—categorizing the cause of changes helps in identifying the most common reasons for change and can be used to improve the software process.
- **Source of change**—identifying the source of change (that is, who requested the change) helps anticipate the sources for change in the future.

Visualize. Contractor can use visualization to increase understanding of requirements and the dependencies between requirements. Visualization makes it easier to identify potential problems, such as missing use cases. And pictures can be easier to read and navigate than text-based requirements. For teams that do not want to follow the Agile practice of writing code early in the process, visualization and simulations can be used to elicit early feedback to achieve many of the same objectives.

Collaborate. Collaborate and break down silos between groups from the beginning of the process. For instance, while a business analyst might have the End-User view of what a requirement should be, collaborating with the development team helps determine whether implementation of the requirement is feasible.

When these best practices are implemented, Contractor projects are more likely to meet intended business metrics, including budgets, schedules, and client satisfaction by eliminating the gaps between work processes performed in IT silos.

Standardization and Best Practices.

Embedded in Contractor's methodologies are common best practices that can be tailored to suit the County's needs, including those from BABOK, CMMI, ISO, and SSE. These methodologies integrate business analysis with the other development disciplines to verify continuity of standards through the project stages.

Gather and document County business functional requirements when working with County departments.

Contractor shall leverage its Enabling Delivery and Global Excellence (EDGE) methodology and toolset. EDGE is a flexible repository of best multi-functional methods, tools, and processes that Contractor shall tailor for each County project.

Contractor Business Analysis Services relies on a set a proven best practices, but is highly flexible for the County. Contractor shall draw on a pool of business analysts who have a mix of experience and diverse technical expertise and functional knowledge of the County and its businesses. The analysts shall work directly with the County user groups to accomplish the following:

- **Gain Broad Involvement**. Review documented high-level requirements with internal stakeholders, including representatives of those capabilities who shall be responsible for delivering the solution.
- **Define Goals and Requirements**. Confirm that defined detailed requirements support the business goals and provide compelling business value. Reconfirm boundaries for: business functions, current systems, internal and external interfaces. Confirm stakeholder and End-User profiles, business processes, End-User interfaces and use cases, interface requirements, business rules, data entities, non-functional requirements, geographic regions, language/culture considerations, volumetric(s) (e.g., how many reports were anticipated), and documentation.
- **Define Scope**. Identify perceived gaps in boundary definitions as issues. Document questions and assumptions with regards to understanding the high-level requirements. Transfer knowledge of detailed requirements and estimating assumptions (if any) from solution architect to business analysts and project team.
- **Use Leverage**. Leverage the experience of the detailed requirements development team and transfer knowledge to the solution delivery team. Review assumptions and constraints. Identify perceived barriers to evolving the detailed requirements into a solution. Confirm common understanding of the detailed requirements with client stakeholders. Review and discuss gaps, issues, questions, concerns, and assumptions.

- **Build Consensus**. Determine if the client and project manager agree that the detailed requirements are sufficient for solution development. If the detailed requirements are not sufficient, work with project leadership to assess the impact of delays resulting from rework of the high-level requirements. Raise requests for change as needed
- **Document Results**. The output of this work is a Business Functional Requirements Document. Once the functional requirements are agreed on, documented, and approved by the County, they can be translated into technical requirements or directly into a solution depending on the complexity and functional nature of the requirement. Contractor shall use templates that are already in use with the County and supplement them as needed with best practices templates from EDGE.

With this process and approach, the County users are involved every step of the way and own approval of the final Business Functional Requirements Document as the baseline for next steps in implementing a solution.

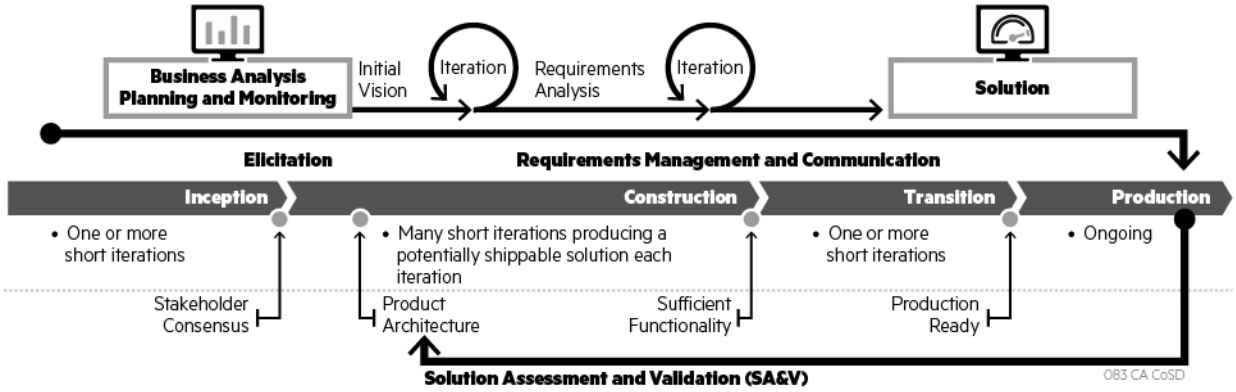
Translate business requirements into solutions or technical requirements.

Contractor's Business Functional Requirements Document shall include:

- Review Functional Business Requirements and confirm joint understanding of the requirements (this process is streamlined and low risk if HPE business analysts helped develop the functional requirements.
- Assess functional requirements and technical components required to meet requirements
- Map all functional requirements to technical requirements
- Ingest and consider technical alternatives and review with the County
- Make build versus buy decision and gain County approval
- Iterate technical specification and solution versus functional requirements to optimize business case – discuss tradeoffs with users and gain their approval
- Perform SIT and UAT
- Deploy

Contractor has a comprehensive process for this translation and solution development, as illustrated in the following figure:

Process to Translate from Requirements to Solution



Contractor shall provide a streamlined approach to reach a solution provides sufficient process control to achieve success.

Additionally, Contractor use the following best practices when translating requirements into solutions:

Once requirements are developed and refined, Contractor and the County may also conduct a Build versus Buy Analysis that identifies a "best-fit" solution based on requirements and budget. The best return for the County

comes when business requirements, staffing, and technology are optimally aligned with both End-User and mission needs. The business analyst's job is to analyze needs, document requirements, and identify optimal solutions.

Build. Contractor shall execute the requirements elicitation approach identified in planning until sufficient information is gathered to document the detailed requirements and estimate the cost to build. This cost can be compared to cost to buy COTS, and a final build versus buy decision is made. Contractor shall refer to previous iteration/release documentation as needed to shape the scope of the detailed requirements elicitation.

Depending on the nature of the build, Contractor shall decompose high-level information; abstract low-level information; distinguish requests versus needs; and distinguish requirements from design constraints. Identified requirements shall include functional/system requirements and may include non-functional requirements (such as performance, environmental, security, etc.), service-level requirements, quality requirements, and project management-related requirements deemed critical for project success.

Contractor shall store the collected information (such as informal or formal documents, meeting minutes, interview notes, emails, and other similar items) in a repository for future reference. Contractor shall document the decision criteria and justification for selecting the build option. Contractor shall select a build process, which leads to a build or development phase.

Buy. A COTS solution may be the lowest risk and least costly way to meet End-User functional requirements.

Contractor shall validate high-level requirements against the selected COTS product and perform a detailed assessment of the gaps to confirm that the essential requirements can be met (out-of-the-box, by configuration, or by customization). Business analysts shall be trained in the use of the selected product (including the features, flow, and architecture) or Contractor shall include COTS SMEs in the elicitation activities to clarify how the COTS product can meet the requirements or the impact of potential customizations.

Contractor shall store the collected information (such as informal or formal documents, meeting minutes, interview notes, emails, and other similar items) in a repository for future reference Contractor shall document the decision criteria and justification for selecting the buy option.

Ensure Business Analysts have the necessary level and type of expertise to perform functional responsibilities.

Contractor's approach to ensure that business analysts can perform successfully for the County has four elements:

- Recruiting and Hiring.
- Professional Development.
- Coaching and Feedback.
- Ongoing Experience and Professional Development

Through consistency in Contractor's processes and diversity in its projects, Contractor's business analysts gain growth and experience opportunities they cannot obtain elsewhere. This helps in retention and in the professional development of Contractor's business analysts.

2.22. Chief Technical Architect (CTA)

2.22.1. Process and Procedures

- Description of solution to meet the requirements

The Chief Technical Architect (CTA) shall be responsible and accountable to lead the development and delivery of strategic technology solutions that fit the business' needs. The CTA shall work directly with EAA and County Technology Office to review business and technical requirements, focusing on solution development throughout the project lifecycle, establishing and maintaining data standards, enterprise taxonomies, align with information management strategies and overall efforts to continuously improve the provision of Services. The CTA shall manage and promote the use of County standards, related to software applications, promote the reusability of existing services and expanded use of County platforms, serve as a subject matter expert to projects and provide support for IT project teams.

Contractor shall use the methodology illustrated in the figure below, which is based on recognized and proven Open Group practices (HPES RightStep, IT Solution Architecture [ITSA] and The Open Group Architecture Framework [TOGAF]).

Contractor's EA Methodology

Contractor's approach enables change and transformation and provides the linkage between key stakeholder groups including business leaders, IT leaders and architects, and Contractor to achieve business transformation.

- Deployment plan for resources and use of facilities

The CTA and the Architects shall be two major components of Contractor's technology team. The CTA shall have overall responsibility for setting Architectural direction and strategy (with CTO), identifying emerging trends, anticipating and understanding transformative shifts in technology, developing enterprise and departmental roadmaps, and maintaining strong relationships with Contractor's leading technology partners. The CTA shall then translate this information and direction to the Architects for execution.

The Architects, who shall receive strategy and direction from the CTA, shall be responsible for executing that strategy including adherence to methodologies, standard processes, best practices, accelerators, and standards.

The CTA shall report to the Account Executive, and the Architects shall report to the Contractor's Technology Office. The structure unencumbers the CTA from the administrative burden required when one has direct reports, including HR activities and staff professional development—these activities shall be the responsibility of the Contractor's Technology Office.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor shall adhere to proven methodologies and processes across the organization that it adapts to meet the County's requirements.

Contractor shall align with its proven architectural methods (RightStep and ITSA) and holistic focus that encompasses business, data, applications, infrastructure, network, security, management and implementation aspects including solution evolution.

Solution Design Documents

SECTION TITLE	CONTENTS
Executive Summary	<Write a brief introduction describing the focus of this design document including, if applicable, the purpose, background and scope that affect the design of the project. This summary should be written in nontechnical terms as an introduction to the technical sections. It should contain enough information for a reader to get familiarized with what is discussed in the full document.>
Client Opportunity	[Use this section to describe client opportunities, problems, business drivers and/or goals. Include quotes or comments from clients if appropriate. Where appropriate, personalize the document for the client, mentioning the customer name and specific topics related to their environment.]
Proposed Design	<This section describes the logical and physical solution design including the physical architecture. Include one or more diagrams of the design either as an embedded picture or in the appendix. It is important to highlight that this template just provides guidance which must be tailored by the architect or engineer for their specific work. Not all sections and subsections are applicable to all solutions, and there may be some key ones missing for the solution you are designing. This is a template to help jumpstart the work at hand and provide ideas for design content that otherwise might be left out.>
Business Architecture	The business architecture defines the manner in which business strategy/mission, vision, governance, organization and key business processes come together to define the activities that deliver on the business strategy. Business architecture can be developed with a scope that encompasses an enterprise or solution scale. <This section is used if the impact to business from the implementation of this solution needs to be understood by the client stakeholders. For example, if there are significant changes to the way the client does business {business processes, roles of the client employees, business organization, etc.) here you would describe the logical changes to the business architecture. Each section would include the current and proposed architecture.
Data Architecture	< Data architecture provides a blueprint for the structure of the information components in the context of the business processes and the business organization, the application systems and their interactions (integrations), as well as the relationships between them. This includes the data, data service interfaces, and data management components and can be developed with a scope that encompasses an enterprise, solution or technology scale.
Applications Architecture	< Application architecture is the blueprint for the individual application systems to be deployed, their interactions (integration) and their relationships to core business processes of the organization. Application architecture can be developed with a scope that network requirements or touch points.
Infrastructure Architecture	Infrastructure architecture describes the software and hardware that effectively enables the deployment of other architectures. This includes IT infrastructure like servers, storage, backup devices, End-User devices, middleware, processing and standards used in operations, and does not include the network or communication components which have their own section. Infrastructure architecture can be developed with a scope that encompasses an enterprise, solution or technology scale.
Network Architecture	Network architecture describes the software and hardware that effectively enables the connection between infrastructure components and architectures. This includes networks,

SECTION TITLE	CONTENTS
	firewalls, load balancers, WAN, LAN, VLAN, communication devices and appliances, infrastructure device placement within the network, and the associated network standards used in operations. Network architecture can be developed with a scope that encompasses an enterprise, solution, or technology scale.
Security Architecture	< Security architecture is the blueprint for the structure of the security components of the overall solution, and how they are maintained in line with the security policies, both principles and requirements. It provides the central definition of the capability independent threat and vulnerability structure as well as disaster recovery. A security architecture can be developed with a scope that encompasses an enterprise, solution or technology scale.
Acceptance Criteria	<Describe the success criteria and acceptance requirements guidance. This is at high level; acceptance test plans are created later in the lifecycle guided by these criteria but with much greater detail. This is to provide guidance to the architecture and design on how successful outcome is measured by the stakeholders/client. business acceptance criteria would be those measured in terms of business goals, drivers, metrics, outcomes or results, if any ("Improve claim handling productivity by XX%">. Functional acceptance criteria by those that measure what is included (if the many areas of scope were included, functionality of given modules or components, non-functional requirements or qualities). Technical acceptance criteria are related to "how" the solution is put together (how the layers are put together {three tier architecture for example}, how the interfaces work, how the roles are spread across the many environments, etc.). Implementation acceptance criteria revolve around "with what" and in what order the solution is made {for example, database was required to be on Oracle, middleware and ESB using TIBCO, small project implemented first and later phased to full production, support personnel training, documentation standards and content, etc.}.
Implementation Considerations	<Describe the items that were addressed during the design phase of the project for implementation.>
Deployment	<Describe the technical details of the solution's deployment. Include architecture diagrams.>
Infrastructure Management	<Describe how the infrastructure is to be managed, operated and which companies or organizations are responsible.>
Maintenance Plan	<Provide an explanation of the ongoing maintenance support model. Include reference to any existing agreements as well as any new procedures, processes or resource units.>
Evolution	<Describe the evolution requirements or special considerations that affect project planning and solution implementation aspects—order of implementation of the many components, changes in solution scale /size during the various implementation phases, bringing in highly specialized or hard to find resources, etc. This is not a repeat of other sections of the solutions, this is an extract of what project managers should watch for and take into account in the implementation, testing and development planning.>

RightStep and ITSA shall align with the Contractor framework and governance for consulting services, to facilitate integration with all other supporting methods and disciplines—grouped under the umbrella of the Contractor transformation framework. This framework shall align and integrate the architecture with other Contractor capabilities and methods that are necessary for successful transformation including business consulting, value management, management of change, program and project management, portfolio management, IT service management, SOA services, and governance.

Use of Tools

To create architectural designs, Contractor shall use modeling tools such as EA Sparx, ProVision, and/or MEGA to represent business processes, models, and patterns that define the business architecture. To address IT transformation challenges, the Contractor architecture team shall introduce MEGA as the business intelligence tool to provide comprehensive visibility across business functions, application components, servers, networks, system software, and financials using imports from PPM and County AppsManager. Using EA life cycle processes (for example, BRICK) and principles, MEGA enables comprehensive enterprise portfolio management to identify core systems, systems of differentiation, and systems of innovation to facilitate alignment with County business strategies.

Application Architecture

Contractor's applications architecture shall include application principles, integration models, application landscape models, application portfolio maps, application to process maps, application flow models, application to information matrix, and application standards, among others. These are organized within topic areas (sometimes called domains and subdomains) and supported by RightStep, as described above.

Staffing and organization of Architecture Services.

Contractor's global architecture capability is an organization with a formal charter and governance model within ES that supports all aspects of architecture services—methodologies, processes, best practices, accelerators, standards, and professional development. This applies to all architects, whether enterprise, solution, business, or technology architects. This is consistent with Contractor's approach to create architectures that seamlessly provide guidance from the enterprise scope to the solution and technological layers. The guidance and standards provided by the ES architecture capability team is also used by other business units. Architecture capabilities/teams reside throughout Contractor's organization, in both accounts and in local and regionally available teams that can be leveraged as an element of a client engagement. To facilitate the organization of architecture services, a collective set of standards, best practices, tools, and accelerators for each strategic capability are kept within the Contractor's EDGE platform.

Common architecture toolset and documentation standards

Contractor architects shall regularly conduct whiteboard sessions with other team members— security, application, the County, and other vendors—before Contractor creates an SDD for any project. The updated SDD template, included in the Solution Summary and Rationale section above, shall cover all necessary architecture artifacts and design consideration, which shall include high availability, scalability, County architecture/network patterns, reuse of existing County technology assets, leading to complete, consistent and coherent solutions. Contractor shall also use this document for internal reviews as the standard template for architecture projects from start to finish. Every SDD document shall also be used in its entirety in downstream activities, for example, by engineers for technical design documents, run books, server builds, load balance workbooks, and firewall changes. This approach facilitates consistency across all projects from design through implementation.

2.23. Enterprise Application Architect (EAA)

2.23.1. Process and Procedures

- Solution Summary & Rationale – Description of solution to meet the requirements

The Enterprise Application Architect (EAA) shall be responsible and accountable for the "advise to manage" (illustrated in the figure below) portion of the enterprise architecture, while supporting the CTA, CISO and County Technology Office in the "strategy to technology" portion. The EAA shall work directly with CTA and County Technology Office to review business and technical requirements, focusing on solution development throughout the project lifecycle, establishing and maintaining data standards, enterprise taxonomies, align with information management strategies and overall efforts to continuously improve the provision of Services. The EAA shall manage and promote the use of County standards, related to software applications, promote the reusability of existing services and expanded use of County platforms, serve as a subject matter expert to projects and provide support for IT project teams. The EAA shall provide the bridge between County business and the IT staff that ensures that the application architecture meets business goals and objectives, that promotes reusability and provides data and interface connectivity across the Enterprise.

CONTRACTOR'S EA Methodology

- Resource and Facility Approach Summary –deployment plan for resources and use of facilities

The CTA and the EAA are two major components of the Contractor's architecture team. The EAA shall serve as a technology lead and liaison to County business in developing and linking technical solutions that meet requirements and act as a subject matter expert on the effective use of technology in developing County business solutions. Working with the CTA, County Technology Office and CISO, once overall architectural strategy and direction has been established, the EAA shall advise IT staff regarding the feasibility of their proposed approaches to project solutions in terms of systems capabilities, new technologies and alignment with established application architecture guidelines and standards. The EAA shall have overall responsibility for IT strategy execution across the enterprise including adherence to methodologies, standard processes, reference IT patterns, accelerators, and standards.

- Methodology & Key Processes – Key methodologies and processes in solution including year-to-year continuous improvement

Contractor shall adhere to proven methodologies and processes (RightStep and ITSA) across the organization that are adapted to meet the County's requirements. Contractor's Architecture Services Methodology is based on principles that the County Technology Office has adopted—principles precede requirements and they help frame the overall solution approach to align with County strategic direction.

Processes: Contractor has two primary architecture methods recognized by The Open Group (HPES RightStep and ITSA). Since the EAA is focused on solution development across the lifecycle, the EAA shall primarily use Contractor's Global Method of IT Strategy and Architecture (ITSA). ITSA is Contractor's methodology for

developing solution, initiative, or technology architectures. It is a structured as a participatory approach that involves key stakeholders in the client's business. It has been proven effective through many years' experience in defining, guiding, and evolving complex information systems in multiple application domains. ITSA helps architects understand the needs of all stakeholders by viewing the architecture from four vantage points or views:

- Business View – *Why* is the engagement being done? What are the motivations and business drivers?
- Functional View – *What* will the system do? What information will it provide?
- Technical View – *How* will the system be realized with IT components?
- Implementation View – *With what* specific products and other components will the system be implemented? In what organization? According to what plan?

ITSA defines each view using principles, models, and standards appropriate for the business domain. When combined, the four views enable Contractor to understand the needs of all stakeholders and create a snapshot of the solution. Business factors (drivers, goals, metrics, principles, models, and standards) are the basis for all technical and implementation decisions. The methodology does not specify (or limit) the techniques to use to gather the business information or products to solve the customer's problems and compliments each client situation to determine business need, maturity, and existing standards.

- Automated Tools

To create architectural designs, Contractor shall use modeling tools such as EA Sparx, ProVision, and/or MEGA to represent business processes, models, and patterns that define the business architecture. To address IT transformation challenges, the Contractor architecture team shall introduce MEGA as the business intelligence tool to provide comprehensive visibility across business functions, application components, servers, networks, system software, and financials using imports from PPM and County AppsManager. Using EA life cycle processes (for example, BRICK) and principles, MEGA enables comprehensive enterprise portfolio management to identify core systems, systems of differentiation, and systems of innovation to facilitate alignment with County business strategies.

2.24. Innovation Management Services

2.24.1. Process and Procedures

Innovation Management Services shall support the transformation and innovation model of continuous progressive change in how Services are delivered. This shall include, but is not limited to, delivering Services via a bimodal approach, with an emphasis on exploration, agility, and speed, while still maintaining operational integrity and stability.

Innovation Management Services shall begin at Transition completion with presentation of a qualified Innovation Officer (IO) to the County for County approval. The IO shall develop for County approval a program charter and rules of engagement that define the process to:

- identify potential needs/issues/gaps/opportunities for improvement
- create a list of potential services available to further innovation and transformation, to include:
    - joint development workshops
    - white-board sessions
    - prototypes
    - pilots

  - demonstrations of products, software or services
- design and develop lab environment(s) and rules of use
- determine method to define success criteria
- define collaborative engagement model with EA, CTA, EAA, CISOs and County Business Leaders

Innovation Management Services shall include an Innovation Management Office that shall serve as the foundation for continuous business improvement, innovation, and transformation. The Innovation Office (IO), planned for January of CY2, shall be composed of the Innovation Officer and additional on-demand resources, upon County Approval with the directive to drive IT innovation/transformation and create a true environment of agility and high-velocity change at the County.

The IO shall create and update in the Standards and Procedures Manual the necessary information for the Innovation Management Review Board.IO shall work with County Technology Office and County Business leaders to identify specific actions in support of County Excellence Goals. This results in a series of initiatives in which Contractor shall propose solutions, business case analyses, anticipated pricing, and project timelines and resource plans. The proposed initiatives shall be reviewed by the Innovation Management Review Board and, if approved, shall be executed using (as appropriate) agile and rapid-prototyping methodologies.

- Resource and Facility Approach Summary –deployment plan for resources and use of facilities

The Innovation Management Office shall be a virtual office with some members residing at CAC and Contractor's Rancho Bernardo facility and others at US-based facilities as determined by skillset required.

Starting after CY1, Contractor shall provide Resource Units rates for the following three (3) resources or more to be used on-demand, upon County approval:

- Senior Technologist (skillset akin to CTA)
- Senior Solution Architect
- Senior Business Analyst

The above resources shall be billed at the Innovation Core Team Member rate as defined in Schedule 16.1 (Fees) – Exhibit 16.1-1 or any applicable labor category rate if it is lower. Any of these labor category rates are to be consumed against the 50%/50% jointly funded Innovation Fund as defined in Schedule 16.8 Fee Adjustments.

Additional personnel ebbs and flows through the Team as required by Innovation/Transformation ideas/pursuits/opportunities.

Additional personnel may come from the County, Contractor, Contractor's partners or other 3rd parties and could include:

- Business Leaders
- Senior Technologists
- Innovation Lab Personnel
- Local Government advisory personnel (e.g.: Gartner)
- Architects/Engineers
- Business Analysts

- Software Specialists
- Logistics Engineers
- Mobility Specialists
- Change agents
- Logistics experts
- Asset and Billing Specialists
- Government Strategists

At execution, Contractor shall propose utilization of an existing RU aligned with the skillset of the team member. If an existing RU cannot be utilized for the activity to be performed, Contractor shall propose an hourly rate or FFP for County consideration. Rates shall be agreed upon in writing by the Parties.

- Processes including year-to-year continuous improvement

Methodologies and key processes shall be defined by the charter and rules of engagement.

Governance shall be provided by the Innovation Management Review Board, co-chaired by County CIO and Contractor AE who shall have joint approval on all proposed initiatives and activities.

Contractor shall perform an annual assessment of Innovation Management Services for County review and approval as part of Schedule 5 reporting requirements.

3. SERVICE DESK SERVICES

3.1.1. Process and Procedures

The Contractor solution to meet the requirements

The following shall be the various support tiers and transfer types used by Contractor:

Support Tiers:

Tier 0 – Self Service
Tier 1 – FCR (anything that can be addressed by the initial agent with no transfer)
Tier 2 –Ticket transferred to a second level agent for support for resolution of an issue requiring on-site support or additional administrative permissions (typically applies to feature functionality issues i.e. Operating System, Browser, MS Office Programs, etc.)
Tier 3 – Ticket transferred to a 3rd level agent (framework) for resolution. Datacenter, Applications, Security, Network, Vendors/3rd party, on-site, engineering, etc. Feature functionality issues typically require specialized support and advanced permissions to resolve the issue
Tier 4 – Global administrator/engineering/architecture required to resolve the issue

Unless otherwise provided in the script documentation the following Transfer Types shall apply:

Transfer Type	Description	Priority
Cold	Ticket sent straight to frame work in the ticketing system with no communication	P4/P5
Warm	Chat E-mail Text	P3/P4/P5
Hot	Phone call	P1/P2/P3

The Contractor Service Desk for the County shall serve as a single point of contact and the primary owner for monitoring and tracking of all incidents and Service Requests (SRs) for approved End-Users. Contractor's key solution strategy is to use ITIL-aligned processes to meet requirements, achieve 70% first-call resolution (FCR), and achieve 12-minute phone handle time as well as Service Desk ownership for end-to-end tracking of all tickets and SRs. Contractor's Service Desk shall use a knowledge documented in the electronic Knowledge Management System (EKMS) to make a swift determination on whether an issue is warm transferred to Contractor's remote desktop/device management (RDM) capability or escalated to deskside/field support or the appropriate framework (e.g., Applications M&O, End User, Network).

Contractor's updated training processes shall provide agents with in-depth knowledge of County processes, scripts practice, and ITIL-based practices. Contractor shall ensure all employees including new hires receive Contractor's Doing Business with the County instruction and monitor individuals for its completion. Contractor integrates the training activities Contractor's agents receive with real day-to-day work assignments. Contractor's training increases agent comprehension of County-specific issues and expertise in routing tickets efficiently and effectively to the appropriate technical support group. shall identify those agents who require additional instruction and customize training to strengthen their skills.

As Contractor implements the self-service technologies of the Agreement, Contractor shall encourage users to access the Service Portal's self-service functionality from their desktops, tablets, or mobile phones. Contractor shall provide its technology End-User adoption approach,

Contractor's HPSM system's data analytics functionality shall include documentation and display on the Service Portal of Service Desk statistics tied to both Contractor's team's objectives and the County's service levels. The data warehouse, accessible through the Service Portal, shall contain County attributes for reporting and analytics such as PA-ID, POETA, County Group, and County Department. Contractor's Service Desk manager shall perform quality reviews on relevant areas such as call waiting/call abandonment, efficiency in meeting the phone time to resolve metric, rate of FCR success, and End-User satisfaction levels upon ticket resolution. On systematic review of trends, surveys, and reports, the Service Desk manager, together with other members of the Contractor account management team, shall find opportunities for improvement of Service Desk services and operational cost efficiencies.

Service Desk Structure

Service Desk.

Contractor agents shall be the first point of contact and if needed shall provide remote desktop/device management (RDM). If support requests cannot be resolved by the first contact agent (Level 1), then the call shall be escalated to RDM (Level 2). In some cases, the Service Desk agent escalates to the deskside/field team or subject matter technical support (Level 3), which includes frameworks such as applications, engineering, exchange, data center, infrastructure, storage, etc. Level 1 and Level 2 resources shall reside within the Service Desk Framework. Level 3 support shall be provided primarily by the various frameworks unless the Service Desk has the ability to resolve the issue based on the documentation provided by the framework and has the required access to the systems. Contractor shall provide to all agents Service Desk training and detailed documentation outlining the correct escalation path for each type of incident or SR that guides agents to make certain that tickets requiring escalation are routed correctly the first time.

While the Service Desk Framework is responsible for the full life cycle and management of all incidents, installs, moves, additions, and removals (IMARs), and SRs, each framework shall be responsible for management of its work stream, making certain that work is triaged within the required timeframes. Points of contact (POCs) are identified within each group to manage these activities and verify work is completed. Costs associated with these activities outside of the Service Desk agents shall not result in additional costs to the County.

Remote Desktop Management (RDM). Service Desk agents shall use RDM to interact with network services, software systems engineering, and/or an applications group to restore service and/or identify and correct problems. This may require assisting in simulation and recreation of End-User problems and recommending systems modifications to reduce End-User problems. Service Desk agents shall be facilitators between customers and other support teams to make certain customer needs are met and tickets are resolved in an expeditious manner.

Comprehensive Service Desk for the County

Contractor shall continually add to the knowledgebase, working closely with other resolver groups to identify areas where Contractor can improve knowledge documentation to provide increased resolution at first call, freeing resources to support their other activities.

Deployment plan for resources and use of facilities

Resource Management — Oversight for Service Improvement. The Service Desk manager shall provide oversight of performance, resource management, and service delivery, including the collection, consolidation, and dispatch of events and information sent by the County as it relates to the environment. As part of this role, the

Service Desk manager shall review metrics on customer satisfaction and success in meeting County requirements and establish quality processes and intensified training approaches to improve Service Desk performance. Contractor's reporting analyst shall analyze Service Desk data, identifying and adjusting metrics queries, and fulfilling the ad hoc Service Desk-related report requests from the County and from the Contractor service delivery manager in the County.

The Service Desk manager shall lead daily status calls with the Service Desk Workflow Manager (Workflow Manager), operations manager, and shift leads to make announcements, communicate County concerns, and review the status of any issues that emerged overnight. In addition to the daily status calls, the Service Desk manager shall call meetings every Monday before each shift begins that include the agents on deck. These meetings shall provide a venue for management and agents alike to raise issues they need to address and to foster interaction with the Service Desk manager in his efforts to support alignment with County expectations. Contractor's Service Desk support shall concentrate agent numbers in shifts during the County's core hours from 6:00 a.m. to 6:00 p.m. PT, Monday through Friday, and maintains support overnight and weekends.

The Workflow Manager shall support the Service Desk manager in providing day-to-day supervision of operations, monitoring that agents arrive on time and are attentive to their responsibilities, adjudicating rotation of shift personnel, and making sure that the metrics gathered on Service Desk are uploaded properly on the Service Portal for review by the Service Desk manager, the quality analyst, the Contractor account team, and County administrators. The workflow manager shall constantly communicate with the Service Desk manager, updating him on Service Desk issues throughout the day, workloads, and staffing, including issues of individual agent performance.

Working with the Service Desk operations manager and scheduler, the shift leads shall monitor the ticket queue to make sure tickets do not go unattended. Other shift lead responsibilities include providing oversight of ticket agents' handling of Priority 1 and 2 Incidents and High Response End-User/Critical User tickets. Contractor's shift leads shall oversee agent performance and work with the Service Desk's training analyst to develop measures to improve expeditious handling of tickets and effective agent–End-User interaction. Contractor's training analyst shall check the training history of individual staff, making certain that all staff take Contractor's mandatory training, and shall provide follow-up as necessary.

Key methodologies and processes including year-to-year continuous improvement

IT Service Management (ITSM) Processes for Service Desk. Contractor shall implement ITIL/ITSM processes for Service Desk with a focus on customer service satisfaction and continuous improvement. As a key ITSM framework process, Contractor's Service Desk shall own and track tickets created at initial call or that are assigned via the Service Portal, and it is their responsibility to maintain open communication channels with the End-User in the event of a ticket inquiry throughout the ticket's life cycle. Contractor's Service Desk agents shall also provide an interface for activities such as SRs, customer change requests, incident management, and third-party support.

Continuous Improvement. ITSM shall collect data from the Service Desk system, Customer interactions, HPSM, the Avaya CMS Call Manager, and the Customer feedback surveys that Contractor uploads for data aggregation and review. All of the data input from these systems along with the additional reporting that Contractor adds from chat and Self Service shall be placed into the analytics environment that is created in support of the Service Portal. Service Desk related data shall be posted to the Service Portal and reviewed regularly with the CTO during the Operations status calls.

Quality Monitoring to Improve Agent Overall Performance and Customer Service. Contractor's Service Desk manager together with the workplace manager and shift leads shall review the results of the customer satisfaction surveys and other relevant data displayed on the portal (for example, phone handle times at initial call, ticketing information, chat data, most common scripts used, etc.) to discover areas for improvement, discuss them with the

quality assurance (QA) analyst for Service Desk, and present findings at a Monday all-hands Service Desk meetings for each shift.

At these meetings, managers and leads shall make recommendations on issues identified or for the agents to raise new problem areas they have experienced the previous week. The workplace manager shall upload results and new resolutions from the meeting to the Service Desk dashboard reserved for agent posts. As each shift conducts its Monday meeting, additional comments shall be added to the dashboard. These recommendations shall be communicated by the Service Desk Manager to the CTO.

Contractor shall implement the following five-step quality management framework, supported and documented by Contractor's QA analyst: (1) Monitor Performance; (2) Analyze Performance; (3) Identify Areas for Improvement; (4) Establish Corrective Actions; and (5) Verify Improvement. The framework aligns with Contractor's seven-step ITIL processes for continuous service improvement.

Monitoring Performance of Individual Agents. Contractor shall capture agents' voice interactions with users along with the corresponding computer desktop activities, such as data entry for logging tickets, cataloging and prioritization, screen navigation, and data retrieval from the knowledgebase. To effectively coach employees, Contractor shall use two quality monitoring methods: side-by-side and remote. In side-by-side monitoring, the shift lead shall use a headset to join the call of a new agent or an agent learning better communication skills. The shift lead shall also use remote monitoring—that is, agents are unaware they are being monitored—to audit and evaluate agents' performance for Contractor's quality metrics.

Contractor's Service Desk manager shall consult with the workplace manager and shift lead to perform agent evaluation review and identify patterns to assist agents in understanding how each aspect of their performance affects the whole.

Automated systems and tools involved in Contractor solution

Contractor shall implement for the County HPE Service Manager (HPSM), Contractor's system that includes comprehensive core and extended Service Desk advanced functionality. It shall provide key Service Desk automated processes and manage Contractor's responses to County users, including first call resolution (FCR), deskside support coordination, and ticket and SR escalation to support, including to AT&T network/mobile SMEs and other vendor support.

Contractor shall implement the Service Portal and its self-service capabilities within 90 days of the Contract Effective Date. The portal implementation approach as detailed in the Transition section for the Service Desk shall include the core functionality of new services and links to current data sources and source systems to integrate with current repositories within the 90-day timeframe.

At the end of the transition period End-Users shall be able to perform the following via self-service:

- online -ticket creation
- Review status of tickets and Service Requests,
- Perform online password resets via the Self Service Password Reset, SSPR tool
- Conduct chat sessions with the Service Desk for information or support
- View reporting.
- Access to the Knowledgebase (FAQs, tips sheets

- View Outage Status, Trending Now, and Announcements
- Access to MyRequests, and various links (ITSC, DocVault, etc.).

The new service catalog that replaces myRequests and the complete integration of the configuration management systems (Asset Manager, Apps Manager, ESL) shall be implemented as a part of the transition and is included under the Cross functional transition section and timeframes. Contractor shall engage the CTO and other relevant County stakeholders to provide input into the look and feel of the portal. County users shall be able to access the Service Portal, including self-service functionality, from their desktops and other platforms.

On-Going Maintenance, Support, and Enhancements: The Service Desk Manager shall be the primary point of contact for the Service Portal for the County of San Diego. Technical support and enhancements shall come from the Contractor's Portal framework, which is a leveraged team. The Service Desk Manager shall make certain that issues related to the portal are being resolved and that maintenance items and new features are being implemented as needed.

Contractor shall follow a quarterly maintenance schedule for changes to the portal that are non-incident related and for changes that may require coordination, training, and communication to the End-Users. Simple changes (adding links, contacts, FAQs, Announcements, Trending Now information, etc.) shall take place on a frequency agreed with the County. The overall focus around the processes and frequency related to these changes shall be to ensure the latest and most accurate information is published to the portal in a timely fashion to benefit the End-Users. Once the timelines are established, processes shall be built, approved and communicated as required. To make certain that the changes being made are communicated, well thought out, and in the best interest of the End-Users, the Service Desk Manager shall be a part of a Portal Review Board, the final composition of which shall be established by the CIO, in consultation with Contractor Account Executive, to discuss, approve, document, and communicate all changes related to the Service Portal. These changes shall include not only the content within the Service Portal but the processes related modifications that need to be made over time to ensure information and Service Portal accuracy. For changes to the Service Portal that require Portfolio Application modifications or County data manipulation, a Budgetary Estimate (BE) shall be provided to the County to determine how or whether to proceed with these changes.

Training: Training shall be provided for all End-Users and support staff as a part of the Transition project related to the Service Portal. This shall cover every aspect of what is in place at the end of this project. As a part of transition planning, Contractor shall discuss with the County the various training options and communications that are needed to ensure that all End-Users understand the capabilities of the portal and how the portal works.

Sample Landing Page for Service Portal with Self-Service Functionality

Unless otherwise agreed to by the County, the landing page for the Service Portal shall be substantially similar to the following:

County users shall be able to click a tile to phone Service Desk, open a ticket on their own, reset their own passwords, make SRs, check County announcements, access training, FAQs, and Tips, and stay alert to outages. In another example, upon clicking "Open Ticket," a dropdown menu appears that allows the End-User to select from a list of problem categories; once the category is selected, a second dropdown menu appears with category-relevant problem descriptions. During the process, if the End-User decides guidance is needed from a live agent, he or she can click the "Chat" tile or "Call Service Desk" for support.

When a ticket is created from the portal or the Service Desk via a phone call or email, Service Desk shall embed the End-User's profile (i.e., contact information, location, and asset information) in the ticket and track it until resolution, posting updates on the ticket's progress on the portal. The solution shall allow the End-User to easily obtain ticket status by accessing the portal landing page from his or her desktop, tablet, or mobile phone.

The fully-implemented HPSM shall include myRequests.

Ownership and end-to-end tracking of Incidents

Service Desk shall have ownership of all tickets and shall track them from End-User submission through ticket resolution. Contractor shall use ITIL-aligned processes. The Service Desk agent shall update the End-User on ticket progress until it is resolved.

Service Desk Handle Time and Escalation of Incident Tickets. When an End-User calls in an Incident by phone, the Service Desk agent who answers the call shall own the ticket. The agent shall first verify whether the call is for an Incident rather than a SR. Once an Incident is validated, the agent shall log the ticket, including the End-User profile, categorize the Incident, and prioritize the ticket according to the County's priority matrix (i.e., Priority 1–3); if the caller is on the High Response End-User list, the End-User profile shall automatically alert the agent to register the ticket as Priority 1 or 2 depending on the severity of the issue.

If the Incident arrives through an End-User-created ticket via the Service Portal, its automated processes shall upload it to the ticket queue for selection by available ticket agents. Ticket assignment order shall be determined by first in/first out and by severity. Severity 1 and Severity 2 tickets shall receive immediate attention by Service Desk agents, with oversight by the Workflow Manager and Shift Lead.

Once the Incident is logged, the Service Desk agent shall assign the ticket, start troubleshooting, and diagnose it using information provided by the caller or the description on the portal-generated ticket. The Service Desk agent shall quickly resolve low-level Incidents associated with known errors by applying approved solutions or workarounds. In cases where the Service Desk agent may know immediately that the Incident cannot be resolved, the Service Desk agent shall determine, based on knowledge documented in the EKMS, whether it can be routed to deskside/field support or to the appropriate framework for resolution. In some cases, vendor-specific support may be required. The knowledge incorporated in the EKMS shall derive from information provided by the vendor on its hardware/software; resolution and workaround instructions developed by Contractor's SMEs based on their respective areas of expertise (e.g., applications, network); and information developed by the County SMEs on its infrastructure.

Deskside Support Escalation. When Contractor's deskside technicians receive a ticket, they shall retrieve all the service attributes from the EKMS and launch scripts and perform progressive troubleshooting based on the documented knowledge to identify the probable source of a service Incident. For example, if Service Desk performs troubleshooting and is unable to resolve the ticket, the Service Desk agent shall itemize the actions taken and issues still unresolved on the ticket's Comments section. Service Desk shall notify the End-User that the ticket needs further troubleshooting deskside; the technician shall coordinate the date and time for the visit with the End-User and post the appointment in the ticket. The ticket information, including scheduled deskside visit, shall be viewable via the Service Portal.

Subject Matter Expert (SME) Escalation. When the Service Desk agent recognizes that the source of the Incident requires SME support, he/she shall escalate the ticket to the SME support team appropriate to the affected framework.

In addition, Service Desk shall escalate unresolved "child" tickets that match a "parent" ticket to the SME support team working on that Incident's resolution. The SME support teams shall perform additional diagnostics, as necessary, to identify and implement an appropriate solution or workaround. These teams shall take a comprehensive approach to resolution, keeping in mind the parent/child ticket linkage and recording their actions in the Comments section of the ticket accordingly. Once the issue is resolved, the Service Desk shall update the status of all the linked tickets on the Service Portal and notify all impacted users.

Vendor Support Escalation. When a ticket is escalated to a Third Party regarding a product that cannot be resolved by Contractor's deskside technicians, the Service Desk ticket owner shall confirm that the problem is fully described on the ticket before it goes to the vendor's helpdesk.

Ticket Closure. Once the ticket is resolved, the resource responsible for the resolution shall change the status of the ticket to "Resolved." This action shall automatically notify the End-User via email of the resolution. The body of the email shall request a reply within 3 days if the issue was not resolved to the End-User's satisfaction. If no answer is received after 3 days, the ticket status shall remain "Resolved" for an additional 7 days in case the End-

User is out of the office. If the End-User does not reply after the additional 7 days, the ticket shall automatically be set to "Closed." Contractor shall continue using this format to update the End-User on resolution if desired by the County, but at the County's option, Contractor shall implement a verification email that shows the End-User how the ticket was resolved, encourages the End-User to complete the customer feedback survey, and promotes the County's self-service password reset requirement. When the End-User clicks on the respective blue icons in this message, he/she goes to the Service Desk site related to the text.

Maintenance and refresh of Service Desk scripts.

Contractor shall use structured formats for receiving calls and scripts that have proven successful in addressing problems and accelerating resolutions within 12 minutes on Service Desk. Contractor shall develop scripts for RDM and higher-level technical solutions. When the County users request a new script or a modification of a current script, the appropriate technical support group shall communicate with them in developing the script in adherence with Service Desk Script Revision Process documented in the Standards and Procedures Manual.

Contractor's knowledge content analyst for Service Desk shall review scripts for consistency with the database methodology and style guide, recognizing that certain Service Desk scripts are spoken to the caller. Contractor shall maintain successful scripts in a Service Desk EKMS with rules-based access to Contractor's agents/technicians. Contractor shall refresh the information in EKMS and the Self-Service Knowledgebase information annually.

Contractor's Service Desk Manager shall adhere to the Framework Revision Process flow established by the County and post in the Service Portal Contractor's Monthly Revised Scripts—Revision/Acceptance Report, which enumerates the total scripts in the EKMS and the number of revisions that month.

Using HPSM, Contractor shall collect metrics on response and resolution times associated with respective scripts that Contractor's agents use against identified problems.

In reviewing metrics and issues raised by Contractor's agents, the Service Desk Manager shall identify less helpful scripts and assign them for rework. Contractor's development of new scripts or revisions of existing ones shall draw from the HP Global Service Desk scripts, a database of proven scripts to address a range of problems that have demonstrated success on Contractor's accounts worldwide.

Contractor's Service Desk shall support the Service Portal by reviewing the scripts in the EKMS and selecting those appropriate for revision for "how to" instructions with visual aids for upload into the Self-Service Knowledgebase. Contractor shall work with relevant SMEs in developing suitable language for End-Users accessing the Service Portal's self-help functionality. This shall include tips, training and FAQs.

Preventing abandoned calls

Contractor shall increase Contractor's training of Service Desk agents, both new hires and incumbents, to increase their ability to resolve tickets quickly. This training shall include Contractor's indexed Knowledgebase and scripts to resolve less complex Incidents quickly at first call. For callers making SRs, the trained Service Desk agent shall point the caller to the related content in the Service Catalog for products and direct the caller on how to use the SR tool on the Service Portal.

Additional Measures: Contractor shall take measures that shorten the phone handle time to restore service to the End-User as quickly as possible and allow the agent to help the next End-User.

- Contractor shall provide Contractor's agents with a Self-Service Knowledgebase with an indexed search engine at their fingertips;
- Contractor's agents shall open their response to the caller with a time-saving structured format (template)

- The call waiting recording shall provide the option for the End-User to leave voicemail to be returned within 15 minutes

First call resolution strategy

Upon receiving a call, the Service Desk agent shall access the Service Desk module's dropdown menu, which shall provide a range of predefined problems or SRs.

A Service Desk agent shall quickly assess the issue and determine if it can be resolved by the agent or must be escalated for SME support.

- Contractor shall identify data in HPSM to determine overall FCR performance, by contact type and agent identification.
- Contractor shall calculate the number of repeat calls on the same issue to identify trends and problems and develop Knowledgebase and "how to" articles accordingly, including tips and FAQs.
- Contractor shall identify Service Desk agents needing additional training.

Resolution of Impacts to County and non-County End-Users

The Service Desk shall quickly identify High Response End-User and critical systems issues, and shall page Contractor's appropriate on-site technical support.

Contractor's HPE Service Desk agents shall provide elevated support when it comes to critical events in the County. Critical or special events include but are not limited to the following classifications:

- County-wide disasters/emergencies. For these events (e.g., fires, floods, power outages), the Office of Emergency Services (OES) is activated and support personnel are required to work with the County to support the End-Users and the public. The size of these events vary, and Local Assistance Centers (LACs) may be required
- Disasters/emergencies that are small in scope. Response to these events (e.g., focused areas of flooding, building damage) are typically initiated by the Business Group that is impacted. In some cases, a relocation is required to continue to provide service, or an LAC must be stood up.
- Elevated service levels are activated for the Registrar of Voters in support of elections.
- Elevated service levels are activated for Treasurer Tax Collector in support of several public-facing activities conducted by the County.

Each of these events shall have a documented process in place to ensure that Contractor's agents and staff not only understand these requirements but also can route calls appropriately for resolution. The Service Desk agents shall have everything they need and be trained to support this effort and are able to distinguish between an emergency event and standard call.

Contractor shall update the High Response End-User priority matrix and a list of County and non-County High Response End-Users as provided by the CTO.

Calls, emails, or Service Portal notifications from these High Response End-Users and organizations shall be automatically flagged at the Service Desk for escalated response. The Service Desk agent receiving the notification shall follow the mission-critical workflow and the Workflow Manager shall provide oversight to make sure the call is escalated if it cannot be resolved right away.

On-site support to End-Users

The Service Desk agent may determine that deskside support is the necessary next step to resolve the ticket. Before escalation, the Service Desk agent shall review the ticket to make sure that all actions taken in diagnosing and troubleshooting have been recorded in the Comments section.

The Service Desk agent shall notify the End-User that the ticket requires a deskside visit for additional troubleshooting. Then the deskside technician shall coordinate, via Chat or on the mobile phone or email, the visit date and time with the End-User. The scheduled time, date, and location shall be updated in the ticket, which shall be available for lookup on the Service Portal.

Once the deskside technician resolves the issue, the ticket shall be set to "Resolved" and shall follow the "Ticket Closure" process described above.

Contractor shall locate Contractor's deskside support personnel at the Rancho Bernardo facility and at the CAC and COC. Contractor shall station Contractor's mobile phone personnel at the AT&T facility on Trade Street.

End-User self-service capabilities

Contractor's self-service solution shall provide End-Users the option of accessing the Service Desk to open a ticket, obtain ticket status, make an SR, check outages, and perform password reset via the Service Portal from multiple platforms, such as mobile phone, desktop, tablet, or Chat.

Chat. As part of the Service Desk transformation, Contractor shall enable users to use Chat with Service Desk agents to request information, report an incident, or request information on SRs. As with other methods of contacting the Service Desk, Chat shall begin with the standardized ticket workflow and ends with successful resolution. Agents can handle multiple, simultaneous text Chats. The chat tool shall come as a part of the HPSM toolset that is being implemented for the County. The End-User shall be able to access this chat functionality through the Service Portal so no additional software is required on the End-User's devices. **Self Service for Incidents/Problems**. The new self-service ticket capability option shall enable an End-User to open a non-critical ticket that is automatically submitted to the Service Desk queue for review and action. The End-User clicks on "Open Ticket" to submit hardware, software, connectivity, printing, phone, and voice issues, as well as general questions. Users shall be able to track their ticket status without contacting an agent by clicking the "Ticket Status" tile on the portal.

Self Service for Password Reset. As a part of self-service, Contractor shall implement HPE's Self-Service Password Reset Tool (SSPR tool). The SSPR tool delivers multiple ways for End-Users to reset their own passwords. This solution removes the requirement for Service Desk intervention where End-Users have forgotten their passwords and/or locked their account. SSPR is a web browser-based, automated password reset tool that uses dedicated infrastructure, within the County's domain. It also provides a Web-Services based API that allows password resets directly from the Logon Screen. SSPR can also be accessed by visiting the SSPR Web Page from any supported browser on any device, provided it is connected to the County's network. Integration with Active Directory shall be completed as a part of Transition. Other repositories to be added as requested by the County via Service Request.

Additional Self-Service Features. Contractor's portal capabilities shall include more features for both self-service and agent assistance:

- Knowledgebase search engine capability that provides users on their desktop, laptop, or phone "how to" instructions for resolving common problems. Contractor's Knowledgebase content shall use standard text information that delivers clear "show me" instructions that walk the End-User through resolution, click-by-click. It shall also provide videos for step-by-step problem resolution.

- FAQs based on Contractor's review of questions typically asked by users and Tips that enable quick search on a range of information.
- Self-service password reset online tool that allows users to securely reset their own passwords without agent intervention. Users access the secure system by a simple web-based interface, such as a County public-facing website, linked to the portal but implemented separately.
- Dashboard view of the end-to-end County IT environment. Both County management and users are also able to view Rich Site Summary (RSS) feeds, system-wide notifications, alerts, and other important information that impacts the overall IT environment.
- Mobile device "click to call" brings easy dialing options to contact a service

Contractor's approach to introducing the new technologies promotes early County administration and End-User adoption because self-service saves time and improves End-User productivity. Among Contractor's techniques, Contractor shall host training sessions for County users to demonstrate portal and self-service capabilities. On deskside visits, Contractor's technicians shall demonstrate functionality and answer questions. Contractor shall distribute tent cards with "how to" instructions on County desks.

End-User survey process

Contractor shall provide a customer survey for break/fix tickets. The format of the survey shall be designed to make it easy for End-Users to assess in as little as a few seconds the level of their satisfaction with the Service Desk and provide comments if desired. Contractor shall consult with the County on the final design of this survey; upon agreement, Contractor shall distribute the survey after ticket resolution via email or mobile phone. The customer survey shall be an automated process. The automated dispatch and collection of the survey shall be independent of Service Desk.

Contractor shall provide survey results on the Service Portal each month for the appropriate CTO staff. The survey shall identify the ticket agent and the type of issue that was resolved. HPSM metrics shall provide the time taken to resolve the issue and the tier level of resolution, including whether Contractor is meeting Contractor's 70% first call resolution rate.

Contractor's Service Desk Manager shall collect and regularly review the survey data collected; a reporting analyst shall identify trends and mentoring and training opportunities.

Continuous measurement of Service Desk performance

The Service Desk ticket system, phone reports, and customer interactions and surveys shall provide the data needed to the Service Portal. These data points shall provide the detail that not only makes certain that Contractor is meeting Contractor's service levels, but provides the level of information that Contractor requires to continuously improve Contractor's services.

The HPSM Service Desk module shall enable Contractor to standardize the collection of data, collect more categories of data, and provide more accurate data on which Contractor can identify areas that need or demonstrate improvement. For example, dropdown menus with predefined service issues shall allow Contractor to enumerate a standardized selection of issues and determine their average time to resolution. It shall also indicate agents who take longer than the average who may need more training, are working an issue that may require more documentation, or have come across something new that Contractor needs to put in place. Contractor shall follow ITSM processes in tying data collection and metrics to continuous service improvement.

The Service Desk Manager shall define the metrics needed to improve Service Desk customer satisfaction and shall use the HPSM Service Desk's data collection capability. HPSM logic shall be aligned with ITSM processes, thus allowing Contractor to collect data not only directly tied to the service levels but also more detailed data that support Contractor's strategy for continuous improvement.

Inputs to this step shall include collecting data against the service levels. HPSM shall have the capability to collect data automatically, including:

- Baseline data on call waiting times
- Call abandonment rates
- Initial call handle time
- Resolution time in Service Desk by agent
  - Categorization of predefined issues and their resolution time
- Customer Satisfaction Survey ratings and End-User comments

Service Desk Manager and Workflow Manager shall conduct a daily operations status call to review and report metrics and discuss issues that may have emerged overnight or are trending. This call shall take place before County standard business hours to ensure Contractor can resolve issues that were raised from the night before. Together they shall review data collected on Contractor's response and resolution times. They shall develop corrective action plans and implementation schedules to improve areas that are lacking or areas where new items need to be put in place.

HPSM has more than 150 reports that Contractor can use to gather information. The reporting and data that Contractor uses from this system can be filtered in any way necessary to for Contractor to either provide the information to those requesting it or to isolate the area in which Contractor need to improve or is making an improvement. Information from the various reports that are needed to support the business shall be provided to the County via the Service Portal and the various meetings that take place (CTO Operations Meeting, Portfolio Review Meetings, etc.). Contractor shall seek direction from the County on the reports to be displayed and who needs to view which set of reports as Contractor moves through Transition and build out of the Service Portal.

Contractor's ITSM-aligned, seven-step process, depicted below, provides a solid foundation for capture and reporting of data to support analysis that Contractor can use to identify opportunities for continuous improvement.

Seven-Step Process for Measuring Performance to Support Continuous Improvement

Error! Reference source not found. describes relevant Continuous Service Improvement (CSI) activities, such as service level reporting and management processes, that Contractor has tied to the Seven-Step Process:

Continuous Service Improvement Service Desk Approach for the County.

CSI ACTIVITIES	CONTRACTOR CSI APPROACH TO SERVICE DESK
Steps 1, 2, 3, 4 Performance Metrics	Contractor shall capture a performance metrics and capture the same metrics every month thereafter for comparison. Contractor shall display Contractor's metrics on the Service Portal metrics dashboard in a meaningful, easy-to-use format for access by Contractor's agents and the County. These metrics shall come from HPSM and the Avaya Call Manager system.

CSI ACTIVITIES	CONTRACTOR CSI APPROACH TO SERVICE DESK
Step 3 Customer Satisfaction Surveys and Assessment	In combination with the performance metrics that Contractor shall use in steps 1 to 4, Contractor shall leverage HPSM Service Desk to collect customer feedback using customer satisfaction surveys. Contractor shall regularly review customer satisfaction surveys and follow up on any negative surveys. This allows a feedback loop into the process for improvement as well as follow-up communication to the customer.
Step 5 Identifying Opportunities for Improvement	Contractor's Service Desk Manager, working with Contractor's Work Shift Manager and agent leads, shall use a real-time portal view of Contractor's Service Desk performance metrics (e.g., call waiting time, call abandonment, Service Desk time to resolution, volume of tickets escalated to different resolver groups), data analysis, and lessons learned to identify improvement opportunities for Contractor's Service Desk team of agents.
Step 6 Daily Agent Meetings Dedicated to Service Improvement	The Service Desk Manager, Work Shift Manager, and Service Desk agents shall meet daily to review areas that need improvement and brainstorm ways to improve performance. For example, if metrics show that Service Desk phone handle time has increased with the use of the script for break/fix, Contractor shall work together to see what phraseology is causing the problem and correct it.
Step 7 Corrective Action Development and Implementation	For serious quality issues, Contractor shall develop a Corrective Action Plan (CAP) with support from the accounts QA personnel that includes a timeline for implementation. Following implementation, Contractor shall gather metrics specific to the issue to measure progress.

Design for the Service Portal

Contractor shall use HPE Service Manager (HPSM) software at the core of Contractor's ITSM Service Desk. HPSM shall include Contractor's integrated Service Portal solution for providing a closed-loop incident process and End-User self-service Incident resolution, SR creation, and information search. HPSM together with the Service Portal shall provide multiple dashboards easily accessible by County users and Contractor management, and Service Desk agents.

Key components of the Service Portal Contractor shall include:

- Access from both the Internet and the County Intranet
- Support for key processes, including incident, problem, change, SR (interaction), self-service, and service asset and configuration management
- Single sign on (SSO) integration and predefined roles and rules
- Improved, standardized screen layout with "smart indicators" to flag related information
- Rich cross-process functionality via a range of wizards
- Management reports, service-level reports, all required County deliverables
- Service Desk-specific components include:
  - Service levels built in with data analytic capability that generates reports such as ticket volume and response times
  - Self-service access to the Service Desk to open a ticket, access the Service Catalog, make an SR (through the SR management tool), access ticket and SR status, see announcements including number of outages
  - FAQs, tips, training, and self-service password reset capability

- County-dedicated EKMS for technical support teams that includes documentation and flowcharts for processes, procedures, root cause analyses (RCAs), and high-level work around instructions across the frameworks

3.5. Service Request Management Services

3.5.1. Process and Procedures

A self-service indexed Knowledgebase developed specifically for access by all End-Users, upon County approval, to help them obtain the best answers in real time to their request for information and resolve low-complexity problems.

Contractor shall provide Service Desk agent assistance for fulfilling Service Requests (SRs) and to enable users to create their own SRs on the electronic processes of the Service Portal's self-service capability. Contractor's Service Portal shall use HPSM and myRequests, the current application for SRs and ticketing. The Service Portal shall also provide the entry point for other tools such as SharePoint. As part of the Cross Functional Transition phase, Contractor shall migrate myRequests to HPSM's more advanced SR functionality.

Contractor shall work with County to capture and document all SR-related content and maintain it in a rules-based database within the SR Management tool. Contractor shall also develop a Service Portal version of the OIC Service Catalog.

Service Desk Agent SR Assistance. Contractor's Service Desk agents shall assist users with submitting SRs for items such as installs, moves, additions, and removals (IMAR) or changes to the workplace environment.

Service Desk shall provide this service by creating records on SR forms, copying an existing record, or applying a predefined template that prefills specific fields using electronic processes:

- The End-User makes the SR to the Service Desk by phone, email, fax, or the Service Portal.
- The Service Desk agent determines if the SR is a request or an Incident and follows a closed loop process
  - If the request is an Incident, it is handled as discussed in the Incident Management Section.
  - If the request is an IMAR, the agent shall refer to the appropriate documentation to make certain that the request is routed properly to the appropriate framework. Details of this process are provided in the End User Services Section.
- The Service Desk agent categorizes the request and assigns a priority level.
- The Service Desk checks the Service Catalog, which is based on the OIC Service Catalog, to determine if the SR needs approval and, if so, the level of approval required.
- If a request is approved, the Service Desk agent escalates it as appropriate, and updates the End-User upon request.

Service Portal Service Catalog. Contractor shall develop a version of the OIC Service Catalog suitable for Service Portal self-service. The portal's version of the Service Catalog shall be accessible to all End-Users for making Service Catalog-based SRs. The SRs shall display the approval process required to the End-User before being routed to the Service Desk. A Service Portal version of the Service Catalog shall provide the following benefits:

- Reduces Service Desk's workload by providing self-service capabilities for Service Catalog requests that flag approvals that are required
- Ensures all self-service SRs are routed to Service Desk for review

- Provides a single, guided, questionnaire-style End-User interface for requesting support for catalog and non-catalog items
- Provides tablet and mobile End-User support.

4. END-USER SERVICES

4.1.1. Process and Procedures

Assessing and mitigating impacts to existing desktop systems and business applications while transitioning to new standard platforms.

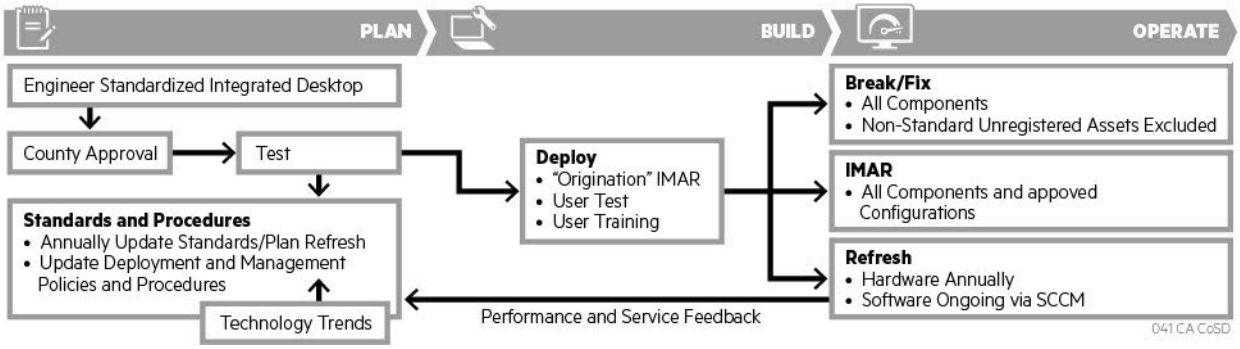
Generally, updates to the existing desktop environment, including hardware, core software, and OS, and all other components shall be organized as follows:

- **Standard Yearly Updates.** These are annual updates to the standard configurations for hardware and Core Software – the total "platform." Concurrently with these updates, hardware equipment that is due for tech refresh shall be scheduled so that all changes are made as one event.
- **Ongoing Updates and Refresh.** This activity entails ongoing, incremental, regular updates to approved configurations. Ongoing updates relate primarily to software. Contractor shall check the hardware inventory annually to determine which machines are eligible for refresh.
- **Ad hoc and Emergency Pushes** – Emergency pushes shall be event driven. Typically, these are defensive security pushes in response to vendor patches to protect the security posture of the standard desktop configuration and/or minor functional updates from the software OEM (versus major version upgrades, which shall be assessed more thoroughly and shall be part of the standard yearly update).

The figure below shows the Plan, Build, and Operate life cycle.

Enterprise Architecture and Desktop Engineering shall collaborate on changes to the standards—Desktop Engineering shall build and tests those changes and provide updates to the knowledge base and End User Service technicians via documented procedures and cross-training sessions.

End-User Services Framework



Standardization and Governance

The cycle for standards governance and standard desktop configuration updates shall be annually.

Standards shall be updated based on a County request, Contractor's assessment of the technology market, vendor presentations to the County, or other County initiatives. All requests shall be reviewed and consolidated. Contractor's engineering group shall lead the consolidation and analysis of these requests and bring the County a consolidated list of recommendations, which shall be presented to the Governance Review Board for approval. Once Contractor has received the County's approval, Contractor shall perform more detailed engineering and testing of the new configurations.

Process to Review and Approve Annual Updates to Standards. Major updates to the standard configurations and core software shall be made yearly, with a monthly rhythm. The timeline for annual updates to the standard configuration is shown in the table below.

Monthly Flow of Annual Standards

TIMEFRAME (MONTH TO MONTH)	ACTIVITY
Ongoing (January through December)	County performance trend analysis Industry trend monitoring User needs analysis
September through October	Current industry product assessments by Contractor team Vendor briefings to the County and Contractor
October	Draft updates to standards Review and approve new standards Update timelines/roadmaps
November through December	Perform desktop/core software testing and Systems Integration Test (SIT) Perform applications User Acceptance Test (UAT)
January through December	Deploy all tech refresh – annual updates based on device type and End-User-specific configurations Deploy software refreshes via SCCM

- Governance: Sponsored by the County CIO
- County participants include CIO and staff, and End-User representatives of each functional organization.
- Contractor participants include the COO, Account Chief Technologist, Technology Office Lead, Desktop Services Management, Applications Lead, and appropriate members from those organizations.
- Boards and Review Committees exist for Standards and Catalog management—such as the Configuration Governance Board (CGB) and Catalog Review Board (CRB).

Between the annual cycles and standards governance events, the Contractor's Technology Office shall host weekly Enterprise Architecture meetings with the County that review new technology trends, vendor roadmaps, and as needed, performance issues in the County environment. These meetings shall provide ongoing input once a configuration is fielded regarding immediate and/or systemic issues and provide a safety net to the annual engineering and testing cycle.

Engineering

Desktop Engineering shall be involved before and after standards are set up front with Enterprise Architecture to ingest new requirements, review new and emerging technologies, assess integration compatibility with current and fresh configurations, and recommend new standards. As new standardized configurations are rolled out, Desktop Engineering shall resolve Tier 3 tickets and systemic issues. The functions of Desktop Engineering, Integration Engineering, Enterprise Architecture, Applications Management and Operations, as well as Applications Development, IT security, and County business application owners shall work together to standardize and test desktop configurations and applications.

Major changes in hardware, operating systems, or other significant architecture upgrades shall receive more extensive engineering and testing.

Systems Integration and User Acceptance Testing. The Desktop Engineering group shall perform SIT and UAT testing using the test lab at the Rancho Bernardo facility. This test lab has multiple device types and

configurations to test against to confirm that configurations are ready for deployment. The Desktop Engineer shall conduct SIT with the Test Engineer when images are updated and created to make sure the image and software work properly. Test results shall be peer reviewed and any issues shall be resolved before production deployment. For major upgrades Contractor shall perform full regression testing – End-User, performance, and security – as part of SIT and UAT.

UAT shall be performed by both Contractor and County users on both types of applications. It shall be performed when an application is first requested and approved, and when there is a major upgrade to the core software and OS standards.

Overall, this methodology results in a new gold image for new deployments and an upgrade path/procedures for current desktops that may or may not require re-imaging the desktop depending on the scale and scope of the upgrade.

This methodology shall be governed by County procedures.

Specific Support to Business Applications.

Contractor shall have an End-User representative for each application. Contractor shall also have an entire Applications organization that shall be responsible for applications and their support.

There shall be two types of applications:

- Catalog Applications – Catalog applications shall typically be COTS; they shall be limited to 440. Contractor shall monitor the number of applications to control County expenses. Contractor shall continuously work with the County to help optimize the applications list. Catalog applications do not have backend infrastructure associated with them – they are software packages, typically off-the-shelf. They shall be installed on the desktop and have no interaction with any other components (i.e., no database or servers it needs to talk to).
- Portfolio Applications - Portfolio applications shall be supported by the Contractor applications team and shall typically be hosted in the data center, on a two-tier or three-tier architecture (thus servers and databases are involved, along with a desktop client most of the time). With Portfolio applications, the project team (more than just desktop engineering, to include the DBA and application SMEs) shall be involved in SIT before it goes to UAT.

Some portfolio applications (e.g., Kronos) require unique configurations or n-1, n-2 desktop configurations that are not the current standard. Contractor shall accommodate these needs on a case by case basis. Contractor shall work with the County to improve the standardization of these exceptions.

Desktop Computing refresh activities as well as maintenance and upgrades to the Desktop Computing Core Software, including the Operating System.

Contractor shall update the existing desktop environment as follows:

- **Standard Yearly Updates.** Annual updates to the standard configurations for hardware and Core SW. Concurrently with these updates, hardware equipment due for tech refresh shall be scheduled for refresh.
- **Ongoing Updates.** Ongoing incremental, regular updates to approved configurations. Ongoing updates shall relate primarily to software.
- **Emergency Pushes.** Event-driven, defensive security pushes to protect the security posture of the standard desktop configuration and minor functional updates from the software OEM (versus major version upgrades, which shall be assessed more thoroughly and are part of the standard yearly update).

Contractor shall only perform refresh activities which either 1) have passed the configuration control and governance processes to become part of the standard configuration, including having been assessed for cost/risk/benefit; or 2) are emergency in nature and have been approved through a streamlined process.

Hardware Refresh. Contractor shall have a group dedicated to refresh that shall travel the County, working from the refresh list, focusing on one site at a time to minimize disruption.

Software Refresh – Software/SCCM.

Contractor shall use System Center Configuration Manager (SCCM), previously known as SMS, to automate refreshes and updates and manage the overall deployed configuration. SCCM shall prevent users from installing un-authorized software or authorized software in unauthorized configurations.

Software refresh shall include updates to the OS and applications.

SCCM

Contractor shall provide SCCM 2016 and the following core capabilities for the County:

- Software distribution – by End-User, by machine; mandatory and optional (self-service)
- Asset intelligence – hardware and software inventory, compliance, application usage tracking
- Hardware and software updates – firmware and security updates
- OS deployment – for workstation only
- Mobile device management

SCCM 2016 shall be introduced into the Library environment to maintain currency of and distribute software to the devices on the Library network with the enterprise standard tool.

Using SCCM, non-emergency software refresh shall be performed outside core hours, usually at 2:00 a.m.

Major software and OS version updates (e.g., from Windows 7 to 10) shall be considered changes to the standard configuration and shall be managed as such. For major OS upgrades, the methodology is more extensive and may include re-imaging the disk.

Requests for Change (RFCs) shall be used to document a change to the environment. Updates may be applied as a push change and documentation shall remain in the knowledge repository of the End-User Services. The RFC shall remain in the CRCB document repository.

Contractor shall adhere to the County Microsoft Windows Non Security Updates Process document. Contractor shall follow overall architecture, desktop, and LAN/WAN security practices, using tools described below.

For security-related updates, in addition to the steps above, the security office shall review and validate the security updates. Urgent updates shall be pushed out on an accelerated schedule—either that night or immediately—in accordance with streamlined emergency approval process.

Approaches, processes, and procedures are governed by County procedures.

Operations and Maintenance of Core Software, including OS.

Desktop Engineering shall have procedures for maintaining the OS image and core software. On a quarterly basis, new device drivers shall be tested for items such as printers and network interface cards and added to the OS image. Security and non-security updates shall also be added quarterly to the OS image to facilitate a faster imaging process. Core software shall be updated during the year with minor revisions, to address vulnerability issues with the browser, for example. Major revision upgrades of the Core software and OS shall be addressed via updates of standards that are approved by the County and executed as projects.

Maintaining an up-to-date (Core Software) Desktop Computing environment

Generally, updates to the desktop environment, including hardware, core software and OS, and all other components, shall be organized as:

- **Standard Yearly updates.** These are the annual updates to the standard configurations for hardware and core software. Concurrently with these updates, hardware equipment that is due for tech refresh shall be scheduled for refresh.
- **Ongoing Updates.** This is ongoing incremental regular updates to approved configurations. Ongoing updates shall relate primarily to software.
- **Emergency pushes.** Emergency pushes shall be event driven. Typically, these are defensive security pushes to protect the security posture of the standard desktop configuration and minor functional updates from the software OEM (versus major version upgrades, which are assessed more thoroughly and are part of the standard yearly update).

SCCM.

To maintain the core software configuration, Contractor shall use SCCM (previously SMS) to automate refreshes and updates and manage the overall deployed configuration. In addition, SCCM shall control and identify users installing unauthorized software or authorized software in unauthorized configurations.

The software distribution process shall be as follows:

Software Distribution Process

- The County approves the core software standards and configurations.
- Desktop Engineering (DE) posts completed Software Distribution templates to the DE SCCM Production Requests SharePoint site and informs SCCM Ops.
- The SCCM Ops team lead reviews the document for accuracy or any issues.
  - If issues found, he notifies DE and requests update/correction.
  - If no issues found, he sends notification to the SCCM Ops team and applicable desktop engineers that it is approved for production distribution.
- SCCM Ops team member is assigned to perform the setup in the SCCM console.
- SCCM Ops team member sets up the software distribution as specified in the document.
- SCCM Ops sends notification to SCCM Ops team and applicable desktop engineers that setup is complete and includes details of the setup and a link to the advertisement status report for the new advertisement.
- After the advertisement start/mandatory time, SCCM Ops monitors the advertisement status to help identify and correct problems with distribution.

End-User computer devices shall be locked so users cannot perform their own installs.

Performance or systemic issues on desktops

For enterprise-wide systemic issues in the desktop environment, Contractor shall use ITIL Problem Management to identify the root cause and to drive remediation. Steps shall include:

- Treat performance and systemic issues as cross-functional problems in that they involve desktop services, engineering, asset management, etc.
- Use data from tools (such as Riverbed, Cascade and APM), users, and tickets.
- Perform analytics; look for patterns and trends.
- Isolate a problem or determine a pattern of the same problem, then attempt to replicate the problem in Contractor's test lab so that Contractor can conduct deeper diagnostics.
- Promptly escalate and involve vendor support channels as needed.
- Identify the error and generate RFCs, either to configurations and/or service standards depending on the problem.
- Depending on the nature of the problem and the solution, it may be an emergency push or bundled with a regular release.

- If the root cause of the problem is with the core software configuration, Contractor shall go through the appropriate engineering and testing process to correct the error, gain the County's approval, and change the standard.

At the deskside level, if Contractor finds that there are multiple incidents, or troubling trends, Contractor shall enlist Problem Management to find the root cause and remediate it.

Specific Issues. For any issue, Contractor shall identify it, resolve it, identify the root cause, and then modify standards and/or procedures to prevent the issue from occurring in the future.

Contractor shall have effective processes in place to identify systemic issues that involve human feedback, trouble ticket data analysis, and system performance data. Contractor shall have a rigorous process to promptly address the root cause of systemic issues.

Engineering desktop software and Constant Improvement of quality and timeliness of applications and software package delivery to End-Users.

Service to the User.

Contractor shall involve the End-User and provide the End-User a voice and authority during each phase of Contractor's approach.

Plan

- An End-User shall be able to initiate a request via the Service Portal for new software or applications or support to existing software or applications
- Users, Group IT Managers, CTO, and Contractor Applications team representatives shall be involved in the annual standards refresh along with Enterprise Architecture and Desktop Engineering
- Users, Group IT Manager, CTO and Contractor Applications team representatives shall be involved in the weekly Enterprise Architecture meetings with Desktop Engineering
- Users shall help specify and conduct End-User acceptance testing (UAT)
- Applications shall be tested both by Contractor (first) and the sponsoring End-User

Build

- User manuals, FAQs, and other supporting reference material shall be configured and deployed.
- User feedback from prior similar deployments shall be incorporated

Operate

- User shall receive an introduction deskside to new equipment and software
- Various types of End-User training shall be available depending on the nature of the software and applications
- User service shall always be available via the Service Desk

Desktop Engineering

Requests for packaging software for the desktop shall be made through catalog requests or project requests from the County. As such, Desktop Engineering shall create the installation package, test it in the engineering lab, peer review it, and provide it to the client to conduct UAT, in the case of a catalog request or the Contractor Applications team for testing, in the case of project/portfolio requests. Upon successful Applications team testing, client UAT shall be conducted. When client approval has been obtained, Desktop Engineering shall submit the request to End-User Services – SCCM Ops for production deployment.

Performance Monitoring – HES shall monitor the performance of the applications and hardware devices as part of the overall enterprise. When there is a reason for deep applications performance monitoring or any kind of

additional performance monitoring, Contractor shall perform troubleshooting and analysis using the tools and teams that Contractor discussed previously in this section. The addition of the analytics data warehouse that Contractor puts in place shall pull together the complete view of the information and data that Contractor has within its systems.

Performance Tuning - When applications need tuning, Contractor shall work cooperatively with the application vendor and the Contractor Applications team.

Continuous Improvement

When MASLs identify a process quality issue, Contractor shall implement CSI following the standard Deming Cycle (Plan/Do/Check/Act). Contractor shall on a continual basis seek to improve End-User services by identifying improvement areas, planning and implementing remediated items, and measuring the change in Contractor's quality metrics.

Quality and timeliness of delivery

The quality of desktop performance shall be constantly assessed at many levels.

Quality of Applications. Quality of applications and their hosting shall be tested as the application is approved for the standard configuration or OIPC. In addition to Contractor-performed SIT and UAT, the hosted application shall be tested by the sponsoring End-User. Finally, the applications in the configurations shall be tested by service technicians when an IMAR or refresh action warrants.\

Timeliness of Software Package Delivery.

Contractor shall proactively work throughout the process to facilitate the speed with which users can obtain new applications and the speed with which they can supported. Applications shall go through the Plan, Build, and Operate process.

Plan.

Contractor shall work closely with the County during each step so each application request is prioritized correctly. Contractor shall use the GR, CRB, and weekly Enterprise Architecture review meetings as forums to achieve this. Applications shall be tested both by Contractor (first) and the sponsoring End-User. Some packages require legacy configuration of the standard desktop.

Build.

Once an application is approved, during the Build phase, Contractor shall address engineering issues on a case by case basis and work cooperatively with the application owner.

Operate.

As applications are released as approved and are part of OICP, all standard procedures shall apply. Applications operational issues shall be resolved at the highest possible tier, but some applications are specialized and complex. Applications escalation shall be a Tier 3 item.

4.5. Desktop Computing Services

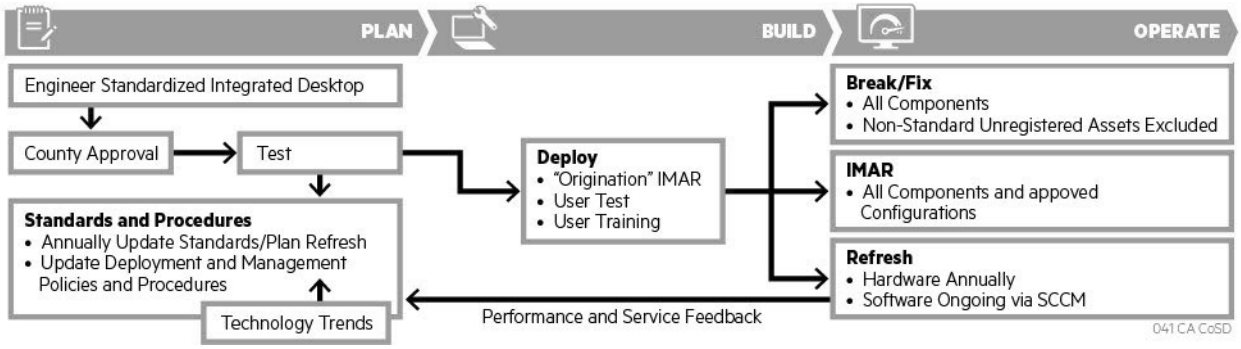
4.5.1. Process and Procedures

- Solution to meet the requirements

Contractor's Desktop Computing Services framework solution shall integrate all required components of End-User Services, interfacing components (such as Service Desk) and cross-functional components (such as Asset Management). The figure below illustrates Contractor's integrated framework.

Contractor shall use the existing framework methods throughout the transition for a smooth and reliable process. The framework shall be driven by the "plan, build, operate" concept, as illustrated in the figure below.

Desktop Computing Services Activities across the Plan, Build, Operate Lifecycle

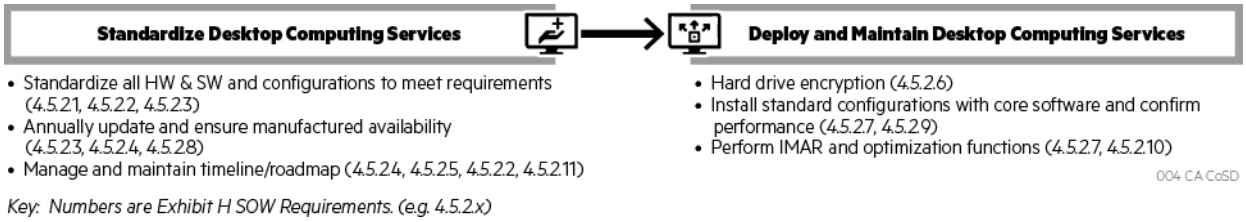


Contractor shall manage the desktop services and architecture as an integrated solution across the Plan, Build, Operate life cycle structure.

Rationale for Choosing This Solution

This solution shall provide standardization as a key component to optimizing service (see figure below). The bulk of Contractor's efforts shall focus on enhancing Contractor's services to the County— best accomplished by standardizing a set of technologies that recognize the diversity of the employee base and also derive support, cost, and efficiency benefits.

Desktop Computing Services Solution



- Deployment plan for resources and use of facilities

Facility Approach. Desktop Computing Services shall provide by a Contractor services team located centrally at Contractor's Rancho Bernardo facility. Additionally, Contractor shall have embedded support technicians at the COC and CAC.

- 1 employee shall reside at the COC
- 2 employees shall reside at the CAC

As service issues require in-person support, Contractor shall deploy technicians from Contractor's regionalized End-User support team. Most site technicians shall reside at Contractor's Rancho Bernardo facility. The technicians shall use this as their home base, traveling to any of the County sites with the equipment and tools required.

Contractor shall staff the core hours of Monday through Friday 6:00 a.m. to 6:00 p.m. with a full shift. Non-core hours shall be staffed at levels sufficient to provide necessary service as required over the weekends, on holidays, and after the business day. Contractor's support service levels shall be available 24x7x365. Online ticket creation shall be available with the Service Desk 24x7 via the Service Portal, phone call, or chat, so even non-urgent service tickets can be logged anytime.

How Desktop Encryption shall be conducted, measured and reported:

1. Conducted: An Contractor recommended, and County approved Standard PC, Standard Laptop and Engineering Workstation Hard Drive Encryption solution, (e.g., Symantec EndPoint Encryption) shall be installed on all Standard PC, Laptop and Engineering Workstation as part of the Core Application Suite prior to delivery to end-users. The approved solution shall be maintained at current vendor version. The Hard Drive Encryption solution shall be installed on all County assets by certified Contractor Services Technicians, or remotely via SCCM. If installed remotely, a successful install shall be verified/QA'd by Contractor prior to deployment and/or turnover to End-User.

2. Measured: The Reporting Console for the Hard Drive Encryption solution shall be the primary tool utilized to identify any Standard PC, Laptop and Engineering Workstation not reporting a successful install of the approved Hard Drive Encryption Solution. Other tools such as SCCM may also be utilized to identify compliant/non-compliant devices. Regularly scheduled electronic scans of all County connected devices in the environment by the Reporting Console shall be the primary tool to measure the quantity of encrypted and non-encrypted devices on the Network. All non-compliant assets shall be scheduled for remediation and/or repair by End User Services.

3. Reported: At requested scheduled intervals, the Reporting Console for the Hard Drive Encryption Solution shall generate a report of all assets by asset tag number that are reporting as compliant and/or non-compliant. The Report shall identify each asset by asset tag and the present version of the Encryption software installed. This report shall be provided to the County and posted on the County Service Portal.

How Desktop Optimization shall be conducted, measured and reported:

1. Conducted: Contractor shall perform optimization analysis daily using Contractor's automated tools that aggregate findings and establish trends that become the basis of Contractor's weekly reporting. Performance issues identified by monitoring or Incident Trending reporting or County escalation shall be investigated by Contractor Problem management team for Root Cause Analysis (RCA). RCA results shall be reviewed and provided to Contractor End User Services Engineering. Contractor End User Engineering shall identify and test solutions to resolve RCA findings and provide those findings to Enterprise Architecture.

2. Measured: Frequency and duration of issues shall be measured by Incidents reported in the HPSM tool.

3. Reported: Contractor shall report issues, findings and resolutions to the County and post on the Service Portal.

How Desktop Performance shall be conducted, measured and reported:

1. Conducted: Formal Desktop Hardware and Software Standards shall be reviewed annually to ensure that the Core Applications suites approved for the County are implemented. Contractor recommended changes to Hardware Standards and Software Standards (e.g. New and or modified existing Resource Units; updated Core SW Versions) shall be tested by Contractor for compatibility, functionality, and performance with the existing approved Core Software suite.

2. Measured: Performance shall be measured by tools such as Cascade and the Application Performance Management suite.

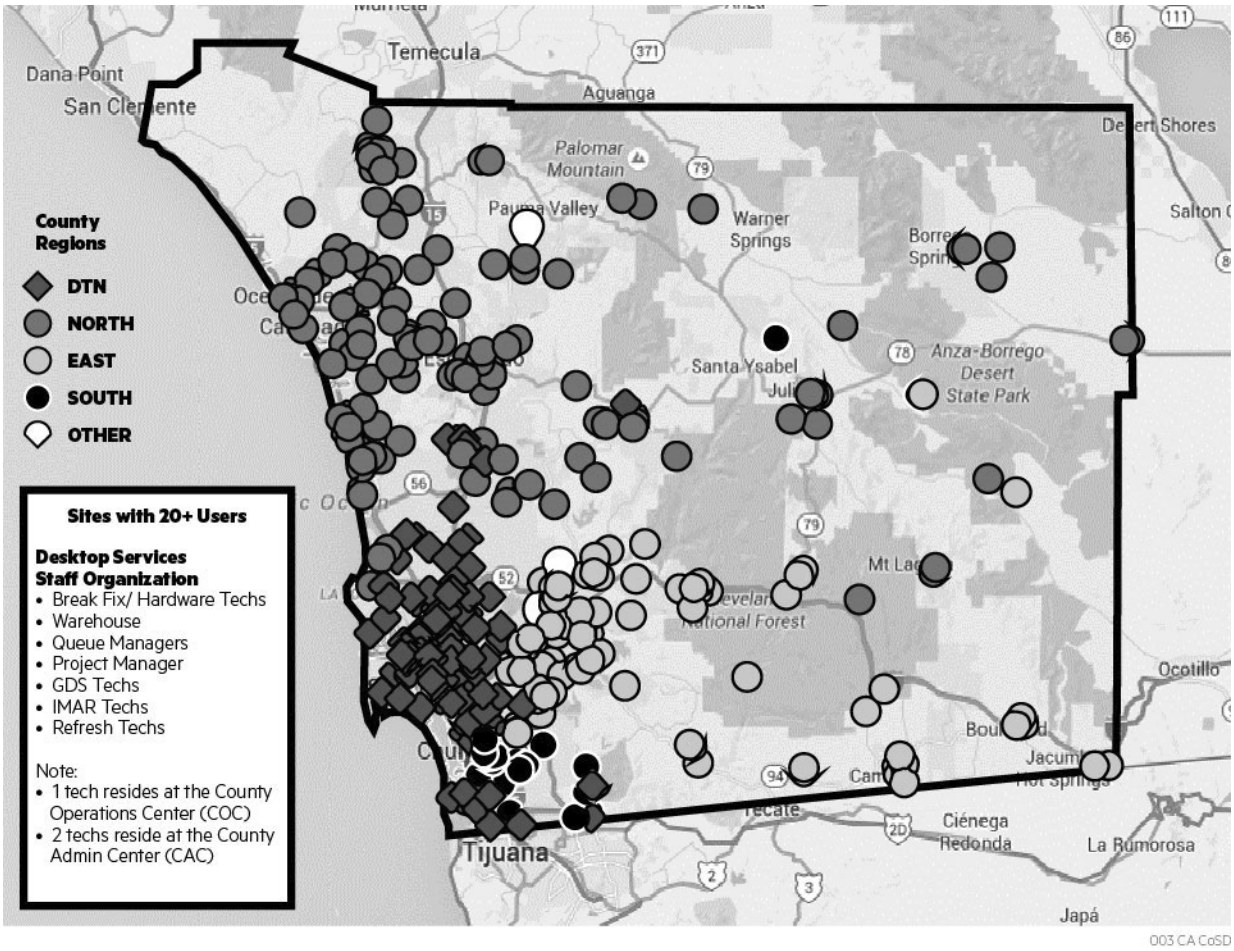
3. Reported: Monthly Reports shall be provided to the County and posted on the Service Portal.

Service Management. To serve all the sites that do not have dedicated onsite support, Contractor shall have a functionally organized technical support team. This team shall travel in a fleet of vehicles, each of which is provisioned with spare parts and "hot swap" spares to provide "first-touch" issue resolution where possible. After assessing the problem, Contractor's technicians shall have the necessary troubleshooting skills and shall be empowered to restore End-User service quickly. Contractor shall then take the faulty equipment back to the warehouse for more extended diagnostics and repair.

Service Scheduling. Service technicians shall provide numerous types of service, including break/fix ticket requests, IMAR actions, or software refresh. Hardware and core software configuration refresh actions shall be planned for implementation throughout the year. IMARs shall also be planned in advance and are non-emergency. For event-driven break/fix service, technicians shall be deployed by the queue manager based on the functional content of the ticket and the End-User's location. The figure below shows the geographic coverage of End-User support and summarizes the functional organization of End-User Services.

Emergency Management. In the event of a disaster or emergency, the Desktop Computing Services team, along with the framework teams, shall provide immediate services to the County. When the OES is activated, the service delivery manager (SDM) on call, along with the Infrastructure Operations Manager, shall immediately be dispatched to the County location with a desktop technician to provide the first shift of support. Contractor shall have a robust rotation of management and technicians that shall remain on site with County staff and other entities that are brought in to support the effort.

Functional and Geographic Organization of Service Staff



When these events occur, Contractor shall work with the County to stand up Local Assistance Centers (LACs) strategically placed where the event has occurred. Contractor, along with AT&T, shall provide all the equipment, connectivity, and onsite staff to offer County employees everything they require. If the OES is not activated and a request comes in from a business group to provide support for a disaster, Contractor shall implement the same process and provide the same support.

Service Technician Skill Profile. The minimum skills and experience required for all technicians shall be as follows:

- Desktop OS (Windows 7, Windows 8.1), with mandatory Windows 10 training for all techs underway
- Basic level server hardware replacement skills
- Customer service skills
- Basic data backup skills
- Minimum 2-year remote and onsite troubleshooting experience
- Attention to detail
- Deskside End-User and technical communication skills

All technicians shall have the same base skills and shall be cross-trained so that, in periods of surge, Contractor can meet the service demand.

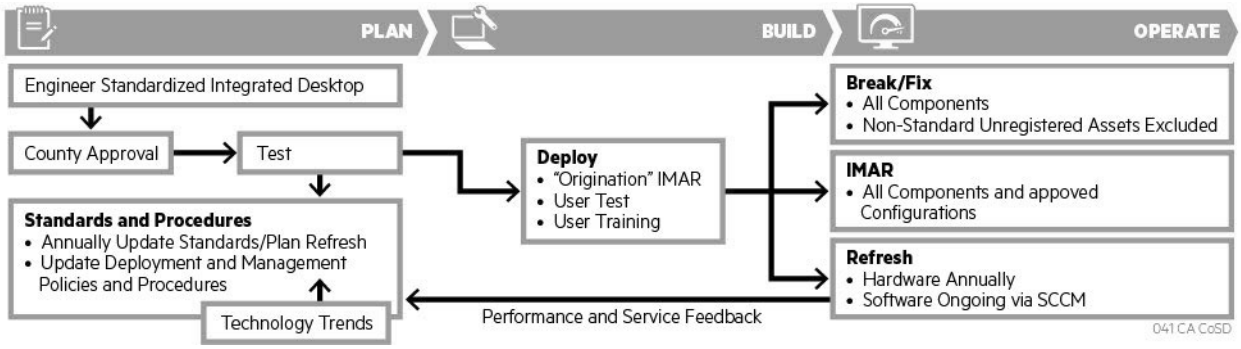
In addition, Contractor shall provide communications to Contractor's service technicians to keep them up to date on the County's mission via all-hands meetings, webinars, leadership briefings, weekly/monthly newsletters, knowledge shares, and other County specific activities.

Contractor's service technicians shall be aware of Contractor and industry state-of-the-art and best practices via newsletters, webinars, the internal Contractor portal, team meetings, and so forth, for information about the latest technology, and for continuing education.

- Key methodologies and processes in solution including year-to-year continuous improvement

The following figure shall serve as a roadmap for Contractor's Desktop Services Methodology.

Desktop Services Methodology



The **Plan Phase** shall include engineering, testing, establishing standards for desktop hardware and software, and obtaining applications approvals. The standard desktop configurations shall be re-assessed and updated annually with County review and approval. During this annual review, the technology may or may not change. Update decisions shall depend on complexity, End-User benefit, technical necessity, and County approvals. Contractor shall continue to bring full transparency and engineering rigor and review into the annual update process. The Optional Items Catalog (OIC) shall include non-standard items that the End-User may still require. In addition to supporting the current field equipment, the standards engineering function shall also include forward-looking work with vendors and the greater technology community to anticipate and plan for future incremental and transformative configurations. These shall be documented in the timeline/roadmap documentation and briefing to the County annually.

The Desktop Engineering organization shall maintain, update, test, and annually release the standard hardware and software configurations. Desktop Engineering shall work with Enterprise Architecture to integrate into the environment, and provide cross-training to the Operations team. This group shall coordinate engineering and testing prior to deployment to address and eliminate issues such as older drivers and network interface card (NIC) mismatches.

Contractor shall conduct a weekly Infrastructure Project meeting to discuss the current status of ongoing infrastructure-related projects in the environment. Enterprise Architecture meetings review, for example, new technologies, changes to the desktop hardware and software standard and technical requirements for a project.

The **Build Phase** shall include the full set of activities to assemble, deploy, and test each individual standardized unit (with approved options); these shall include desktops, laptops, tablets, printers, and other network resources in a standardized MS-Windows based environment. Contractor shall follow the following process:

- Upon receipt of the hardware, Contractor shall tag it and have it ready for imaging when needed.
- The machine shall be pulled from the warehouse, and prepared to be imaged based on the configuration requested.

- Once the image/applications are completed, validated, and tested, Contractor shall put the equipment in the warehouse, where it is kitted with all of the accessories, and shall ensure the device is ready for delivery.
- Service ticket documentation or communication from the refresh the project manager shall then tell the technician where and to whom to deliver the hardware.

Desktop Engineering shall create a custom enterprise operating system (OS) image for the County, which shall comprise the MS Windows operating system and device drivers. This custom OS shall be made available to the imaging technician who handles imaging for refresh, IMAR, break/fix. During the business day, Contractor shall have staff onsite in the Rancho Bernardo facility in the imaging room that can complete hot swap devices for loaners as needed, and copies of these images shall be provided to the technicians in the field for onsite re-imaging.

The **Operate Phase** shall include the maintenance, operations, refresh, IMAR, break/fix, and everything else to support daily operations for the End-User. Operations and support activities shall cut across the frameworks and integrate User Service functions from the Service Desk, such as ticketing and remote support; service management functions such as asset management, configuration management, and process improvement; and other components of the End-User Services framework. Generally, Contractor shall adhere to the following process:

- Ticket requesting action shall be received, logged, and dispatched to a technician.
- Technician shall perform the required action to resolve the End-User's issue in accordance with documented procedures and services standards.
- Functional operation of the hardware and/or software shall be validated by the technician before permission is obtained from the End-User to close the ticket
- User satisfaction shall be confirmed verbally and via the Customer Service Survey sent out at the closure of the ticket.
- Asset management database shall be updated, if required
- The ticket shall be closed.

Hardware and software not in the standard configurations, such as BYOD smartphones and standalone printers, shall be supported as non-standard items. Contractor shall have processes in place to support requests for service on these items on an as-requested basis.

The Desktop Computing Services component shall be used to integrate all components of the desktop configurations: hardware, software, applications, network print, communications and, MDM.

Scheduling

For the annual refresh requirements and schedule, Contractor shall make all reasonable efforts to complete all the equipment at a given location before moving to the next site. Communications shall go out at multiple points for each device to prepare the users and avoid as much disruption as possible on the day of refresh. A target schedule shall be provided on an annual basis to the identified points of contact (POCs) to review and make edits as needed. Contractor shall work with the County's IT coordinators directly, along with the CTO point of contact, so that if changes need to be made to locations and dates, Contractor can accommodate them to prevent disruption. Contractor shall have a dedicated project manager assigned to the refresh activities of the End-User devices to provide solid communication, consistency, accuracy, and delivery of services in this space. The project manager shall also be responsible for the overall status of the project plan created annually for each refresh cycle and shall report on that weekly in the Infrastructure Project meeting.

Refresh.

Technical refresh shall be performed on a rolling basis throughout the year based on equipment type, install date, and refresh timelines. There shall be a 6-month refresh availability window that shall start 6 months before the

scheduled refresh date and a 2-month grace period after each refresh date. Contractor shall take these into account during refresh planning and optimization. Contractor may exceed the 6-month early refresh window based on County requirements.

In addition, the County may request an early refresh of a desktop computing asset through the IMAR process at any time out of normal refresh cycle. If the device is not in the current refresh schedule or the request date is greater than 6 months earlier than the normal cycle refresh date, the department shall be charged a pre-defined rate per month based on device type.

Desktop Computing Services shall have a team of refresh technicians who specialize in performing refreshes. The technical refresh process shall be as follows:

- At the beginning of the calendar year, a draft schedule shall be communicated to the County
- Contractor shall work with the County to around any County business events. Contractor shall then finalize the schedule with the County coordinator.
- Prior to performing planned work at a site, Contractor shall communicate with the coordinator to validate planned activity is still acceptable.
- A review of every device shall be completed 3 to 4 weeks in advance of the actual refresh to identify custom configurations, applications, standalone hardware requirements, replacement model, extra tray requirements, and so forth.
- Equipment, including software configurations, shall be prepared to the extent possible at the warehouse prior to delivery to the End-User based on the information from the pre-field form. This shall include hardware configuration, any hardware default settings, basic software imaging, and standard software configurations.
- Testing is performed.
- Communications shall be sent to End-Users and POCs during all required steps of this process to make certain that nothing is missed.

At the End-User site, Contractor shall back up configurations from the machine that is going to be replaced. Users shall be notified during pre-communication to move data off the devices and onto shared data locations. The technician shall transfer any data that resides on the device that is related to applications. The technician shall also offer up to 30 minutes his or her time to transfer data unrelated to applications as a part of the refresh scope of work. The following actions shall be performed by the refresh technician at the End-User's site:

- Disconnect existing hardware, noting and/or tagging anything End-User- or site-specific, unique or non-standard.
- Install new hardware in the standard configuration, noting and addressing anything End-User-specific.
- Restore End-User configurations onto the new equipment; re-establish network access and network configurations.
- Perform functional tests to demonstrate to the End-User that the refresh was successful. Troubleshoot any issues.
- Make the End-User aware of any new features/functions of the new configuration and equipment. Point the End-User to relevant frequently asked questions (FAQs) or training, if needed.
- Notify the refresh project manager that the refresh is complete.
- The refresh project manager updates the database and reporting measures as activities are confirmed completed by the technicians.
- Notify the Service Desk that the ticket is complete.

In addition to desktop hardware refresh, there shall be an ongoing stream of major and minor software updates. These updates shall be managed by SCCM and shall usually be automatic and transparent to the End-User.

Break / Fix / Hardware Technical Support

Break/fix services shall be event driven and triggered by a service ticket. Technicians shall manage service on the integrated desktop configuration, not just the hardware.

Queue Management. Within Desktop Services, the queue manager shall assign tickets to technicians. This function shall be performed via a process supported by MS Office tools for scheduling. Technicians shall be assigned in an optimal manner, based on a combination of technical requirements, urgency of the ticket, geography of the ticket, and the technical complexity of the problem. For High Response End-User service, Contractor shall make all reasonable efforts to assign a familiar and experienced technician the High Response End-User knows and trusts. When a problem requires desk-side support, Contractor shall use the following methodology:

- Ticket forwarded from Service Desk to queue manager
- Queue manager determines to whom to assign the ticket
- Ticket is assigned to a technician, and the technician is notified of the ticket assignment
- Technician travels to End-User and performs the appropriate diagnostic protocol for the identified problem

To diagnose the issue, generally technicians shall use tools such as HP Diagnostics Toolset, LogMeIn Rescue, SCCM, Active Directory (AD), MS OffCAT, AirWatch, and others, depending on the nature of the problem. Technicians shall have additional options available for more complex problems:

- Correct the problem at the deskside using break/fix troubleshooting procedures for the specific problem
- Get peer level technical specialist support to assist with problem resolution
- Escalate to a SME as appropriate
- Hot swap to a loaner
- Hot swap to a spare

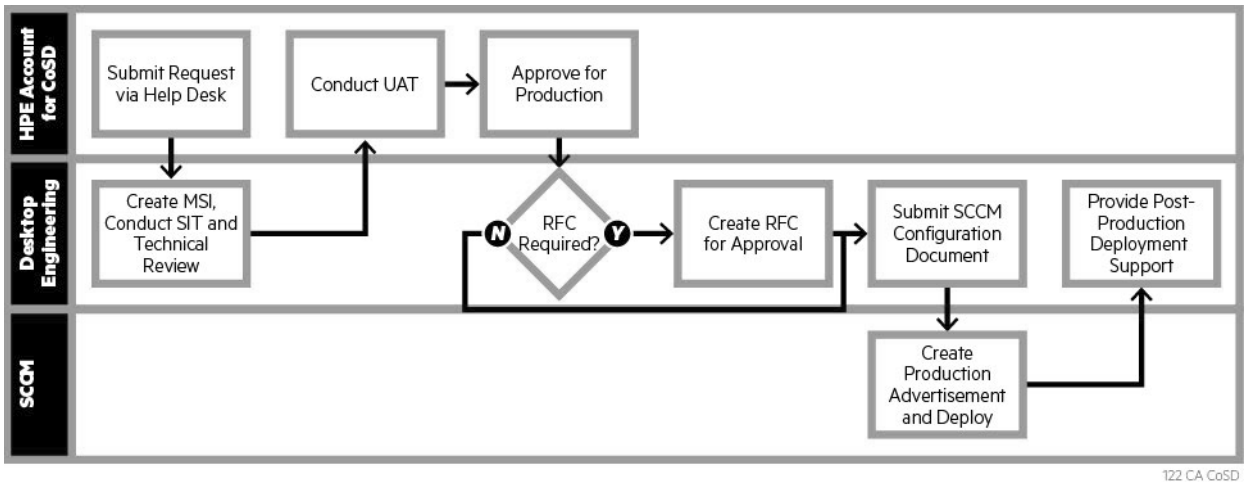
Technicians shall select the right method to get the End-User back in service as quickly as possible while still resolving the root-cause technical issue. The technician shall test and demonstrate to the End-User that the problem is fixed.

- The technician shall perform the foundational set of system and End-User testing, which is a series of standard tests.
- Technician shall log the fix, update the asset inventory (if necessary).
- Upon completion of the service, the technician shall move on to work their next ticket

IMAR

IMAR requests shall typically be triggered by non-urgent events. Any IMAR request that comes in with more than 25 items shall be considered a project and assigned within the End-User Service group to the project coordinator to manage and complete as required. The IMAR process flow, illustrated in the figure below, shall be the same as for all other types of requests.

IMAR Process



HPE Asset Manager shall track all modifications to an asset record that are the result of moves (locations, users, and so on), adds (adding components), or changes (any other changes to the asset record). Modifications shall be tracked by field. If a field value is changed, HPE Asset Manager shall capture the name of the person making the change, the date of the change, and the name of the field that has been changed as well as the previous field value.

Moves, adds, or changes to assets can also be discovered or confirmed through auto-discovery, using the DDMi (Discovery and Dependency Mapping Inventory) tool for consistency. Contractor shall also provide tools to automate software-related IMAR activities, including policy-based software management. An IMAR action can be for a complete desktop, laptop, or other device configuration or just a component. Overall, the IMAR process shall be as follows:

- Receive an IMAR ticket
- Travel to the site of the equipment/bring equipment to the site location for install
- If the equipment is onsite, complete the identification and validation of this equipment to make sure inventory numbers match the tickets and asset database
- Back up all relevant End-User data and configurations and other environmental settings if required
- Make the appropriate IMAR action as indicated in the request:
  - **Install.** The "origination IMAR" is a special case of installation. For the first installation, the equipment is new, newly refurbished, or wiped to a new configuration. Where Contractor is able, new configurations of equipment can be prepared in the warehouse with hardware configuration, the standard software image installed, and any End-User optional items installed. This preparation work shall ease the installation process at the End-User's desk. Then configuration to the End-User's environment—for example, preferences, network connectivity and printer connectivity—shall be completed.
  - **Move.** A move is similar to a remove and install, except that software installation does not need to be performed. For a move, the technician shall note the End-User's connections and configurations, power down the old equipment, minimize its disassembly but do enough disassembly to safely move the equipment, and then physically move the equipment to the new location. Once at the new location, the technician shall perform the necessary installation steps completing with reconfiguration of End-User-specific and site-specific parameters.
  - **Add.** An add is typically for a new piece of hardware or software. Procedurally, an add follows the same steps as an install.
  - **Remove.** Complete removal of equipment can happen when an End-User leaves the County or when the equipment they are using is refreshed. Upon removal, the technician shall shut down the equipment, making necessary logical and physical disconnections and take the equipment away. Removed equipment shall go through the warehouse for asset management and proper disposal. Hardware at end of life shall

be so noted in the asset management database and is donated to San Diego Futures Foundation (SDFF). Removals of software shall include an action to make certain that any active licenses that were originally obtained are returned to the licensing pool for reuse.

IMAR Testing. In all actions that result in retained or upgraded equipment, the technician shall validate via deskside testing that the End-User functionality is correct and End-User configurations are created and/or retained as appropriate. This deskside test process shall be similar to that described in break/fix.

Continuous Improvement.

- Using the Deming PDCA (Plan/Do/Check/Act), Contractor shall on a continuing basis seek to improve End-User Services by finding improvement areas, planning remediation and implementing them, and measuring the change in Contractor's quality metrics.
- Contractor's leading indicators of quality shall be the service levels measuring Contractor's performance along with the Customer Satisfaction Survey data provided. The service levels and surveys are leading indicators of quality, but Contractor also has all the data and analytics about the installed configurations and break/fix trends such as types of tickets, hardware configurations involved, system performance to ensure maximum optimization of the desktop environment, the nature of problems, and time to repair metrics.
- Contractor shall analyze these indicators to determine if Contractor needs to embark on a Service Improvement Plan to improve Contractor's quality. These efforts shall be tracked, and the team recommends improvements. After putting them in place, Contractor shall then monitor closely both the incident and problem trends and their impact on Contractor's service level performance.

During the Cross-Functional Transition, Contractor shall implement Microsoft SQL Server Business Intelligence to begin the process of building a reporting data warehouse, thereby bringing more automation and continuous improvement to the reporting process.

While the initial focus is on supporting SLA Reporting, the data warehouse shall provide a central repository that can support other ITSM analytic scenarios. Contractor is committed to continuous improvement and, over time, Contractor shall work with the County to extend both the data contained in the data warehouse as well as the BI/Analytics platform to support a more complete IT Service Management Analytics capability. Benefits to the County can be measured through increased system availability, reduced system disruptions, predictive analysis of system changes, and optimizing staffing levels.

The four specific areas of focus shall be:

- Service Strategy and Improvement Analytics: This area shall focus on analysis that supports recommendations to improve business outcomes and improve customer satisfaction. Analysis of available data sources can be used to assess; IT Infrastructure Health, IT Transformation alternatives, predictive analysis of customer satisfaction, and customer sentiment analysis

- Service Design Analytics: This is a way to use analysis to better understand capacity demands and service availability by predicting degradations, preventing outages and reducing downtime. Using ITSM data Contractor can forecast demand and utilization on the infrastructure, predict service degradation with the goal of reducing system downtime.

- Service Operations Analytics: Blending ITSM data and benchmark IT performance data, Contractor can conduct analysis to reduce business impact of events, incidents, and problems.

- Service Transition Analytics: These analytics address the correlation of incidents and events to root causes in order to speed recovery and to identify ways to reduce IT complexities.

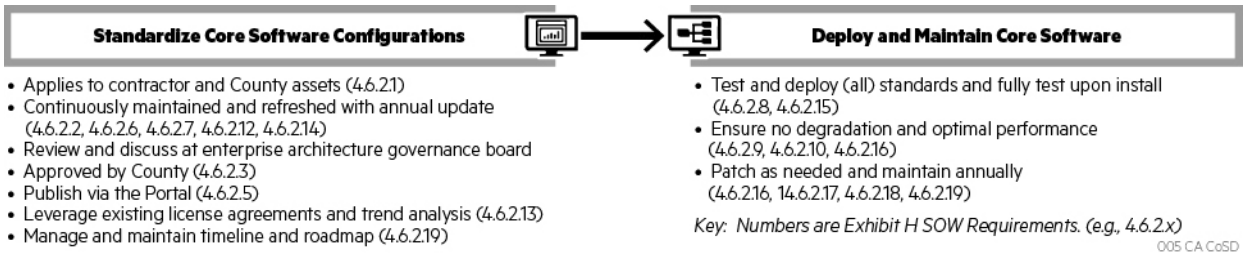
4.6. Core Software Services

4.6.1. Process and Procedures

- Description of solution to meet the requirements

Core Software Services shall be responsible for standardizing, describing, deploying and supporting a standardized and fully tested image onto all desktop assets including county retained assets. The fundamental activities of Core Software Services can be described as Standardization Management activities and Deployment and Maintenance Support activities, as shown in the figure below.

Core Software Service Solution



Core software configuration and updates shall undergo component testing, System Integration Test (SIT), regression testing, and User Acceptance testing (UAT) by the Contractor Technology Office, Applications Office, and Desktop Services organizations. Testing shall be both technically focused and End-User "use-case" focused. Testing shall also validate the security strength and integrity of the core software configuration and install.

Standards Enforcement and Exceptions.

Contractor shall use a process to regularly verify software versions and update as needed using SCCM, which shall scan the installed base of equipment for unauthorized programs. These checks and software updates shall be performed automatically over the network during off-hours.

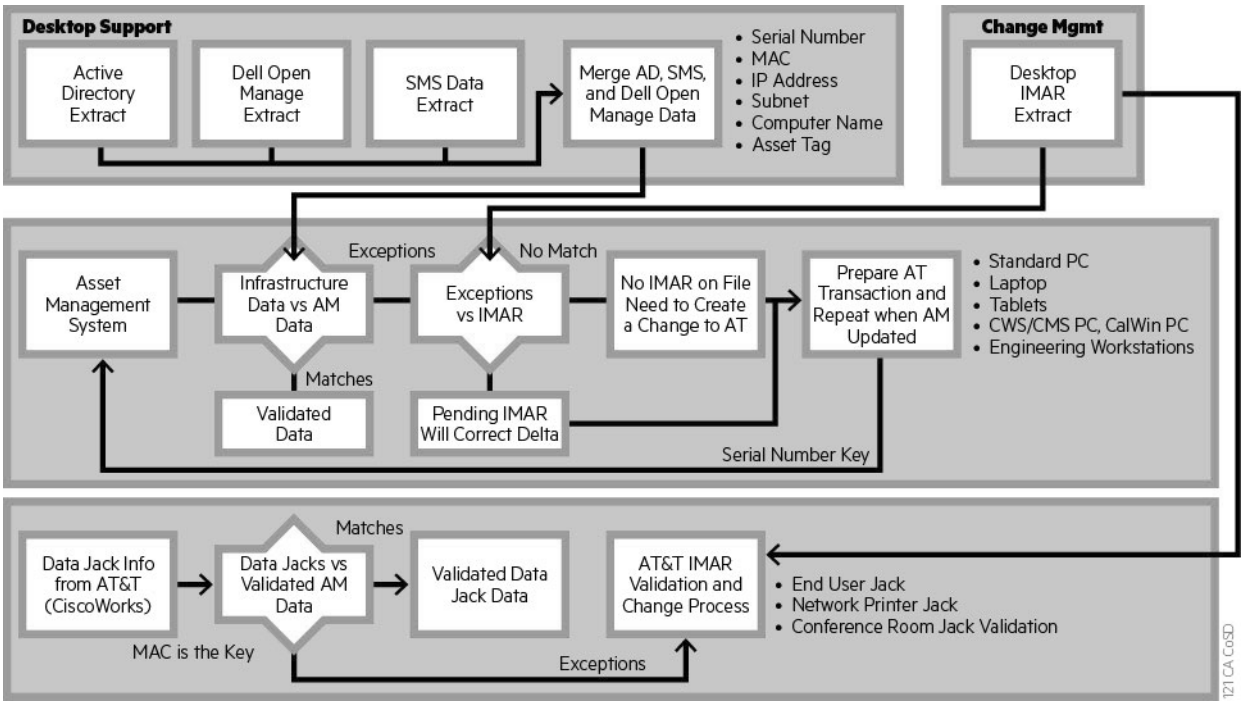
Contractor shall maintain a request process and adjudication process for non-standard items. The standard test shall be whether a business function cannot be performed with the standard configuration—not just that the End-User prefers a different tool. Users shall have FAQs, training, videos, and other tools available to them from the Service Portal to help them learn standardized tools. The End-User Services Manager along with the Service Desk Manager shall ensure all FAQ's and documentation related to the End-User environment is kept up to date on the portal and that as new applications and hardware are implemented the appropriate documentation is put in place as required.

- Deployment plan for resources and use of facilities

The Resource and Facility approach shall be the same as for Desktop Computing Services. In addition to the Desktop Service Technicians, this component shall rely on the Project Management Office, Desktop Engineering, and Testing teams. These people shall also be located at Contractor's Rancho Bernardo facility.

- Key methodologies and processes in solution including year-to-year continuous improvement

Core Software Services Process Flow



Core Software Services shall follow a process similar to Desktop Computing Services (Plan/Build/Operate), as described above. Some aspects with unique characteristic are described as follows.

Integration and User Acceptance Testing. This function shall be performed by the desktop engineering team, using onsite lab devices. This lab shall have access to the County and Library networks, and shall have many device types including the current standards and approved exceptions. When a new custom OS image or a new software package is built, testing shall be performed in this lab via a peer review process—meaning another member of the Desktop Engineering team shall perform the test to make sure it installs correctly, without errors, etc., and provides feedback/results to the desktop engineer who created the custom OS image or software package. Upon successful integration testing, if this is a Portfolio application, the Contractor Application team shall be engaged to perform UAT. When Application team UAT is completed, the software application shall be provided to a small subset of County employees, who perform UAT as well. Upon successful completion of UAT, the software package shall be made available for production distribution to the intended End-User community via SCCM. If this is a catalog application, the County client who requested the application shall perform UAT and, upon approval, it shall be made available to the intended End-User community. If this is a custom OS image, upon successful SIT, the image shall be made available to the support teams via Microsoft Development Toolkit (MDT).

Desktop Computing Refresh – Software/SCCM. System Center Configuration Manager (SCCM) shall be used to automate distribution of updates and to manage the overall deployed configuration. In addition, SCCM shall control and prevent users from installing unauthorized software or authorized software in unauthorized configurations.

Software refresh shall include updates to the OS and applications.

OS refreshes shall be treated as projects and are architected for little to no interruption in the County employee's daily work.

Using SCCM, non-emergency software updates shall be performed outside core hours, usually at 2:00 a.m.

For large OS upgrades within the year on a specific desktop, the software refresh methodology is more extensive and may include re-imaging the disk. Whenever possible, Contractor shall make reasonable efforts to bundle major software upgrades concurrently with hardware refresh equipment replacement as part of the annual cycle to minimize disruption to the End-User's work environment. Security Services for End-User Services shall be based on the defense-in-depth model.

4.7. County Retained Assets Services

4.7.1. Process and Procedures

- Description of solution to meet the requirements

County assets shall adhere to the same standards for configuration of hardware and software as all other assets. These machines shall be verified and enrolled just as all other assets. Then, County Retained Assets shall be serviced and supported using the same strategies, methodologies, procedures, resources, and facilities as contractor-provided assets. All appropriate service levels shall apply to standardized County Retained Asset Services.

When an End-User requests support on a non-standard item or non-enrolled item, the Service Desk or End-User support technician shall identify this situation using the asset database. If Contractor can support the non-standard item easily, Contractor shall do so as an act of immediate customer service on a case-by-case basis, with County approval.

- Deployment plan for resources and use of facilities

Since County Retained Assets that adhere to the standards and are enrolled are serviced the same as contractor-owned assets, the resource and facility approach to servicing these assets shall be the same as it is for Desktop Computing Services and Core Software Services.

- Key methodologies and processes in solution including year-to-year continuous improvement

County Retained Assets shall be managed the same as other assets and the solutions, methodologies, and procedures described elsewhere in this framework shall apply, depending on the nature of the required services.

County assets must adhere to the standard configurations, be "enrolled" to be on record as part of the managed configuration, and be recorded in the asset database. When contractor support is required to "build" the software configuration for County assets, this function shall be performed using the same standards and procedures as described in Desktop Services and Core Software Services. Once a standardized County Retained Asset is successfully enrolled, it shall be managed and serviced such as any other asset. Service tickets shall be flagged as "County Retained Assets" so that the technician knows of the hardware status just in case there is a troubleshooting problem related to the asset's origin.

Enrollment. In order to be serviced, a County Retained Asset must be enrolled in the Service Manager (SM) asset management database. At the time of enrollment, adherence to configuration standards shall be confirmed. Enrollment of County Retained Assets shall always verify by the Service Desk upon first service request.

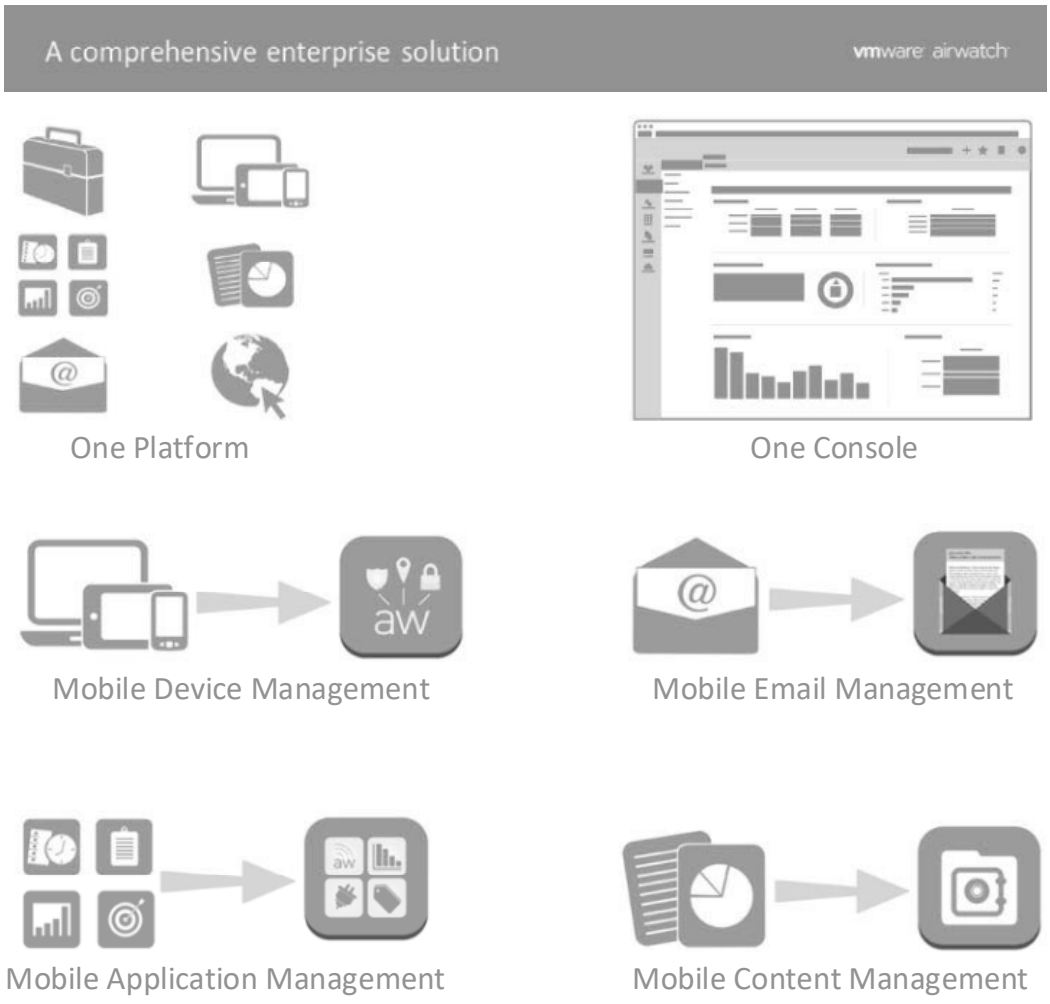
4.8. Mobile Device Support Services

4.8.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall provide the specific capabilities offered by the AirWatch platform, as shown in the figure below. All initial enrollment and other support requests shall be made to the Contractor Service Desk. The Service Desk shall validate the End-User's information and offer information and support that may solve the problem. For all mobile services that require AT&T support, the End-User's ticket shall get a "warm handoff" to the AT&T helpdesk. Contractor shall ensure that AT&T's helpdesk provides a single AT&T point of contact through each service transaction, even when AT&T needs to access multiple support organizations. Contractor shall ensure that AT&T support handles certain issues either by the local AT&T Incident/IMAR managers or by the AT&T Mobility Solution Services (MSS) and AirWatch partners. These End-User requests shall include Device Enrollment or Registration, Passcode Reset/Unlock, Lock Device, Locate/Find, Add/Delete Users, Device Enrollment (bulk or individual), and Device Wipe.

Capabilities Managed by the AirWatch MDM Solution



To expand support, Contractor shall provide a fully managed Mobile Device Support Service that shall provide comprehensive operational support of all County-provided mobile devices as well as County resources that are available on BYOD devices. This service shall provide County users with single point of contact for AT&T's MDM support, using a multi-tiered model designed to handle any type of mobility support need—mobile application, operating system, content management, device familiarity, email access, and even carrier related issues. The Contractor shall ensure that AT&T Enterprise Mobile Support team resolves AirWatch MDM, device/OS, and carrier-agnostic mobility issues in response to County End-User-generated trouble tickets logged with the Contractor Service Desk. This team shall provide expertise and support for most current mobile devices and accessories and shall directly engage the End-User in the diagnosis and resolution of their issues or shall route requests to the appropriate support organization if required. They shall also provide a "warm transfer" for County users for those issues requiring wireless carrier intervention. Throughout the process, this team shall also provide ticket management and communications through the Contractor's Service Portal so that service levels are accurately tracked and the End-User is kept informed of the status of the request throughout its lifecycle. If the ticket requires further technical intervention, it shall be escalated through additional tiers of MDM support by AT&T.

The following is a summary view of each group's responsibilities:

AT&T Enterprise Mobile Support Team

This group shall interact directly with the End-User on all MDM-related issues and provide the basic support and continuity of support for issues such as Device Enrollment, Device Lock and Wipe, etc. Additionally, this team shall provide general device and operating system support as well as facilitate warm transfer to the carrier as the need is identified. For the large percentage of issues, they shall provide first-call resolution. For the remainder of these tickets, they shall also act as the coordinator for the report if it requires escalation to one of the technical support organizations.

AT&T LCM Trade Street Service Desk

This group shall maintain overall responsibility for ticket management and service level attainment for MDM actions. As part of the ticket flow, they shall also provide the interface to Contractor for custom mobile application support, Active Directory, and Outlook email Exchange group issues.

AT&T Mobility Solutions Services (MSS) Application Service Desk

This Application Service Desk shall provide leveraged technical support to AT&T Enterprise Mobile Support team via phone, email, or internal AT&T portal for additional MDM support services. Responsibilities shall include advanced troubleshooting, isolation and resolution, application use, and configuration support as well as MDM managed services requests.

AT&T ASD/MSS Service Assurance Team

This is the first-level technical escalation point to the AT&T MSS Application Helpdesk, which shall perform deeper troubleshooting to reproduce, isolate, and resolve the most complex technical issues.

AT&T ASD/MSS and AirWatch Mobility Consultant Teams

This team shall serve as the escalation point for the AT&T ASD/MSS Service Assurance Team, which shall involve the AirWatch vendor technical team for any MDM application issues requiring the highest level of analysis and support.

The following figure provides more detail on the organizational roles for the mobile solution.

MDM Support Model

<table>
<tr><td>HPE Service Desk</td><td>AT&T LCM Trade Street Service Desk</td><td>AT&T ASD/MSS and Airwatch Team</td><td colspan="2">• The escalation point for the AT&T MDM SA team for any MDM application issues the SA team was unable to resolve</td></tr>
<tr><td rowspan="3">End-to-End Ticket Oversight</td><td rowspan="2">Overall Responsibility for service assurance on mobility report</td><td>AT&T ASD/MSS Service Assurance Team</td><td colspan="2">• Services Assurance is the escalation point to the Tier 2 AT&T MDM ASD
• Perform deeper technical troubleshooting to reproduce, isolate, and resolve the most complex technical issues</td></tr>
<tr><td>AT&T ASD/MSS Application Service Team</td><td>• Provides helpdesk-to-helpdesk support via phone, email, or web portal for MDM services
• Respnsibilities include advanced troubleshooting, isolation, and resolution, ticket management, and communication, application use, and configuration support as well as MDM
• Enhancement requests
• Send SMS, email, or push messages
• Block Email access
• Passcode reset, lock/unlock, verify device enrollment, and policy verification</td><td>• Add/delete users
• View and verify policies
• View device inventory and details
• Device enrollment
• Verify device enrollment
• Change device ownership
• Events and notifications creation/change
• Relay status back to tier 1</td></tr>
<tr><td>Also interfaces to HPES for custom app support, active directory, and email exchange group issues</td><td>AT&T Enterprise Mobile Support Team</td><td>• Multi-carrier mobility helpdesk, reduces burden on IT staff
• Service and expertise
• English-language technical support
• Single point of contract via phone or email for end users
• Support for most popular mobile device hardware, accessories, and operating system
• Domestic carrier connectivity support via warm transfer or a direct call if preauthorized by the customer
• Application issues triage and referral if necessary
• Verification of email settings</td><td>• Resolution of simple MDM issues such as passcode reset, lock/ unlock, verifiy device enrollment, and policy verification
• Engagement of third-parties for resolution of end-user issues via warm transfer or referral
• Ticket update through resolution</td></tr>
</table>

167 CA CoSD

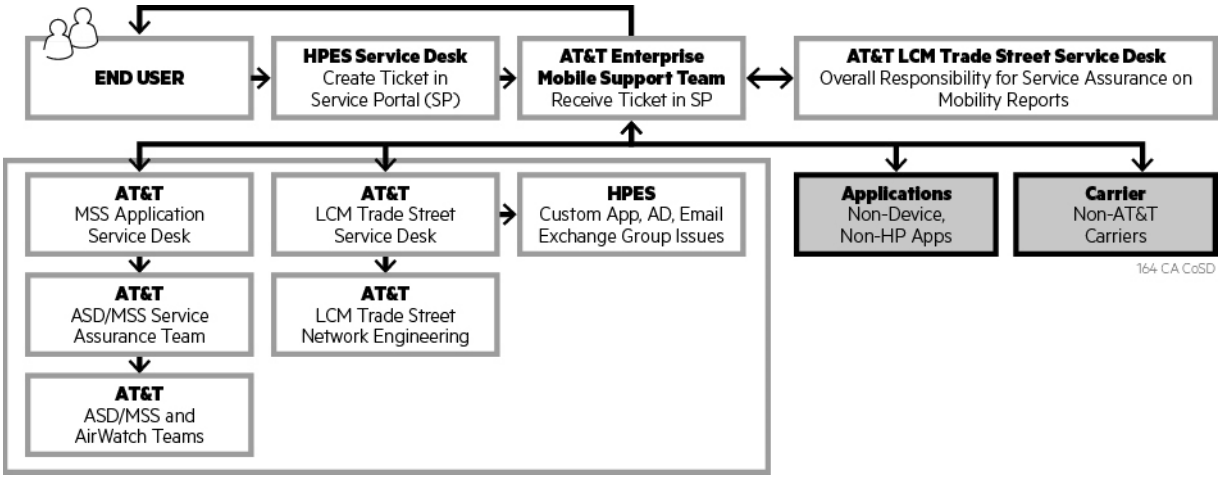
- Deployment plan for resources and use of facilities

Contractor shall leverage the local Life Cycle Management (LCM) team, the AT&T Enterprise Mobility Support team, and the AT&T Application Service Desk (ASD) organization. AT&T LCM personnel shall be located at the AT&T facility in San Diego. All other personnel and facilities shall be located at leveraged sites around the U.S.; this leveraged support shall be transparent to the End-User. The County's MDM infrastructure shall be hosted in the AirWatch shared cloud and shall interface with County resources through a geo-redundant AirWatch Cloud Connector configuration located at both the AT&T Point of Presence (POP) and the County Operations Center (COC). Smartphone users who are using BYOD shall have the option to get additional service related to their devices overall at their service provider's walk-in retail location, including AT&T locations for AT&T subscribers.

- Key methodologies and processes in solution including year-to-year continuous improvement

The same set of tools and processes used by the LCM Incident/IMAR desk shall be replicated for the Enterprise Mobile Support team. They shall have access to the Contractor's Service Desk ticketing platform used for break/fix reports and shall be able to status and resolve tickets generated by the Contractor's Service Desk. They shall also follow existing procedures in using the AirWatch console for MDM related problems. The Contractor's Service Desk Tier 1 agent shall maintain end-to-end ticket tracking, maintaining automated and chat communication with the AT&T Service Desk for MDM, mobile device, and wireless carrier issues. The LCM team shall continue to meet service level responsibilities and shall follow all reports to closure. The following figure illustrates the organization of Service Desk components for mobile users.

County of San Diego Mobile Support Services Methodology



Contractor shall follow the standardized and documented procedures shown in the table below.

Standard Documented Procedures

PROCEDURE NUMBER AND NAME	SOLUTION SUMMARY AND RATIONALE	TOOLS
AirWatch – MDM AT&T Incident	Once ticket is received, or warm transfer of caller from Contractor's Service Desk after AD password and role has been verified, Tier 1.5 shall work with the End-User to fix the issue. If Tier 1.5 cannot resolve the issue, it shall be given to Tier 2 to be worked through to conclusion. The incident manager shall document in HPE Service Manager, and transfer the ticket to the correct group to fix the issue or resolve the ticket.	AirWatch Console
AirWatch – MDM AT&T IMAR	Once an IMAR is created, IMAR Manager shall review line item and ensure End-User appears in the AirWatch Portal correctly. Monitor to ensure other line items are closed by Contractor and send out instructions to the requester for AirWatch app install and configuration. Working with End-User on deleting the old device when requested. IMAR manager documents change in the IMAR and close.	AirWatch Console

Remote device management

Remote Desktop Management (RDM)

Contractor shall provide a "warm" transfer escalation process between Service Desk and RDM. If support requests cannot be resolved expeditiously by the Service Desk, then the call shall be escalated to an agent with higher level skills and RDM capability. In some cases, the Service Desk agent shall escalate to a higher tier deskside/field team or technical support. Service desk training and detailed documentation outlining the correct escalation path for each type of incident or service request shall guide agents to make certain that tickets requiring escalation are routed correctly the first time. Contractor shall always ask permission from the End-User before accessing his/her desktop, and the End-User can terminate the remote session at any time.

Remote Desktop Management (RDM). The primary function of the RDM agent shall be to provide a higher level of technical service, handling problems and issues that the first-tier support was unable to resolve and providing RDM skills to increase first-call resolution and customer satisfaction. Using RDM for remote tool capabilities, agents shall remain on the phone with the customer for longer intervals than Service Desk agents to resolve an incident. RDM agents may interact with network services, software systems engineering, and/or applications group to restore service and/or identify and correct the core problem. This may require assisting in simulation and re-creation of End-User problems and recommending system modifications to reduce End-User problems.

Remote Desktop Management agents shall:

- Take tickets routed to them that require a higher level of technical analysis and work these tickets to resolution or route to the appropriate Tier 2 technical support group
- Handle problems and issues that the Service Desk agent is unable to resolve
- Interact with network services, software systems engineering, and/or applications development to restore service and/or identify and correct a core problem
- Assist in simulation and re-creation of End-User problems
- Recommend systems modifications to reduce End-User problems
- Use LogMeIn Rescue as Contractor's remote desktop management tool.

2.7.6 County managed mobile devices.

For County-managed mobile devices (e.g., handheld devices, smartphones, tablets, and other County retained mobile assets), the methodology for MDM shall apply. Any device that is "County managed" and outside the scope of RU fixed price support requires T&M support.

Contractor shall mitigate against risks such as device loss, data loss or breach, and exposure to malware by using inherent capabilities of the AirWatch client.

Through AT&T, Contractor shall enable secure, VPN-based interaction with enterprise data using one of two methods. First, the Pulse Secure mobile client shall allow applications to establish an encrypted connection to the enterprise via the same SSL VPN solution used for enterprise computing. Second, the AirWatch solution shall allow applications to be developed to use "per-application VPN."

Contractor shall enable AirWatch managed content and collaboration features, using the AirWatch Secure Content Locker tool. This tool shall allow for direct access, encrypted access to enterprise data, leveraging containerization capabilities to prevent data transfer to external sources. Secure access to web-based services such as SharePoint shall also be enabled.

4.9. Unified Communications Services

4.9.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall provide Unified Communications (UC) Services, which shall enable improved collaboration capabilities across each business areas in the County. These UC capabilities shall include O365, Lync/SfB, Mutare Enhanced Voicemail for voicemail to email delivery as well as Avaya's EC500, which extends both internal and external calls to a County End-User's desk and/or a mobile phone provided by the County. UC capabilities shall be delivered to users on their computer, tablet, smartphone, or VoIP handset.

The following table sets forth when Contractor shall provide the specified UC services:

UC Services

AS OF CONTRACT EFFECTIVE DATE	BY THE END OF TRANSITION	TRANSFORMATIONAL (AFTER COUNTY APPROVAL)
• Mutare Voicemail to Email with SST • Avaya IP softphone • Avaya Extension to Cellular • Avaya IP soft phone for agents • Avaya Enterprise Directory Integration	• Avaya Communicator for Lync • Avaya Collaboration Services for Outlook/ Browser/ Microsoft Office	• Avaya Communicator SIP mobile client • Avaya Presence Services

Office 365 Components

Through the County-licensed Microsoft Office 365 cloud offering, which includes Lync/ (Skype for Business), users shall have access to instant messaging, presence, web conferencing, video conferencing, desktop sharing, and interactive whiteboards.

Table 1. Specifies when the County shall receive the various components of O365

MODULE OF O365	AS OF CONTRACT EFFECTIVE DATE	BY END OF TRANSITION	TRANSFORMATIONAL (AFTER COUNTY APPROVAL)
Lync and/or SfB	Y (Lync)	Partial SfB	Full SfB by 2018
OneDrive	Partial	Partial	Integrated
O365 Office Apps	Y	Continued Y	Continued Y
eMail	N	Y	Continued Y
SharePoint Online	N	N	T&M

Avaya Integration with Lync (Skype for Business)

Contractor shall deploy Avaya Communicator for Lync, which shall allow users to move from limited peer-to-peer audio capabilities into conferencing capabilities hosted within the Avaya Enterprise voice network. As UC services progress, desktop web conferencing capabilities shall become fully interoperable with conventional Cisco teleconferencing platforms.

Other UC capabilities to be implemented include using Avaya Communicator for Lync and collaboration services, which shall contain plug-ins for Outlook, and providing complete call control from the Lync or SfB client with the following key features:

- Click to Call On-Net and Off-Net local and long distance calls, using an End-User's computing device, mobile, or desktop telephone set
- Click to Answer incoming calls from Lync or SfB, using an End-User's computing device, mobile, or desktop telephone set
- Search and Click to Call internal and external County contacts from Outlook email
- Screen pop with contact on incoming calls from Outlook contacts.

Speech to Text (STT) Integration

Contractor shall use the Mutare Enhanced Visual Messaging with STT service. This solution shall transcribe an End-User's new voice mail message into text via email along with a .wav attachment or a secure web link for streaming the message to the County End-User email via SMTP relay.

Mobile Unified Communications

Contractor shall leverage the AirWatch SaaS MDM solution for deployment of UC mobile (e.g. Avaya mobile client, Skype for Business) applications to the County of San Diego mobile application store for corporate owned managed devices, as well as, upon approval, employee owned BYOD devices. Once the UC mobile application has been deployed, whether on a corporate managed device or an employee owned BYOD device, Contractor and AT&T shall provide full support of the application and its connectivity and functionality to the systems that provide these UC capabilities.

Through the integration of the AirWatch Mobile Device Management (MDM) and the Symantec Managed PKI solution for deployment of PKI payload profiles, all corporate managed and BYOD mobile devices and users shall be authenticated prior to accessing UC services or resources. This shall allow for County mobile users to take advantage of the Lync/SfB mobile application, which provides presence, instant messaging, and other capabilities while on the go. Additionally, through Avaya's Communicator for Mobile application, users shall be provided with full enterprise telephony functionality from their mobile device, allowing them to make, receive, transfer, and put calls on hold as well as use advanced features such as Active Directory (AD) lookups and presence status from Avaya voice and SfB users. Users shall have Full Call Control in addition to common enterprise voice features, such as:

- Make/receive calls
- Hold/retrieve calls
- Transfer calls
- Multiparty conference calls.

UC Data Sharing

UC data sharing shall also evolve from traditional SharePoint and network file share capabilities to enterprise file sharing and synchronization.

- **Email** – This shall be provided by Contractor for all County employees and shall be migrated to Office 365 Exchange Online during the transition phase of the Agreement.
- **SMS** – Contractor shall provide this feature as part of the mobile device services, and this feature may be provided by the carrier of choice by business unit. This shall be a hosted service and shall be isolated to the business unit and not available to the enterprise.
- **Fax** – Contractor shall provide Local and premise-based fax services either through the Avaya PBX or separate 1 MB lines by AT&T Core, and shall ensure that all are supported by AT&T life cycle management (LCM). Additional fax capabilities shall be offered by Contractor via the Right Fax solution, which shall be integrated with Office 365 Exchange Online. This solution shall provide users with fax to email services.

UC Support

Contractor shall provide front line support as a part of both Contractor's Service Desk Services and End-User Services. Support and training resources shall also be provided through the Service Portal. Contractor shall continue to leverage Contractor's previous Service Desk activities as well as develop, update, and maintain Service Desk scripts and processes for the UC End-User community. Contractor shall post training videos. As with all Contractor's Service Desk activities, Contractor's UC support shall include incident tracking, escalation, and resolution.

Teleworker and Remote User UC

Contractor shall deploy, after County approval, Avaya Communicator integrated UC and voice services clients. These integrated clients shall provide the 2,600+ users, and any future SSL VPN County users, access to a complete, consistent, and rich set of capabilities both on-net and off-net. Avaya Communicator desktop and mobile clients shall be able to operate in both VPN and non-VPN mode to provide remote connectivity. Avaya's Session Border Controller, in conjunction with Client Enablement Services, shall allow users of Avaya communicator clients (desktop or mobile) to operate in SIP (session initiation protocol) mode. Enterprise security standards, such as TLS and SRTP (secure real-time transport protocol) encryption, shall provide effortless access to UC and voice services integration, enabling teleworkers to function as if they are in the office regardless of their location.

Software and Release Management

Contractor's subject matter experts (SMEs) shall subscribe to Avaya's UC integrated client updates, service packages, or version upgrades. These shall be thoroughly reviewed by SMEs for County environment relevancy and tested in a lab environment before production deployment is recommended. This standardized process shall validate production functionality of any recommended new release update, service package, or version upgrade so that the County End-User environment is not disrupted or compromised.

Contractor SMEs shall apply industry standard software release management methodologies to support standard version delivery and consistency across all County users' devices and assets. These standards shall apply to Avaya One X Communicator, Avaya Communicator for Lync/SfB, Avaya Communicator Mobile, Avaya One X Agent, and Avaya Collaboration Services. The same shall apply to any proposed applications that need to be deployed to the County's managed mobile devices via the AirWatch MDM solution.

Contractor shall create, post, and document consistent UC client software packages for all client types.

This process shall integrate with all ITSM processes in place to ensure communication, approval, etc. and full integration with the overall program.

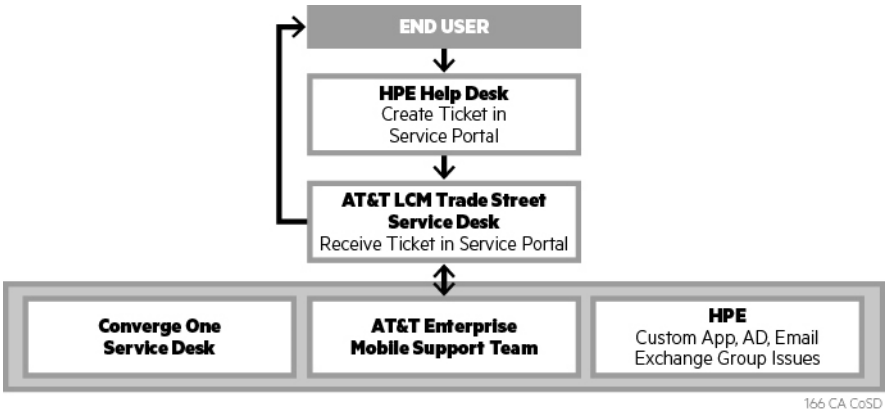
- Deployment plan for resources and use of facilities

As with other services, the County shall use Contractor's Service Desk to support UC. Contractor shall have high-tier support with both AT&T and Microsoft. Contractor's Service Desk shall still own support tickets through the entire life cycle for the convenience of the County.

- Key methodologies and processes in solution including year-to-year continuous improvement

All support services, whether triage, new requests, change requests, or removals shall be initiated by the County End-User to the Contractor Service Desk. All requests that are within the network framework for real/non-real time services shall be directed to the AT&T LCM team for assessment and completion. The following figure illustrates Contractor's support services methodology.

County of San Diego Unified Communications Support Services Methodology



The following table delineates services Contractor shall perform for End-Users in accordance with the standardized and documented procedures.

Services to be Performed by Contractor for End-Users

PROCEDURE NUMBER AND NAME	SOLUTION SUMMARY AND RATIONALE	TOOLS
Mutare EVM Incident Request	Documented process for End-User request to repair trouble with Mutare EVM service	Service Center
Mutare EVM IMAR Request	Documented process for End-User request for active or new service for Mutare EVM	Service Center
Avaya IP Softphone Incident Request	Documented process for End-User request to repair trouble with Avaya IP Softphone service	Service Manager
Avaya IP Softphone IMAR Request	Documented process for End-User request for active or new service for Avaya IP Softphone	Service Manager
Avaya Extension to Cellular Incident Request	Documented process for End-User request to repair trouble with Avaya Extension to Cellular service	Service Manager
Avaya Extension to Cellular IMAR Request	Documented process for End-User request for active or new service for Avaya Extension to Cellular	Service Manager
Avaya IP Softphone for Agent Incident Request	Documented process for End-User request to repair trouble with Avaya IP Softphone for agent service	Service Manager
Avaya IP Softphone for Agent IMAR Request	Documented process for End-User request for active or new service for Avaya IP Softphone for agent service	Service Manager

For quality UC support, Contractor's SMEs shall use numerous automated tools. These tools shall enable Contractor to continuously monitor the overall health and performance of voice appliances, assist in rapid restoration through fault isolation, and perform traffic analysis as shown in the table and discussed further below.

Contractor shall deliver complete manufacturer system maintenance coverage on all County Core Voice Services assets. Together, these tools shall provide complete health monitoring and expeditious issue resolution. Avaya Expert Systems and Secure Access Link shall be online and engaged 24x7 to diagnose and attempt to resolve

known system alarms, clear many service affecting issues, and escalate to engineering resources for prompt attention when necessary.

Contractor's UC team shall use Nectar's UCMP and its complete suite of innovative features to provide the County enhanced, integrated network services. Nectar shall provide multivendor management services including application dependency tree visual alerting and vendor knowledge modules, which shall help Contractor's SMEs proactively pinpoint and resolve cross-platform integration issues quickly and restore services to County users. The UCMP shall also include real-time network quality of service reporting using RTCP integration, and shall be able to create simulated traffic injection between designated network segments for analysis. This shall allow the SMEs to monitor and report on all VoIP related traffic transmissions.

The quality of service reporting tool shall provide per-hop statistics and in many cases shall assist in quickly identifying improper packet handling hop points. The Nectar platform shall include statistical resource utilization data gathering and storage that shall enable trending analysis and capacity planning. These capabilities shall be available using an intuitive and customizable dashboard with visual and electronic alerting from sophisticated threshold configurations. The dashboard shall allow Contractor to acknowledge, respond, and correct issues proactively, in many cases before County users know or report an issue.

4.10. Catalog Services

4.10.1. Process and Procedures

- Description of solution to meet the requirements

Solution Summary. The Optional Item Catalog (OIC) shall hold all approved single user applications, standard and nonstandard hardware items, and support only services.

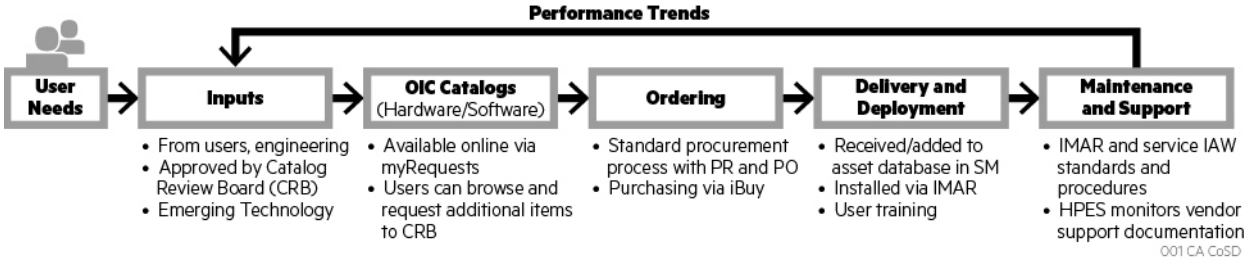
The configuration of the catalog shall be controlled by the Catalog Review Board (CRB). The board shall consist of Contractor and County selected points of contact (POCs) from each department to discuss, review, and approve items for inclusion in or removal from the catalog.

Catalog activities, such as ordering, maintenance, and approval, shall be accessible online via the Service Portal and myRequests. While all users shall be able to order, only select users shall be able to perform other functions––review and approve, for instance—based on their organizational role and authority. myRequests shall be replaced with Service Catalog and Request Manager during the Cross Functional Transition, as described in the Transition Services Framework.

Requirements and requests for new catalog items or updates can come from users, engineering analysis, new technology offerings from HPE, third-party vendors, and elsewhere. County desktop hardware peripherals, laptop accessories, stand-alone printers, and desktop software prices shall be reviewed on a quarterly basis by HPE Global Procurement through a Request for Quote (RFQ). Contractor shall check with suppliers to compare prices and delivery schedules to match the existing catalog and make the necessary changes. Once the catalog manager receives the updated list from HPE Global Procurement, he/she shall update the OIC. The updated list shall be reflected in the following OIC publication, which shall occur on the 20th of every month. The catalog shall be updated with new End-User hardware peripherals and End-User software, including pricing on these items, one for hardware replacement and one for end of life (EOL) hardware.

The figure below provides a summary of the OIC solution—rom identification of item need to delivery and support.

The OIC Process



Once approved, the catalogs shall be available via the Service Portal. Users shall order via myRequests using functionality described in the "MyRequests User Guide."

For nonstandard items that are already installed and deployed, Contractor shall support OIC items through the warranty period for hardware. If additional assistance is needed, Contractor shall implement other processes to provide support for these items.

User training shall be available on OIC items, as necessary. OIC items shall be monitored by Contractor for manufacturer updates and shall be incrementally refreshed as recommended and approved. Specialized End-User support for applications shall depend on the nature of the applications and the problem. Technical and configuration support shall come from Contractor's break/fix technicians. If the issue is determined to be related to an application with a Portfolio Application Identifier (PAID), identifying it as a supported application, Contractor's Service Delivery Manager (SDM) for the business unit shall work with the vendor and the County apps owner for that portfolio application.

Each item in the hardware and software OIC catalogs shall be sorted by category, with a brief description, manufacturer, model/reference, and a unit price. For commercial items, pricing shall be set competitively via Contractor's procurement organization in agreement with the RFP requirements. If an End-User selects an item that requires End-User Service support for installation, those requests shall be added at the end of the optional item ordering process.

On the software side, there shall be three categories of desktop software:

- Purchase - Software products that are available for purchase.
- Supported but no longer available for purchase – Software products that are part of the Desktop Application Directory but are no longer available for purchase (for example, old versions of software). These products are still supported by Contractor.
- Other desktop software - Software that can be installed if licensing is in place. An analyst contacts the requester to discuss licensing before the software is installed.

- Deployment plan for resources and use of facilities

The OIC shall be available via the Service Portal in myRequests, both of which shall reside on servers at the Contractor data center. OIC management and deployment/service of optional items shall involve Contractor resources in management, engineering, procurement, and End-User services, most of whom shall be assigned to the Rancho Bernardo site. Others shall be part of a virtual team from across the U.S.

- Methodology & Key Processes – Key methodologies and processes in solution including year-to-year continuous improvement

Online Catalog. The OIC shall list items available for purchase by County users and shall contain standard items as well as optional items. Users shall be able to shop for items available for one-time purchase or RUs (monthly fee), including bundled services. Users shall also be able to suggest changes to the catalog. When an item is

approved and an order is placed, Contractor shall fill the order and deliver the products to the requester. Contractor shall:

- Coordinate an installation appointment with requestor
- Assist with set-up, including physical installation and connection of the device to the workstation or network
- Assist with the initial loading of the software products listed in the catalog,

The OIC is accessed from the myRequests page, which shall reside as a link from the Service Portal.

Viewing/Modifying Catalog Requests

All catalog requests shall be viewable by the requestor but shall only be able to be modified prior to submission. If a change is needed after submission, the End-User shall need to clone the request, make the changes, and delete the old request. The End-User shall be able to see the purchased status of an item by clicking the Purchasing tab.

Reviewing and Authorizing Catalog requests. If an End-User is a reviewer for the Catalog, they shall be able to access requests that have been submitted. These requests shall appear on the Review Catalog Requests screen. After accessing a request, the reviewer shall make comments that are then sent back to the requestor, rejecting or approving the request as submitted.

Shopping from the Catalog

An End-User shall be able to order hardware, software, or services from the catalog including video conferencing equipment, audio-video equipment, and telephones, computer and phone services, or special bundles for new employees. For all catalog orders that involve site installations, they must be authorized by the County Technology Office, who shall be notified by the myRequests system.

Billing, Authorizer, and POETA

After a request is made, the End-User shall be prompted to enter their billing and authorization information. myRequests shall use this information to "file" the request with the appropriate County agency and provide the correct financial account management. Each letter in the word "POETA" stands for a different billing item. The End-User can contact the financial coordinator of the business group for the correct information to submit. Billing shall be in accordance with the supplied POETA information.

Procedures. Catalog updates shall be managed in coordination with other standards governance activities, including the annual standard desktop configuration update and the weekly architecture review meeting. The catalog shall be updated in synch with other configuration changes.

The key to continual improvement in the Catalog Services component shall be to perform benchmarking with vendors, making sure that the catalog is refreshed regularly, is responsive to End-User needs, and that catalog optional items integrate and interoperate well with the standardized core configurations. Each new component shall be SIT and UAT tested and approved by the County.

4.11. Network Printer Services

4.11.1. Process and Procedures

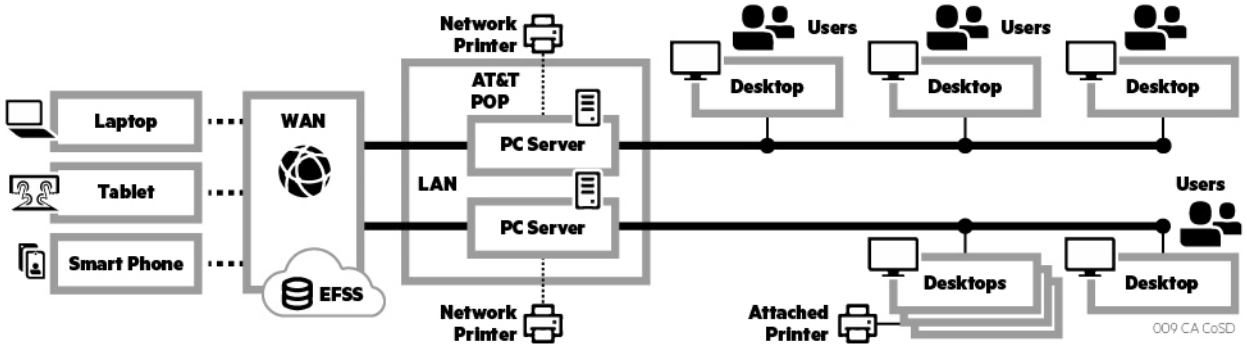
- Description of solution to meet the requirements

Network printers shall be integrated into the End-User service model and network architecture seamlessly.

The network printer support solution shall be the same for all types of printers. The only difference shall be in configuration and utilization information related to specific makes and models of printers. The figure below summarizes the network printer configuration.

Network printers shall be standardized attached devices and are operated and maintained under many of the same procedures for hardware and core software. Desktop services shall handle the printers, their configurations, drivers, and the queues. The local server team shall manage the print servers located in the AT&T POP and in the DR POP location in San Diego, as well as other locations where servers are installed throughout the County (such as FRCs and CAC).

Network Printer Architecture



- Deployment plan for resources and use of facilities

Contractor shall perform this work from Contractor's Rancho Bernardo site.

All service technicians shall have basic training and skills in network printer operations, maintenance, and troubleshooting. Contractor shall have a hardware team that specializes in printer/server support, but all field technicians shall be trained at a basic level to support these devices. Printer specialists shall be embedded in the Desktop Services organization but shall not be a separate team.

Contractor's technicians shall have the same core skills but different levels of expertise in specialized areas, such as surge and DR situations. Because of this, Contractor shall be able to cross-assign staff to a critical area.

- Key methodologies and processes in solution including year-to-year continuous improvement

Printers are a specialized device on the network, but the overall processes and procedures described previously in the End-User framework shall apply to printers. Printer management shall involve printer specific activities such as:

- Printer service IMAR and operations
- Printer device management
- Queue setup
- Load balancing
- Printer security management
- Configuration setup and management for groups and individual users.

The requirements to support network printers shall be part of Contractor's plan, build, operate approach. The table below maps each of the framework component requirements into a Plan, Build, and Operate (PBO) phase and then summarizes Contractor's solution and methodology and key processes.

Mapping of Framework Component Requirements for PBO Phase

STAGE	COMPONENT REQUIREMENT (SUMMARY)	CONTRACTOR'S SOLUTION, METHODOLOGY, AND KEY PROCESSES
Plan	Standardize	• Printers are included in annual engineering and standardization reviews • The County approves standard printers
Plan, Build, Operate	Provide back-end infrastructure	• Printers must be compatible with the County Architecture • Network capacity is engineered to support printers
Plan, Build, Operate	Upon device failure or network failure build in redundancy and failover procedures	• Engineer and maintain for reliability and recovery
Operate	Keep drivers current; maintain firmware (slightly specialized)	• Drivers are maintained via SCCM • Firmware versions are monitored via vendor FAQs and pushes
Plan, Build, Operate	Categorize printers; printers are either standard resource units or in the OIC	• Several classes (monochrome, color, high performance, large format, label and multifunction devices) of network printers are installed • Printers are in Report 44 and the OIC
Build and Operate	Support the User – develop training, tip sheets, update the portal, among others	• User support materials are built by engineering once the printer is selected
Build and Operate	Continuously maintain Service Desk scripts and support info for technicians	• Printer install and End-User support materials are built by engineering • Tickets feedback inputs to improvements
Plan, Build, Operate	Leverage existing licenses	• Printer timeline and refresh strategy is maintained to reduce cost of licenses • Strategic negotiation and leverage utilized for license costs
Plan	Make effective standards at the start of each new year	• Printer standards are selected as part of the annual standardization process • Printer vendors brief County and Contractor on current products and migration path(s)
Plan and Operate	Supply via the portal a list of consumables	• Consumables list to refreshed annually along with the standards selections • The County can therefore forecast consumables expense and do supply management
Operate	Excluded printers not attached	• Concur
Operate	County shall be responsible for consumables	• Concur

STAGE	COMPONENT REQUIREMENT (SUMMARY)	CONTRACTOR'S SOLUTION, METHODOLOGY, AND KEY PROCESSES
Operate	Maintenance, availability, and break-fix	• In agreement with overall service and break/fix methods • Printer experts are available to assist at all Tiers of support
Plan	Maintain and update annually a timeline/roadmap regarding support to active devices and planned tech refresh	• Printers are part of the overall standards assessment, engineering, test and governance The County approves the standard printers and any OIC printers

4.12. [Reserved]

5. NETWORK SERVICES

5.1.1. Process and Procedures

Bandwidth and capacity management and reporting.

Contractor has tailored its bandwidth and capacity management processes to meet the County's increasing needs. Bandwidth shall be proactively delivered to County locations before link saturation affects performance. This process shall begin with weekly reporting on key capacity metrics using AT&T's CA spectrum and eHealth tools. These tools trend bandwidth and latency against baselines. These trends shall be validated as legitimate business traffic using AT&T's deep packet analysis tools before action is taken. Using the thresholds below, which may be modified by mutual agreement of the parties, Contractor's Capacity and Performance Monitoring team shall make recommendations for bandwidth upgrade in the weekly Operations Governance. This approach to capacity management helps the County of San Diego provide the right level of capacity at the right location and at the right time.

Below are the thresholds for both WAN and Internet Transport:

Bandwidth Utilization Threshold (WAN): 90% Peak Utilization over 4-week period of time + corresponding latency threshold breach
Bandwidth Utilization Threshold (ISP): 90% Peak Utilization over 4-week period of time + a 1.5 – 2Mbps drop rate
Latency (WAN): GigaMAN (greater than 4ms), Opt-E-MAN/NoD (greater than 8 ms), T1 (greater than 15 ms)

As part of this process, Contractor shall provide:

- Weekly review of network capacity metrics as part of the County's operational governance process.
- Capacity management that meets the business needs of the County using tools that provide real-time threshold alarming.
- Communication of findings and recommendations that help the County achieve optimal utilization and capacity.

The local team shall continue to meet weekly with the County's operational team to present and review findings and make recommendations. Contractor shall perform optimization analysis daily using its automated tools that aggregate findings and establish trends that become the basis of Contractor's weekly reporting.

Contractor shall migrate remote sites to AT&T's Switched Ethernet (ASE) with Network on Demand. This allows the bandwidth and capacity management practices for the County to become even more dynamic. Using the software-defined networking capabilities that are inherent to ASE with/Network on Demand, bandwidth can be adjusted from as low as 2 Mbps to as high as 1 Gbps in 15 minutes.

Contractor shall implement a solution whereby adjustments can be made within the Network on Demand infrastructure on a scheduled basis, providing the County a great deal of flexibility in bandwidth management. As an example, if the County Health and Human Services Agency planned an employee training event that required heavy video and interactive content (not distributed using a centralized, multicast town hall solution), Contractor's capacity team schedules an adjustment to specified remote sites for an agreed period of time. This shall deliver the required bandwidth where needed and, at the completion of the training, automatically adjust the bandwidth back to its normal business capacity.

Real-time bandwidth adjustments shall also be made as needed. This may be required as the result of unexpected local or national events creating unanticipated demand on the data network. As future events occur, Contractor shall be able to do more than just increase the ISP bandwidth. By using its capacity and performance monitoring

tools, Contractor shall analyze the traffic and determine if it is affecting the County's WAN. At that point, real-time adjustments shall be made to alleviate the congestion in minutes.

All transport services—including WAN, AVPN/MPLS, ISP, and SIP trunking shall be scaled to maximum interface capacity as well as built in parallel so that growing County bandwidth needs are met over the life of the term. Also, as new services are made available with additional speed or throughput capabilities, Contractor shall require AT&T to evaluate the feasibility of such services and make corresponding upgrades where reasonable under existing service commitments.

Performance monitoring and reporting

Contractor shall provide the data necessary to optimize network service to the County. Capacity planning is used to determine the network resources necessary to prevent performance issues from impacting these critical network services. Performance monitoring/management is the process of managing network and data services response times, consistency, and overall service quality.

Contractor's network team shall administer, monitor, maintain, and manage performance of the data network services and network services infrastructure. This shall involve input from many areas of the business to identify what IT infrastructure is required to support the County's business.

The process components shall include:

- Performance monitoring for routers, switches, firewalls, and network servers and appliances
- Capacity monitoring of WAN transport circuits
- Internet performance monitoring of public and staff CIR
- Trend reporting and analysis.

Key sub-processes shall be:

- Network bandwidth monitoring to specified thresholds
- CPU/memory utilization and errors monitoring on all network devices to specified thresholds
- Responsive impact assessment and mitigation planning
- Proactive trend-based "situational watch list" assessments and corresponding action plans
- Real-time traffic analysis initiated from "exceeded threshold criteria" in the form of Spectrum critical alarms.

Performance Monitoring Tools

Using AT&T's capacity and performance management functions that utilize various toolsets, Contractor shall provide monitoring, reporting, trending, and analysis services to the County.

CA's eHealth and Spectrum tools shall integrate to maintain critical service levels across complex network environments by combining eHealth's automated availability and performance management with the Spectrum network service and analysis platform.

The eHealth and Spectrum tools shall allow for more efficient alarming and reporting, enabling the network capacity and performance management team to focus on proactive troubleshooting, performance optimization, and service level management.

Another toolset that shall help manage system performance within the County network infrastructure is Riverbed Cascade Profiler, which provides a unified end-to-end view of service delivery, application, and consumption from the data center to the End-User. Cascade Profiler assists in troubleshooting the threshold deviations reported in eHealth, troubleshooting in real-time and from a single probe interface. Cascade retrieves real-time

information, providing quick and easy access to logical views such as link analysis, link usage over time, Top N applications, and Top N conversations and hosts.

Troubleshooting and Forensics

The above mentioned promiscuous tools enable event correlation and forensics through the active capture of network traffic combined with reporting capabilities that provide real time and historical data. This capability applies not only to the previously mentioned tools, but also includes the deployment of desktop based tools such as Wireshark, which are used as needed to conduct packet captures from individual assets. When used in active troubleshooting, all of these tools are used to correlate the event to a root cause for resolution by the appropriate framework using cross framework troubleshooting processes.

Performance Baselines

Contractor shall use these tools to provide data on specific metrics for historical and baseline performance evaluation. These baselines are important in Contractor's monitoring of the County's network since they can directly affect bandwidth provisioning and other resources.

Performance Threshold Alarming

Once baselines have been determined, thresholds shall then be established based on variables within the network infrastructure. Circuit measurements depend on bandwidth to determine baselines and thresholds. Physical devices such as routers and switches report memory allocation errors, CPU utilization, and buffer hits. There are also broader ranges of environmental specifications to which thresholds are tracked, such as power supply, fans, and temperature, among others.

Threshold severity is currently defined in four levels, each dictating an appropriate course of action as listed in the table below.

Threshold Severity

SEVERITY	ACTION
Warning	Track element status on weekly basis.
Minor	Add to Watch List (document in Situation-to-Watch and status any changes).
Major	Assess and engage relevant framework, open internal ticket if necessary. Add to Watch List.
Critical	Trigger to "Attention" notification tool, initiate internal break-fix. Troubleshoot and actively mitigate until resolution.

Critical alarms shall be sent to the Attention application system that notifies the NOC operations team (and on-call) members via phone, SMS, and email. The Attention system software shall provide a predefined notification process for critical alarms as well as escalation processes for overdue or pending alarms on a 24x7 basis.

Other important thresholds that have been established include site latency and Internet CIR thresholds. Site latency thresholds shall include latency deviation based on the type of circuit. Internet CIR thresholds shall be triggered when bandwidth use on the Internet link goes 20% above the daily average, as measured by eHealth and in conjunction with quality of service (QoS) policies applied to the Internet router.

Performance Trending and Analysis

Once baselines and thresholds have been established, Contractor shall perform trending and analysis. There are a number of variables that contribute to the analysis of a trending element. Bandwidth use, CPU use, physical

hardware errors and application response time delays can all have an impact on network health. eHealth reporting (Situations-to-Watch, Top N Reports defining baseline statistics, Health Index Reports indicating CPU, errors, and discards) along with Cascade Profiler reporting (application response time statistics, link usage, top application layer applications and hosts) shall be used to collectively qualify and pinpoint performance degradation associated with the network or an application. This detailed information shall drive necessary corrective actions as well as engagement of the appropriate Contractor framework in problem resolution.

Reports showing an increase in trending for elements in the network shall be reviewed and investigated for further analysis. Report trending from Situations-to-Watch, Top N latency, and health index reports shall be addressed by further analysis with a deeper dive into the affected element(s).

Adjustments made to correct issues associated with variables related to bandwidth use, memory allocation errors, CPU processors, or other changes in the network, shall be based on investigation of the specific cause. Increasing the bandwidth for a specific County site shall be determined by identifying historical data and trending analysis for a specified period of time. There shall be an initial assessment and continued monitoring of the network thresholds (application, End-User count, throughput and other associated activities) to validate the appropriate remedy for a given issue.

Real-Time Anomaly Detection

As the Contractor Operations team begins developing processes around real-time anomaly detection, they shall develop automated alarming and event correlation capabilities, with focus on application performance. The tools mentioned in this section—along with other data center and desktop-based platforms—shall enable a layered approach to event triangulation, which, combined with the daily stand-ups, improves the proactive performance management of services across the enterprise. Contractor shall dedicate resources to improving proactivity over the life of the term, with measured results reported through the operations governance process.

Data Aggregation and Analytics

Contractor shall contribute key capacity and performance tool data to the cross functional data warehouse, with focus on bringing enabling automation and continuous improvement through a global analytics and reporting practice.

Contractor shall work with the County in extending both the data contained in the data warehouse as well as the BI/Analytics platform to support a more complete IT Service Management Analytics capability. The benefit to the County can be measured as follows:

- Service Strategy and Improvement Analytics: This area focuses on analysis that supports recommendations to improve business outcomes and improve customer satisfaction. Analysis of available data sources can be used to assess; IT Infrastructure Health, IT Transformation alternatives, predictive analysis of customer satisfaction, and customer sentiment analysis

- Service Design Analytics: This is a way to use analysis to better understand capacity demands and service availability by predicting degradations, preventing outages and reducing downtime. Using ITSM data Contractor can forecast demand and utilization on the infrastructure, predict service degradation with the goal of reducing system downtime.

- Service Operations Analytics: Blending ITSM data and benchmark IT performance data, Contractor can conduct analysis to reduce business impact of events, incidents, and problems.

- Service Transition Analytics: These analytics address the correlation of incidents and events to root causes in order to speed recovery and to identify ways to reduce IT complexities.

Performance Reporting

Contractor shall ensure that tools are in place, baselines and thresholds are completed, and trending and analysis processes are established to provide reports to the County that affect not only bandwidth provisioning, but adjustment and potential corrective action to a wide variety of County resources. On-demand reporting shall be available upon County's request for fast turnaround on critical and time sensitive issues.

Trend and health reports shall be scheduled monthly to collect data and identify the top volume and health index leaders throughout the County network infrastructure. The report shall identify contributors that qualify for threshold conditions such as, use, CPU, memory, errors and latency.

Elements each month shall be sorted by the Top N elements and performance indicators that require attention or resolution. A summary analysis shall be presented for the monthly activity and shall provide watchful situations or those exceeding threshold limits that require corrective actions.

Included in the monthly reports shall be a "Monthly Summarization Report." The details in this document shall include opened tickets for County sites that were affected by latency, bandwidth, errors, CPU, and memory related performance issues.

New and layered approaches to integrating capacity and performance and real-time anomaly detection shall be defined that leverages multiple toolsets. This shall involve cross-framework teams that proactively respond to enterprise issues affecting End-Users.

Identification and Elimination of single point failures in Network Services.

The County increasingly relies on the continuity of the data network for its business functions to remain operational under any circumstance. With this in mind, Contractor shall focus heavily on redundancy and survivability of critical core network services.

Contractor shall avoid single points of failure in its network elements (such as circuits, central offices, and core network elements) via AT&T's redundant network design and software defined infrastructure. These redundancy solutions allow Contractor and AT&T to maintain continuity of the regional, nationwide, and global backbone in the event of isolated failure. One dynamic of the County network solution leverages this redundancy through the use of diverse pathway and ISP exchanges in both San Diego and Gardena, California. With this configuration, the geo-redundant County ISP service remains dynamically available in the event of a regional service interruption.

Increase of visibility into all data communications and data flows between End-Users and Services within the Data Center.

Effective tools are not the problem facing proactive performance management. It is the practice of modeling, trending and analysis that can unlock the potential of the data the tools can deliver, if performed with a broad understanding of the enterprise.

Contractor shall create a cross-framework predictive analytics team whose charter is to manage performance on an enterprise basis. This team shall create and execute a repeatable process to be documented in the Standards and Procedures Manual using a layered approach using numerous tools to monitor and respond to shifts in baseline data.

By developing baseline traffic patterns for network, application, desktop, server, and management traffic, this team shall define thresholds and event patterns, allowing the team to take predictive action, correlating anomalies in the environment. Using the multiple sources of data, Contractor shall conduct daily stand-up calls where threshold breaches are evaluated and diagnosed. This team shall open internal operational tickets on the issues and shall have the authority to escalate across any framework to engage resources as needed to respond and identify

the source of the anomaly. Ongoing reports shall be provided to the County operations team and covered in weekly governance meetings, identifying open issues that are being monitored as well as successful closures.

Contractor's County Operation team shall also be tasked on an ongoing basis with improving processes, tuning their practices to better predict, correlate and resolve anomalies. This team shall also have the responsibility to train on their tool sets, improving their mastery in the art of performance analytics. Further, Contractor shall evaluate new and emerging tools that it proposes for implementation, adding to the depth of the data sources at the County's disposal.

The members of this team shall be identified by each framework as responsible for performance management in their discipline and will dedicate the necessary time to maintain a best in class performance analytics function. By taking early action, this team shall drive through chronic issues and eventually reduce the effort for their resolution. Tools and practices, effectively used together, shall increase the visibility of anomalies across the enterprise, improving the End-User experience while maximizing organizational performance and business output.

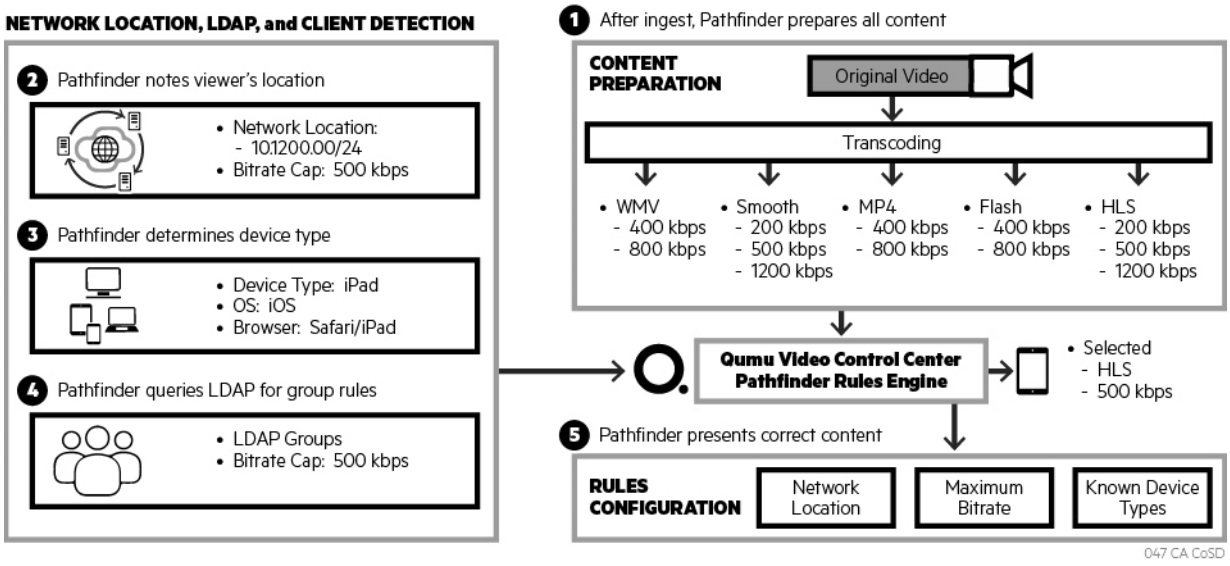
Town Hall Services.

Contractor shall use AT&T Video Management Services (AVMS) and its partner Qumu to provide town hall video services for the County.

Through AVMS, Contractor shall provide all of the functionality needed to capture, manage, and publish video content for both live and video on-demand (VoD) distribution for local and remote users. AVMS's advanced transcoding capabilities shall support formats from various capture devices—from production studio and video conferencing platforms to mobile devices and video cameras. For distribution, the solution shall allow for consumption of video content on a wide variety of devices such as laptops, desktops, tablets, and smartphones while optimizing the End-User experience based on the device being used and bandwidth available.

By means of Pathfinder, AVMS' intelligent routing and distribution element, Contractor shall optimize and present content viewing based on device, network location, and bandwidth, as illustrated in the following figure.

Optimization of Content Viewing



Contractor shall use subdomains to provide separate access to video intended solely for users on the County domain, such as internal communications or training. Internal and mobile video viewing shall have the option to be limited to specific groups based on active directory (AD) group.

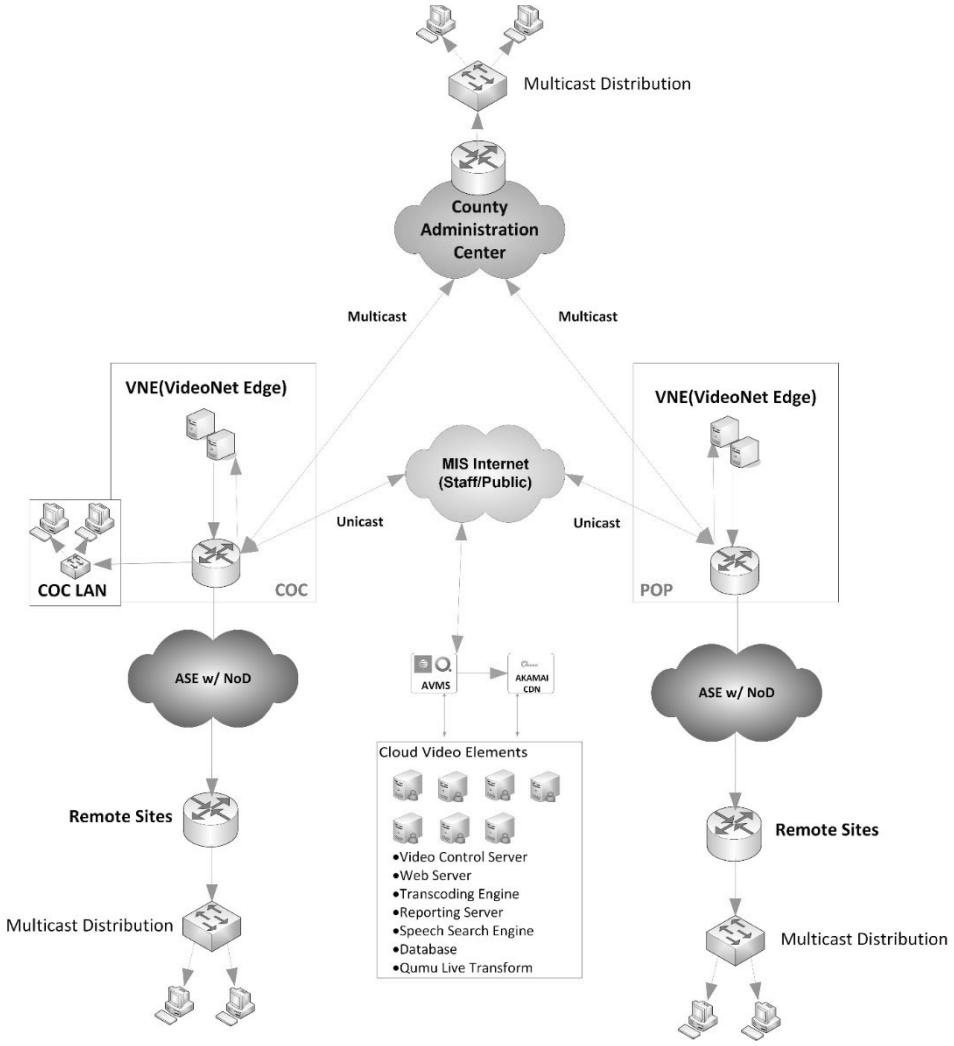
Embedded polling and feedback features shall be included to offer increased benefit to the County by engaging viewers and soliciting their input. Contractor shall use high grade analytics to provide viewer statistics along with broadcast performance detail to provide a clear picture of content performance and identification of possible impacts.

AVMS offers both on-premises and cloud-based options. Contractor shall use the cloud-based architecture, which provides high availability without the need for extensive local hardware and associated support costs. With the added benefit of burst capacity for mobile or public users in real-time, the solution is able to handle traffic spikes without degradation of the delivery quality. The hosted solution can scale to cover all of the County users with growth up to 100,000 simultaneous viewers. With archiving capabilities, video content can be preserved and made available for replay for a configurable length of time.

AVMS makes use of both internal and external Content Delivery Network (CDN) technology. For external content delivery, Contractor shall leverage the Akamai platform. This external content delivery shall be used to augment or replace the Granicus streaming solution.

From within the County domain, the AVMS solution shall enable multicast video presentation through VNE's (VideoNet edge) to multiple viewers simultaneously without causing an exponential impact to network performance. Contractor shall implement four VNEs, two at COC and two at POP. From this geo-redundant core, the multicast stream can be routed across the WAN to the remote edge, where the LAN redistributes the stream to each requesting End-User.

AVMS Topology



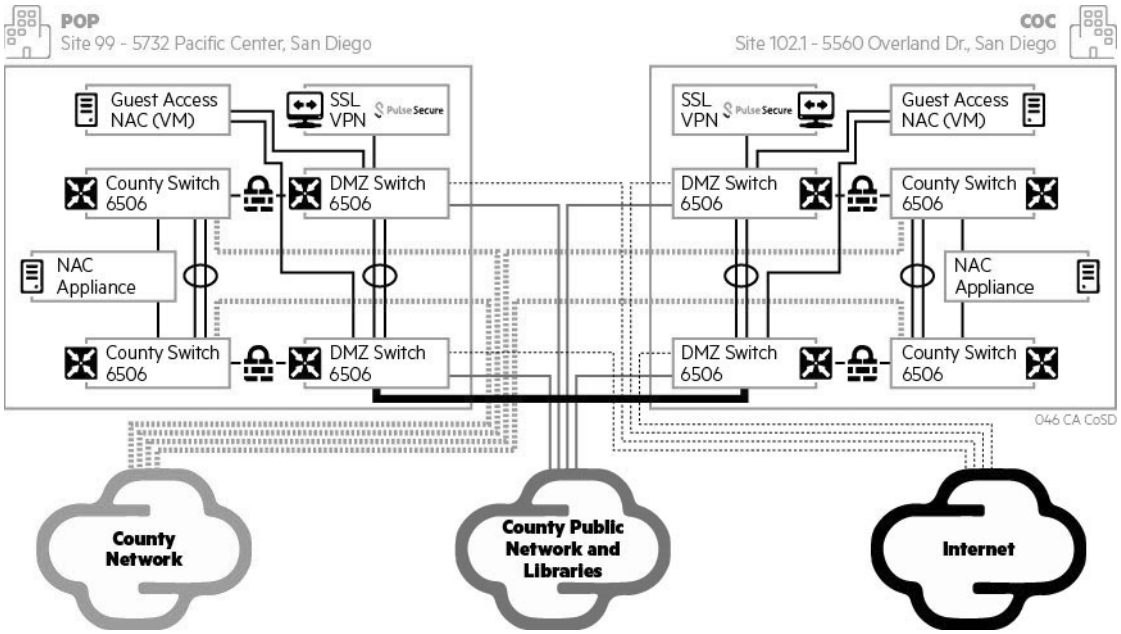
Topology of the AVMS solution, highlighting cloud based services feeding geo-redundant Video Network Edge devices that feed multicast video streams to the remote County sites.

In order to represent a complete solution with no limitations to the County, Contractor is only Providing AVMS for enterprise video content distribution. Contractor shall implement this service within one year of County approval. The solution shall be charged through a fixed monthly Resource Unit Fee for an unlimited number of townhall events. Such RU Fee may be allocated to business units based upon the County's discretion.

Network access controls and PKI-based device authentication for Wireless Services.

Contractor shall use Aruba's Clear Pass Policy Manager (CPPM) to provide a comprehensive yet integrated NAC solution. This product shall provide the County all the features of NAC in a single platform to ease management, administration, and troubleshooting efforts. Contractor shall use an integrated RADIUS server, coupled with the ability to perform guest access authentication, shall provide a wireless solution enabling County staff and the public appropriate, policy based network access across any access point in the County. This solution shall provide a seamless authentication for the staff while allowing various options for the redirection of public or untrusted devices. While the wireless deployment is planned to be implemented first, the solution shall function on all physical ports Countywide.

NAC/Guest Access



NAC/Guest Access centralized management topology is provided via a geo-redundant architecture.

The Aruba NAC solution shall be implemented to align with Contractor's geo-redundant, high availability standard. One appliance shall be located at the AT&T POP and one installed at the County Operations Center (COC). These appliances shall manage and enforce policy on the staff wired and wireless infrastructure by leveraging 802.1X and EAP-TLS (Extensible Authentication Protocol-Transport Layer Security).

The solution shall allow any County domain joined device that is plugged into the network, and logged into with a valid active directory account, to be given access to County network resources. Any devices plugged into the wired network that do not meet the above criteria, or predefined NAC policies for non-domain joined or non-dot1x compliant devices, shall be placed onto a public VLAN with restrictions that allow for access to the Internet only.

The integration with the existing wireless infrastructure shall continue to leverage EAP-TLS to validate certificates for access to the existing County secure wireless network. The certificate required to authenticate, as well as the wireless profile, shall be installed at the time a computing device is prepared for distribution by means of a group policy object (GPO) push within the desktop framework. This GPO is the only way the client machines can receive the certificate required.

To provide public guest access, the Contractor shall install a virtual instance of a clear pass policy manager in the DMZ at both the AT&T POP and the COC for redundancy and resiliency. This provides guest access on the public Wired/Wi-Fi network. The solution shall force all users of the public network to view the captive portal splash page where terms and conditions can be presented and must be accepted prior to being granted access to the Internet. The contents of the splash page, as well as the look and feel (theme), can be modified to include desired content or photos and provide automatic forwarding, after acceptance of terms and conditions, to the County's home page.

The guest access solution shall also offer functionality that shall be leveraged for business unit specific use cases.

Contractor shall maintain a RADIUS server (steel belted radius [SBR]) that acts to authenticate radius sessions from the wireless network. The Contractor team shall leverage the two Aruba appliances planned to be installed at the AT&T POP and the COC to provide radius server functionality in place of the existing SBR server. The two

appliances shall be fully redundant, thereby removing a single point of failure and providing all services currently offered by SBR. Contractor shall integrate the new radius servers with the Microsoft CA infrastructure, as well as the new Symantec-managed PKI solution.

Generally, staff users are unaware of any additional security when using a managed County computing asset. The EAP (Extensible Authentication Protocol) required to validate the End-User and machine shall leverage currently logged-in End-User credentials and domain membership to allow access.

Transformation Opportunities

Currently, the County is evaluating cloud-based services to provide cost-effective ways of delivering services to employees and constituents. Contractor's team has already identified the transformations required to receive the full benefits of cloud architecture. Contractor is proposing an AT&T NetBond solution that extends connectivity using a Multiprotocol Label Switching (MPLS) network into County-selected third-party vendors. The NetBond solution provides a secure, performance-assured interface to the cloud, while offloading the Internet Service Providers (ISPs) and dedicating bandwidth to the services. Additionally, Contractor's proposed solution facilitates fully integrated and centralized connection management functionality and supports third-party cloud services with Contractor's contractual service levels.

The foundation of this service is to be deployed in a geo-redundant manner, using AT&T Virtual Private Network (AVPN) MPLS circuits; it is included in the Data Network Services and is priced. Future implementations of NetBond services (proposed as a resource unit (RU) on a bandwidth basis) use this transport connectivity to create the peer-to-peer connection with the selected cloud provider (cloud provider costs may apply).

In support of the transition of Exchange to the O365 cloud, and in line with Microsoft's recommendation, Contractor shall ensure adequate bandwidth is provisioned on the geo-redundant Internet ISP's to allow access to O365 services. As an option for isolating this service away from the ISP, Contractor shall also offer optional NetBond functionality in a peering arrangement with Microsoft's Azure Express Route product. The solution shall be evaluated as a part of the design effort and shall be offered as an optional service, and priced as a separate RU that combines the NetBond RU with the Express Route costs to complete the connectivity model for the service.

5.5. Data Network Services

5.5.1. Process and Procedures

Collaborative Approach

Through involvement in weekly CTO architecture sessions, as well as participation with the Enterprise Architecture (EA) governance process, Contractor shall propose new technologies that have been evaluated and measured against County strategy and business requirements. This continual dialogue with the County, along with Contractor's broad industry knowledge of network solutions and their impact on adjacent technical disciplines, allows the Contractor team to successfully propose and implement emerging technologies within or even before the agreed-upon technology refresh cycles. This approach allows the County to quickly realize the benefits of new technologies. This ongoing interaction also facilitates the standardization of hardware and software deployed by the Contractor team as its solutions receive initial approval from the Enterprise Architecture Forum and subsequently from the Change Review Control Board prior to transformation.

Upon activation of its approved solutions, Contractor shall employ several automated tools to maintain an accurate and up-to-date inventory of all hardware and software supporting data network services. In addition,

Contractor shall use automated tools to continuously monitor the provisioned services from an operational and bandwidth utilization perspective, as well as provide valuable insights into traffic patterns and application functionality.

Monitoring and Management Approach

From an operational view, Contractor's capacity and performance management tools shall continuously measure and report on delay, packet loss, retransmissions, bandwidth use, and service interruptions. In the case of an outage or degraded services defined by specific thresholds, automated alerts and page-outs shall be sent to Contractor's local, dedicated team members who respond to resolve incidents within Service Level Agreement (SLA)-specified parameters. During normal business hours (6 a.m. – 6 p.m.), the engineering and Service Desk teams shall monitor operational status using CA Spectrum and actively respond to alerts. After hours, the Contractor team shall use the automated notification features within the tool to provide the necessary alerts that trigger incident response activities within stipulated SLA parameters (24x7x365).

As part of Contractor's prompt restoration services, Contractor shall report incident response activities to the County using the centralized Contractor Ticketing System. Additionally, on P1 and P2 outages, as well as upon County request, Contractor shall develop root cause analysis documentation and submit it for review. Incident reporting also includes a proactive response to performance or capacity issues, and Contractor's reporting shall clearly identify the nature of the incident or degraded performance and the steps taken to resolve the issue.

Contractor's network performance management shall also use CA Spectrum to provide monitoring. One component of CA Spectrum is CA eHealth, which Contractor shall use to perform trend analysis based on historical measurements as well as current indicators to model, optimize, plan, and report on network services. This tool allows Contractor to meet the County's requirements for speed, reliability, capacity, and quality. CA eHealth also provides real-time and predictive performance analysis capabilities, enabling identification and provisioning of increased bandwidth capacity prior to reaching End-User performance issues on the intranet or Internet.

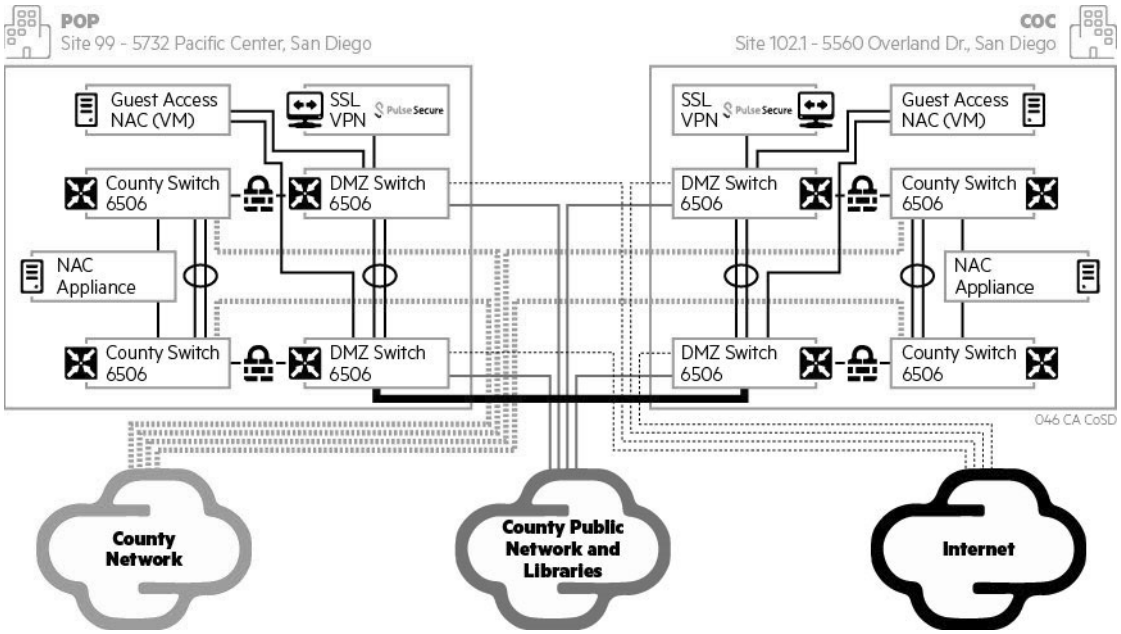
Although CA Spectrum provides passive network monitoring and measurement techniques, Cascade Pilot and Cascade Shark allow active capture, measurement, and analysis of network and application traffic in support of anomaly detection and forensics. The Contractor team shall use these deep packet analysis tools to trend application network performance—establishing thresholds that can be alarmed, correlated, and compared to baselines, enabling a proactive approach to identifying application or desktop issues. Additional network-based tools shall be used to enable a layered approach to trend analysis and event correlation, including Security-based tools such as Palo Alto's Panorama (packet capture and analysis, application identification, traffic volume identification, malware detection, and threat identification); Wireless tools such as Aruba's Airwave (Wireless capacity/ performance); and Voice tools such as Nectar (quality of service [QoS], mean opinion score [MOS], jitter/latency measurement, and round-trip time [RTT] analysis). As Contractor continues to evolve its approach to real-time anomaly detection, new tools and processes shall be evaluated and proposed—improving Contractor's capability to support adjacent frameworks in identifying enterprise anomalies.

Continuous Improvement

Contractor's network shall provide maximum flexibility, enabling adoption of new applications and cloud services while maintaining the highest security and service levels. Acting as an "enabler to the enterprise," Contractor's network shall allow any device—managed or unmanaged—to be evaluated, authenticated, and allowed policy-based access. This next generation network shall transform the enterprise by reducing cost and increasing flexibility while improving security and service levels. This new technology shall be expanded in the new term, replacing Opt-E-MAN circuits as well as T1 circuits where possible.

The following figure shows the future state of the centralized, geo-redundant, high-availability network core.

County Network – Future State



County network transformation (future state topology) takes advantage of AT&T's latest software defined network and cloud-based solutions, simplifying the network topology while improving performance, availability, and security.

- Deployment plan for resources and use of facilities

The Contractor network framework team shall maintain infrastructure in County facilities and work closely with the County Technology Office and the Department of General Services to support accessibility and security.

The local life cycle management (LCM) team shall consist of dedicated, full-time resources—many of whom have worked on the County's network for a decade or more. The Contractor network team's primary location shall continue to be in San Diego. All LCM technical, operations, and project management personnel work out of this location. All network services framework components shall rely on the use of the AT&T point of presence (POP) and the County Operations Center (COC). These two geo-redundant sites shall be the core locations holding the centralized communications equipment, appliances, and transport capabilities that securely enable feature-rich capabilities to every business area within the County.

- Key methodologies and processes in solution including year-to-year continuous improvement

The Contractor team shall apply the following key methodologies in its solution:

- Iterative and bi-modal approaches to solution evaluation: "Start fast," evaluate options, and align solutions to County business needs and long-term strategies; establish proofs of concept, all prior to discussion on cost/price.
- Weekly architecture team collaboration sessions allow a continual transformative approach to be maintained across the entire network framework.
- Weekly Enterprise Architecture Reviews enable cross-framework dialog so that adjacent requirements are understood and delivered.
- Contractor employs ongoing, discipline-specific technical roadmap development.
- Contractor uses a structured refresh process, at 4 years, for core routing infrastructure; and 5 years for LAN switching infrastructure. This approach shall be continually reviewed with the County, making certain that the

refresh activities bring the greatest value to the County, with options for deferral provided while taking service level performance into account.

5.6. Remote Access Services

5.6.1. Process and Procedures

Contractor shall maintain its scalable and secure remote access solution to provide the necessary breadth and depth of functionality. In close coordination with the County, Contractor shall maintain a suite of remote access services via Secure Socket Layer (SSL) connections to satisfy the County's evolving requirements through numerous transformation initiatives.

Contractor's experienced, on-site dedicated staff members shall maintain safe, reliable, and secure sessions allowing End-User-role appropriate access to County resources as dictated by County policies and enforced through the use of groups established within Active Directory (AD). This solution set offers an inherent advantage by leveraging the existing AD capabilities. This solution precludes the need to logically connect a disparate system to AD.

To maintain the security and privacy of County resources, Contractor shall establish specific Active Directory group profiles that allow users and capabilities to be directly tied together through specific rule sets for each End-User within the group. Thereafter, Computer Services Registration Form (CSRF) tickets shall provide the direction and authorization needed to assign specific users into their designated profiles. As a result of their specific group membership, users shall be allowed access to a predefined set of resources and precluded from accessing other resources. In this manner, Contractor staff shall enforce County-directed policies.

The Contractor remote access services shall be provided via two independent resource units, Network Persistent VPN, (Virtual Private Network Level 1) and Application Persistent VPN (Virtual Private Network Level 2). These two resource units may be subscribed to stand-alone or in combination and shall apply to the infrastructure, maintenance and support of the hardware and software behind the remote access technology. Base access costs shall be recovered through the Network Access Wired/Wireless RU and shall apply to all County domain registered users.

PulseSecure SSL VPN – Network Persistent VPN (Virtual Private Network Level 1)

Contractor shall maintain geo-redundant remote access gateways from the County Operations Center and the AT&T POP. This solution shall use PulseSecure PSA7000 appliances in the two POPs in conjunction with PulseSecure software loaded on the laptops to facilitate SSL virtual private network (VPN) access into the County domain. This solution shall work with wired and wireless configurations.

Contractor shall continue to evaluate any changes to the environment to identify potential single point of failures and shall work with the County to eliminate them.

This solution shall have the capacity and flexibility to expand, as needed, to support additional users and profiles beyond the existing 2,600 remote users. This scalable solution shall support three profiles—SSLVPN1_D, SSLVPN1_DRW, and SSLVPN1_DRWF. Network access control shall be achieved through a feature known as host checking; the remote host shall be verified as being either a County-owned device or a non-County device and granted domain access as appropriate. For those with full domain access this solution shall provide further granular control by restricting or allowing the use of additional features.

The PulseSecure client loaded on the County-managed laptops (as well as managed mobile devices once that project, which is currently in flight, is completed) shall allow full network access to any and all resources available to the End-User when connected on the County LAN. This client-based connection shall associate each

session with a unique IP associated only with the specific End-User's SSLVPN connection for the duration of his or her connection. This connection shall be logged as well as tracked and reported as necessary, and it shall be used during troubleshooting activities that can be isolated to each End-User session.

At the End-User's discretion, a web portal connection shall be initiated by browsing to a URL and authenticating via the End-User's AD username and password. From within the browser session, users shall have the option to perform up to three activities based on their membership privileges:

- **Initiate a terminal services session (remote desktop)** back to their own County desktop (if configured) or another County network device configured to accept terminal service connections. From there, users can perform normal LAN activity within that remote desktop session as well as create bookmarks for quicker access in future sessions.
- **Browse to County intranet sites** (such as Insite) using the browse function within the web portal window. Users can create bookmarks for these sites on their main web portal page.
- **Access file shares** that users have been granted permission to access, and create bookmarks to these shares.

All of these actions take place within the web portal window. Anything done outside of that window, including web browsing using a separate window or tab, does not flow to the County network.

There are two remote access security features available for transformational use:

- **Security posture evaluation** assesses a device's security posture by determining the presence, versions, and levels of antivirus, spyware, and malware protection as well as operating system (OS) version and patch level, software patches, and disk encryption.
- **Role-assigned remediation** allows the restricted network access of devices for the sole purpose of performing remediation of any failed checks found during the security posture evaluation.

.

Another feature of the PulseSecure solution is direct support for smartphones and tablets provided by installing the PulseSecure mobile application onto these types of devices. However, due to inherent limitations with these mobile devices at present they cannot be configured to automatically sense the unavailability of one gateway and connect using the alternate.

Currently the PulseSecure mobile client is not "connection aware" and is unable to dynamically reconnect to a secondary gateway in the event the connection to the primary gateway fails. Contractor has initiated feature requests and roadmap discussions with PulseSecure to address the manual failover inherent to the mobile VPN solution for the County, which shall be implemented at no additional cost to the County. If this feature does not become available in the first 9 months of the Agreement term, the Contractor shall evaluate and implement a global load balancing solution such as F5's GTM (Global Traffic Manager) by the end of CY 2 of the Agreement at no additional cost to the County. This solution shall involve the installation of two virtual appliances leveraging Contractor's existing virtual infrastructure at both the POP and COC. This solution also possesses the potential to be leveraged for other services such as Mutare Voicemail to Email Service and could extend the capability of global load balancing to all solutions offered externally from the COC and POP.

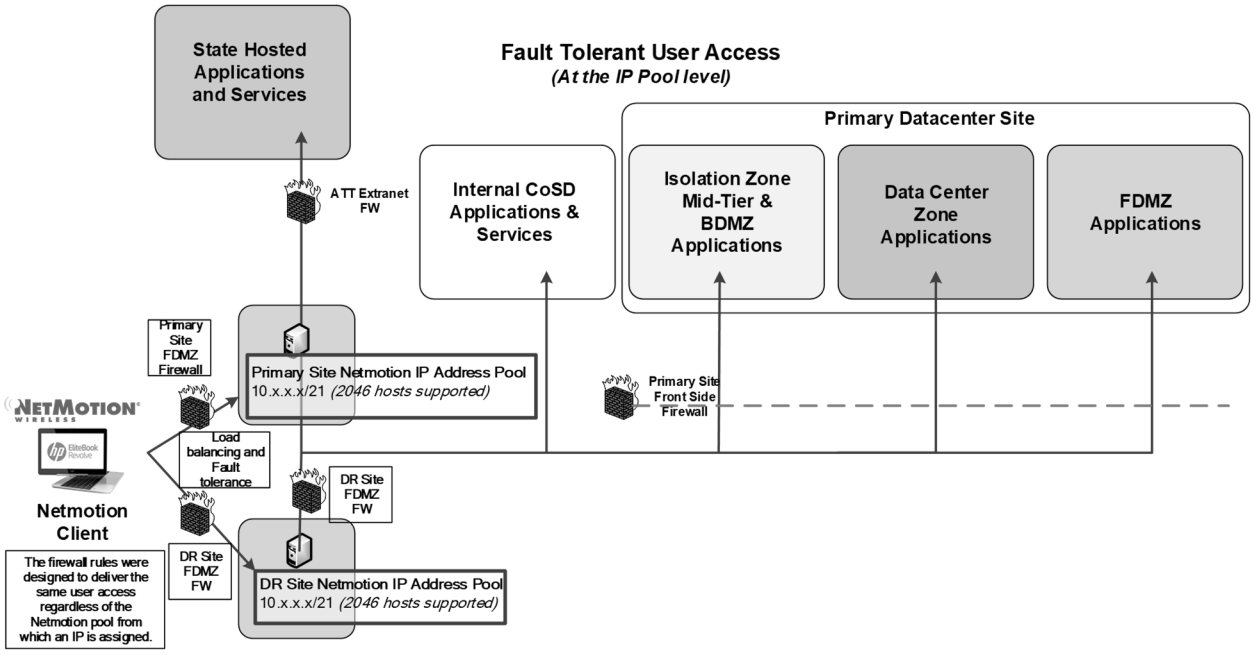
NetMotion – Application Persistence (Virtual Private Network Level 2)

Contractor's remote access solution shall include application-persistent capabilities through its deployment of NetMotion Mobility VPN. Similar to the SSL VPN System, the application-persistent capabilities of NetMotion are enabled by assignment to the correct group profile, which also determines which specific application an End-User may access. Currently, there are approximately 1,200 mobile workers who require VPN connectivity and application persistence to support their business objectives and who require connectivity to the County as they roam between networks. In the new single data center model, NetMotion shall be configured for high availability

with redundant servers load balanced and takes advantage of the built-in redundancy within the data center for storage, network, electrical, etc., as well as the redundant connections to the data center.

Contractor shall deliver an environment that supports mobility session persistence for County mobile workers as they roam wireless carrier networks throughout their business day. Also, it considers the internal County and external County network destinations to which mobility users must connect for successful business productivity. Contractor key objective is to manage the mobile End-User traffic efficiently so that business traffic traverses the links to the applications within the data center and internal County networks, but non-business traffic is redirected through the wireless carrier network or broadband connection. This capability is known as split-tunneling, and it maintains the performance and security of the County's network. A depiction of the logical solution architecture is presented in the following diagram

Figure 2. Fault Tolerant User Access



Remote Access Services

- Deployment plan for resources and use of facilities

For continuity of Contractor's existing geo-redundant network and remote access capabilities, Contractor shall use the AT&T POP in the County as well as the County's Operations Center to hold the Mobile Access Gateways, VPN appliances, and to facilitate circuit terminations. The NetMotion application-persistence solution shall be hosted on highly available and load-balanced virtual machines within the primary Contractor data centers. Contractor shall maintain the NetMotion solution infrastructure in accordance with the standard procedures and policies, while supporting the application with guidance from NetMotion.

Working from its local facility, Contractor's SMEs shall monitor, support, and maintain the remote access services. Any client side issue support shall be initiated through Contractor's Service Desk process.

- Key methodologies and processes in solution including year-to-year continuous improvement

Through the Contractor team's routine involvement within the Enterprise Architecture Forum meetings, the Contractor team's SMEs shall maintain an in-depth understanding of the County's remote access needs and proactively prepare Solution Design Documents for County approval. Thereafter, Contractor's planning and testing of the solution shall allow activations to go smoothly, with back-out plans executed if required.

When a new End-User or group of users requires remote access, Contractor shall gather requirements and determine the type of access needed. For SSL VPN and Application Persistence users, new users shall be placed into an Active Directory group with the appropriate level of access and security. For Mobile Access Gateway users, a Mobile Device Management (MDM) solution shall provide the appropriate level of access and security. Contractor shall continually evaluate new technologies and vendor roadmaps so that the most secure and reliable system with the highest performance is available to the County. The Contractor Service Desk shall post text-based information into Tier 0 repositories, and the Contractor network team looks forward to working with the County to advance into video-based Service Desk files in order to better reach Contractor's customer support community.

Hardware associated with remote access shall be refreshed on an ongoing 4-year cycle. This approach shall be continually reviewed with the County, making certain that the refresh activities bring the greatest value to the County while offering continuous improvement to the service.

On a continual basis Contractor shall create, maintain, and update End-User training documentation and tips as well as associated Service Desk scripts pertaining to the remote access to match the version and features of the product.

To allow the maximum return on the County's investment, Contractor shall make full use of the existing solution set, which can adapt to the County's future requirements. However, as the technology and requirements landscapes evolve, Contractor's SMEs shall evaluate and propose new solution sets as needed to meet the County's needs and joint objectives

Network persistence and application persistence in Remote Access Services.

In support of the County's vision of a "Government without walls," Contractor shall maintain a remote access solution that leverages redundant infrastructure with software enabled network and application persistence. This multiplatform solution was designed and delivered to meet specific business purposes, starting with the functionality of SSL VPN and then expanded to provide application persistence for mobile users that actively interact with enterprise data while physically in motion and in turn are exposed to the connectivity interruptions that can occur across carrier mobility networks.

Contractor shall maintain the Pulse Secure SSL VPN service.

As remote access technologies continue to evolve, Contractor shall consolidate the network and application persistence.

User experience, impact to business associated with a change in solutions, as well as providing the proper levels of support shall be carefully weighed for any and all solutions under consideration.

Contractor's approach is to take a transformative approach to this goal, evaluating the best options for the County in the term of the agreement. Contractor shall continue to closely monitor industry trends, vendor roadmaps, and innovation in the remote access space to properly evaluate and select the best solution for the County. Contractor shall work closely with vendors to determine the optimal solution in terms of reliability, usability, functionality, features, and the ability to make full use of the redundant network architecture to preclude any single points of failure as part of the solution.

5.7. Voice Services

5.7.1. Process and Procedures

Voice Services

Each transformational activity shall be initiated through the Enterprise Architecture Forum, where Contractor shall provide ongoing architecture and management resources to facilitate the planning of upgrades, refresh, and strategic plans related to Contractor's voice services. In this forum, Contractor shall perform the following:

- Maintain ongoing collaborative voice and unified communications roadmaps and architectural standards, with yearly reviews/revisions, enabling the continued advancement and adoption of emerging technologies.
- Identify single-point failures within the voice architecture and propose solutions for County consideration.
- Make recommendations to reduce County usage costs.

VoIP Services

Contractor shall leverage the existing network infrastructure and build upon it by replacing older TDM and PBX technologies with Voice over Internet Protocol (VoIP) solutions that tie seamlessly into capabilities already implemented on the County network. As with other transformations, service changes must be completed within realistic cost constraints that provide demonstrable return on investment. Due to these real-world restrictions, Contractor's solution includes significant reuse of existing assets that are current technology and well inside of the technology refresh cycle. Contractor shall reuse the major core voice-related appliances and associated licenses shown in the following table.

Major Core Voice-Related Appliances and Associated Licenses

AVAIL	IN USE	TYPE	DESCRIPTION
26,305	23,901	Aura Communication Manager-Core	Core license for CM stations
26,305	166	EC500	Extension to cellular
26,305*	277	One X Communicator	Softphone on desktop
26,305	0	One X Mobile	Softphone on mobile device
26,305	1	One X Communicator for Lync	Softphone on desktop for Lync integration
2,647*	2,647	Call Center Elite	Core call center software license
321	284	Elite Multichannel	Software for screen pops at ACCESS
484	452	Avaya Call Recording	Software for recording/ storage of agent/ customer voice calls
1,051	2,883	Call Management Agent	Per agent license for CMS
125*	309	Call Management Supervisor	Per supervisor license for CMS
12*	9	One X Agent	Desktop client phone for agents
175*	175	AAEP port	Experience Portal port license
181*	181	AAEP CM Connection	Experience Portal to CM connection license
82*	82	Enhanced Call Classifier	Experience Portal call classifier license
117*	117	Nuance ASR	Experience Portal speech recognition license
117*	117	Nuance TTS	Experience Portal text to speech license
1,000	481	Mutare EVM	Mutare voice mail to email
1,000	481	Mutare giSTT	Mutare voice mail to text transcription
17,000	16,941	Modular Messaging	Voice mail licenses

AVAIL	IN USE	TYPE	DESCRIPTION
26,305	200	Session Manager SIP connections	SIP licenses
3,758	200	Session Border Controller Trunk	SBC licenses for SIP connections
3,758	2	Session Border Controller Stations	SBC licenses for SIP connections

To support Contractor's transformational objective for VoIP services, Contractor's SMEs shall work within the architecture forums and draft Solution Design Documents for the site Transformations. Contractor's formal solution design approval shall then be used by its project management team to develop implementation strategies and communicate with site-based County resources to upgrade each specified facility to VoIP services. These changes reduce equipment footprint at each of the sites, while dramatically reducing the overall power consumption and increasing availability and reliability. Equally important, the upgrade improves the End-User experience by reducing trouble tickets regarding set-based issues—such as speaker and cord problems—and also provides new feature sets.

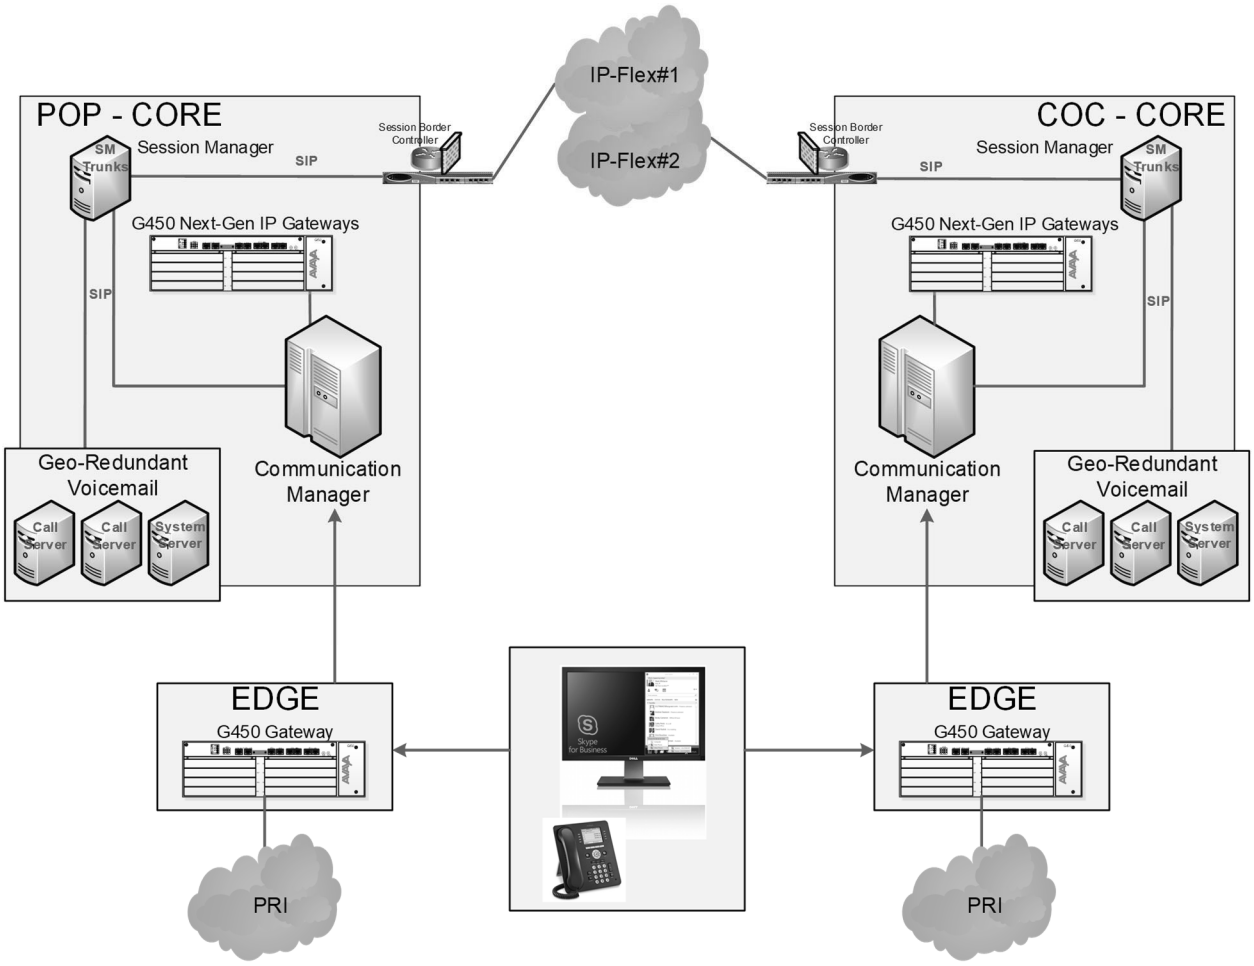
As a part of this Transformation project, each site shall also be migrated to a new E911 service, so that first responders have the necessary site and call location detail in the event of an emergency.

All new County sites shall continue to be implemented with VoIP services as part of Contractor's ongoing efforts to continuously maintain technical currency and modernization of these services.

Geo-redundant Voice Mail

Contractor shall leverage a geo-redundant voice mail platform to provide a standardized voice mail experience across all County locations where enterprise voice services are offered. This solution shall include a phased migration of Centrex users to the new platform as these services are brought into new voice services standards. The following figure is a representation of the high-level topology of the voice mail solution that shall be in place at the time of the Agreement if approved.

High-Level Topology



AVST with Neverfail provides geo-redundant, high-availability voice mail services.

Voicemail to Email Services

Contractor shall continue to support Mutare speech-to-text service for transcribing voice mail messages into text with delivery to the End-User via email along with a .wav file to the County End-User email on a per-request basis by the County. This service is provided via a cloud-based platform.

Unified Communications

Contractor's team shall expand the integrated desktop and handset functionality as part of Contractor's efforts to integrate voice services into unified communication services. These enhancements shall include complete call control from the Lync or Skype for Business client with the following key features:

- Click to call and click to answer from Lync or SfB
- Search and click to call from Outlook contacts
- Outlook contacts match and screen "pop" click-to-conference.

Avaya Communicator Softphone

Contractor shall offer Avaya Communicator softphone functionality. This service allows remote and teleworkers a full featured software client, deployed upon request to their County provided device. Leveraging the

connectivity provided by a direct LAN connection or PulseSecure VPN/Netmotion, Avaya Communicator allows End-Users to make and receive calls from their designated County telephone number at their desk and remotely via a headset.

On-net Dialing and SIP Trunking

Contractor's solution to voice interconnectivity shall use the robust, fault-tolerant solution deployed within the data network to provide resilient connectivity not only within the County domain, but as needed to support cloud-based solutions. This connectivity facilitates improved end-to-end collaboration and also reduces operational costs by implementing efficient local and long-distance dial plans. Contractor shall include capacity expansion of the existing SIP-trunking internally and externally for increased efficiencies. As an immediate objective, Contractor's team shall expand the capacity of SIP services, configuring them to support not just local calls but also long-distance and toll-free (800) calls. Contractor shall eliminate usage charges for all outbound domestic calls from the enterprise and reduce the usage charges for toll-free 800 inbound calls.

Centrex Migration

AT&T has developed a Transformation approach to migrate a majority of these users/stations to a VoIP solution, while maintaining a roadmap for remote and intentionally off-net services to be executed over the term of the Agreement. This effort is planned for implementation early in the term as a Transformation initiative and is included in the Voice Services.

The first transformational step to migrate Centrex users shall include the deployment of stand-alone IP-based telephones at sites with existing data network functionality. This solution provides VoIP telephone sets at the remote site, centrally managed by the Avaya geo-redundant voice cores at the AT&T POP and County Operations Center. While these sites do not have local survivable gateways, they take advantage of the data network for their connectivity to the enterprise voice infrastructure. Through this migration, individual stations shall be converted to the Avaya enterprise standard, where they are provided new centralized voicemail and Unified Communications functionality options as well as a new telephone set.

Basic/Simple IVS Solutions

Contractor shall provide the support of Auto Attendant and Automated Call Distributor services as a right to use feature for subscribers of Voice Services. This basic functionality is inherent to the Avaya enterprise telephony network. Contractor shall enable 39 previously billed "Simple" IVS resource units to consume the service no additional charge.

411 Operator Services

In 2015, AT&T upgraded the IVR that supports the County 411 information line, providing additional self-help capabilities and bilingual voice recognition. This new service has provided improved efficiency in delivering County and public users with County information. Contractor shall continue to provide these services, including a live operator option for users and constituents who "zero" out of the IVR. Over the life of the Agreement, additional recommendations shall be developed and proposed to enhance and improve this important service.

800 Toll-Free Services

Contractor shall ensure that toll-free services for publicly dialed County telephone numbers are supported by AT&T and provided at a significant price reduction relative to current rates.

- Key methodologies and processes in solution including year-to-year continuous improvement

For End-User support within the new contractual service level requirements, the Contractor team shall continue its multi-tiered service and support structure. This structure provides the appropriate skills at each level to handle incidents, coupled with a clearly defined escalation management process to facilitate proper incident response and resolution. In addition, Contractor shall use a complete set of automated tools, which drives quicker response and resolution and minimizes impact.

Each platform/service type shall use a predefined set of operational processes to achieve customer satisfaction and service levels. The Contractor team shall leverage the Nectar Unified Communication Management Platform to access knowledge modules to assist with identifying and resolving issues. Also, Contractor shall leverage an internal SharePoint Services Knowledge Base that provides a customized set of knowledge and process tools specifically reshaped over time for Contractor's internal use only to support voice service response team. The Contractor team shall maintain its voice-specific internal SharePoint Wiki that has complete infrastructure documentation organized by site.

5.8. Network Security Services

5.8.1. Process and Procedures

Network Security Services

- Description of solution to meet the requirements

Contractor shall leverage the existing security infrastructure solution to further improve the security posture of the County network. The following components shall be included in Contractor's solution:

- **Palo Alto next-generation firewalls with unified threat management capabilities.** These appliances provide not only firewall services, but they also provide intrusion detection/prevention (IDP), spyware and AV filtering, and web content filtering. Automated, daily threat updates allow the County network to be protected against the very latest in malicious content and activities. Extensive reporting in this solution enables deep dive views of network communications to highlight the possible effects on network performance. This solution also provides automated alerting of possible malicious activity for immediate investigation and remediation.
- **Websense cloud-based content filtering.** This technology further protects County assets, even when outside the County domain. By replicating content-filtering policies in use on the local County network to the cloud-based service, Contractor is able to support continuity of protection across all avenues of connectivity in use by County personnel, regardless of their physical locale.
- **Websense Data Loss Prevention (DLP) for web channel and data in motion.** This service prevents sensitive data (personally identifiable information [PII] for instance) from being transmitted outside of the County network in unencrypted communications or copied to a removable device (i.e., thumb drive).
- **Advanced Distributed Denial of Service (DDoS) detection and protection.** This service protects County Internet circuits and provides security event analysis and correlation via live 24x7x365 monitoring.
- **Tenable Security Center.** Continuous perimeter scanning provides a close to real-time view of supported and non-supported inventory, including real-time threat updates and monitoring of vulnerabilities and risk, as well as close to real-time asset status updates. This provides an improvement to the snapshot in time information that is currently available.

Transformation Opportunities

As part of Contractor's dedication to continuous improvement for the County, Contractor shall support and maintain the following efforts:

- **Application-level security policies.** By moving from port/protocol-based firewall policies to application-based policies the tools can fully inspect traffic flows. This type of technology safeguards against programs attempting to use non-standard ports to circumvent port/protocol-based security. The Contractor team may refine security policy to data flows, as well as determine the types of applications in use on the County network. This enables Contractor to provide more in-depth assessments and recommendations for network enhancements.
- **User identification.** By providing positive identification for each End-User tied to a data transmission, firewall policies can be written to allow authorized network communications based on End-User ID rather than an IP address. Consequently, the policy is in effect for the End-User, regardless of his or her location on, or entry point into, the County network. This solution eliminates the need for static IP addresses for firewall policy mapping—thereby providing better policy management without the need to map policies to entire subnets to accommodate the mobile nature of today's workforce.
- **Active Directory group-based policies.** Much like End-User identification, AD-based policies allow for the mapping of security policies to specific groups created within AD. This allows for a security policy to be applied to all users who are members of an AD group, regardless of where they reside on the County network. For example, if a member is added to the HR group then he or she automatically inherits the security policies applied to that group without having to have a firewall change made to accommodate him or her specifically. As a result, Contractor's SMEs have greater flexibility in mapping security to End-User roles without increasing complexity in either process or implementation.
- **Network Access Control (NAC).** This capability provides appropriate levels of network access based on the device being connected. County-managed devices are given full access to the County network just as they are today. Non-County devices are segregated on the County network and allowed only access to the Internet unless otherwise authorized through a formal review process.
- **Integration with the County's PKI solution.** These integrated solutions guarantee that only County-authorized devices are able to connect using County wireless networks or via the County's SSL VPN solution. This approach effectively isolates the network from exposure to non-County managed devices that pose a security risk.
- **Websense Data Loss Prevention (DLP).** The DLP solution is already in place for data in motion and web channel, protecting against the release of sensitive data onto the public network or transfer of data to removable devices. The next phase of that enables the scanning of repositories to identify sensitive data being stored in non-secure locations.

- Deployment plan for resources and use of facilities

All hardware and software used to provide network services from the AT&T POP location shall be contained in a secure location, accessible only by AT&T personnel or those they escort. All personnel having access to County associated devices at the AT&T POP shall have undergone background checks and verification. Security measures shall include guarded access, with signature and ID required for admittance along with biometric security.

Access to network services hardware and software located at County facilities is to be managed by the County.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor shall evaluate patches and updates as they are made available to determine their applicability to the County environment and shall deploy them immediately as needed.

The continuous 4-year refresh cycle shall apply to security hardware as it does to all network refresh activities. The hardware and systems shall be continuously evaluated so that they can meet the requirements of the County's high-speed network and are upgraded as needed.

Contractor shall perform the configuration of the hardware and software using industry best practices—resulting in hardened, or locked down, systems. Contractor shall remove default usernames and passwords and disable

unnecessary services, and all management communications to and from the devices shall be via encrypted connections.

- Use of Tools

Contractor shall provide and maintain a centralized management platform to deliver strict change control along with powerful reporting and alerting capabilities and automated notification of security events.

Through AT&T's vendor, Security on Demand, Contractor shall capture these threats by performing analysis against the data, including behavioral analytics, to determine whether there is a potential threat. If such a threat exists, or further analysis with the LCM team is required, then a ticket shall be generated or a call placed directly to Contractor's dedicated security staff for high severity issues.

The logging mentioned above, as well as all of the logging from the Contractor security devices, shall be fed into the security information and event management (SIEM) solution for analysis and triangulation against other security data sources such as data center firewalls and intrusion prevention systems/intrusion detection systems (IPS/IDS).

Automated email alerts shall also be delivered daily to the dedicated Contractor security staff by Contractor's Palo Alto environment, where additional analysis shall be conducted and fed to the Cross Framework security team and Cross Framework capacity and performance team. Finally, Contractor's Security team shall use these tools to develop recommendations for evaluation by the Contractor CISO and County CISO.

From this analysis, Contractor shall take actions to include, but not be limited to, scanning of devices, removal from the network and reimaging of desktop devices if necessary (for County assets), and configuration of network or URL blocking and tuning of threat signatures. Contractor shall conduct investigations to determine whether hosts have fallen victim to malicious activities and what the impact or spread of those may be. All investigative reports shall be provided to the County for its review.

In addition, monthly reporting shall be provided to the County CISO for review with PMO Security on both threat alerts and URL blocking taking place in the County environment. This allows both trending analysis and the development of future security strategy roadmaps.

5.9. Video Conferencing Services

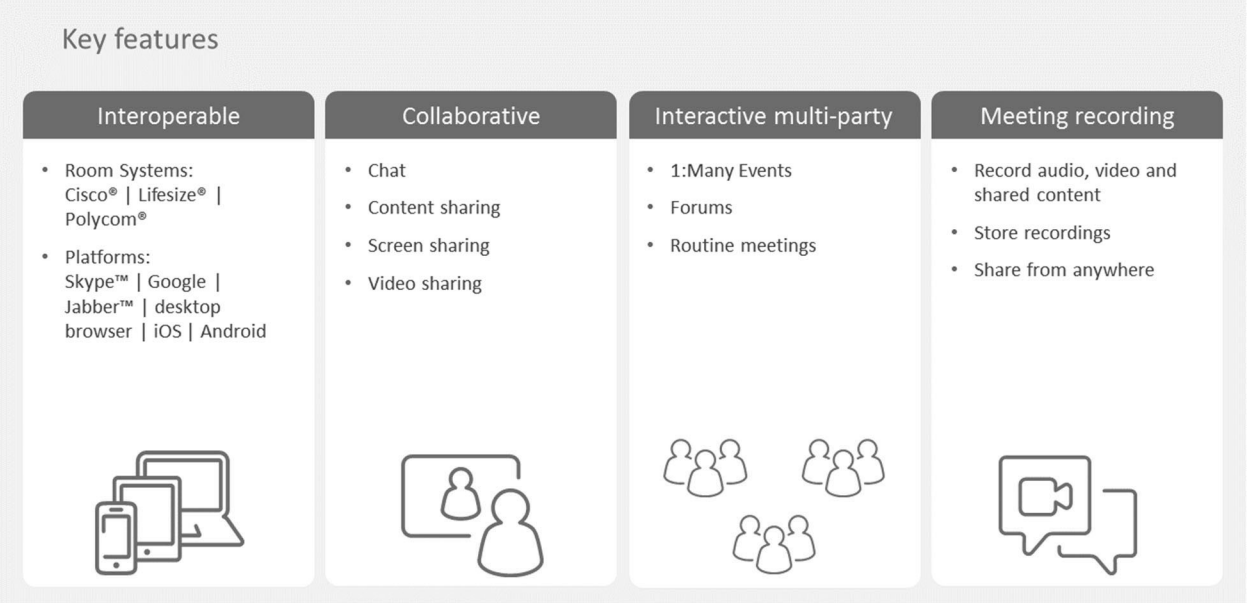
5.9.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall continue the use of existing video conferencing capability in conjunction with a cloud-based solution to fulfill all of the County video conferencing requirements. To remain compliant with required equipment refresh cycles, part of Contractor's solution replaces the Tandberg Management System (TMS) and Video Conferencing System (VCS) with the Cisco Unified Communications Manager (CUCM) virtualized appliances, which shall be implemented in a geo-redundant configuration between the AT&T POP and the County Operations Center.

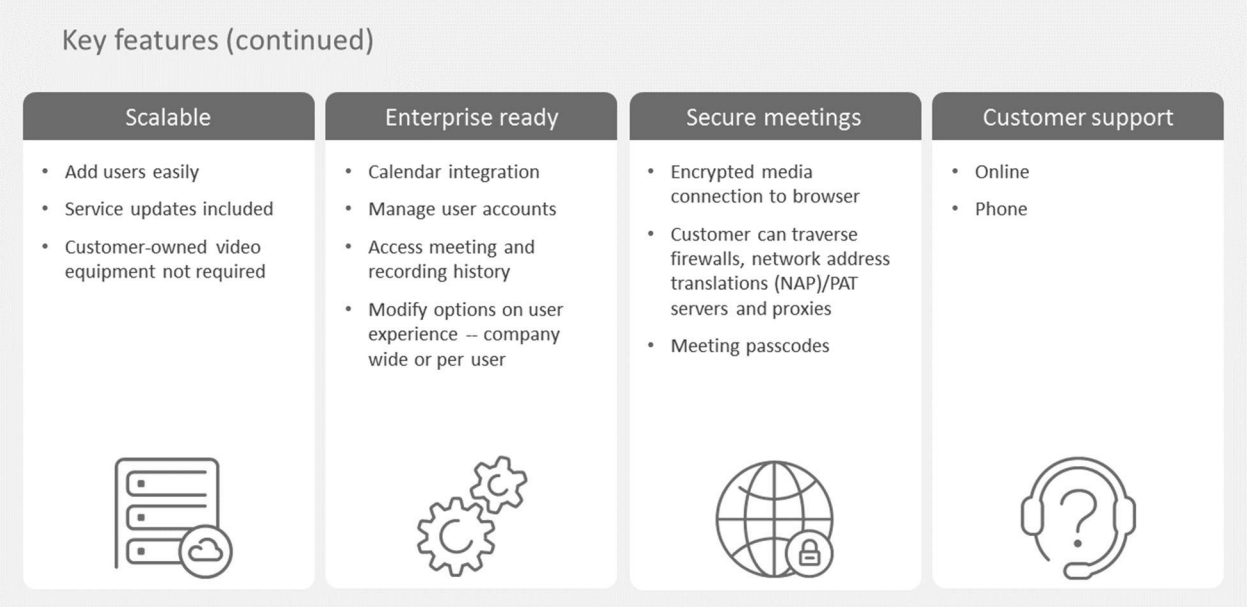
To fulfill the need for a fully integrated video teleconferencing solution, Contractor shall provide AT&T Meetings with BlueJeans. This solution offers a cloud-based video bridging capability that can integrate services like Skype for Business and Google Chat with traditional standards-based room video systems. The system is scalable, device and platform agnostic, and provides a flexible yet standard platform for video teleconferencing. Features of this integrated solution is depicted in the figures below.

BlueJeans via AT&T



The hosted Meetings with BlueJeans via AT&T provides full interoperability across many platforms and allows for many types of collaborative, real-time interaction.

Hosted Meetings with BlueJeans via AT&T



The hosted Meetings with BlueJeans via AT&T scales easily both internally and externally, while providing additional enterprise and security capabilities.

This Meetings with BlueJeans solution leverages the availability of existing videoconferencing units around the County and facilitates interoperability with the existing Skype for Business clients for extended telepresence. Users can participate from anywhere using any device—with a dedicated app, a web browser, or the Skype for Business mobile application.

From a desktop/laptop/tablet/smart phone End-User's perspective, the Meetings with BlueJeans experience is as easy as clicking on a link in an email or a meeting request. The Outlook plugin adds the capability to schedule meetings using a personal meeting ID or a dynamic meeting ID. Users can also edit default meeting preferences and add/edit/cancel meetings. The additional support for delegate scheduling allows executive support personnel to schedule meetings on behalf of executive staff. From an existing Cisco videoconferencing unit, an End-User simply dials by inputting the IP address as listed in the invitation.

Additionally, the Meetings with BlueJeans hosted solution allows numerous customizations, including the ability to set language preference, meeting passwords, entry tones, meeting security controls, and more via the web-based End-User interface. Features such as the high-definition content support, video sharing, and the ability to record meetings coupled with the integrated encryption allow the County to conduct video meetings securely as desired today and into the future.

- Deployment plan for resources and use of facilities

Contractor's solution shall use the existing video conferencing solution set and the associated facilities that house the equipment, including core infrastructure in the AT&T POP and the County Operations Center. Furthermore, Contractor's existing local staff shall continue to support the video conferencing services as well as all of the other framework components from its County location. This local staff shall also be responsible for continuous development, maintenance, and updates of all items associated with video conferencing, including Service Desk scripts, training documentation, and processes for End-User support—and this staff shall continually provide new and updated material to support operational needs.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's SMEs shall continue to evaluate solutions and introduce them through the weekly network architecture meetings and thereafter through the Enterprise Architecture Forum. These iterative processes allow Contractor's solutions to address known and projected business requirements, convey direction, gain insight regarding other project path implementations, and allow required approvals as well as maintain consensus.

The Contractor team shall use insight gained from the ongoing operation and maintenance of the infrastructure to assess potential transformational, refresh, and upgrade activities. If other SPOFs are identified and remediated, then Contractor's SMEs understand the processes and documentation to effect the change with minimal effort by all parties involved. Contractor's local, dedicated team provides the coordination of resources necessary to plan, design, and implement the video and archiving solution.

When Contractor receives an Install/Move/Add/Remove (IMAR) request, it shall gather information and design a solution to present for the County's approval. Once approved, Contractor shall order, receive, and stage the equipment and other necessary components for installation. Contractor shall coordinate the installation date with the End-User or business unit and dispatch a technician to complete the installation.

The BlueJeans integrated video teleconferencing solution shall include a 100-host license, where designated video conferencing hosts are to be identified by the County. These 100 licenses represent simultaneous conferences, as only one licensee is required per conference. These licenses are dynamic and can be changed in real time to different users via the scheduling portal.

Over the life of the term, the wider adoption of standards-based systems like Skype for Business/O365 along with anticipated industry enhancements may shift the solution for multi-platform video teleconferencing. The Contractor believes that the Microsoft's planned development of multi-platform transcoding via a Skype for Business mediation server positions the County to move towards a Skype based standard for all video teleconferencing services. The Contractor shall work with the County to evaluate such options and make recommendations accordingly.

Integration of desktops into Video Conferencing Services.

Contractor shall provide AT&T Meetings with BlueJeans, a hosted video bridging capability that can integrate services such as Skype for Business and Google chat with traditional standards-based room video systems. This enables fully integrated business-to-business (B2B) video calling and is scalable, device and platform agnostic, and provides a flexible yet standard platform for video teleconferencing.

Additionally, as the County increases its use of video teleconferencing, AT&T NetBond enables videoconferencing traffic to be redirected off of the ISP connections to a private multiprotocol label switching MPLS connection to support additional performance, scalability, and security above and beyond the integrated encryption. The NetBond to BlueJeans cost is not included in the Baseline Resources Units.

BlueJeans users can also benefit using Outlook plug-ins. An End-User can schedule meetings using a personal or dynamic meeting ID, edit default meeting preferences, and add, edit, or cancel meetings. Delegate scheduling provides administrative staff the ability to schedule meetings on behalf any team member. To set up a call, the End-User simply inputs the IP address as listed in the invite.

The BlueJeans platform allows numerous customizations including the ability to set language preferences, meeting passwords, entry tones, and meeting security controls via the web-based End-User interface. Features like high-definition content support, video sharing, and the ability to record meetings, coupled with the integrated encryption, provide secure meetings for County users.

5.10. Video Streaming and Archiving Services

5.10.1. Process and Procedures

Video Streaming and Archiving Services

- Description of solution to meet the requirements

To support the increasing video distribution needs of the County, from both live and on-demand perspectives, Contractor shall use the existing Granicus System as a compliant starting point. This provides continuity and stability as more future-focused technologies are investigated.

- Deployment plan for resources and use of facilities

Contractor shall use the two current core facilities already in use at the AT&T POP as well as the CAC as a primary video content sourcing location. Furthermore, this solution shall use the existing network infrastructure to support an efficient video distribution capability. Contractor's local, dedicated staff shall be active liaisons on behalf of the County, and Contractor shall select external cloud providers so that required service level requirements are continually met.

- Key methodologies and processes in solution including year-to-year continuous improvement

Going forward, Contractor shall achieve consensus on the Video Streaming and Archiving Services Roadmap by vetting or via recommendations in the weekly network architecture meetings—and thereafter via the Enterprise Architecture Forum. Use of these iterative processes allows Contractor's solution to address known and projected business requirements, convey direction, gain insight regarding other project path implementations, and allow required approvals while maintaining consensus. As such, Contractor's SMEs shall continue their active participation within these forums as well as their participation in other meetings to stay abreast of customer needs, report on changes in technology, and propose low-risk solutions to meet County business requirements. Furthermore, the Contractor team shall use insight gained from the ongoing operational and maintenance aspects of the infrastructure to assess potential transformational, refresh, and upgrade opportunities. Contractor's local, dedicated team shall provide the coordination of resources necessary to plan, design, and implement the video and

archiving solution. All work efforts and problem reports shall flow through the existing processes in place for support of the County's network by the AT&T LCM team.

On a continual basis, Contractor shall create, maintain, and update End-User training documentation and tips, as well as associated Service Desk scripts pertaining to the solution, to match the version and features of the product.

- Use of Tools

As new appliances and capabilities are expanded within the existing data network, the Contractor team shall expand the use of CA Spectrum and eHealth to monitor the operational status of the appliances and the bandwidth usage so that the ongoing operational capabilities are met as compared to the service level requirements. High-grade analytics shall provide viewer statistics along with performance information to provide a clear picture of performance and where possible trouble spots within the infrastructure may be occurring so that Contractor can take near-real-time corrective actions.

5.11. Mobility Infrastructure Services

5.11.1. Process and Procedures

Mobility Infrastructure Services

- Description of solution to meet the requirements

AirWatch MDM Infrastructure

All components of Contractor's industry-leading AirWatch Mobile Device Management (MDM)/Enterprise Mobility Management (EMM) solution for the County shall be maintained and supported in a fully geo-redundant configuration. The AT&T MDM solution shall use a cloud-based AirWatch Software as a Service (SaaS) MDM/EMM solution integrated with on-premise AirWatch Cloud Connectors (ACCs) deployed into the AT&T POP and the County Operation Center. These ACCs in turn shall interoperate with the County's Active Directory infrastructure for End-User authentication.

Contractor shall maintain and support its proxy services between County Enterprise Systems and the SaaS MDM/EMM cloud, as well as application gateways services for developed or acquired applications, to internal County resources from mobile devices using Mobility Infrastructure Services.

Due to the nature of the cloud service and the geo-redundant configuration of the on-premise infrastructure, the AT&T MDM solution has no identified single points of failure.

Mobile User and Device Profiles

Contractor shall maintain and support the three profile groups established within AD: The Corporate Single Device, the Corporate Multi Device, and the Bring Your Own Device (BYOD). These profile groups can be expanded as business needs are defined, where the Contractor team simply adds a group profile within AD recognized by the AirWatch Platform. Users are identified through CSRFs and placed into the respective groups.

Contractor shall support County "corporate owned" devices and BYOD in a reliable and secure manner and shall manage them according to specific County-defined policy.

After being enrolled within the designated group, when a mobile device End-User requests access to the County domain, the End-User is certified against the AD; thereafter three profiles (Passcode, Restrictions, and Exchange) are pushed Over the Air (OTA) to the device.

The AirWatch cloud-based solution provides central management and control of all mobile devices and mobile applications from a single unified console. This console also allows Contractor's solution to enforce County-approved device policies for security and data protection across the End-User population of County and BYOD mobile devices. For instance, Contractor's solution provides the County Mobile Application Store for developed or acquired mobile applications and limits the access to the applications to only County-managed MDM devices.

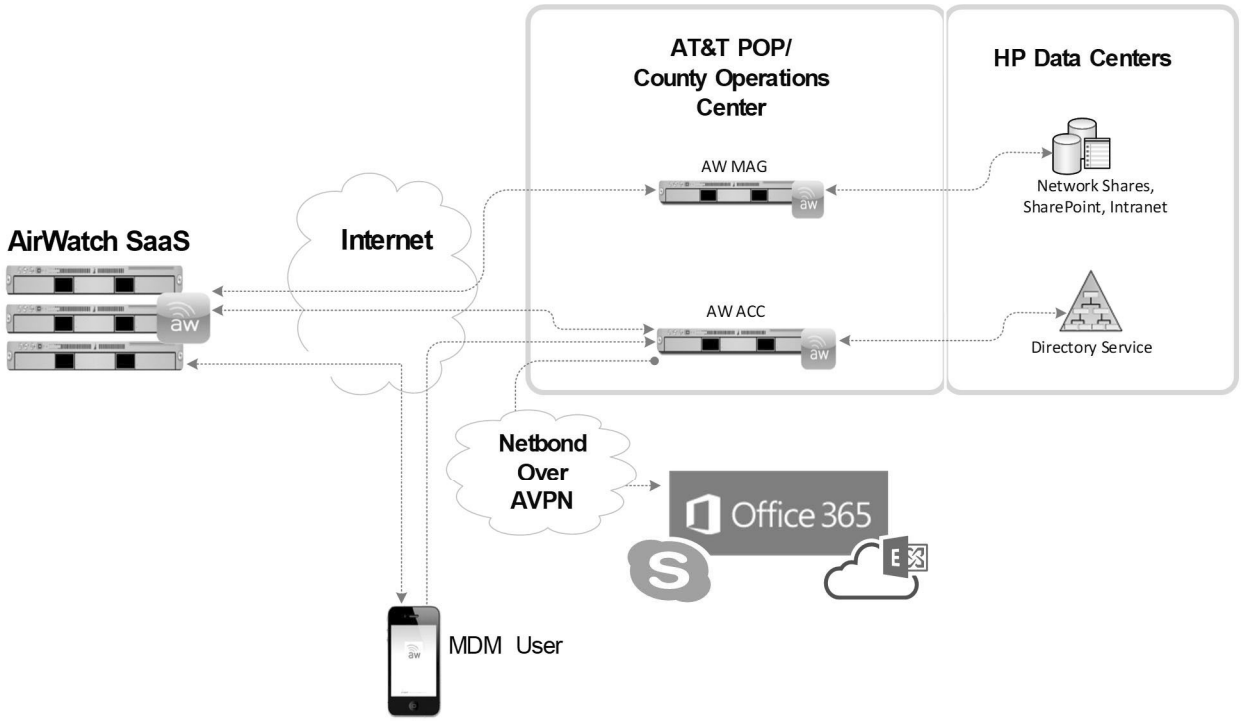
Mobile User and Device Authentication

Contractor's solution shall enable client authentication, encryption, and message signatures to secure corporate resources and connections. AT&T's SaaS MDM/EMM solution shall integrate with third-party Certificate Authorities and Public Key Infrastructure (PKI) providers in cloud and on-premise deployment models. AT&T's SaaS MDM/EMM solution shall distribute Symantec Managed PKI certificates to corporate managed mobile devices for mobile VPN authentication and integration. Future roadmap capabilities shall include the potential for PKI integration delivered via AirWatch MDM for access to County staff Wi-Fi as well as seamless integration with the PulseSecure Mobile VPN application.

AirWatch Integration with O365

As a Transformation initiative, Contractor plans to migrate Exchange to the O365 cloud. Although the current integration from the AirWatch SaaS MDM/EMM solution to the County infrastructure for email services is premises based with integration to services in the data center, the solution can be configured to integrate to Office 365 with Outlook via an AVPN with AT&T NetBond service. Contractor shall ensure that AT&T and its Mobility Solution Services team engages in this migration effort, updating design documentation and making certain that End-User connectivity to email is enabled as the services are migrated to the cloud. The figure below presents the reconfiguration of the AirWatch premise-based infrastructure.

AirWatch



The AirWatch premise-based infrastructure is reconfigured as part of the migration of Exchange to the O365 cloud, enabling email access to MDM-compliant devices.

- Deployment plan for resources and use of facilities

Contractor shall use the existing, knowledgeable AT&T Lifecycle Management team located at 7337 Trade Street in San Diego, California, along with AT&T's leveraged Mobility Support Services (MSS)/Application Service Desk (ASD) organization to continue to support the premise- and cloud-based AirWatch infrastructure.

The ASD is composed of experienced, industry-certified professionals who provide hands-on, comprehensive, and proactive managed services and technical support. In addition to the ASD, the local team also retains a highly skilled mobility consultant, who has intimate knowledge of the County AirWatch tenant and continually provides support and guidance on operational and strategic initiatives.

Facilities involved shall include an AT&T POP in the County as well as the County's Operations Center.

- Key methodologies and processes in solution including year-to-year continuous improvement

The SaaS MDM/EDM solution shall include the following key processes:

- User acquires phone and needs access to County resources.
- A request is made for access via an Install/Move/Add/Remove (IMAR) through Contractor's Service Desk.
- User goes to the public apps store and downloads the MDM/EDM application.
- The Contractor team processes the request and gives permissions for allowed systems for the End-User.
- User enrolls into the MDM/EDM system via an End-User guide provided by the Contractor team.
- Any issues are directed to the Service Desk.

Contractor's MDM service shall require a monthly RU and a one-time upfront fee per End-User at the time a new End-User subscribes to the service. The one-time fee includes licensing costs.

Contractor shall participate as dedicated resources supporting upgrades, refresh, and transformational activities related to mobile infrastructure services. Contractor's SMEs shall continue to use Pilot Charter and Solution Design Documents as well as other documents and briefings to convey Contractor's recommendations for County review.

To stay up to date Contractor shall conduct quarterly collaborative reviews of mobile device standards, including hardware and operating systems, for incorporation into the Standards and Procedures Manual for Standard Mobile Devices. Furthermore, the Contractor team shall use the approved Standards and Procedures Manual when developing standards for all mobility infrastructure services that are submitted for approval on a semi-annual basis. Contractor shall conduct quarterly updates to the timeline/roadmap of all mobility infrastructure services hardware and software version life cycles so that responsive time frames and completion dates stay within supported versions of hardware and software.

5.12. Wireless Network Access Services

5.12.1. Process and Procedures

Wireless Network Access Services

- Description of solution to meet the requirements

Contractor shall manage a comprehensive wireless architecture that provides services to County staff and constituents. Contractor's solution shall provide wireless services for managed computing assets on the secured County internal wireless LAN as well constituent and guest assets on a public Wi-Fi infrastructure. This wireless infrastructure shall consist of centralized geo-redundant controllers, wireless access points, various software-based management tools, and security components.

Wireless Infrastructure

Contractor's two centralized wireless LAN controllers shall provide redundancy and resiliency through high-availability, geo-redundant configurations that leverage diverse facilities (AT&T POP and the County Operations Center). These controllers shall maintain Contractor's centralized configuration, act as a single point of interface for changes and monitoring, and support a variety of access point models.

Contractor shall maintain and support the 380+ wireless access points throughout the County to provide wireless connectivity for the End-User. The Contractor team has standardized on the Cisco 3702 for wireless access within County facilities, whereas for outdoor areas Contractor has standardized on the Aruba 274/5. Both products shall continue to provide support for legacy connectivity, such as 802.11 A/B/G/N as well as the new 802.11AC standard. This wide range of support shall allow all Wi-Fi capable devices, regardless of age, to obtain connectivity through the County wireless infrastructure.

The Contractor team shall continue to use several software suites to provide visibility deep into the operations, planning, and support of the County's wireless infrastructure. These tools include management tools, such as Airwave and Cisco Prime Infrastructure, as well as survey tools such as Fluke's Air Magnet.

Wireless Network Authentication

For County secure wireless, the Contractor team has worked with desktop support services at Contractor to deliver a certificate to all managed devices required to authenticate via EAP–TLS and connect to the County's secure wireless infrastructure. Contractor shall continue to provide public access in various County locations, such as the libraries, and shall be segregated logically and physically. Additionally, Contractor shall use its next-generation firewall infrastructure, including content filtering functionality, to provide the most robust security available for the wireless infrastructure.

This architecture, coupled with an NAC and PKI initiative, shall serve to further increase the security posture of the wireless infrastructure. By leveraging these capabilities, additional controls shall be enabled, providing seamless access to wireless staff users, while redirecting untrusted/unmanaged assets to a guest access portal via a splash screen, where they can then obtain public network connectivity. This architecture shall support a closed loop system whereby only known, managed assets shall be able to connect to the secure wireless infrastructure, with little to no additional interaction from the users to facilitate this additional security.

- Deployment plan for resources and use of facilities

The local, dedicated LCM team shall provide all design, implementation, support, monitoring, and reporting of all wireless network services.

Core infrastructure for the wireless network shall be housed at the AT&T POP and County Operations Center, which shall provide secure, restricted access. Wireless access points shall be installed upon request in County facilities according to industry and County-approved standards.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's engineering team shall work with County's CTO to evaluate the new and emerging wireless standards and their enterprise readiness. Contractor's recommendations shall take into account not just the performance of new wireless access points, but also the device standards being used by County End-Users, so that the timing of the investment enables the largest population of users to take advantage of the advancements.

When a recommendation is approved, the Contractor team shall move forward with project management processes, including planning, scheduling, and implementation of the refresh of existing equipment as well as other infrastructure changes.

For equipment issues, the Service Desk and engineering team shall work to identify and remediate the problem.

5.13. Third-Party Network Access Services

5.13.1. Process and Procedures

Third-Party Network Access Services

- Description of solution to meet the requirements

Contractor shall use the existing solution sets in response to expanding business requirements to support third-party access to and from and across the County data network. Overall, three different types of support shall be provided:

- Dedicated leased line connectivity
- IPSec connectivity
- Virtual circuit support.

Each of these solution sets play a vital and specific role in supporting various County business areas. The solution used for access is based on the location of the third-party devices, the type of communication required (system-to-system versus End-User interactive session), the tolerance of bandwidth variations, and latency impacts.

Using the Third-Party Access Request (TPAR) process, Contractor shall determine the required connection types and any details necessary to provision the access. This process shall identify the specific third-party devices, the County resources being accessed, and whether the communications occurs over the internal domain and/or open Internet. This information shall be used to create strict firewall policies so that only the approved devices and resources are accessed for use by the third parties.

Contractor shall provide unified threat management technologies to include intrusion detection and prevention, virus and malware filtering, firewall security policies, monitoring, and reporting for these third-party connections. All data traverses the County's next-generation firewalls to enable full visibility into all data flows up to and including the application level. All data classified as sensitive and above shall be encapsulated in a secure tunnel as it egresses the County network, regardless of its point of origin within the managed network.

Third-party interfaces shall also be included in the LCM team's capacity and performance monitoring services. This approach facilitates reporting on usage and possible impacts to performance resulting from spikes or increases in usage. All access to County resources from third-party users shall be managed via Active Directory and End-User account levels of access.

Contractor shall support and maintain third-party network access models and use cases are as follows:

- **Dedicated Leased Line Connections.** Third-party leased line connections are used to connect the County network to a third-party network via a dedicated transport (i.e., T1, Opt-E-MAN, Opt-E-WAN, and so forth) that is provided by the Third Party. This solution is chosen when throughput must be guaranteed because the dedicated circuit is not impacted by fluctuation in utilization of public Internet circuits. A dedicated circuit also provides the highest level of security in terms of confidentiality, integrity, and availability.

IPSec Connections. IPSec provides a secure tunneled connection over the Internet. It encrypts sensitive data and allows machine-to-machine connectivity for scenarios where automated jobs run connections into or out of the County network without End-User interaction. It also provides access into the County network for authorized systems or users without the need to install specialized VPN software on the remote hosts. Virtual Circuits. The virtual circuit design allows placement of non-County devices onto the County network in a way that keeps them isolated from County assets. All communication to and from County resources is still regulated by firewall policies. Presently, this solution supports users within 55 virtual circuits inside the County domain without exposing the network to risk.

As part of the dedicated team's ongoing efforts to provide continuous improvements to, and enhancements of, all frameworks for which they are responsible, Contractor shall continually look for alternative solutions that benefit the County's voice and data network.

- Deployment plan for resources and use of facilities

The local, dedicated LCM team shall provide all design, implementation, support, monitoring, and reporting of each of the third-party access solutions. All managed hardware in association with such shall be housed at the AT&T POP, which shall provide secure, restricted access as well as fully redundant power. Contractor technical personnel and hardware associated with the County program shall be dedicated to the program.

- Key methodologies and processes in solution including year-to-year continuous improvement

The local, dedicated LCM team shall be embedded in the full life cycle of every third-party access connection—from the initial gathering of requirements, through the design and implementation phases, to managing and monitoring, and even decommissioning when requested. Through customer meetings and security reviews, the team shall evaluate the proper access method so that it is sized appropriately and verifies that all necessary security measures are in place.

Third-party network access options shall be continually evaluated based on County business requirements in addition to current and emerging technologies.

5.14. External DNS Management Services

5.14.1. Process and Procedures

External DNS Management Services

- Description of solution to meet the requirements

The external Domain Name Service (DNS) cloud-based platform, which uses Akamai cloud-based FastDNS service, shall be the basis for Contractor's DNS management service.

The Akamai FastDNS solution shall provide an authoritative DNS service that offloads DNS resolution from the County's infrastructure to the cloud to provide 24x7 DNS availability. It shall be optimized for performance through global distribution and presence and reliability—protecting against DDoS attacks while allowing for additional security through the Domain Name System Security Extensions (DNSSEC) to protect against DNS forgery and manipulation. Contractor shall perform DNS management as required for all of the external-facing County DNS records (A, MX, CName, and so forth) via a web browser that accesses the Luna Control Center. The Luna Control Center is the web-based portal that provides customers with access to—and control of—their Akamai services as well as reporting and monitoring functionality.

Through coordination with the County, Contractor shall fulfill requests to add, move, or change the information published for specific domain name records within the Akamai solution, as well as remove obsolete records to preclude any instances of orphaned or bad records. Although the existing DNS implementations allow a logical separation between the internal and external DNS, Contractor SMEs shall integrate specific elements, as required by the County, subject to essential network security provisions.

Through the use of the Akamai FastDNS service, single points of failure shall be inherently mitigated by the design of the solution. The Contractor team shall regularly evaluate this position throughout the life of the term so that the most cost-effective and technically sound solution is provided to the County.

Also included within Contractor's support activities include the maintenance of a comprehensive roadmap of all external DNS management services required in conjunction with Akamai and the County. This roadmap allows

Contractor to adequately inform its customer and plan time frames and completion dates for any software changes needed to improve service capabilities. As an integral part of these coordinated services, Contractor's SMEs shall facilitate ongoing product and solution strategy planning with Akamai, so Contractor's collaborative roadmaps remain up to date with new and emerging functionality and service changes.

- Deployment plan for resources and use of facilities

The LCM team shall continue to use the Akamai cloud-based resources as an integral part of Contractor's solution. Contractor shall operate and manage the service from its Rancho Bernardo site, where its support personnel shall manage all aspects of the data network to include external DNS support services.

The Contractor team shall leverage some remote resources, such as those from Akamai, and those support activities fall directly within the purview of one or more of Contractor's local SMEs for adherence to the County's requirements.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor staff shall participate in supporting continuous architecture and management activities for the internal and external DNS.

From an external DNS perspective, Contractor shall work to establish new records or remove existing records based on the associated activation or deactivation of new services that tie to an external DNS service.

5.15. IP Address Management Services

5.15.1. Process and Procedures

IP Address Management Services

- Description of solution to meet the requirements

Contractor shall use the BlueCat Proteus Enterprise IPAM v4.0.5-20 Platform as the single user interface providing integrated management of all static and dynamic addresses. Operating within the AT&T POP, this virtualized solution configures and documents changes to the IP address landscape and collects real-time information related to the current IP allocation within the network. A standby platform shall be located within the COC to mitigate against a single point of failure. In turn, the Proteus management platform shall communicate with the BlueCat Adonis appliances that are geo-redundantly located within the COC and the AT&T POP. These appliances shall serve as the policy recipients from Proteus and thereafter monitor, manage, and configure all Dynamic Host Configuration Protocol (DHCP) services within the County's internal network. The Adonis System also relays IP address utilization information back to Proteus for data aggregation, analysis, and presentation, as required.

Due to the inherent capabilities of Proteus, Contractor uses this management platform for a structured approach to IP subnet assignment, to control static IP address use, and to monitor dynamic address allocation. Additionally, Contractor's solution allows IP address data to be collected, analyzed, and organized into the monthly DHCP pool and IP subnet utilization and trending reports for the County. In addition to providing automated discovery of IP addresses, this tool allows Contractor engineers to detect and manage conflicting or duplicate address use quickly so that normal network operations are maintained.

This solution set shall manage and control the network domain using an IPv4 address schema, but it is fully capable of supporting IPv6 when address transformation is required. Contractor shall support the equivalent of 916 Class C address blocks for internal, external, third-party, and public network access through Contractor's data networking services using efficient, fault-tolerant routing so that Contractor's services meet the County-specified service level requirements. The Contractor solution shall be fully and continuously synchronized with the internal

DNS services using the DHCP servers, which provide DHCP clients with the fully qualified domain name and IP addresses for DNS services. Additionally, Proteus provides Active Directory information regarding IP address assignments for System Center Configuration Management (SCCM). Via SCCM, efficient network utilization is maintained by designating Distribution Points (DP) within the domain to service adjacent blocks of IP addresses for system upgrades or patches. In this manner, blocks of IP addresses are automatically directed to the nearest DP, network traffic is localized to the extent possible, and latency is reduced.

- Deployment plan for resources and use of facilities

The LCM solution shall continue to use the County Operations Center and AT&T POP for the reliability and resiliency IPAM services to help the continuity of network in accordance with service level requirements.

Additionally, Contractor shall continue to use the AT&T Trade Street facility to house its local support personnel and manage all aspects of the data network, including IPAM. LCM shall continue utilization of its local team, which has allowed close alignment with the needs of the County.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's SMEs shall continue to use the weekly network architecture meetings and the Enterprise Architecture Forum to notify Contractor's user community of identified SPOFs or other enhancements and then implement Contractor's approved solutions. Additionally, Contractor staff shall also continue maintaining a comprehensive roadmap of all IPAM services hardware and software life cycles. This roadmap allows Contractor to adequately inform and plan time frames and completion dates to stay within supported versions of hardware and software.

From an IP addressing perspective, Contractor's support methodology focuses on four scenarios that require Contractor staff's intervention to provide the County with timely service:

- **New Site Activation.** Contractor project management personnel are involved in the creation of any new site, and they include IPAM as part of the actively managed project plan. As needed, new block(s) of addresses are allocated for the site, and the recommended DP is also determined.
- **Site Decommissioning.** Contractor project managers are involved in any site decommission, and IPAM is part of the project plan as Contractor recovers existing block(s) of addresses for reuse.
- **Significant site growth projections.** Depending on the scale of growth projected, Contractor project managers shall be involved and include IPAM as a part of the project plan. In contrast, Contractor shall use the IMAR process for smaller projects.
- **Static addresses are required.** To accommodate these requirements, Contractor leverages the existing IMAR process to gain a static IP address, which is issued from a predetermined range for each site defined within the IPAM tool.

5.16. New Site Installation Services

5.16.1. Process and Procedures

New Site Installation Services

- Solution Summary & Rationale – Description of solution to meet the requirements and the rationale for choosing this solution rather than alternative approaches

One of the key strategic initiatives for the County has been real estate planning and facility construction for the long term. This has resulted in the design and construction of new, state-of-the-art County sites. Since the beginning of the existing Agreement in 2006, the County has built 87 new locations throughout the region. The majority of these have been Leadership in Energy and Environment (LEED) certified; more than 30 have been

awarded the highest level of LEED achievement. AT&T has partnered with the County and Contractor to help plan, engineer, and build IT infrastructure in all of these locations through the new site installation services component of the Agreement.

The current structure of new site installation services categorizes new sites into tiers based on the number of network access, voice, or VoIP jacks resource units to be installed at each location. This has provided the County with the advantage of predictable telecom infrastructure costs when forecasting the overall financials for facility construction. It has had the disadvantage of restricting the County's flexibility in assigning structured cabling work to vendors other than the IT contractor when circumstances warrant.

To meet the County's requirement for the flexibility to engage its own cabling vendor, the Contractor shall provide a solution that includes base services and optional services within the prescribed End-User based tiers that define the site types. This new RU structure shall consist of 5 RU's by site type, with base and optional services within each.

Base services (the fixed component), shall include activities such as pre-field work and requirements gathering, network design, circuit design/provisioning, installation of network hardware and project management that are required regardless of the cabling vendor used.

The optional services (the variable component), shall include all cabling vendor activities as well as contractor project management oversight. These optional components are broken into two work categories to allow the County to select either all or a subset of the cabling work necessary at the new site. The first component within the optional services shall be identified as "Riser Cabling". This component shall include the placement of pathway and rack infrastructure as well as the placement and testing of fiber/copper based cabling runs between MPOE and MDF, and between MDF and IDF rooms/floors. Trenching is not included in this service and shall be the obligation of the County or their contractor to provide. The second optional component of the service shall be identified as "Horizontal Cabling". Included in this service shall be the placement and testing of all wall jacks, patch panels and plenum cabling between the IDF and the workstations or designated end points.

- Should the County elect to move one or both of these optional service components to a vendor of their choice, the resource unit shall be decomposed to provide adequate cost recovery for the remaining New Site services. For example, in a situation where the County were to elect to do their own Horizontal and Riser cabling at a New Site, the cost of these activities shall be deducted from the overall Resource Unit price and Contractor shall execute the base (fixed component) of New Site activities required to establish connection to the County network. Additional clarity on these fixed and optional services can be found in Schedule 16.1-2. Resource and Facility Approach Summary –deployment plan for resources and use of facilities

Resources that Contractor shall utilize for this effort shall include facility project managers and network design and field engineers. They work out of the Trade Street AT&T facility. This team conducts the design and planning function as well as the staging of all equipment used in the construction of the new site. They also interface directly with County personnel at the proposed new site locations.

The structure of the new site installation service requires involvement from the County's General Services organization in those cases where the decision is made to have the structured cabling and other components installed by the County's selected vendor. All new sites do require the County to provide certain components—such as power and air conditioning—that are determined on a project-by-project basis.

- Methodology & Key Processes – Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's project management team uses standard Project Management Institute (PMI)-based Project Management Methodologies and has successfully used them to bring 87 new sites online for the County. These processes have been tailored to identify all site-specific activities needed to activate IT services at a new location. Contractor's project managers (PMs) actively walk the proposed site with County stakeholders and engineering

resources initially and at various points as the project requires. After requirements and the design are fully understood, the project plan, schedule, and task list are developed by project managers —laying out the details of the project as well as capturing internal and external dependencies. Identified as early as possible, dependencies under control of the County or County contractor are managed with a clear understanding of the associated impacts so that they do not become roadblocks to the project's successful completion. At project close, key learnings are identified and documented by the PM for sharing, learning, and continual improvement by the team.

Although external dependencies are not within Contractor's control, Contractor's team routinely focuses on these actions early in each project to mitigate the risk to completion of Contractor's deliverables. An example of this was the Health and Human Services Agency's move into their new Escondido facility. At a critical point in the project, difficulties in obtaining permits from the City of Escondido were identified. The AT&T team noted that these permits were a key dependency in the installation of telecommunications services to the site. To keep the project on schedule AT&T was able to leverage contacts within the City to obtain the necessary paperwork. Working in parallel, the AT&T PM also escalated internally so that AT&T leveraged resources were able to accommodate last-minute schedule changes and so that the County build and move-in schedule was maintained. For this effort, the product team was given the IT Customer Service Award by the County Technology Office.

Another aspect of Contractor's processes include how project RU billing estimates and final billing are determined as follows:

- Project Start: The network design and pricing estimates documented in the initial Scope of Work are based on the County-provided estimate of End-User occupants for the site.
- Project Completion: Upon project completion Contractor shall update the final End-User count in the SOW and present that to the County for project completion sign-off and billing initiation.
- Post Project 6 Months: Contractor shall perform a final true-up assessment 6 months from the County SOW sign-off. If the site End-User count has exceeded the tier limits for the new site RU originally bills, then Contractor shall initiate a billing adjustment.

5.17. Interactive Voice Services

Solution to meet the requirements

Interactive Voice Services are defined as an IVS system which builds on the basic services provided in Voice Services, includes one or more of the following capabilities:

- Call Management Reporting
- Call Recording
- Speech Recognition Application
- County data integration (data dip)
- Wallboard (Physical/Virtual)
- Computer-Telephony Interface (screen pop)
- Work Force Optimization
- Outbound/Predictive Dialer
- Agent Softphone
- Speech Enabled Customer Surveys

Three categories of IVS shall be created. Each shall provide for technical design, infrastructure, licensing, hardware/software maintenance and support and initial End-User training. The categories shall contain the following components:

- **Small IVS** – *shall include Automated Call Distribution (ACD) and/or Auto Attendant (AA) & Call Management System*
    - Automated Call Distribution (ACD)
        - Distributes calls to customer facing agents.
        - Supports the total contact center agent population at all County network locations.
        - Includes trunking infrastructure to support the routing of calls.
        - Can be used as a stand-alone component or in conjunction with an Auto Attendant.
    - Auto Attendant (AA)
        - Supports Touch-tone input to route calls across the County voice network.
        - Includes the professional recordings both English and Spanish menus and prompts.
        - Includes trunking infrastructure to support the routing of calls
        - Can be used as a stand-alone component or in conjunction with an ACD.
    - Call Management System (CMS)
        - Provides reports of contact center agent metrics such as abandoned calls, average talk time etc.
        - Used in conjunction with an ACD to manage contact center performance.
        - CMS is the additive feature which initiates the Small IVS RU category vs. the right-to-use ACD and/or AA capability associated with the Voice RU's.
- **Medium IVS** – *shall include all components from the Small IVS RU category and shall also include:*
    - Automated Call Recording (ACR)
        - Provides for up to 90 days of customer agent recorded calls for both compliance and quality purposes.
    - Virtual Wallboards
        - Provides ACD statistics and messages displayed on contact center agent and supervisor desktops.
    - Agent Softphone
        - Provides IP softphone via a desktop client that provides County contact center agents full functionality whether they are working at their primary County facility, a remote/alternate County site or at home.
- **Large IVS** – *shall include all components from the Small and Medium IVS RU categories and shall also include:*
    - Interactive Voice Response (IVR)

        - Platform for custom applications such as outbound predictive dialing, multi-language support, voice recognition and County data integration.
- Computer-Telephony Interface
    - Customizable interface between IVR and Desktop components to provide database information to a contact center agent when receiving a call from a constituent.
- Short Message Service (SMS)
    - Provides up to 200,000 outbound text messages to specifically defined County client lists.
    - Requires the manual upload of a County file of customer contact information to the hosted platform.
- Work Force Management
    - Centralized platform of work force scheduling, forecasting and adherence of contact center agents.
    - Provides long term strategic forecasting of agent resource requirements based on historical data
    - Integrated with CMS for agent call statistics
- Physical Wallboards
    - Provides ACD statistics and messages displayed on physical monitors in County call centers
    - Includes the controller infrastructure and supporting software to County provided monitors

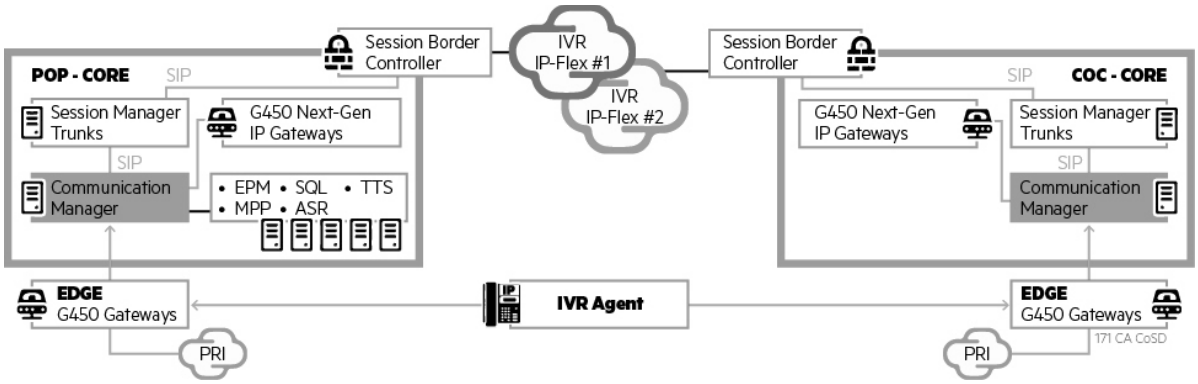
Integrated Voice Response

At the core of the functionality provided under IVS Services is the Integrated Voice Response platform. The IVR infrastructure is built around the Avaya Experience Portal, located at the AT&T POP. This platform provides IVR, self-service, touch-tone as well as speech recognition services for key contact center solutions across the County such as the Department of Animal Services, the Land Use Environmental Group, and various departments within the Health Human Services Agency. This scalable, high-availability infrastructure provides many options for programming and agent integration—allowing customization for any type of constituent-facing contact center service.

The platform shall undergo near-term changes relative to external telephony connectivity as AT&T initiates plans to implement dedicated, fault-tolerant inbound and outbound IP Flex SIP trunks for the County's IVR infrastructure at the AT&T POP and County Operation Center. This IVR solution shall not impact enterprise voice traffic, allowing business units to conduct high-volume contact center activities, such as outbound dialing campaigns. This new capability shall provide standardized resource unit base from which business units can leverage the platform. This upgrade shall be provided as a Transformation initiative and shall be included in Voice Services as a means to meet relevant scope requirements. Further details of AT&T planned transformation of IVR services is defined in Sections above, Transformation Services, subsection "Initiatives: Voice Services Transformation."

Over the term of the Agreement, Contractor shall ensure that AT&T develops a transformative roadmap, where proposals shall be developed to increase the redundancy and resiliency of IVR applications, as well as to provide additional feature benefits, such as automated agent call-back and web chat. The figure below presents Avaya's Experience Portal connectivity.

Avaya's Experience Portal Connectivity



Avaya's Experience Portal leverages geo-redundant communication managers and redundant SIP trunking for inbound and outbound contact center traffic.

- Resource and Facility

The County Operations Center and AT&T POP shall be the primary facility locations for IVS services. Over the life of the term, Contractor shall implement geo redundant systems for key functionality as well as make proposals to introduce new features and functionality. Refresh shall be performed for the systems on a five-year basis.

- Methodology & Key Processes – Key methodologies and processes for year-to-year continuous improvement

As mentioned above, the process for changes and enhancements needs reflect the County's need for flexibility. For minor/basic changes to existing voice applications, County may make these types of changes at no additional cost.

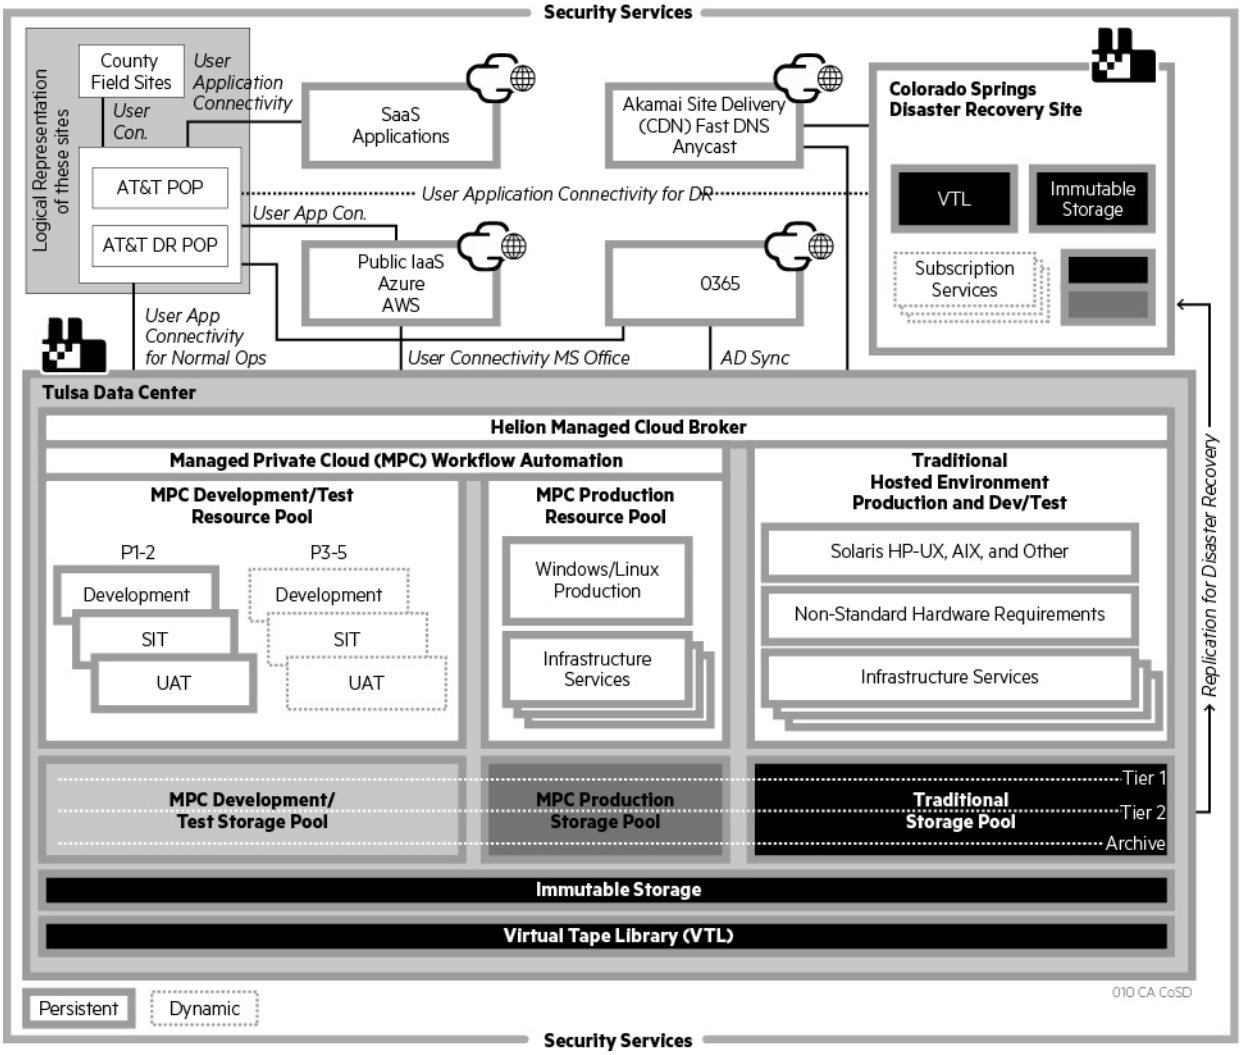
- Additions, changes or deletions to existing call flow/menu prompts
- Additions, changes or deletions to existing routing or transfer points
- Implementation of licenses associated with provided features
- Professional voice recording of changes on basic Auto Attendant and ACD systems

6. DATA CENTER SERVICES

6.1.1. Process and Procedures

Contractor shall provide a data center services framework solution, shown in the figure below, to fully meet the County's needs and facilitate consolidation of applications and infrastructure services into a single Tier 3 production data center in Tulsa, OK. This facility shall be ISO 9001:2008 certified and meet stringent public sector compliance and security requirements.

Contractor data center Services Framework Solution



Data Center location and solution as it relates to disaster recovery requirements.

The Contractor's Continuity Services center in Colorado Springs, Colorado, shall be the designated disaster recovery (DR) site for the County. Contractor's solution shall incorporate 100% redundancy of infrastructure, provided on a subscription basis, for applications that currently require a DR solution. Production data shall be replicated from Tulsa to the DR site using a dedicated network connection. Contractor's Colorado Springs center shall be a purpose-built, SSAE16-audited data center. The Tier III design shall provide a concurrently

maintainable and continually operating facility with infrastructure built with redundant capacity components and multiple independent distribution paths serving the computer equipment.

Contractor's solution shall meet required recovery time objectives (RTOs) of 48 and 72 hours while also eliminating the current dual data center architecture. The Colorado Springs DR site shall have sufficient capacity to support a dedicated environment for an active/active architecture, should the County decide to reinstate it. Contractor shall include in the solution the core network components (Akamai and Global Traffic Management capabilities) to support an active/active architecture.

The DR location and solution shall provide recovery of production midrange and private cloud environments as well as technical assistance for recovery of business processes. In case of a disaster, the production environment shall recover gracefully in Contractor's Colorado Springs data center.

Note that traditional VMWare and MPC environments are handled identically for DR purposes; the Managed Private Cloud is a collection of virtual servers, some of which have DR recovery time objectives, some which do not. The DR environments for the virtuals within the MPC shall be virtual servers that spin up with a copy of the MPC virtuals, for those servers that have designated RTOs in Apps Manager. The Colorado Springs DR site shall have the following features:

- It exceeds Tier 3 data center specifications and:
  - Is on two different power girds
  - Has multiple points of entry for telecom and Internet access
  - Has multiple on-premise power generators that are physically separated—in different rooms with fireproof walls—to make sure that, if there is a fire, Contractor does not lose all of Contractor's generators.
- Colorado Springs provides subscription offerings and Continuity professionals who are trained and certified in Business Continuity disciplines. They shall advance the County's Disaster Recovery strategy and testing methodologies to provide full assurance of application recovery that meets the County's requirements.

Contractor's Rancho Bernardo environment shall use replicated backup sets at the DR site in Colorado Springs to meet remote backup set storage requirements.

Identify and eliminate single point failures with infrastructure and portfolio applications in Data Center Services.

Contractor shall assess redundancy as part of Contractor's design process to avoid single points of failure in the infrastructure and for high-availability (HA) P-1 and P-2 portfolio applications, taking into consideration the criticality of the application or infrastructure element. Contractor shall build quality into the design process by conducting peer reviews so that changes or additions do not create single points of failure.

Contractor shall provide redundant switches in the data center and redundant circuits to the data center. The physical servers shall have redundant connections to the network and to the storage fabric. Physical servers shall be configured with redundant components such as redundant power supplies, which shall be plugged into separate power leads in server racks. Storage arrays shall have redundant components as well, such as redundant disks and power supplies, and shall have the ability to automatically notify Contractor's support teams when an alert is detected on the array. At the application layer, for business-critical applications, Contractor shall incorporate redundant web servers and application servers that are load balanced on the F5s. Databases for business-critical applications shall have replication and/or clustering enabled.

For those applications hosted in the cloud, the Helion Managed Private Cloud (MPC) shall incorporate the tools necessary to continuously monitor server availability across the environment to maintain hardware, upgrade firmware, investigate outages, and perform corrective actions to restore hardware when necessary. Both the MPC and traditional VMware environments shall include spare physical servers that can take over the virtual server load in the event of loss of a physical server in the virtual farm.

The MPC hybrid cloud eliminates single points of failure and meets the service level (SL ID 51) for application availability.

For applications that are unable to meet Service Level 51 without additional redundancy (in both the MPC and traditional environments), Contractor shall add the necessary redundant components upon approval by the County.

The Data Center Services solution for the County shall incorporate the following:

- **Facility Redundancy**: All key components shall be concurrently maintainable, as defined by the Uptime Institute for Tier III facilities, including N+1 data links, power, uninterruptible power supplies (UPS), and cooling as well as redundant network connectivity, power supply, and electrical.
- **IT Architecture Redundancy:** The MPC architecture shall be able to host enterprise-grade workloads that demand high levels of system availability and performance in x86 private clouds. Contractor shall maintain a "system-level" service level objective (SLO) up to 99.95% availability for the entire Infrastructure as a Service (IaaS) stack. This shall include maintaining the availability of the compute; storage; network; security; backup hardware and software, up to and including the operating system (OS); the Cloud Service Automation (CSA) software; and Contractor facilities.

To eliminate server failures, the majority of County traditional hosted applications shall run on VMware virtual machines (VMs). VMware HA shall automatically move and restart VMs on other VMware host servers in the County cluster in case of failure or planned maintenance.

Applications that run in a Solaris operating environment shall use server clustering technology to provide redundancy when needed. Oracle servers requiring high availability shall be deployed in server clusters. If the primary server node fails, services shall automatically fail over to the redundant node. Failover shall also be able to be invoked manually to support a planned outage. More specifically, Contractor shall provide redundancy to the Solaris environment in the following manner:

- Disk
    - OS disk (internal disk): primary/mirror/altboot on three separated disks
    - Application files (external disk array): hardware redundancy
- HBA: At least two host bus adapters (HBAs) per server using either MPXIO or Veritas DMP for multi-pathing
- Networking: At least two physical interfaces for production IP using IP network multi-pathing (IPMP) or link aggregation.
- Server hardware: at least 2 power supplies/ two CPU cores

Private cloud and traditional hosted storage shall use HPE 3PAR enterprise storage designed for cloud environments. The storage shall host OS images, virtual snapshots, and application data. All OS images for virtual machines shall boot from the storage area network (SAN). This architecture shall enable the server image to be disassociated from the physical hardware, allowing the server image to move from one physical server to another as needed for greater flexibility, better resource utilization, and built-in failover for improved availability.

- **Application High Availability**: Contractor shall use the F5 BIG-IP Local Traffic Managers (LTMs) to provide the County application HA by load balancing applications across multiple VMs.

  Contractor shall maintain and support, database clustering tools such as Oracle RAC (e.g., for Oracle IDAM) and SQL Always-On (e.g., for SharePoint 2013) where in use or planned to be in use. The cost of such licenses for database clustering is not included in base services.

- **Disaster Recovery**: To cover higher requirements for redundancy to handle RTO/RPO requirements on mission-critical applications that include P1 Apps – 48 hours with <= 28 hours of data loss and P2 Apps – 72

hours with <= 28 hours of data loss, and services during a declared disaster event, Contractor shall integrate Contractor's Helion Continuity Services delivered through the Colorado Springs DR site.

- **Server Management and Monitoring**: Contractor shall install, manage, and monitor the OS instance and the underlying virtual and physical server. Contractor shall monitor server availability, maintain hardware, upgrade firmware, investigate outages, and perform corrective action to restore hardware when necessary. Contractor shall also maintain the health of infrastructure assets included in the solution, including server, storage, backup, network, and other devices. Contractor shall use HPE Operations Manager (HPOM) and SiteScope to detect problems and send selected alerts to a centralized management server for specific business-critical applications for County business groups. Thresholds shall be set on events to indicate potential problems, so that support teams can respond to them in time to prevent outage incidents.
- **Special Scenarios: Multi-Facility Presence (active/active facility-level requirements).** In the single data center model, the redundancy components described in the "IT Architecture Redundancy" bullet above shall be applied to applications to provide high availability. For example, the Netmotion environment consists of a single application server and a single database server in each data center. Following the consolidation to Tulsa, this configuration shall be replaced with two load-balanced application servers and two clustered database servers. This provides automated failover within the Tulsa site – a more robust configuration than the manual failover configuration in place today.

If the County wishes to return to a multiple-primary data center model for specific applications, Contractor can locate specific servers at other sites. The location and cost of this approach shall depend on the volume and design required.

Design and support an all virtual infrastructure in the data center.

Contractor shall provide virtualization on a standardized platform to further reduce the number of servers needed.

Approach to Design and Support an All-Virtual Infrastructure: The MPC implementation for the County shall serve as the platform to support an all-virtual environment, providing the bridge from a hybrid environment to an all-virtual environment when feasible. Contractor shall initially retain existing applications in the traditional hosted environment until scheduled for refresh or application upgrade. At that time, Contractor shall collaborate with the County, performing a cost/benefit analysis to determine feasibility to migrate additional applications to the MPC environment. In this analysis, Contractor shall take into consideration items such as level of County hardware investment, timeframe for application retirement, if any, and the level of effort for legacy applications to be re-architected to run in the MPC, if applicable.

MPC policy and architecture permits creating clusters similar to the production environment to mitigate potential license cost increases. Contractor as part of the solution design shall incorporate the license considerations to manage costs with the expectation of no change in license costs increase based on the virtual solutions.

As part of the Data Center Consolidation transition design process, Contractor shall make all reasonable efforts to optimize County software licensing costs. County software has a variety of licensing models such as site/enterprise, concurrent user, named user, module, managed budget, server, CPU, and core. Licenses based on server, CPU, and core present an opportunity for consolidation and license cost savings.

Methodologies to reduce license obligations for server/CPU/core based licenses shall include switching licensing models between host-based and guest-based metrics (when offered by vendor), eliminating redundant licensed passive environments, restricting guest resources, and reduction of capacity dedicated to headroom at each site versus single site's shared environment. Contractor shall pursue these methodologies during the design phase of the Data Center Consolidation.

Contractor shall leverage virtualization at the server, storage, and network levels. Virtualization shall separate the applications, data, and network connections from the underlying hardware. Through storage virtualization, the

County shall be able to increase utilization ratios and have greater data tiering flexibility to right-size storage and performance to meet application-specific requirements. With HPE virtualized SDN switches, network provisioning shall be streamlined, making it easier for Contractor to monitor connections.

Contractor shall be familiar with external requirements, such as State or Federal mandates, that can affect the underlying technology demands. Contractor shall collaborate with the County to establish thresholds and project application workloads. Contractor shall combine this information with infrastructure utilization data to create tactical and strategic capacity plans to verify that the County's environment in Tulsa shall accommodate growing and changing business requirements without jeopardizing performance standards.

The MPC infrastructure shall provide the capability to expand capacity quickly due to unforeseen circumstances or emergency situations. This infrastructure shall be supported by Contractor data center professionals who understand the County's business and technical needs. Contractor shall use Contractor's industry-standard software tools to monitor and measure storage capacities and server central processing unit (CPU), memory, disk, and input/output (I/O) utilization and performance on a daily basis.

Contractor shall analyze daily and monthly capacity reporting to identify and address day-to-day capacity constraints. Additionally, Contractor shall analyze capacity trending reports to identify recurring problems that require system upgrades or system refreshes. Contractor shall continue to assess the impact of all changes on the capacity plan and the performance and capacity of all services and resources; tune and optimize the performance; implement County-defined policies; and develop methods to effectively monitor, measure, and report on capacity across the environment. Contractor shall also work with the County departments as they capture forecast demand to produce and maintain a quarterly Capacity Plan that defines planned server system upgrades and refreshes based on growth of existing as well as new application workload. The team shall update the existing capacity plan to reflect each year's forecast. Capacity planning for the County shall encompass the following:

- **Servers** – Capacity management services for servers and mainframes and associated storage shall include monitoring system usage and capacity by analyzing historical resource trends. Contractor shall apply this data during decision-making reviews to assist in formulating environment requirements that meet or exceed future business requirements. Contractor's comprehensive suite of server management and monitoring tools shall monitor the servers against thresholds and alert operations when there is an issue. Metrics shall be captured and run through a data warehouse for trend analysis and capacity planning. Monitoring metrics shall be summarized each day and reported.
- **Planning for Increased Application Usage** – Contractor shall enable performance analysis and availability management to allocate capacity dynamically. Contractor shall use system metrics and statistical reports to gain a clear understanding of overall capacity trends and performance. Contractor and the County shall use this information during decision-making reviews to reshape the compute environment periodically.
- **Network Capacity Planning** – Contractor shall continue to monitor data network usage and performance and generate capacity reports that identify actual and potential network bottlenecks, by establishing capacity benchmarks and by analyzing trends. Such trends shall address the form of overall throughput, percent usage, error rates, and specific performance metrics such as packets per second. Contractor's metrics shall measure both peak and average performance. Contractor shall offer network capacity recommendations for tuning the network to improve efficiency and cost effectiveness.
- **Storage Capacity Planning** – Contractor's storage infrastructure shall support the ability to expand capacity quickly due to unforeseen circumstances or emergency situations. Contractor shall use Contractor's industry-standard software tools to monitor and measure storage capacities, disk, and I/O utilization and performance on a daily basis.

Hyper-converged infrastructure in the delivery of virtual infrastructure.

Contractor shall provide Helion MPC and Helion Managed Cloud Broker (HMCB) to be implemented during the transition period as Contractor builds the County's on-demand Dev/Test and production environment as part of

the data center consolidation. By implementing a private cloud with standard-sized building blocks of virtual infrastructure, Contractor shall be able to analyze whether hyperconverged infrastructure shall ultimately yield benefits for the County. If Contractor is able to fully standardize over time on the x86 platform in the converged infrastructure, then the next logical step would be to move to hyperconverged infrastructure as the data center components come up for refresh. When the County is ready for hyperconvergence, Contractor stands ready to be the County's technology partner to accomplish this objective.

Hybrid cloud integration with data center.

Contractor's in-depth knowledge of the County environment and business objectives enables Contractor to design a hybrid infrastructure strategy that most effectively applies to the County's portfolio of services, accommodates the required workloads, and enables desired business outcomes. Contractor's hybrid approach to enterprise computing combines traditional IT resources for some applications—such as Solaris, HP-UX, AIX, and others—while Windows and Linux applications can be deployed in the cloud. The Contractor's hybrid solution for the County incorporates MPC services with traditionally hosted applications in the Tulsa data center, as described in Application Infrastructure Services.

The HMCB layer enables the County to see all resources —traditional, private cloud, and, in the future (if desired), public cloud such as Amazon Web Services (AWS) and Microsoft Azure—as a unified infrastructure. HMCB shall provide a centralized management layer for traditional and cloud resources managed by Contractor. Contractor's design and architecture shall provide interoperability and integration of tools and common resources (such as storage, network, and security components) with the applications that remain in a traditional hosting environment, enabling smooth transition to hybrid IT.

Contractor shall provide a hybrid model, built using the MPC, customized to the County's requirements, that is scalable and works with the County's infrastructure. Contractor shall optimize the County's applications, as described in the Methodologies and Key Processes section of Application Infrastructure Services to identify which applications are to be in the MPC and which Contractor recommends remain as traditionally hosted.

Additionally, upon integrating hybrid cloud, Contractor shall consider open standards that avoid vendor lock-in as well as architectures with the flexibility to meet the County's changing needs. Contractor shall address the following:

- Continue to support and integrate with the workloads that currently run the business
- Integration must bridge the current applications and workloads with those planned for the future
- Applications differ in how they are designed, hosted, and consumed
- Applications have different infrastructure requirements

Contractor shall use a single management toolset, described in Application Infrastructure, to manage different types of resources. Policy-based placement makes certain Contractor shall deploy workloads to the right infrastructure based on specific business requirements.

Process for physical and virtual servers.

Contractor's hybrid solution shall include Helion MPC services combined with traditional hosted services.

MPC Provisioning: Implementation of HPE's Helion MPC shall enable Contractor to quickly deploy new services where virtual infrastructure is automatically provisioned in hours or less instead of days, upon approval from the County. To provision virtual servers, upon approval by the County, Contractor shall finalize the approved Solution Design Document (SDD) or Confirmation of Server Requirements and shall perform the following tasks for MPC server provisioning:

- **Access the MPC Provisioning Tool** – This provides an intuitive graphical user interface that Contractor shall use to select from a prepopulated catalog of services that Contractor shall define during the MPC build, including provisioning of virtual servers.
- **Browse the Service Catalog** – Using the catalog, Contractor shall browse all predefined offerings and select the primary service desired to initiate the provisioning process.
- **Configure the Requested Service(s)** – Once Contractor has selected a primary service to reflect approved County requirements, the associated selectable options shall be available to Contractor's MPC provisioning team. For provisioning virtual servers, Contractor shall choose the County's required minimum SL, the server name and size including quantity of CPU, RAM, and primary disk size, network connections, server OS, and target resource pool (applications infrastructure, infrastructure, or Dev/Test). Contractor shall then select from a list of predefined templates, which are the County's gold images. Next Contractor shall choose to add-on optional services such as predefined backup and storage choices as required to meet the County's specific workload requirements. Contractor shall then add the item to the cart and repeat this process as needed to configure multiple approved servers simultaneously prior to checkout. Note: Contractor can also reorder or place a request to initiate new services based on prior requests; this streamlines the process.
- **Place the Order** – When the configuration is complete, Contractor shall review and confirm the requested items and confirm the new service(s) or modifications to existing services.
- **Order Fulfillment** – The Contractor initiator receives notification when the automated order fulfillment process is launched, and continues to receive status notifications until provisioning is complete. Contractor shall notify the County once the services or changes are ready.
- **Manage Service Orders** – Notifications shall enable Contractor to track order status in real time. Contractor can also access, monitor, and perform actions on services (such as modifications, cancellations, or deletions), view a detailed list of all orders, and approve requests. Once a service is marked for deletion, a 7-day retention policy is enacted to safeguard the data in case this process needs to be reversed if requested by the County. Additionally, Contractor can track status of servers such as Online, Offline, Transitioning, Reserved, Deploying, Modifying, Modification Failed, Failed, Canceling, Cancellation Failed, Expiring, and Expiration Failed.
- **Manage Services –** For services currently subscribed and running, Contractor can view detailed information about the services and topology as well as the individual components that constitute the overall service delivery. Within this view, Contractor can also request actions such as start, stop, reboot, create or revert snapshot, server resize, and more to manage the County workloads in an expedited manner.

MPC provisioning shall be powered by the following underlying technology and processes:

- **Cloud Service Automation (CSA)** – Combined with Operations Orchestration (OO) and Matrix Operating Environment, CSA automatically enables the design and provisioning of virtual infrastructure services in hours instead of days. HPE Server Automation software shall enable Contractor to automatically perform activities such as server discovery, provisioning, patching, configuration management, and script execution to comply with IT configuration standards.
- **Computing Services** – Contractor shall preconfigure the image for automated provisioning. Using administrator privileges, Contractor shall provide OS patching and ongoing maintenance as well as all database and application installations, patching, and ongoing maintenance. Contractor shall monitor system availability and security, and perform root-cause analysis and corrective action of OS; physical and virtual servers; storage, backup and network environment problems; and all other IT Service Management functions.
- **Storage Services –** Contractor's Helion Storage Services enable efficient information management while maintaining the right level of storage from creation to deletion. Contractor shall manage the County's active system data via a storage area network (SAN) platform using tiering technologies to balance cost and performance; this delivers a lower-cost solution, increases business agility, and minimizes risk. Contractor shall virtualize storage resources to increase utilization and provide greater data tiering flexibility.

Contractor shall provision storage infrastructure (hardware, software, and management tools) to store application and database data from the corresponding computing environment. Features include storage performance and capacity planning, monitoring, reporting, asset management, service operations management, and supplier engagement, when necessary.

- **Server Provisioning, Monitoring, and Management** – Contractor shall install this service and configure it to meet County-specific needs based on the following:
  - Resource pool location for capacity provisioning
  - Availability "System Level" end-to-end Service Level for availability
  - Server size (CPU configuration: x-small, small, medium, large, x-large)
  - Server size (GB of RAM: x-small, small, medium, large, x-large)
- **OS Provisioning, Monitoring, and Management** – Contractor shall install a standard build for the Windows and Linux operating systems and monitor availability of the servers and the OS instances up to the point of connection with network demarcation. Upon detection of an availability, capacity, or performance event, Contractor shall investigate the outage and perform corrective action to restore the system. Contractor shall deploy local admin users for Contractor's Private Cloud Operations OS administration. Contractor's OS management shall include startup and shutdown, OS patch management, and maintenance job scheduling (at the OS and system level) for private cloud internal management activities.
- **Policy-driven Automated System Provisioning –** Contractor shall automatically provision new cloud infrastructure based on defined policies. New systems are deployed once approved by the County, and Contractor shall periodically advise the County when new OS versions and editions become available.

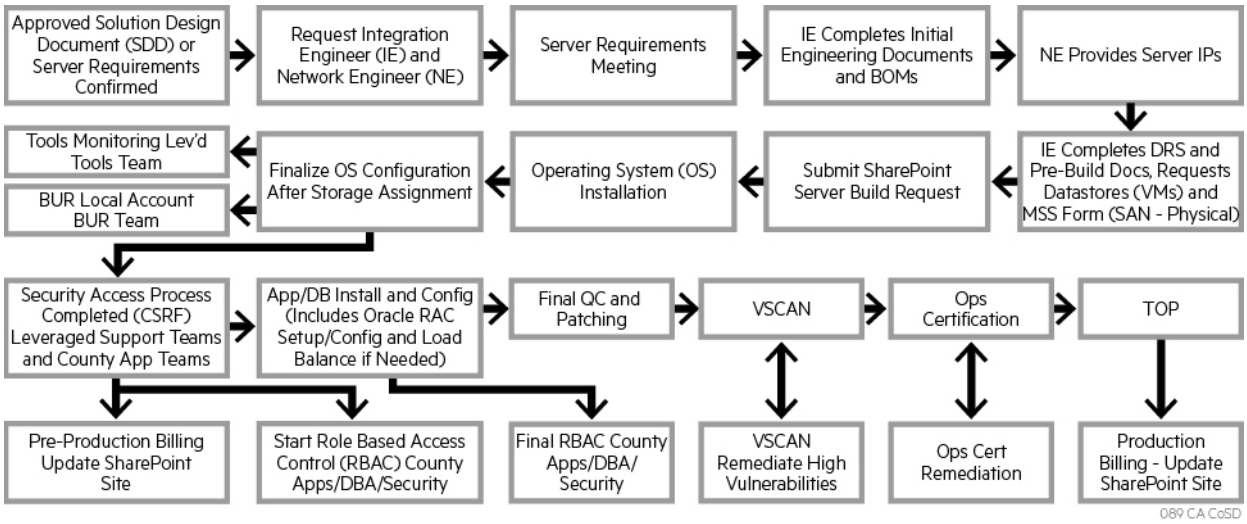
Traditional Provisioning: Using HMCB, Contractor shall perform automated provisioning of VMware servers in the traditional environment. Over the long term, Contractor recommends that all VMware environments within the data center be moved into the MPC and the HMCB provisioning process be used for non-data center servers. The provisioning process for VMware servers in the traditional environment follows the steps above up to the point of layered product installation, at which point Contractor follows the traditional process, described below.

Contractor shall have an established and thoroughly documented process to provision traditional servers that begins when the Contractor server team receives an approved Solution Design Document (SDD) or Confirmation of Server Requirements from the County.

This process shall incorporate all the necessary engineering activities and includes installing the OS, configuring the necessary storage capacity, applying security controls, scanning for vulnerabilities, testing, deployment into the production environment, and finally provided appropriate access to the Applications team to start development or testing as needed.

Adherence to this process shall enable Contractor to meet the County's Provisioning Service Levels.

Contractor Standard (Traditional) Server Provisioning Process



Physical Server Provisioning shall follow the same process as Traditional Server Provisioning, with the following steps added, following the approval of the SDD:

Workload Placement is a step that engages the Hardware Planning team to determine the floor and rack locations and provide any additional power and cabling, if required.

Network Configuration: Switches and remote access capability are configured.

Hardware Installation: If sufficient hardware is available within the pool of spares, this hardware shall be integrated and installed and connected, once the floor and rack locations are ready.

Procurement shall occur to replenish any spares used by the request; or, for large or specialty hardware orders, this step shall occur before hardware installation.

Storage Configuration: SAN fiber shall be connected and LUN allocations shall be presented to the physical server.

6.5. Security Services

6.5.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall consolidate all services (except mainframe and AS400) from Plano, TX and Tulsa, OK (Tulsa) into a single production data center in Tulsa. The new environment shall incorporate a Managed Private Cloud (MPC) environment for production (upon county approval), development/test (Dev/Test) services, and Break/Fix, and retain the traditional hosting infrastructure for production, Dev/Test and/or Break/Fix that are not compatible. It shall include the deployment of firewalls, Intrusion Detection System (IDS)/Intrusion Prevention System (IPS)

devices, host-based security and full spectrum analysis of all traffic in and out of the Tulsa data center. Contractor shall incorporate robust IT security within the Tulsa data center to meet the specified requirements. Contractor's approach to data center security shall involve disrupting the entire life cycle of an attack, by investing in both layered prevention and detection, and in a network configuration that creates separate security zones.

The Contractor solution shall include:

- **Implementation of Palo Alto next generation firewalls.** These multifunction devices provide firewall services, intrusion prevention and detection services, spyware and antivirus filtering, web content filtering as well as unified threat management capabilities. This solution also provides automated alerting of possible malicious activity and daily threat updates.
- **Network zone restructuring.** The production zones shall be implemented by a combination of network segmentation, device separation, and firewall separation between each of the three zones (Front DMZ, isolation zone, and data center zone). The Dev/Test environment has virtual local area networks (VLANs) representing each of the three zones. The Dev/Test environment shall mimic the production environment. That is, VLANs for Dev/Test shall be located in each of the zones (front DMZ, data center zone and isolation zone). The Dev/Test VLANs shall be segregated from the production VLANs by the firewall and shall not have access to the production VLANs, unless access to specific Services are required (e.g. Active Directory). If a firewall change is required by M&O activity, all labor associated to the firewall change shall be covered under Apps M&O. If the firewall change is required by a new application, it shall be included as part of the project. In addition to eliminating the security risk, it shall provide for more comprehensive application testing. Applications shall be able to test firewall rules earlier in the process and hone during testing. This shall facilitate a cleaner cutover to production.
- **Expansion of ArcSight Security Information and Event Management (SIEM) Services.** All firewalls and IPS sensors, VPN devices, and DHCP appliances in San Diego, Plano, and Tulsa shall be enrolled in SIEM services (log collection, log management, and reporting as well as 24x7 alerting and monitoring services). In addition, Contractor shall include "critical servers" such as domain controllers or servers with data subject to regulatory compliance, such as HIPAA and PCI.
- **Email Security.** With the transition of email to the cloud, email-specific security services shall be provided by the Exchange Online Protection (EOP) capability, which provides comparable security services to the IronPort appliances, such as:
  - Data Loss Prevention (DLP) for email
  - Advanced Threat Protection (ATP)
  - Exchange Online Archiving for Exchange Online
  - Legal Hold
  - Antispam/Antimalware at the mailbox level

- **Distributed Denial of Service (DDOS).** DDOS protection shall include protection at the Internet Service Provider (ISP) layer outside of the County environment, firewall configurations, network configurations, Access Control Lists (ACLs), intrusion prevention system configurations, Web/DNS traffic DDOS protection provided by Akamai, endpoint protection on all windows systems, operating system hardening, browser protection as well as application level protections.
- **Active Directory.** The following components of AD2012 shall be re-engineered as part of the consolidation during transition:
  - Domain controller redundancy standards (rule of three) for the CO domain
  - Flexible single master operation (FSMO) roles failover locations for CO and County domains

- Contractor shall also implement the following tools:
  - **Dell Recovery Manager Active Directory (RMAD)**. RMAD functionality includes the restoration of deleted objects as well as corrupted objects and provides the ability to recover an entire domain or forest in the event either of these is lost or corrupted. RMAD eliminates the need to recreate impacted objects and results in quicker service restoration.

- **Dell Enterprise Reporter**. Enterprise Reporter provides reports related to Active Directory, which shall provide the County the ability to monitor and manage End-User access and respond to audits.

- Deployment plan for resources and use of facilities

Contractor shall support security services using a combination of resources dedicated to the County and Contractor leveraged resources with specific areas of expertise. These shall include the Contractor CISO, Contractor Security Operations Manager and leads for the various functional areas (threat management, access management, security engineering, risk management among others). The Contractor security teams shall provide the daily support of the various security services and security infrastructure components based on their area of expertise.

Contractor security staff shall be located at the following sites to support the County:

- Rancho Bernardo. Primary location of Contractor staff specifically assigned to support the County. Test environments, training, and video conferencing are housed at this site as well.
- Contractor's Tulsa Data Center – Tulsa, OK – This is the production data center that shall house the majority of the County IT infrastructure, except for that located in San Diego, and delivery of core IT and security services.
- Contractor's Colorado Springs Disaster Recovery (DR) site – Colorado Springs, CO – This location shall be the DR site for the County data center services. It shall provide back up or failover capability for all Tier 1 and Tier 2 applications, core services, and data center security services.
- Contractor's Orlando Data Center – Orlando, FL – This location hosts the SIEM services.

- Key methodologies and processes in solution including year-to-year continuous improvement

Security services for the data center shall be based on the defense-in-depth model developed by the National Security Agency (NSA).

The defense-in-depth model shall also tie to the controls specified in the Risk Management Framework (RMF). As controls are updated in the RMF roadmap, the defense-in-depth mechanisms and associated delivery processes shall be reviewed to identify any potential changes. The potential changes shall be reviewed with the County to determine implementation approach and timing and are added to the security operations roadmap. This roadmap shall contain items to further improve the security posture or maturity of the County from an operational perspective.

All Security hardware and software versions shall be evaluated upon release with consideration for feature benefit and risk. No deviation from standard shall occur without County approval. Patches and updates shall be evaluated as they are made available to determine their applicability to the County environment and shall be deployed immediately as needed.

For cloud based solutions, there are two scenarios for security integration:

1. For cloud services hosted by Contractor, Contractor shall provide end-to-end security implementation, testing, and continuous monitoring.

2. For cloud services not hosted by Contractor, Contractor shall provide, at a minimum, security implementation, testing, and continuous monitoring for all components under Contractor control, such as network and End-User devices.

Contractor shall follow a detailed Security Management Plan tailored to the County that defines the processes used to provide security services and roles and responsibilities for service delivery. It shall describe the technologies and interactions that comprise delivery of security services.

6.6. Mainframe Services

6.6.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall provide seamless, ongoing operational support to the SA16 LPAR Mainframe and A/S400 in Plano until migration to the new, web-based Integrated Property Tax System (IPTS).

During this time, Contractor shall:

- Be responsible for producing and submitting recommendations for standards on production jobs and Job Control Language (JCL)
- Develop and execute plans to retire the Mainframe and A/S400 upon approval from the County.
- Support Mainframe applications for migration
- Measure Mainframe usage in CPU hours and correlate CPU hours directly to End-User processing for specific applications
- Provide hardware and software utilities to support the Mainframe services
- Be responsible for licensing for all hardware and software used to provide Mainframe services.

As long as the mainframe and A/S400 are live in Plano, Contractor shall support the existing network connectivity that provides End User access, as well as the connectivity to Rancho Bernardo for Managed Print. The DR subscription for the mainframe shall be provided out of Contractor's DR site in Littleton, Massachusetts. Connectivity to Littleton for County End-Users is provided via T1

- Deployment plan for resources and use of facilities

The Contractor team located in Plano shall support the Mainframe until migration to IPTS (mid-range) is complete. Additionally, Contractor staff located in Rancho Bernardo shall support the applications. Following decommissioning of the mainframe, Contractor shall support the IPTS system in Tulsa.

- Key methodologies and in solution including year-to-year continuous improvement

Contractor shall use the following four-step process to decommission the SA16 LPAR Mainframe and AS/400 environments:

- Upon completion of the migration to new applications from the Mainframe and AS/400 environments, Contractor shall decommission the hardware according to standard change management procedures.
- As part of the hardware de-installation process, Contractor shall perform a complete wipe of the disk and tape storage to remove any County specific data. Contractor shall perform a data scrub of all hard drives, permanently removing sensitive data.
- All data stored on tape shall be evaluated for archive requirements. If data archive is required, Contractor shall convert the tape data for access by the new platform. All other data shall be removed (scratched) from the physical media, and either returned to the physical tape scratch pool, or destroyed depending on the condition of the physical media.
- Once the data removal process is complete, Contractor shall remove all hardware from WAN and LAN access. The DASD and tape hardware shall be returned to the Contractor leveraged storage pool for redeployment. The processor environment shall be de-installed and securely disposed.

Following the successful decommission of the mainframe and A/S400, all circuit connectivity to Plano and Littleton for the County shall be decommissioned, and the DR contract cancelled. Any tape media located at the DR site shall be recalled and handled as described in the third bullet above. Contractor shall evaluate the

connectivity required for the transmission of interface files, and, if necessary, shall continue to maintain the dedicated circuit.

6.7. Application Infrastructure Services

6.7.1. Process and Procedures

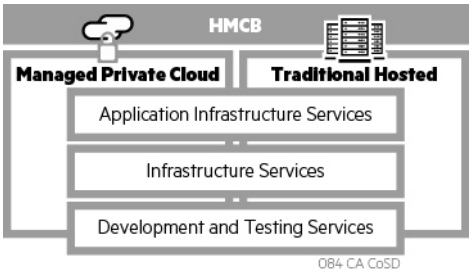
- Description of solution to meet the requirements

To maintain and support County portfolio applications, Contractor shall deploy hardware and software needed to sustain a hybrid computing solution that crosses three framework services, as illustrated in the figure below. Contractor's implementation shall include HPE Helion Managed Cloud Broker solution (HMCB) to provide a high level of automation and orchestration across two pillars: MPC and traditional hosted environments. With HMCB, Contractor shall have the ability to optimize and manage workloads across MPC, traditional hosted VMware, and, in the future (at the County's discretion) other cloud service providers by providing a full service management solution that gives Contractor a single view of the County's IT assets and governance across service management, financial management, operations, and analytics. For applications that are more complex and require greater customization, the traditional hosted environment shall enable Contractor to leverage the County's existing technology investments, and reduce risk by maintaining those environments until and unless they are ready to move. Within these two pillars of the design, each environment shall have its own resource pools for compute, storage, and network, providing the separation of resources required by the County. These resource pools shall be a logical separation. As previously noted, production applications shall not migrate into the MPC during Transition, but shall reside in the traditional VMWare environment until refresh, or such time as Contractor and the County wish to move them.

Contractor shall provide application infrastructure services from the Plano and Tulsa data centers. Contractor shall move compatible platforms in the current application infrastructure from a traditional hosted environment to a more agile MPC. MPC shall support approved versions in accordance to approved County technology standards of Windows and Linux virtual servers.

The pre-defined starting sizes for MPC servers shall be as follows:

Foundation for Application Infrastructure Services



SIZE	CPU ALLOCATION	RAM ALLOCATION
Extra Small	1	2
Small	2	4
Medium	4	8
Large	8	16
Extra Large	8	32

Note that this is only for resource allocation and is unrelated to the billing structure. This range of sizes covers most of the servers in the environment that have a compatible operating system. For servers whose resource requirements are higher (e.g., servers that require 64GB or more RAM), they can still be deployed in MPC as Extra Large, then the resources can be scaled up to meet the application's requirement. Fewer than 10 servers in the environment fall into this category; hence, Contractor did not design additional sizes. If, however, larger resource requirements become more prevalent, additional sizes can be added.

The hybrid environment shall support application infrastructure services, infrastructure services and Dev/Test services (for both Applications M&O and Development and Test projects). The MPC and the traditional hosted infrastructure are sized to accommodate the combined workloads from Plano and Tulsa, and can scale as needed to support the County's needs.

The approximate split of servers between the Traditional and MPC environments is as follows:

Development (Dev/Test + M&O Break/Fix)	271	60

In support of the County's Virtual First strategy, Contractor shall continue to pursue virtualization of as much of the remaining physical environment as possible. When each server comes up for refresh, Contractor shall analyze the rationale for keeping it on a physical server vs migrating to a virtual (and, if possible, migrating it into the cloud environment), and if there is no technical reason a physical server is required, Contractor shall redeploy the server's applications into a virtual server and dispose of the vacated hardware.

MPC Provisioning

As new applications are developed that are targeted to run in the MPC, the Contractor team shall request MPC resources through the provisioning interface, including servers, software, storage, and backup requirements. Once the demand request is received by the system, and the automated parts of the provisioning process complete, the Applications team shall then be responsible for installing, configuring, and testing each application component.

Conversely, as applications are retired or their Dev/Test components are no longer needed for live use, and therefore the associated MPC resources are no longer needed, the Applications team shall submit a service request to de-install the MPC infrastructure for that application. The team shall decommission all of the application components and infrastructure resources for the application environment being retired, and release any licenses through Asset and Configuration Management. If the environment is a Dev/Test environment, the request shall specify whether the environment is to be permanently decommissioned or put into cold storage. If the latter applies, the image shall be preserved on the storage area network (SAN) storage and held in an online inventory, but its compute resources released. Otherwise, all resources shall be released.

From a RU billing perspective, RUs are added to billing at the point a production server environment is made available for County use. RUs are removed from billing at the point when a request to decommission a production environment is issued and approved. If a production application moves from a traditional hosted environment to MPC (as shall be the case during Transition), the old RUs are removed and new ones take effect at the point when the MPC environment becomes available for County use. During Transition, the County shall not be billed for both sets of RUs for any given server. Any move post-Transition from legacy environment to new environment shall be provided at no additional cost to the County, provided that nothing in the legacy environment has changed in a manner that causes additional cost to Contractor.

After Transition is complete, moves between the traditional Dev/Test environment and MPC hosted Dev/Test environment shall not have an impact on billing. Changes to the overall scope of the Development & Test Environment RU shall follow the contract change control process.

For additions to the Dev/Test environment, if the application resource requirements are large, such that its requirements exceed the capacity available (this scenario shall be the exception rather than the rule), Contractor may need to acquire more resources and modify Resource Unit fee accordingly. In most cases, the resources shall be available, and the environments shall be added with no change to RU billing. By the same token, removal of applications from the Dev/Test pool shall not trigger a change to RU billing.

For a description of how Contractor shall manage RU billing during Transition, please refer to, Transition Services.

Managed Private Cloud Specifications

The HPE Helion Managed Private Cloud solution shall be built on a predefined, dedicated solution that enables Contractor to rapidly deploy server, storage, and network infrastructure "as service" for the County via a secure, web-based Private Cloud Portal.

The comprehensive private cloud solution shall include HPE hardware and software, professional consulting and implementation services, and ongoing end-to-end management services. The foundation for the solution shall be HPE CloudSystem Foundation. HPE CloudSystem Foundation is a pre-integrated solution that shall enable Contractor to create and manage virtual pools of servers, storage, backup, and networking resources on behalf of the County using a common management layer.

Helion MPC solutions shall leverage CloudSystem Foundation to provide a predefined, prebuilt, highly standardized infrastructure environment. The configurable infrastructure environment shall consist of a set of preconfigured, dedicated hardware building blocks for computing, storage, backup, and connectivity. These building blocks—which can be scaled independently—shall serve as the underlying, enabling infrastructure used to provide the standard Infrastructure-as-a-Service (IaaS). There shall be a base service to which optional services, or building blocks, can be added. Using this approach, Contractor provides an MPC solution that shall be configured to the County requirements, including selection of the mix of virtual machine (VM) sizes and operating system distribution that best map to the County's application profile.

Standard hardware-related services supporting the private cloud environment shall include but not be limited to the following:

- Hardware installation and configuration
- Hardware management
- Capacity management
- Problem monitoring, including proactive hardware support
- Release management
- Patch and system driver management
- Data center facility (floor space, power supply, cooling, wiring)
- Installation of management software

Some of the standard hardware and software products shall be as follows:

- **Server, Storage, and Backup Devices** – MPC uses HPE's Converged Infrastructure including ProLiant Gen9 blades running inside c7000 blade enclosures. Integration with SAN-based storage and backup devices is required in support of an MPC environment. Contractor's private cloud offering uses 3PAR storage options as a configuration standard.
- **Cloud Service Automation (CSA)** – Combined with Operations Orchestration (OO), CSA automatically enables the design and provisioning of infrastructure services in minutes along the End-User-requested

infrastructure configuration. HPE Server Automation software enables Contractor to automatically perform activities such as server discovery to provisioning, patching, configuration management, and script execution to comply with Contractor and County IT configuration standards. CSA also provides the foundation for the cloud service catalog presentation, automation, management, and orchestration.

The Contractor team shall manage the server, storage, backup, and networking resource pools along with System Management Software, such as HPE Server Automation software layers. These products shall help to facilitate the day-to-day operational support for the converged infrastructure-based cloud resource pool. They shall automatically deploy predefined Windows and Linux operating systems into the environment via predefined workflows.

Contractor shall deploy monitoring, antivirus, and policy compliance agents as part of the automated workflows. The consistent and reusable private cloud infrastructure shall enable the County to rapidly access the infrastructure when needed. Contractor shall maintain and manage all the software, agents, and monitoring infrastructure of the private cloud.

There are two scenarios of security integration for cloud based solutions:

- In the first scenario, the cloud solution is tightly integrated with Contractor's standard data center security and allows for implementation, testing, and continuous monitoring of controls as required by County policy. For example, the Contractor's Managed Private Cloud allows for this level of integration in which all applicable county policies are implemented.
- In the second scenario, the cloud solution complies with Contractor/County requirements but may not allow for testing and continuous monitoring by Contractor. In this case, the cloud offering is to be vetted so that Third Party assessments take place on a regular basis and that they share the audit reports with Contractor and County. Third Party assessments shall adhere to valid standards such as ISO 27000, ISO 27001, or FedRAMP.

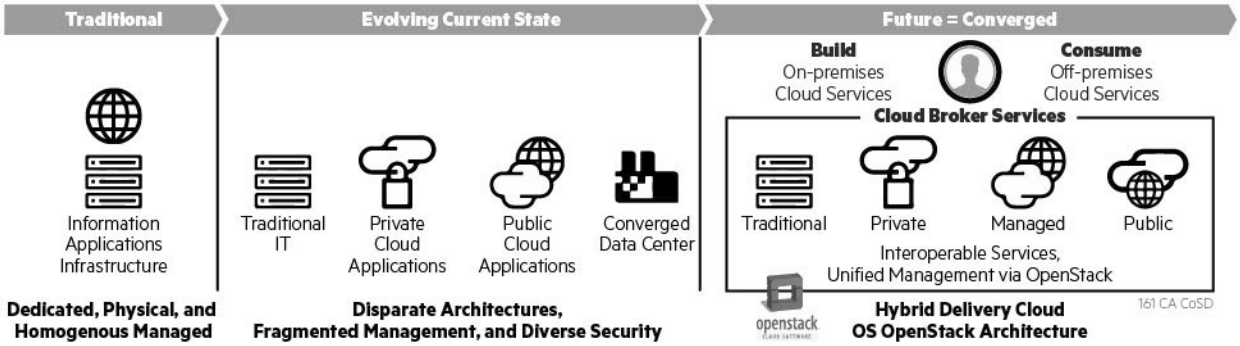
Contractor shall support other key components of the private cloud computing environment, such as CSA and the Private Cloud Portal. Contractor shall support Operations Orchestration, managing the CSA Database, Cloud Controller, and CSA Provider Console, including the following activities:

- Administering the standard Service Request Catalog
- Managing specific CSA settings
- Responding to subscription requests
- Providing lifecycle management of catalog operations
- Supplying standard consumption reports

Implementation of the HPE HMCB shall help Contractor achieve an integrated view of the County's hybrid IT ecosystem and provide the ability to manage VMware-based virtual workloads in the traditional hosted environment both inside and outside of the data center.

With implementation of a hybrid environment in the Tulsa data center, Contractor shall bring application infrastructure improvements throughout the life cycle of an application, whether it is in the MPC or the traditional environment, and whether it resides on a physical server or a virtual host. To improve physical provisioning time, for typical orders of a few servers, Contractor shall keep five (5) spares on hand so that for standard configurations there shall be no wait for procurement. Contractor shall continue to identify opportunities to automate workflows to further improve provisioning of traditional environments to meet or exceed the County's service level requirements. Contractor's complete pre-integrated hybrid cloud solution shall bring to bear data center-wide streamlined service creation, deployment, and monitoring for application workloads, as illustrated in the figure below.

Contractor MPC Standard Building Block and Scale Out Approach to MPC Resources



Contractor shall implement the hybrid delivery architecture shown above under the rightmost arrow ("Future = converged") to bring these disparate silos together. Once in place, Contractor's Cloud Broker shall form the basis to create a continual improvement plan and roadmap. This plan shall unify and bring transparency and consistency of governance to these environments, and Contractor shall help the County target future workloads for the right provider and delivery model.

Contractor's hybrid solution shall provide the following benefits to the County:

- **Faster time to value**. Using the MPC, Contractor shall provide a standard content library with approved County template virtual server (VMs) images that can be provisioned in a matter of hours rather than weeks or months. The standard templates shall allow application solution teams to quickly request web, application and database VMs with preapproved and configured images for the County landscape helping drive the County's "virtual first" strategy.
- **The right hosting solution for any application**. For applications that require a high level of customization, such as use of non-standard platforms, Contractor's traditional hosting service provides this solution.
- **High performance application services:** This shall result in better service to end-users, third parties and constituents of the services.
- **HMCB:** Consolidated management and financial governance of traditional, private, and public cloud hosted environments.

- Deployment plan for resources and use of facilities

Contractor shall provide application infrastructure services for the County applications portfolio in Contractor's Tulsa and Plano data centers, until the consolidation to the Tulsa data center is complete. Contractor shall migrate all workloads from Plano to Tulsa.

Within these environments in Tulsa, the Contractor team, which includes the local team in San Diego, Contractor's service center in Pontiac, Michigan, and Contractor's virtual teams of subject matter experts (SMEs), situated throughout the United States, shall manage and operate the application infrastructure services required by these applications.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor shall use a life cycle approach to support applications infrastructure. Contractor shall follow an application placement methodology in which Contractor shall assess cloud readiness. Contractor shall look at each County application in the production inventory and analyze where that application would best be deployed based on evaluation of the following types of requirements:

- Regulatory requirements

- Performance requirements
- Adherence to infrastructure standards
- Security and confidentiality
- Availability and reliability

When designing the infrastructure to support an application, Contractor shall determine which tiers are required. The tiers shall include the presentation layer, business logic (application) layer, and the back-end (database/transaction) layer. The infrastructure to support any tier can be either MPC or traditional. The County's network zones shall be supported transparently in both environments.

Prior to migration, Contractor shall build out the MPC and upgrade and expand Tulsa's traditional environment to include the required infrastructure for servers, storage and networking components to accommodate the migration of applications into this facility. As part of the consolidation, Contractor shall analyze the application environment and identify the candidate environments to move into the MPC. When this is complete, candidates from the Tulsa environment shall be moved into the MPC to further consolidate and standardize workloads. Upon refresh and subject to County-defined limitations for periodic refresh cycles, Contractor shall continually evaluate additional application workloads to assess the feasibility of moving these to the MPC. Contractor shall analyze items such as County investment, timeframe for application retirement, if any, and the complexity of the development effort for legacy applications to be re-architected in MPC.

For all application infrastructure upgrades, refreshes, and transformational activities that impact portfolio applications, Contractor shall update and maintain AppsManager with information needed in Runbooks. Application infrastructure examples shall be updated DNS, system patches, and sections for outage and notifications, data center and escalation contacts, application interfaces, AD/service accounts and document links, whether provided in the MPC, traditional hosted, or other cloud environments.

Performance Analysis and Improvement

Contractor shall use a variety of methods to analyze performance.

Reactive Performance Management

Contractor shall implement tools to provide early warning alerts to Contractor that shall automatically contact Contractor to look into a situation where some resource or performance metric has passed a threshold point.

Proactive Performance Management

Contractor shall review the trend analytics and reports on capacity and performance on a daily basis.

Netcool and NNMI shall be used to monitor and assess the data center network devices. Performance issues shall be addressed using standard event management (for non-impacting events, such as threshold warnings) or incident management (for End-User-impacting issues) procedures.

Contractor shall review the results of these analyses with the County and make recommendations for County approval.

Performance improvements, in response to either reactive or proactive scenarios, shall include tuning configuration parameters, adding capacity, or making an architecture change such as re-shaping network traffic or moving data to a different storage tier.

Contractor shall also follow the same methodologies and processes to manage the application infrastructure as Contractor does for infrastructure services.

6.8. Infrastructure Services

6.8.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall provide infrastructure services such hardware, software, network resources and services required for the existence, operation and management of the County IT and telecommunications enterprise, at both Plano and Tulsa until the data center consolidation is complete. These infrastructure services shall provide the foundation that supports County End-Users, third parties, and constituents. The infrastructure services environment shall be comprised of the hardware, software, storage and support services that underpin the operations of the applications and Dev/Test environments, including:

- Server environments that run the supporting tools, including Service Portal, ITSM systems, monitoring, reporting, analysis and alerting systems.
- Infrastructure that provides software distribution and delivery services for mobile, desktop, and data center server environments.
- Local file and print services, distributed throughout County locations.
- Network infrastructure supporting the data center, such as load balancers, WAN Accelerators and global traffic managers (GTMs).
- Background services for applications, such as backups, batch processing and File Transport Protocol (FTP) services.

The servers for infrastructure services shall reside in both the MPC and traditional hosted environment. Over time, Contractor shall work to optimize and standardize this environment as opportunities arise. Servers that support infrastructure services shall receive the same supporting functions (such as performance and capacity management, and backup and restore) as application servers. Contractor shall make sure that no single points of failure exist that could potentially impact the availability of applications or facilities that support County business.

Contractor shall perform comprehensive infrastructure testing for all components in an integrated environment for compute, storage, network, and database in a physical or virtual environment. Contractor shall maintain documentation that identifies all infrastructure services' hardware versions and software version life cycles so that Contractor may adequately plan timeframes and completion dates to stay within supported versions of both hardware and software. Contractor shall also track hardware and software assets to adhere to the County refresh cycle. ESX servers and network components that comprise the MPC shall be refreshed on the same schedule as their traditional hosting/network counterparts.

Contractor shall deliver skilled operations and engineering expertise to manage and monitor the infrastructure services environment, and apply automation to all processes to the greatest extent possible. Contractor shall deploy monitoring, antivirus, and policy compliance agents as part of the automated workflows. Contractor shall manage the County's server, storage, backup, and networking resource pools and system management software, to facilitate daily operational support.

Contractor shall manage and maintain the County's server (compute), storage, backup, network, and security environments. Contractor shall follow ITIL-aligned processes to determine critical business impact to component or system failures in infrastructure services, and to continuously analyze, identify and remediate single points of failure in infrastructure services.

Computing Services—Contractor shall install, fully manage, and monitor the operating system (OS) instance and the underlying virtual or physical server. Contractor shall also maintain the health of infrastructure assets included in the solution, including server, storage, backup, network, and other devices.

In the MPC and traditional hosted environments, Contractor shall preconfigure the OS image for automated provisioning, provide OS patching and ongoing maintenance including performing all software installations, patching, and ongoing maintenance, and monitor system availability and security. Contractor shall perform root-cause analysis and corrective action of OS, physical and virtual servers, storage, backup and network environment problems, and all other IT Service Management functions.

End-User Software Distribution – Contractor shall design, deploy, and maintain software distribution infrastructure and services for End-User computing services and integrate and perform software delivery for County desktop and mobile devices. Contractor's infrastructure services shall include support for devices on the County Public Library private network.

Operating System Software Support—Contractor shall provide a standard build for, then monitor and manage, virtual and physical operating systems such as Microsoft Windows, Red Hat Enterprise Linux and Oracle Solaris. Contractor shall also support other types of UNIX operating systems and VMware as well as other hypervisors.

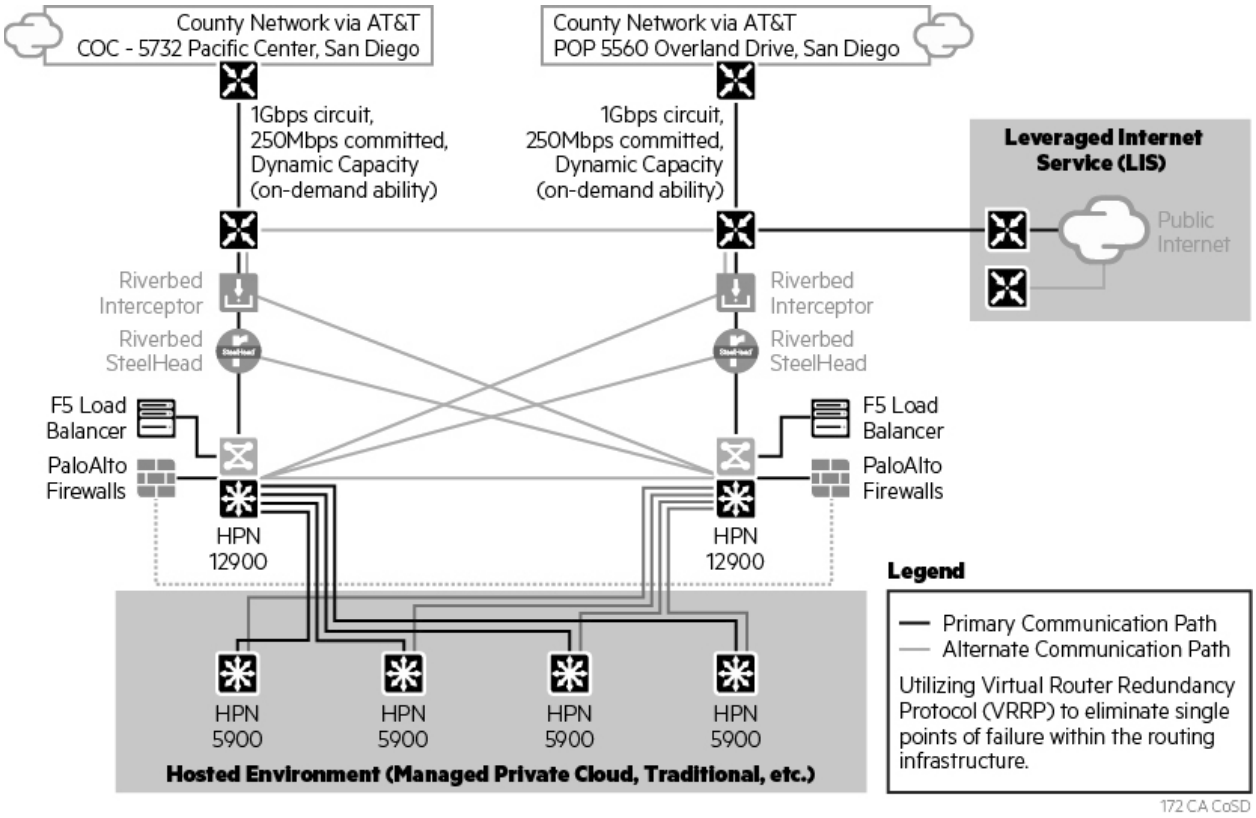
Storage services—Contractor shall use the HPE 3PAR enterprise storage, which is designed for both cloud and traditional environments. The storage shall host operating system images, virtual snapshots, and application data. All operating system images for virtual machines shall boot/reboot from the Storage Area Network (SAN). This architecture enables the server image to be disassociated from the physical hardware, allowing the image move from one physical server to another as needed for greater flexibility, better resource utilization, and built-in failover for improved availability.

Backup and Restore Services—Backup services for virtual and physical computing services shall provide operating system and filesystem (offline) backup for computing services to enable data restoration after a data loss event. Backups shall be accomplished by copying the specific data to backup media. Contractor shall perform the following:

- Provision backup infrastructure and backup software
- Perform backup management
- Maintain the backup schedule
- Review backup job completion status
- Intervene in the event of backup error
- Store data on disk
- Performs OS, file system, and database restore.

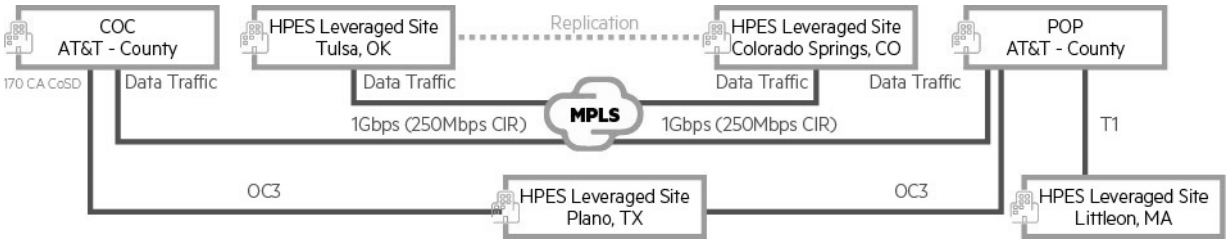
Contractor shall initiate and perform on-demand backups of the County environment. Shortly after the request is submitted, an incremental backup shall begin. For virtual servers, Contractor shall be able to conduct regular snapshot backups of each virtual server instance, with the most recent snapshot being retained for recovery purposes. The snapshot feature shall back up the OS disk and all attached data disks. The figure below illustrates the data center network architecture.

Data Center Network Detail



Contractor shall provide a wide area network service construct with diverse paths and entry points into each data center at Contractor's Tulsa, Oklahoma, and Colorado Springs, Colorado, locations. All circuits shall be in an Active configuration to allow operation. Multiprotocol Label Switching (MPLS) circuits with a 250Mbps committed information rate (CIR) shall be used to connect Contractor's data centers to the County's Pacific Center and Overland Drive locations. Each of these circuits shall allow bursting above the CIR to provide on-demand bandwidth increases. Replication shall occur between the two Contractor data centers via a dedicated 10GB circuit. The figure below illustrates this connectivity.

Data Center Connectivity to the County Network



Contractor's WAN and LAN network infrastructure shall deliver multiple, active network paths with 1+1 redundancy at a minimum, whereby multiple components can fail without impacting end-to-end network availability. This enables Contractor to deliver an environment truly capable of targeting 100% availability.

Scalability shall be delivered through the 1+1 active/active construct. Contractor shall use the HPE 12900 and 5900 series switches to provide a high performance, scalable, and open architecture designed for the County to

leverage for the next decade. The platform shall be purpose-built for the data center around the principles of modularity, extensibility, and agility.

The network shall be designed and implemented with modularity. This enables Contractor to expand in the future in accordance with the forecast workload. It also simplifies network deployment activities. Contractor shall provide an environment with inherent High Availability capabilities, which is concurrently maintainable, and simple and efficient to operate, reducing the risk of administrative error.

In addition to Contractor's LAN and WAN infrastructure, Contractor shall provide a Leveraged Internet Service (LIS).

Connectivity from the County network to the Plano and Littleton data center, required to remain post-transition to support the mainframe and AS400 environment, is depicted in the diagram above; this connectivity shall remain in place for as long as required to support the mainframe and AS400, and shall be decommissioned once the mainframe and AS400 applications are replaced.

Contractor's LIS shall use circuits from redundant ISP providers, terminated on hardened data center infrastructure to maximize reliability.

LIS shall be offered in monthly subscriptions from 1Mbps to 10Gbps for access to applications and servers hosted within Contractor Data Centers. For implementation during Transition, Contractor shall deploy 50 Mbps, consistent with current traffic requirements in Plano and Tulsa; this shall automatically surge if needed, with no additional charges to the County for surge usage.

Network Management Services—Comprehensive network design and infrastructure management services shall enable provisioning of up to 1024 VLANs per server; monitoring and management of data. Contractor shall implement new network technologies across the enterprise, manage disparate networks, and maintain reliable network performance. Contractor's network management services shall provide a centralized and standardized system that automates network management of End-User data, security, and distributed resources. Contractor shall continuously monitor and maintain all load balancers for optimal operational performance. Contractor shall also deploy and maintain application and network acceleration in the delivery of the Services.

Security Services—Antivirus agents shall automatically be deployed and activated in an automated workflow when a server is deployed. Security policy compliance shall check system configurations against security standards at a predefined scan frequency based on Contractor's security best practices. Contractor shall automatically load policy compliance agents as part of the deployment workflow and maintain and manage the security software, antivirus and policy compliance agents, antivirus definitions, and underlying infrastructure to support the security technology. Contractor shall maintain and provide all infrastructure security components including IPS and firewalls.

Data Center Facilities Services—Contractor shall design all the key supply components (for example, power, air conditioning, and wiring) to be redundant. In addition, Contractor shall control access to the data center to prevent unauthorized entry, and provide a robust infrastructure that provides adequate resistance to damage by the elements.

Costs Included in the Resource Unit (RU)

Hardware - This RU shall include the cost of Load Balancers, Network Accelerators, and Facility charges for infrastructure hosted in the AT&T POP.

Hardware costs (servers and storage) for servers designated as Infrastructure; i.e., servers that run the tools used in providing Framework services, or are otherwise used for a purpose other than to run County business applications

shall be included in this RU. Other servers that shall be included in this category are servers that represent a non-variable cost component of another RU; for example, the servers that run the Netmotion and Granicus applications are billed under the Infrastructure Services RU rather than under the RUs specific to those applications because the costs do not vary in linear proportion to volumes. This prevents the possibility of over-billing if volumes grow significantly.

A portion of data center network hardware and circuit cost shall be allocated to all servers. The portion of that cost for the servers designated as infrastructure shall also be included in this RU.

Software - A portion of data center software/tools cost to provide services such as software distribution, performance management, capacity management, and other automation and management functions shall be allocated to all servers. The portion of that cost for the servers designated as infrastructure shall be included in this RU.

Operating system, database and hypervisor software specific to infrastructure servers shall be included in this RU.

Labor - A portion of server, storage and network support labor shall be allocated to all servers. The portion of that cost for the servers designated as infrastructure, as well as the support cost for the network components described in the hardware section above, shall be included in this RU.

- Deployment plan for resources and use of facilities

H Contractor's data center staff in Tulsa, the Contractor local support team in San Diego, and Contractor's virtual team of SMEs, located throughout the continental U.S., shall provide ongoing operations and maintenance of the County's infrastructure.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor shall operate the Tulsa datacenter in accordance with ISO 27001 and the ITIL framework and best practices. To manage County infrastructure environments, Contractor shall follow ITIL-based service management (event management, and others) best practices.

Contractor shall put in place a process and roadmap to unify and integrate the various providers of services, and develop decision criteria that target workloads with specific characteristics for a specific type of service provider. In addition, continual improvement shall include convergence of tools for a more integrated data center services catalog and more self-service. Contractor shall provide additional self-service capabilities from the Service Portal at the County's pace.

For all infrastructure environments, whether provided in the MPC, traditional hosted, or other cloud environments, Contractor shall provide a robust support service, to include the following processes:

- Hardware installation and configuration
- Hardware and firmware management and support
- OS and layered software product installation and subsequent patching and release management
- Supplier maintenance agreements and coordination of suppliers' activities in support of the applications infrastructure
- Capacity and performance monitoring and management
- Problem monitoring, including proactive hardware support
- Data center facility (floor space, power supply, cooling, wiring) services
- Network integration into the Tulsa data center
- Underpinning services that use the infrastructure services framework (such as directory and domain name management services), described in Section 2.5.

- Refresh of hardware components, at 25% per year for Windows environments and 20% per year for UNIX, Linux, and VMware ESX environments (MPC hardware is included).

These services shall be provided for applications infrastructure, infrastructure services, and development and test services. The work instruction documents for these processes shall be available to the County in the Standards and Procedures Manual.

6.9. Development and Test Services

6.9.1. Process and Procedures

- Description of solution to meet the requirements

Contractor's solution for the County's Dev/Test services shall take advantage of the hybrid infrastructure approach described in the previous two sections, employing both the MPC and traditional hosted environments, with resource pools separate from application infrastructure and infrastructure services. This approach shall provide the unified consistent architecture that makes sure the Dev/Test shall provide an accurate picture of how an application's production environment performs. The MPC environment shall be a highly standardized environment with high redundancy and high availability to eliminate single points of failure. Moving to MPC shall provide streamlined server provisioning, enabling Contractor to provision, scale, and de-provision virtual servers in hours instead of days, once approved by the County. It shall also include tools that simplify capacity and performance management, monitoring, patching, and security and regulatory compliance.

Both the MPC and the traditional hosted infrastructure shall be sized to accommodate the combined workloads from Plano and Tulsa.

The "Dev/Test" RU consists of two logical environments – "Dev/Test" and "Break/Fix." Although there is one Resource Unit for "Dev/Test," the second logical name of "Break/Fix" was added to describe a component of the "Dev/Test" RU for management reporting on utilization and consumption of resources. The logical name "Dev/Test" is used primarily by Applications Development, while the logical name "Break/Fix" is used primarily by the Applications Maintenance and Operations. Details of what is in included in the "Dev/Test" and "Break/Fix" environments are outlined in the appropriate documents.

The MPC environment designed for the County shall provide the following benefits for Dev/Test:

- For Applications maintenance and operations (M&O) Break/Fix environment, dynamic and persistent resources provide a cost-effective solution for certain P1/P2 category applications, Contractor shall keep persistent environments in place, to support rapid test cases, such as performing testing of production fixes in response to incidents. P1/P2 applications shall have persistent Dev/Test environments in the MPC. P1/P2 applications that have been stable for a long time and are not often updated may only need dynamic environments. For these, as well as all P3/P4/P5 environments, Contractor shall take advantage of MPC's elasticity, where Contractor dynamically scales the County's secure, dedicated virtual infrastructure up and down as needed quickly and easily by obtaining and releasing IT computing resources on demand.
- Faster provisioning of hosted application services, and cold storage of dynamic virtual images not in use shall help the County to avoid operational costs and data center footprint associated with paying per-server for idle servers.
- Enhanced scalability and flexibility to adapt to the County's dynamic business demands.
- Security, privacy, and compliance—the MPC infrastructure is 100% dedicated to the County, and Contractor shall protect this behind a highly secure data center firewall. Contractor shall deploy and manage the

technology based on Contractor's extensive security testing practices that meet multi-segment security standards and compliance beginning with FedRAMP Moderate requirements.
- Access to the latest cloud innovations when the County is ready. Contractor shall help the County stay at the forefront of this technology by continuing to offer service and technology enhancements as HPE Labs research and develop next generation cloud systems.
- Integrated with County identity and access management services either through Active Directory or Oracle IDAM.

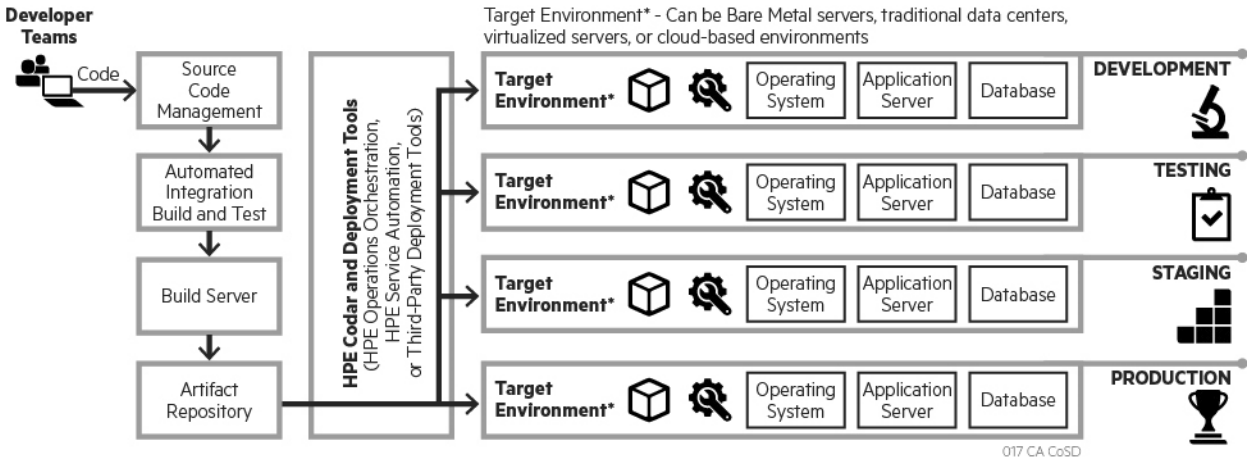
The Dev/Test environment shall be designed to meet County goals for continual improvement and cost effective innovative services to help the County transition to a marketplace of hybrid-provided services governed by Reports 49/50 standards and County IT strategy. Financial governance of the Dev/Test environment shall be through the HMCB and shall provide visibility across the hybrid environment to all Dev/Test resources in MPC and traditional hosted environments as well as public cloud environments.

Contractor's solution shall use the VMware automation built into the HPE Helion Cloud tools.

To further increase the level of automation and improve the Dev/Test environment builds, Contractor shall mature the cloud development, orchestration and delivery tools that shall enable Dev/Test environments to be quickly placed through one-click deployments, automatic rollbacks, and applications promoted across virtual environments. Contractor shall establish modeled environments that shall enable additional consistency through Contractor's automated tools such as HPE Codar and HPE Cloud Automation solution for version-controlled, one-click deployments, rollbacks and promotions.

Employing the same architecture used in application infrastructure services for Dev/Test shall streamline and simplify the migration of applications—from Dev/Test to production. Contractor shall ensure that all individual technical components configured with or added to the services mesh together to achieve the intended results prior to release to the production environment. Contractor shall operate the Dev/Test environment according to all County standards and in close alignment with the production environment. Upon County approval, Contractor shall use the VMware integration capability of the MPC and HMCB to clone production images to the Dev/Test environment.

Automated Tools for Deployment of Environment Models



Contractor's v 4.0 MPC solution is a commercial-release offering and shall be designed as a set of building blocks that can be sized and deployed to fit almost any enterprise's requirements.

Contractor shall provide sufficient SAN capacity in the Dev/Test environment for MPC to store cold virtual machine image files. Contractor shall manage Dev/Test workloads within a SAN-based repository visible to the

private cloud and perform tasks such as boot up and shut down of virtual machine images on-demand. Upon the County's request/approval, the tasks shall commence automatically. The Dev/Test environment shall have interfaces enabling connectivity to the production environment as needed to meet business needs. Contractor shall secure these interfaces with VLANs and access control lists. Identity access management services shall be applied across all County environments, including Dev/Test.

Production and non-production virtual servers in the MPC shall never reside on the same physical servers. If the application moves from the development/test phase to production, by making the test VM itself production, then that virtual server shall be moved into the production farm (cluster) when it goes live.

- Deployment plan for resources and use of facilities

The Dev/Test environment is part of the overall hybrid data center architecture and shall reside in the Tulsa data center.

The Rancho Bernardo lab remains available for integration and testing services and proof-of-concept applications or infrastructure that need to be isolated from the production network.

Resources working in the Dev/Test environment shall include Contractor project managers (PMs), developers, and operations staff, as well as designated County stakeholders during End-User testing phases.

- Processes solution including year-to-year continuous improvement

The methodologies and processes used to manage the Dev/Test Service are the same as those described previously in the Infrastructure Services

As described in the Solution Summary section above, Contractor uses the following methodologies:

- IT Strategy and Architecture (ITSA)
- ITIL framework

As a continual improvement initiative, Contractor and the County shall consider adopting development and operations (DevOps) approach to managing development. Contractor shall incorporate DevOps practices of collaboration, source control, deployments through version-controlled models, and system configurations. DevOps shall work together to design and maintain models and configurations in version control from which automated tools can fetch and deploy.

Specific to the Dev/Test environment, the Contractor team shall create new processes for:

- **Automated Release Management** – Using the approach described in the Solution Summary section above
- **Dynamic Image Management –** Used for turning up and down dynamic images and making sure that cold-stored images are reused (as opposed to creating new images every time) and processes for inventorying and removing cold-stored images. For physical servers, images are not dynamic, but if an environment is targeted for turn-down so that its resources may be reused for another project, Contractor shall have processes and scripts to back it up and remove it from active support status during the time while no projects are using its resources.

When a Dev/Test team needs an environment to support a new release, for example, they shall submit a request for requisite resources through the cloud interface or the traditional request process, depending on the resource needed. Upon approval of the request, and determination that sufficient capacity is available to support it, the resources shall be automatically provisioned in the cloud or the traditional VMware environment (or provisioned with task-level automation in the traditional hosting environment) and the requesting team notified of its availability, measured in hours, not months.

6.10. E-Mail Services

6.10.1. Process and Procedures

- Solution to meet the requirements and the rationale

Contractor shall migrate the existing, traditional-hosted Exchange 2010 email to O365 Exchange Online as a transition project.

Contractor shall manage the current Exchange 2010 high availability environment for email service that includes four Exchange servers each in Plano and Tulsa. Contractor's support shall include mailbox management, OWA traffic, ActiveSync, mail relays, GALsync, and RightFax. Contractor shall provide backup and restore functions, and meet special mailbox recovery and journaling requirements. Contractor shall also meet the current retention requirements of 118 days for deleted items and mailboxes and perform backups every other week and retain tapes for 2 weeks before overwriting.

O365 shall fully meet the County's requirements for email services and shall allow the County to take advantage of additional available functionality in a timeframe convenient for the County.

A full discussion of NetBond is provided in the Network Services Framework.

Rationale:

The transition to Exchange Online shall result in the following changes to the existing environment:

- One hybrid exchange server in Tulsa to maintain the local distribution lists
- The RightFax servers in Tulsa shall be connected to redundant local SMTP relays
- Microsoft shall provide email archiving, journaling and e-discovery services.

Contractor shall provide support for email, even after the transition to O365. The Contractor Service Desk shall own the trouble tickets and resolution from start to finish. Contractor and Microsoft shall use Contractor's ticketing system that is devoted to Contractor client support to meet the County's required SLs.

The following table illustrates how Microsoft Exchange Online meets the requirements of the RFP.

Microsoft Exchange Online and Office 365 Features

Requirement	Solution
With respect to licensing, the County has a Microsoft Enterprise Agreement (EA) in place that includes Office 365. The Microsoft EA also includes licensing for the data center Exchange servers.	Contractor's solution covers the County's existing subscription with Microsoft.
Migrate to the current version of Exchange	All MS office productivity applications such as Outlook are continually updated and patched to the most current version. During the migration to Exchange Online, End -Users shall be updated to the latest version of Office 365 Professional Plus. Office 365 Professional Plus shall be installed on all End-User devices as a part of Transition
Migrate to the current version of Outlook to desktops	
Contractor shall ensure high delivery of cloud based E-Mail Services and complete End-User integration.	
Maintain versions of Exchange within 12 months of new releases	
Maintain patch levels of Exchange within 3 months of any new release	

Appendix 4.3-1 Contractor's Solution

Requirement	Solution
Maintain County retention policies (60 days) without exception	Retention limits can be set across the board or down to an individual mailbox. A County-requested legal hold would be the only exception to the retention policy.
Unlimited Mailbox storage	Contractor shall configure the mailbox to use the archive as the mailbox location to provide unlimited storage.
Unlimited End-User archive storage	
Redundancy built-in to insure minimal down time for E-Mail End-User	MS Office 365 (including Exchange Online) provides 99.95% availability. Their infrastructure is architected with sufficient redundancy and replication to support this level of availability with no data loss due to failures; Contractor provide redundancy of network and surrounding components.
Continuous backup to prevent failure due to data loss	
Contractor shall maintain E-Mail Services so there is not a single point failure thereby assuring County daily use continues to operate during any unplanned event or outage.	
Malware and anti-spam protection at the perimeter and within the Outlook client	Exchange Online Protection (EOP) is included in Contractor's solution and provides malware and anti-spam protection at the perimeter and within the server. Malware protection at the desktop is provided by Symantec Endpoint Protection. EOP also provides the following capabilities: - Journaling - E-Discovery - Archiving - Data Loss Prevention Additional information about Exchange Online security is provided below this table.
Immutably preserve or In-Place Hold for End-User data, as requested	
Protection against unsafe attachments at the perimeter and the Outlook client	
Data Loss Prevention implemented per County policy	
E-discovery implemented and used as requested by the County	
Migration of PST files to Exchange archive	The capability to import PSTs in support of eliminating them from the local environment is available. Contractor shall provide migration of End-Users' PSTs
Elimination of PST files from End-User environment	
Implement Outlook Web Access (OWA)	portal.office.com is the Office 365 replacement for OWA—this is provided as part of the implementation during transition. Portal.office.com will only be accessible using County credentials. The process to enforce policy parameters on OWA is described below.
Lockdown OWA to further protect County information	
Mobile aware and productivity included	Microsoft offers a mobile application suite, including Outlook, or users can access portal.office.com via mobile. The same security capabilities apply.
Contractor shall establish and maintain global directory and synchronize E-Mail directories with all County Departments (e.g. Sheriff, District Attorney, SDCERA) or as specified by the County.	Synchronization is accomplished via Azure AD Connect, which Contractor has already implemented for County users. Additional End-User groups shall be added to the synchronization prior to migrating their mailboxes.
Complete migration of all active E-Mail users	Contractor's transition plan shall migrate all active email users
Contractor shall integrate fax capabilities into E-Mail Services for End-Users	Contractor shall integrate the current RightFax solution with Office 365 using a hybrid Exchange server and SMTP relay in the Tulsa Data Center.

Requirement	Solution
Contractor shall recommend a plan for County approval, and execute the approved plan for integrated digital signing to all mailboxes leveraging County PKI platform.	S/MIME is supported and configurable in Office 365.
Contractor shall recommend a plan for County approval, and execute the approved plan for integrated encryption services on all mailboxes based on leveraging the County PKI platform.	Encryption is provided in Office 365 and can be integrated with CoSign and/or the Symantec solution; Contractor shall provide a plan post-migration for County approval.
Contractor shall ensure through continuous review and report that all End-User mailboxes comply with the County's E-Mail retention policy.	Exchange Online provides administrative reporting and auditing that meets this requirement
Contractor shall recommend a plan for County approval, and execute the approved plan to send encrypted E-Mails to E-Mail addresses outside of the County network.	Cloud File Management provides integration into Outlook, which allows transmission of encrypted content to internal or external recipients which require authentication. Exchange Online Data Loss Prevention (DLP) also provides expiration of protected email and content. Cloud File Management has an "I forgot my password" function to enable self-service reset.
Contractor shall recommend a plan for County approval, and execute the approved plan for the ability of external recipients of encrypted E-Mails with access to encrypted content via an authentication.	
Contractor shall enable End-Users an expiration date for sent encrypted E-Mail messages.	
Contractor shall provide self-help password administration for recipients of encrypted E-Mails that permit passwords to be established and reset.	
Contractor shall maintain a timeline/roadmap of all E-Mail Services Hardware versions and Software version life cycles to adequately plan timeframes and completion dates to stay within supported versions of both Hardware and Software that assists in defining the standards.	For the Office 365 Pro Plus environment, Microsoft typically releases updates on the second Tuesday of each month to the Internet. Microsoft publishes an Office 365 public roadmap that provides visibility into upcoming releases to the cloud environment. Contractor shall maintain a timeline/roadmap of all email integrated hardware and software that support this schedule and release the Office 365 Pro Plus updates to the County End-User environment according to that schedule. A detailed description of the update process is available on Microsoft TechNet: https://technet.microsoft.com/en-us/library/dn761709.aspx and the public roadmap is available here: http://fasttrack.microsoft.com/roadmap Exchange Online updates are released quarterly. More information about Microsoft's update process for Exchange Online is available at https://technet.microsoft.com/en-us/library/jj907309(v=exchg.160).aspx
Contractor shall provide centralized support and tools for E-Mail Services hosted within the data center or hosted outside the data center.	The Service Desk shall provide the single point of contact for all email support, including Office 365 and all surrounding infrastructure, such as network, firewalls, fax equipment, and other supporting components. Through Contractor's enhanced support

Requirement	Solution
Contractor shall maintain and be responsible for all components needed to provide E-Mail Services (e.g. load balancers, firewalls, IPS).	service, Contractor provides agents co-located with Microsoft support teams to make sure that issues that need to be escalated with them are not simply dispatched but are followed through to completion.
Contractor shall provide continuous architecture and management resources to participate in planning of upgrades, refresh and transformational activities related to E-Mail Services.	Contractor's Architecture and Engineering team shall provide these services, in coordination with Contractor's Portfolio teams, Microsoft, and Contractor's other suppliers/partners such as AT&T, Symantec, and RightFax.
Contractor shall continuously investigate emerging technologies and services that improve the overall efficiencies, lowers overall costs and improves business application performance and security	

Office 365 Exchange Online Security

Encryption in Exchange Online. Office 365 encrypts data while at rest on their servers and while in transit between End-Users and Office 365.

Data In Transit. Exchange Online supports certificates using Transport Security Layer (TLS) version 1.0 through 1.2, and has recently moved from Secure Hash Algorithm (SHA)-1 certificate support to SHA-2 (Microsoft began deprecating SHA-1 certificate support in June of this year). TLS 1.2 uses Advanced Encryption Standard (AES) with 256-bit length cipher key. Microsoft begins with the strongest cipher key and algorithm and negotiates the proper level with the receiver. There are three types of encryption options with Exchange Online, as follows:

- Office Message Encryption (OME)
- Secure/Multipurpose Internet Mail Extensions (S/MIME)
- Information Rights Management (IRM)

Data-At-Rest. Email data at rest is encrypted using BitLocker Drive Encryption at Microsoft Government Community Cloud Data Centers on hardware using Trusted Platform Module (TPM) version 1.2.

Anti-Malware and Anti-Spam. Users on Exchange Online with Exchange Online protection have their email messages automatically protected against spam and malware. The service has built-in malware and spam filtering capabilities that help protect inbound and outbound messages from malicious software and help protect the County from spam. Exchange Administrators do not need to set up or maintain the filtering technologies, which are enabled by default; however, Contractor shall make company-specific filtering customizations in the Exchange Admin Center (EAC) or via remote Windows PowerShell, as required.

Spam shall be prevented as follows:

- **Connection filtering:** Checks the reputation of the sender before allowing a message to get through. Contractor is able to create an allow list, or safe sender list, to make sure that users receive every message sent to users from a specific IP address or IP address range. Contractor can also create a list of IP addresses from which to block messages. Since the license includes Advanced Threat Protection (ATP), connection filtering is used by *spoof intelligence* to create allow and block lists of senders who might be trying to spoof the County's domain.
- **Spam filtering:** Checks for message characteristics consistent with spam. Contractor can change what actions to take on messages identified as spam, and choose whether to filter messages written in specific languages,

or sent from specific countries or regions. Contractor can also turn on advanced spam filtering options if the County wants to pursue a more aggressive approach to spam filtering. Additionally, Contractor can configure End-User spam notifications to inform users when messages intended for them were sent to quarantine instead. From these notifications, End-Users can release false positives and allow Contractor to report them to Microsoft for analysis.

Office 365 Exchange Online can also monitor outgoing messages to determine whether they are assuming the characteristics of spam, and allow Contractor to act quickly. Contractor can further enhance spam filtering by creating custom Transport rules based on County policies. For example, Contractor can use Transport rules to set the spam confidence level (SCL) value for messages that match specific conditions.

Malware shall be prevented in the following ways:

- **Layered Defenses Against Malware:** Multiple anti-malware scan engines help protect against both known and unknown threats. These engines include powerful heuristic detection to provide protection even during the early stages of a malware outbreak. This multi-engine approach has been shown to provide significantly more protection than using just one anti-malware engine.
- **Real-time Threat Response:** During some outbreaks, the Microsoft anti-malware team may have enough information about a virus or other form of malware to write sophisticated policy rules that detect the threat even before a definition is available from any of the engines used by the service. These rules are published to the global network every 2 hours to provide the County with an extra layer of protection against attacks.
- **Fast Anti-Malware Definition Deployment:** The Microsoft anti-malware team maintains close relationships with partners who develop anti-malware engines. As a result, the service can receive and integrate malware definitions and patches before they are publicly released. Contractor's connection with these partners often enables Contractor to develop Contractor's own remedies as well. The service checks for updated definitions for all anti-malware engines every hour.

As part of the County's Advanced Threat Protection (ATP) subscription, there are further protections available. ATP helps prevent zero-day malware attacks in the County's email environment. Contractor is able to set up separate policies for ATP to check either links or attachments or both. Each policy can be applied to a specific set of End-Users, at County direction.

ATP aids in both email delivery and Web browsing from links in emails as follows:

- **Email Delivery**: If the safe attachments policy that applies to a particular recipient has an action of "Block," the email shall not be delivered until the attachments can be detonated by the safe attachments technology in EOP. Safe attachments shall launch a unique hypervisor to open the attachment. This can result in a delivery delay of 5 to 30 minutes for each mail evaluated by safe attachments.
- **Web Browsing (Safe Links)**: If a link points to a website recognized as not malicious, *Safe Links* adds very little latency to loading the target page. If the link points to a website recognized as malicious, the End-User is routed to a warning page and has to go through it (if click-through is enabled) to continue on to the site.

Exchange Online is a highly secure email platform with built-in encryption, anti-malware, and anti-spam. Any system is of course only as secure as its weakest link, and typically that link is at the client level. Microsoft has continually enhanced and hardened its mail clients, and Outlook on Windows as well as the Outlook app on mobile platforms is a highly secure portal to the County's email.

Outlook Web Access (OWA) has been Microsoft's web-based email solution for years; because it has been optimized for multiple browsers and versions of HTML, it is perceived as being less secure than other ways to get email. Contractor does not disagree with this perception. If one needs to use OWA, however, there are few methods to make its use more secure. The most secure way to access web-enabled clients is of course multi-factor authentication (MFA), but Contractor acknowledges that MFA is not a preferred approach at the County, so

Contractor is not recommending it. Contractor's recommendation therefore stands that, to maintain a highly secure email environment across the entire chain, it is most prudent to use Microsoft's dedicated client apps.

For End-Users who require OWA access, various limitations can be configured using the owamailboxpolicy parameters. For example, OWA on Office 365 Exchange Online can be configured to not allow downloading of any attachment while using OWA. It is configurable in two ways:

- via the GUI (basic on/off)
- via Powershell commands for owamailboxpolicy (which provides more options).

DirectFileAccessOnPublicComputersEnabled	Specifies left-click and other options available for attachments when the End-User has signed in to Outlook Web App from a computer outside of a private or corporate network. If this parameter is set to $true,Open and other options are available. If it's set to $false, the Open option is disabled.
DirectFileAccessOnPrivateComputersEnabled	
ForceWacViewingFirstOnPublicComputers	Specifies whether an End-User who signed in to Outlook Web App from a computer outside of a private or corporate network can open an Office file directly without first viewing it as a webpage.
ForceWacViewingFirstOnPrivateComputers	
ForceWebReadyDocumentViewingFirstOn PublicComputers	
ForceWebReadyDocumentViewingFirstOn PrivateComputers	Specifies whether an End-User who has signed in to Outlook Web App can open a document directly without first viewing it as a webpage.
WacViewingOnPublicComputersEnabled	Specifies whether an End-User who has signed into Outlook Web App from a computer outside of the corporate network can view supported Office files using Outlook Web App.
WacViewingOnPrivateComputersEnabled	

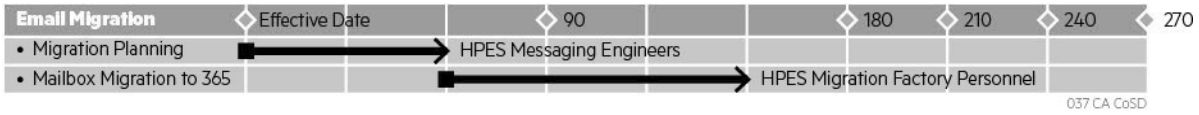
WebReadyDocumentViewingOnPublicComputersEnabled	
WebReadyDocumentViewingOnPrivateComputersEnabled	Specifies whether WebReady Document Viewing is enabled when the End-User has signed in from a computer outside of the corporate network.

- Deployment plan for resources and use of facilities

Contractor's approach to O365 deployment is a repeatable process that Contractor developed through numerous successful migrations, including the Contractor corporate email transition. Referred to as the Migration Factory, it is a standardized service that uses specialized tools running on temporary servers to move email boxes from traditional Exchange servers to the Microsoft cloud. Contractor shall complete the migration virtually, and at the Tulsa data center.

The migration planning process, shown in **Error! Reference source not found.**the figure below which Contractor anticipates to last 60 days, begins at the Contract Effective Date with Contractor's messaging engineers assessing the environment, determining the migration infrastructure need, setting up the temporary infrastructure, and developing a mitigation strategy to address any identified issues. With the migration infrastructure in place, the Migration Factory takes over, moving over email boxes quickly and seamlessly. Contractor expects the migration to occur during an 8 to12 week period.

Email Migration Timeline



Contractor shall provide project management support. Contractor's PM shall guide the process, and County personnel shall be supported through the normal Service Desk for any issues that might arise from an End-User access standpoint.

Contractor shall provide Enhanced Support for Microsoft Office 365. This service is a bridge between Contractor's Standard Service Desk services and the services provided by Microsoft. This is a team that is located in Redmond, WA, with Microsoft. The table below provides a list of the services provided by that team, showing the delineation between Contractor-provided support and support provided by Microsoft. The costs of these services are allocated between the Email RU and the User Data RU (Refer to Transformation Services for a description of this Service).

Contractor and Microsoft Support Responsibilities

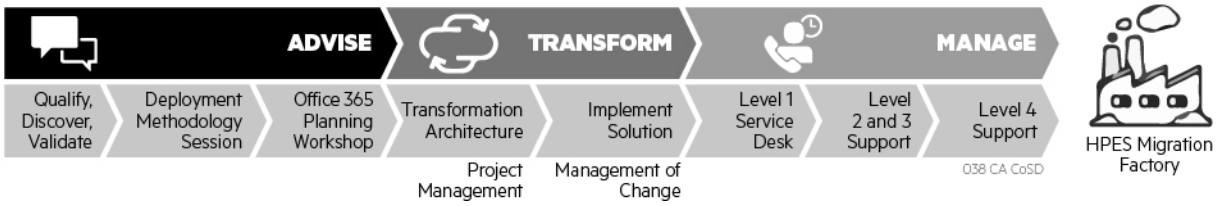
Roles or tasks	Contractor	Microsoft
Contractor and Microsoft Office 365 support team	– Contractor presence in Microsoft Redmond office – Shared document repository – – Knowledge databases, process documents, issue tracking – Weekly team meetings to review tickets, ongoing issues, planned changes, process improvements	
Office 365 service monitoring **Microsoft initiated triage and incident ticket management**	– Action tickets for hardware investigation and repair – Communicate any Office 365 service issues to the County	– Monitor services and platform, hardware, and network – Escalate ticket via case exchange to Contractor
County or Contractor initiated triage and incident ticket management	- Troubleshoot and provide resolution - Escalate via Contractor and Microsoft case exchange - Communicate resolution to the County	– Responsible to troubleshoot and work with Contractor to resolve the incident – Communicate the resolution to Contractor
Post incident time line and summary	Communicate post incident and prior to release of Microsoft Post Incident Response (PIR)	Review time line and summary with Contractor
Post incident response (PIR) and root-cause analysis	– Communicate to the County – Request Microsoft PIR on behalf of the County	– Responsible to develop PIR – Communicate with Contractor

Reporting	– Active and inactive mailboxes – Types of mailbox connections – Mailbox usage and mail activity reports – Mailbox administration activity reports – Mail Security reports – Mailboxes marked for eDiscovery and Litigation Hold – OneDrive for Business sites deployed – OneDrive for Business storage	– Service level availability compliance – Incident reporting – Volume and resource utilization – Post Incident Response and root-cause analysis

- Solution including year-to-year continuous improvement

The O365 Transformation methodology follows Contractor's standard process to advise, transform and manage, illustrated in the figure below. Messaging engineers shall conduct due diligence on the current environment, and prepare the infrastructure and tools that the Migration Factory personnel shall use to move from Exchange 2010 to Exchange Online. As groups are migrated, Contractor shall move into the manage phase, providing support for the entire Office 365 suite from Contractor's Service Desk to Contractor's Contractor/Microsoft co-located support group in Redmond.

Contractor Transformation Methodology



6.11. Unified Communications Infrastructure Services

6.11.1. Process and Procedures

- Description of solution to meet the requirements

With the transition to O365, the vast majority of the County's email shall come from Microsoft's Government Community Cloud, as well as the Lync/Skype for Business infrastructure.

While most End-User experience with UC is local, the underlying functionality shall be delivered from the Microsoft Government Community Cloud. Contractor shall continue to support Avaya phones at the desk and from the AT&T POP in San Diego.

Hosting UC in the cloud is the most-cost effective and technically feasible approach as this architecture is designed for Cloud Delivery.

- Deployment plan for resources and use of facilities

Aside from a single hybrid Exchange server and an email relay in the Tulsa data center, almost all of the data center Services infrastructure for Unified Communications shall be in Microsoft's Government Community Cloud.

Some features of the Government Community Cloud shall be as follows:

- The County's content is stored within the U.S.
- Access to County content is restricted to screened Microsoft personnel.
- Office 365 Government complies with certifications and accreditations that are required for U.S. Public Sector (USPS) customers, such as FedRAMP Moderate.

Lync/SfB functionality shall be, by the end of transition, on O365 Exchange Online also.

6.12. Storage Services

6.12.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall provide storage capacity to support Tier 1, Tier 2, and all dependent applications in the Tulsa data center using a dedicated SAN. The 3PAR P20000 shall have a 5.6TB of Solid State Disk (SSD) storage for 3PAR metadata. Service storage tiers shall be provided as follows:

- Tier 1 storage in the Tulsa data center shall be configured using low cost 10,000 RPM drives, blended with 9.6 TB of flash storage, that are thickly provisioned and shall provide higher performance at a lower cost than the current 3PAR with 15,000 RPM drives.
- Storage for Tier 2 applications, shall use 10,000 RPM disk drives when thinly provisioned or combined with 7200 RPM disk drives.
- Contractor shall also use 7200 RPM disk drives for archive storage that includes low performance, End-User replicated or infrastructure services.

Contractor shall use the SAN 3PAR array to develop, install, and maintain Wintel and UNIX application infrastructure storage. In some cases, direct attached storage may be required for ongoing service support. Contractor shall work with the County to develop plans to migrate all services requiring storage to the SAN storage solution.

Contractor shall refresh the EMC Centera for the immutable storage tier in the Tulsa data center and at the DR site. The immutable storage shall be replicated from the Tulsa data center to the DR site to ensure a copy of the documents on immutable storage are available during a DR event.

At the document processing center (DPC) Tier, Contractor shall use a storage cache for scanned paper documents that shall be transferred to immutable storage in Tulsa.

Rationale: Tiering Level.

The storage solution provided is a 3PAR 20000 with the same storage tiers provided from 10,000 RPM drives and 7,200 RPM instead of the 15,000 RPM and 7,200 RPM drives. This is possible because the new 3PAR 20000 uses an internal infrastructure to achieve better performance using 10,000 RPM drives. The architecture features the HPE 3PAR Gen5 Thin Express ASIC for hardware accelerated thin technologies, including inline deduplication and 5.6TB of flash storage. Using 10,000 RPM drives provides a lower price per GB of storage at a higher level of performance.

The 3PAR 20000 solution with SSD disk drives, 10,000 RPM disk drives, and 7200 RPM disk drives was selected to provide better performance with lower cost disk drives than the current 3PAR P10000 with 15,000 RPM and 7200 RPM drives.

The current 3PAR P10000 storage is using a maximum throughput of only 2450 KBs per second, and the 3PAR 20000 with 10,000 RPM drives is able to provide throughput of 2438 MBs per second—a rate that is nearly 1,000 times greater than the Country is using in their current storage solution. Providing more than 1,000 times the performance than the Country is using would not be money well spent, and providing 10,000 RPM drives shall more than meet the performance that the County requires.

The figures below were generated from the County's recent storage activity. Performance data from the two current 3PARs were used to simulate the expected performance of the new frame. The current Tulsa and Plano 3PAR P10000 reached a peak of ~2450 KBs per second, while the 3PAR 20000 10000 RPM drive storage is capable of 2438 MBs per second. The 3PAR 20000 is the latest innovation in enterprise storage from HPE. It is the evolution of the time-tested 3PAR storage, so there is little risk to the County by refreshing this storage. Primary data (all 3PAR-based tiers) is replicated to the DR site for applications requiring a 48-hour RTO. **Error! Reference source not found.** summarizes performance of 3PAR 20000 with 10000 RMP drives.

Performance Summary 3PAR 20000 with 10000 RMP Drives

Drives	Quantity	Model	RAID	Workload	I/O size	R/W	MB/S	IOPs
SAS	608	1.2TB SAS 10K SFF	RAID5 (7+1)	Random	32K	60% Read	2,438	30
SSD	32	400GB SSD SFF	RAID5 (3+1)	Random	32K	50% Read	4,712	150,796

EMC Centera was chosen for immutable storage. EMC professional services shall be used to install, configure, and migrate the existing immutable storage environment to the refreshed environment.

Contractor selected this storage solution because it delivers a cost effective approach through the use of different types of storage media aligned to meet the criticality of the applications being stored. In combination with the MPC storage capabilities, the storage capacity shall provide the flexibility desired by the County because it can be allocated as needed to meet changing requirements.

- Deployment plan for resources and use of facilities

With consolidation of the data centers to Tulsa, storage shall be provided at Tulsa and at the DR site in Colorado Springs. Contractor shall provide storage administrators in Tulsa and a supplemental staff in San Diego to support all County locations. All of these sites shall be access controlled to restrict physical access only to people who need it.

Contractor's San Diego storage team shall have overall storage management responsibilities as the central storage management point for the County.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor shall follow established and proven methodologies and key process in all aspects of operations and maintenance (O&M) support, and Contractor shall fully support the County as described below.

- Contractor shall utilize an ITIL framework, Contractor's proven SOPs, industry standard best practices and County policies, processes and procedures to provide storage and innovative, proactive, and responsive O&M.

- Work with the County to develop plans to migrate service from direct attached storage to SAN storage.
- Refresh, support, and manage DPC storage.
- Work with the County to make sure application infrastructure services Contractor SAN storage.
- Support the traditional data center and MPC in Tulsa using the same SAN 3PAR to provide a centralized storage services solution managed by a single SAN administration team.
- Provide usable capacity reports to the County not to include replicated, backup, or DR data storage.
- Provide 20% year-over-year storage growth for 5 years to accommodate the County's business growth.
- Produce storage services reports by storage tier to the Business Group, department, and End-User levels.
- Provide OneDrive for Business for End-User unstructured data storage on Microsoft's Government Community Cloud. User can log into the OneDrive for Business portal to monitor and self-manage OneDrive storage. Contractor shall work with the County to provide self-service reporting and self-service management in other areas of storage services. Initially this shall be access to regular monthly storage reports via the Service Portal, but if desired, Contractor can expand this to include ad-hoc reporting.
- Work with the County to lower the cost of storage.
- Continually evaluate, evolve, and deliver plans to reduce data loss for storage services.
- Produce and submit recommendations on storage services architecture.
- Produce and submit plans on shared storage services consolidation and application server migration to shared storage services environment annually.
- Produce and submit storage services policies and procedures.
- Produce and submit storage services reporting policies and procedures.
- Produce and submit storage services refresh plan annually.
- Produce and submit plans for meeting storage demands.
- Produce recommendations for process improvement in backup and recovery for storage services assets.
- Recommend and submit recovery policies/procedures for storage services assets.
- Produce and submit recommendation on capacity management.
- Produce and submit plans to add storage.
- Plan and schedule all storage-related software/driver/microcode patching and upgrades.
- Design and implement recovery processes based on approved policies/procedures.
- Design and implement storage services management processes based on approved policies and procedures.
- Implement storage services reporting.
- Design and implement storage consolidation based on approved recommendations.
- Deploy, manage, communicate, and report on activities related to storage service refresh
- Design and implement storage services provisioning and allocation processes based on approved policies
- Design and implement capacity management
- Implement approved Storage services policies and procedures
- Implement necessary physical and logical security to protect the County's data (through access controls, storage network, and host-based allocation controls, SAN zoning and host/array-level logical unit [LUN] masking).
- Provide support, including break-fix, for all storage services assets.
- Manage and affect the appropriate resolution of Incident events until the operation of the storage is returned to normal by following customized procedures as well as resolving Incidents upon an automated or manual detection of an event related to storage components
- Manage and support the storage services,
- Produce and submit monthly storage services reports,
- Support storage services refresh,
- Perform and support media management activities for storage services
- Manage and support the media requests
- Provide data storage services (such as RAID groups, storage pools, LUNs, presenting— masking and zoning, reclamation, optimization—tiers, deduplication, thin provisioning, among others)
- Perform tapes mounts as required.
- Perform special tape shipments as requested.

- Provide options for on-premise and offsite data backup storage.
- Provide backup and restore options such as single End-User restores.
- Load and manage third-party media as required.
- Prepare and manage media for use by microfiche service.
- Manage and perform file transfers and other data movement activities related to break/fix or consolidation of storage services assets.
- Perform data backups of storage services per approved policies and procedures.
- Perform recovery processes on storage services assets.
- Perform storage utilization management.
- Manage and maintain all storage services assets and services.
- Produce and submit storage services management reports,

Classification of County data to match required storage tiers.

Classification can imply the County's standard sensitivity classification structure: Public, Sensitive, and Confidential; however, classification can also be extended to permit very granular categorization to support specific policies.

Contractor shall tag documents as they are ingested using a technology-oriented approach to analyze and auto-classify the data.

Contractor's structured four-step process for data classification shall include the following:

- **Understanding the Landscape** – The process begins by gaining insight and understanding of the legacy and "dark data" landscapes. Contractor defines dark data as information assets collected as normal business activity, but these are generally not used for other purposes. Contractor then creates a Solution Roadmap illustrating the go-forward plan and Return on Investment (ROI) for the organization. For the County, Contractor shall accomplish this by sampling approximately 1 TB of data currently residing on the County's existing file share environments. The assessment shall showcase where unstructured data exists and how frequently is it being referenced/used so that intelligent decisions can be made around data management, archiving, retention, and retirement.
- **Develop data categories** – Using automated tools and common categories, Contractor develops a set of categories specific to the County such as Public, Sensitive, and Confidential. Contractor selects a set of representative documents from the County's data repositories to use for training and benchmarking. This makes certain that the categories created are based on meaningful concepts and real business context. This capability improves the efficiency and accuracy of categories and the application of policy to content. Preparation of these draft categories shall not affect documents in production systems.
- **Refine and Test** – To determine the relevance of the categories to enterprise documents, refining a category is done by adjusting the weighting of a term, the selection threshold, or by adding a field text. These activities can be done individually or in combination. A category can be published, making it available for use in automated policy execution against content managed by the tool suite.
- **Auto-Classification (requires optional Transformation project)** – Once unstructured data is categorized; Contractor applies policies for ongoing management. Policies can be created with keywords, metadata, and/or example documents. Using the desired tool suite, Contractor can automate policy application and govern all aspects of the information lifecycle including deletion prevention, storage management, and ultimately disposition management by applying policies at data creation. Additionally, de-duplicating unstructured data across repositories helps to minimize storage costs and reduce discovery times.

Use of Tools

Contractor shall use tools native to 3PAR that are included in the software of the storage devices.

The 3PAR provided in this solution shall be capable of creating thinly provisioned volumes. The Contractor storage team shall be well-versed in managing these volumes, including close monitoring of volume growth that results in having storage available when needed. Traditional provisioning of storage volumes generally results in large amounts of unused storage that has already been dedicated to a host. Thin provisioning allows for over allocation of the 3PAR storage array and reduces the County's cost by delaying physical storage increases.

The 3PAR shall also have auto tiering capabilities with flexible configuration rules that allow for internal automatic migration, lightly accessed data on high performance, high cost storage to more cost effective, lower performing storage when the need for high performance storage is not warranted, based on the auto tiering configuration. The auto tiering configuration is flexible and allows Contractor to adjust the data migration criteria to rebalance data and free up higher performance storage as needed.

HPE 3PAR System Reporter Software shall be used to automatically collect data on a number of different object data points in the background. The Storage Administrator shall use the 3PAR StoreServ Management Console (SSMC) or the 3PAR Command Line Interface (CLI) to display and report on collected data from an array. Using the SSMC, graphical reports are available for the following metrics.

• Historical data (Performance, Histogram, Capacity)

• Real time data (Performance)

HPE 3PAR System Reporter is a feature-rich analytical engine, which helps Contractor interpret and respond to collected performance data and make sure the Portfolio Applications are performing optimally in the environment.

6.13. Backup and Recovery Services

6.13.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall continue to create backup schedules and policies for the County's data. Contractor shall monitor the backup infrastructure, follow the change management process, facilitate backup completion, and restore backup data on a consistent basis by performing backup restore tests at least once per quarter. The BUR solution shall be adaptable to a non-disruptive transition of services.

Contractor shall provide the current BUR services at the Plano and Tulsa data centers and at the County's sites.

In preparation for the data center consolidation, Contractor shall provide planning support to the County and minimize disruption as workloads and technologies evolve while providing O&M support during transition without interruption.

The existing production backup sets shall be copied to the new solution so that no backup set data is lost during transition. A StoreOnce VTL at the DR site shall join the backup environment as a replication target. Backups shall be replicated to the DR site. Full replication of backups shall serve two purposes:

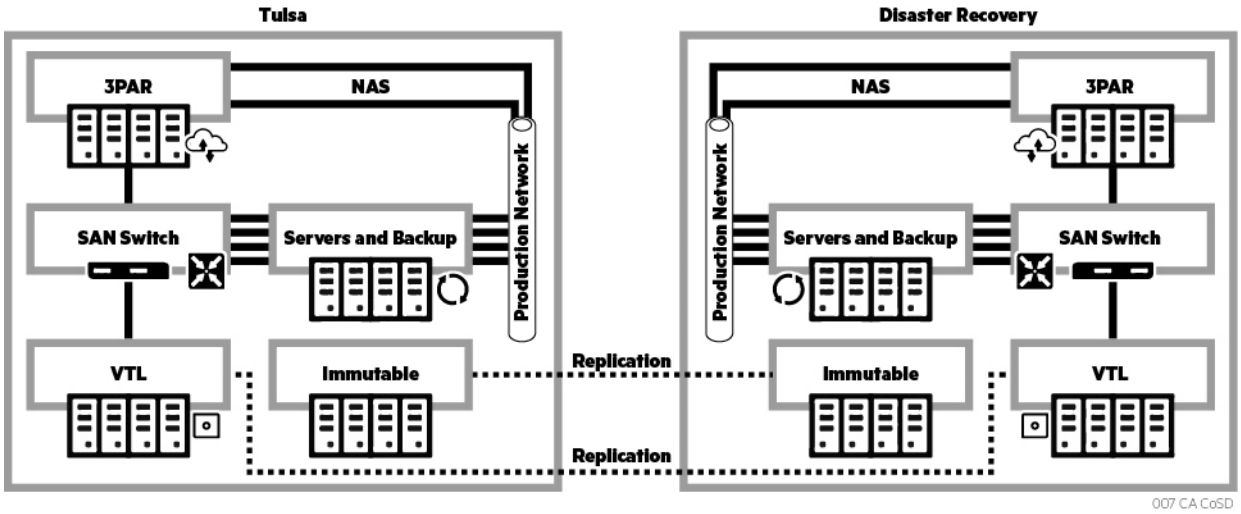
- For applications that require a 72-hour or greater RTO for DR, these backups shall be used to restore service at the DR site.

For all applications, the duplicate backup system provides restore capabilities in the event the primary system is unavailable for an extended period of time. As services are migrated from Plano to Tulsa, Contractor's backup administration team shall create the service's schedule and policy in Tulsa and remove the service backup schedule and policy in Plano for those servers that have completed migration. These backup sets shall be

replicated to the DR site as they are created. When all Plano services are successsfully migrated to Tulsa, the backup environment in Plano shall be decommissioned.

. Contractor's solution shall incorporate 100% duplication of BUR data for the production data center at the DR site. The information shall be replicated between the sites using a dedicated network connection. The backup sets shall be stored in a Virtual Tape Library (VTL) at both locations. **Error! Reference source not found.**The figure below illustrates this solution.

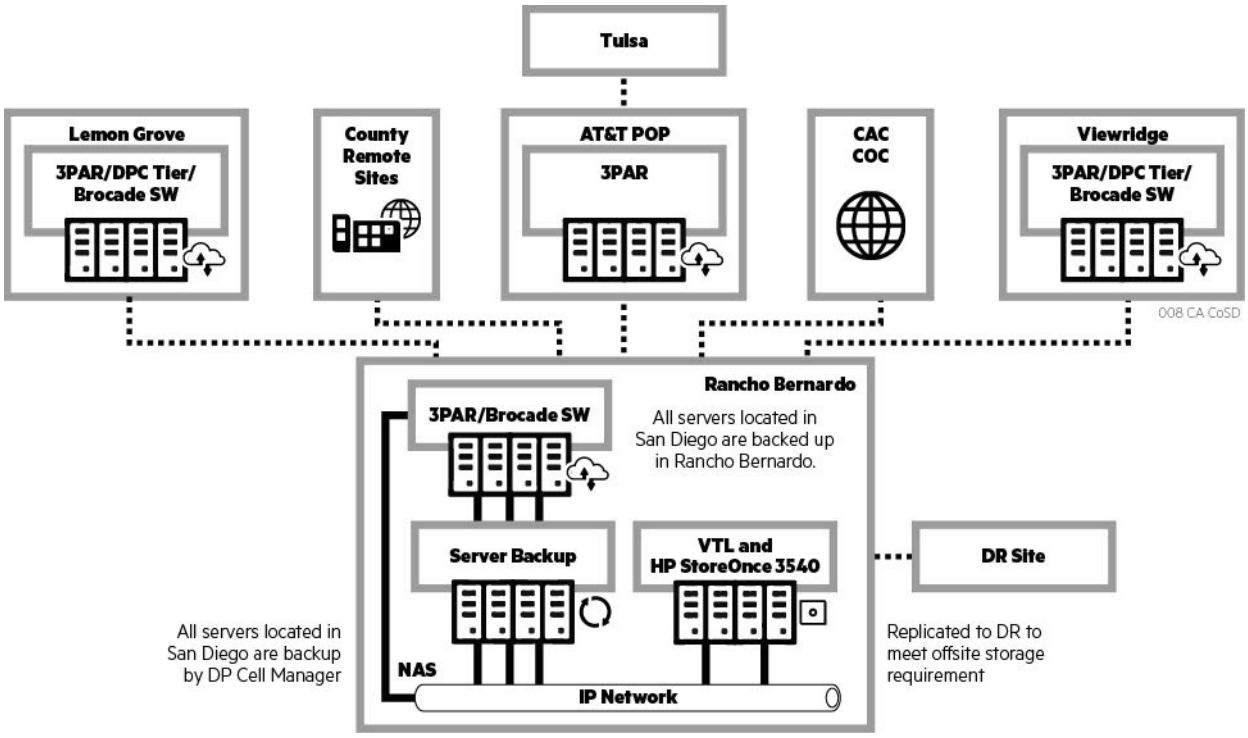
Future Logical View of Data Center Mid-range Server Storage / BUR



Contractor's BUR solution shall provide 100% redundancy of backups in the Tulsa data center and the DR site, providing secure off-site storage of backup data, improved reliability, and quicker data recovery.

In the County's document processing centers, Contractor shall create and consolidate backups at the Rancho Bernardo site using a small disk-based VTL, which shall be refreshed with a replacement of similar size. These backup sets shall also be replicated at the DR site in Colorado Springs. The figure below provides an overview of this solution.

Future Logical View of Document Processing Centers Storage / BUR



Contractor's BUR solution for the data processing centers provides added reliability by backing up servers to Rancho Bernardo and replicating those backups for off-site storage at Colorado Springs.

Contractor shall perform backups of the AT&T POP, Lemon Grove, Viewridge and Rancho Bernardo (collectively known as the San Diego sites) in Rancho Bernardo. Contractor shall copy the existing Rancho Bernardo backup data sets to the replacement VTL to prevent backup dataset loss during the refresh. During the transition period, Contractor shall also replicate the Rancho Bernardo backups to the DR site for off-site retention. This approach provides several advantages:

- Elminates the need for a physical tape library and physical backup tapes, reducing the time required and complexity associated with performing backups.
- Eliminates the need to transport tapes for off-site storage by taking advantage of the DR site to perform this storage function.
- Speeds data restore activities by eliminating the time required to obtain backup tapes from a remote storage facility.

When the data center consolidation is complete, the production and Dev/Test, storage and BUR infrastructure, and O&M support shall be provided in Tulsa, with DR capabilities in Colorado Springs, Colorado. The Contractor backup administratiom team shall continue to provide centralized backup and recovery management from any location because all backup shall be to VTLs and replicated to the DR site over a dedicated replication network connection, eliminating any local tape handling requirements. All County data shall be backed up, as required.

Built on HPE Data Protector 9.0 software, Contractor's BUR solution shall provide comprehensive functionality designed for enterprise environments using a dynamic and agile data protection strategy. HPE Data Protector servers shall integrate with LDAP authentication services and support file inclusion and exclusion as an extra level of control. The Contractor administration team shall provide for auto-discovery of virtual servers, supports single-pass image backups of virtual servers, shall provide integration with HPE Data Protector with Oracle RMAN, and shall integrate with VSS to backup Shadow copies that have been created. It shall provide

standardized backup and recovery across applications, formats, storage platforms that include disk, snapshots, tape, and cloud, with improved reliability if it becomes necessary to load stored backup data in the event of a failure. It shall provide standardized backup and recovery across applications, formats, storage platforms that include disk, snapshots, tape and cloud, with improved reliability if it becomes necessary to load stored backup data in the event of a failure. HPE Data Protector shall provide real-time operational intelligence through a customizable BUR dashboard, that Contractor shall publish on the Service Portal.

Backups shall be weekly full backups and daily incremental backups. The backup retention period shall be customized within the policy that defines the backup, based on the type of data being backed up. Custom retention periods can be defined for specific Portfolio Applications, with County approval if the retention period requested is outside of the policy. Contractor shall categorize the types of data requiring backup and retention timeframes, as detailed inthe table below when developing the BUR solution.

Types of Data Requiring Backup and Retention Timeframes

TYPE OF DATA	RETENTION PERIOD
User unstructured Data (NAS): • H: Drives • S: Drives • Application Dev/Test • Application Production	90 days
Exchange 2010 (Email) • All Passive databases	14 days
Structured Data (Databases) • Dev/Test • Production	30 days
Application Servers • Dev/Test • Production	30 days
Infrastructure Servers • Domain controllers, SCCM Servers, Citrix, among others	30 days
Immutable Storage • Host based backups	30 days

For the County, the hardware solution shall be comprised of:

- HPE Data Protector Servers (7 cell managers and 9 media managers)
  - Cell managers are the servers that control, monitor, and store all backup object information
  - Media manager servers connect to backup target medion (disks, virtual tape or physical tape media) to access those media destinations.
- HPE StoreOnce B6600 disk-based backup media target, or VTL, in Tulsa. All Tulsa data center backups shall be replicated to a VTL in the DR site in Colorado Springs
- Contractor's StoreOnce 3540, at the Rancho Bernardo site, shall also be replicated to the DR site for off-site backup set protection.

Additional functionality provided by this solution includes the following:

- SharePoint – granular restore
- VM Server – snapshot restore

- Synchronized backup application for the Enterprise Document Processing Platform (EDPP).

  For cloud applications hosted outside of the Contractor data center, backup options shall be provided by the Cloud Service Provider.

Rationale: This approach shall provide improved reliability by eliminating a point of failure present if portions of data are backed up by different sites.

- Deployment plan for resources and use of facilities

Until the data center consolidation is complete, BUR services shall continue to be provided in the Plano and Tulsa data centers and the County document processing centers at Lemon Grove and Viewridge.

After the data center consolidation, Tulsa shall serve as the production data center and Colorado Springs shall be the DR site. The County document processing centers at Lemon Grove and Viewridge shall continue to serve the same functions. At this time, the space provided for the County in the Plano data center shall be released, and connectivity from the AT&T POP shall serve Tulsa only.

Contractor shall provide backup administrators in Tulsa with additional local staff to support the San Diego sites and shall be responsible for management of the immutable storage in Colorado Springs. They shall also manage the replicated images, 100% of which shall be replicated to the DR site.

SAN and SAN storage hardware shall be managed by Contractor USPS resources.

- Key methodologies and processes in solution including year-to-year continuous improvement

Contractor's BUR processes shall address the following types of backups:

- Virtual Servers – Snap Shot is VMware based for data within the VMware image, includes system state.
- Physical Servers – Host-based, using traditional backup agents that coordinate backup by looking at the files from the Host side.
- NAS – Fiber Channel, the backup system communicates directly to the array instead of the host to take the backup.

Specific process documents are discussed in the table below.

Process Documents

PROCESS	PURPOSE
HPE Data Protector Backup Verification Process	This purpose of this document is to verify that backup data can be restored and read. This shall be performed weekly by the BUR Administrator.
Preparing HPE Data Protector Cell Managers Prior to Scheduled Backups	The purpose of this document is to outline the steps preparing HPE Data Protector Cell Managers prior to scheduled backups. This shall be performed weekly by the BUR Administrator.
Upgrading the DPA Collector Agent on HPE Data Protector Cell Managers	The purpose of this document is to outline the steps to upgrade the DPA collector agent on the HPE Data Protector cell manager servers. This shall be performed weekly by the BUR Administrator.
Restarting Stalled or Unresponsive HPE Data Protector Backup Sessions (DOC ID BUR 0010)	The purpose of this document is to provide the process to be followed when In-progress backup sessions appear under Monitor in the HPE Data Protector Manager GUI, but attempts to view the

PROCESS	PURPOSE
	session result in the GUI freezing. This shall be performed as needed by the BUR Administrator.
StoreOnce Troubleshooting (DOC ID 0015)	Outline the process steps on how to troubleshoot the StoreOnce application. This shall be performed as needed by the BUR administrator
Workaround for Hung Sessions Due to Catalyst Media Server Timeout (DOC ID 0017)	Outline the steps and workaround procedures for hung sessions due to Catalyst media server timeouts. This shall be performed as needed by the BUR administrator.
How to Restart and Resume County of San Diego Backup Sessions (DOC ID 0018)	Outline the steps for restart and resume County backup sessions once failed objects and sessions have completely failed. This shall be performed as needed by the BUR administrator.
How to Kill the HPDP Session Using PID with Catalyst Devices (DOC ID 0019)	The purpose of this document is to outline the process steps on how kill the HPDP session using PID with Catalyst devices. This shall be performed as needed by the BUR administrator.
How to Archive Bit Reset Configuration for SQL Flat Files in HPE Data Protector (DOC ID: 0020)	Outline the process steps on how to archive bit reset configuration for SQL flat files in HPE Data Protector. This shall be performed weekly by the BUR administrator.
Resolving Latency on User and Data Shares (DOC ID: 0021)	Outline the steps and procedures for resolving latency on End-User and data shares. This shall be performed weekly by the BUR administrator.

Integration of data with Backup and Recovery Services, using required connectors such as Oracle RMAN and VSS.

Contractor shall support and maintain RMAN to write database backup files to spinning storage that is made available on the database server for the purpose of backups. The cost of the licenses for Oracle RMAN is not included in base services. The backup files on spinning disk shall then be captured in the next Contractor Data Protector backup. The files shall be stored on Contractor's tapeless backup media and replicated over a dedicated replication network connection to the DR site hundreds of miles away in Colorado Springs. Contractor shall support the creation of VSS (shadow copies), and the Contractor backup solution shall also be able to back up VSS shadow copies directly with a local copy of that backup written to the tapeless backup target and be replicated to Contractor's remote backup media.

6.14. Managed Print Services

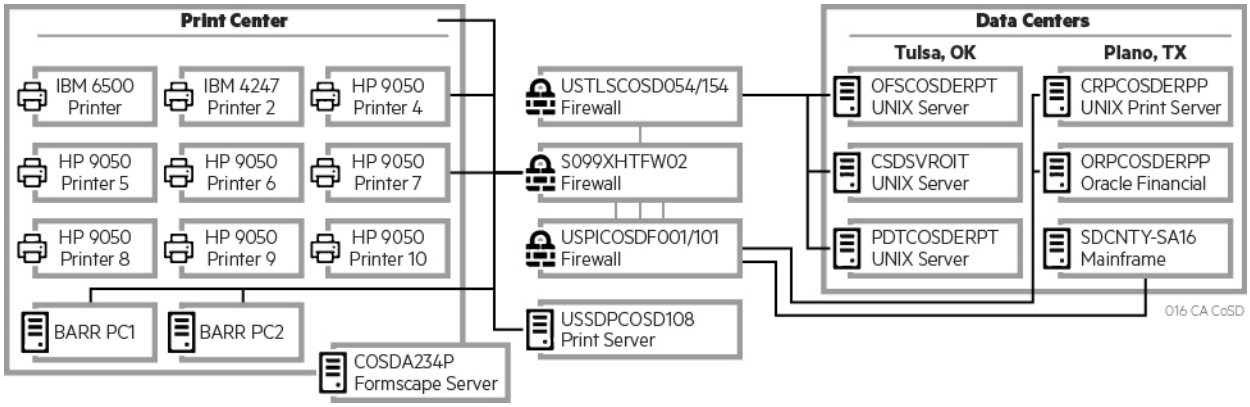
6.14.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall provide managed print services via the County print room facilities located at the Rancho Bernardo site. Contractor's print operations processing shall take place Sunday through Friday from 8:30 p.m. to 2:00 p.m. PT, with on-call support available as needed.

With the transition of the Juris-managed print requirements to Fujitsu, Contractor shall continue to provide managed print services of approximately 200,000 pages per month on average to meet Assessor and Tax Collector requirements. This shall be conducted at Contractor's print facilities at the Rancho Bernardo site. Contractor shall use the BARR print management tool to receive the files for printing. **Error! Reference source not found.**The figure below illustrates how print files are currently transmitted to Contractor's print center.

Transmission of Print Files to Required Printers



Migration from SA16 LPAR Mainframe to the Integrated Property Tax System (IPTS) shall consolidate and modernize the legacy property tax systems in a web-based system designed to vastly improve the efficiency of the property tax-collecting process. It shall also generate the tax bill files for printing. After implementation of IPTS, Contractor shall update processes and procedures associated with running daily print jobs for County Assessors and Tax Collectors.

Contractor shall provide the following services for the managed print framework component:

- Order supplies such as Contractor print toner and printer maintenance kits
- Ordering special forms and paper
- Provide support for microfiche

- Daily delivery of reports Deployment plan for resources and use of facilities

Contractor's primary print facility shall be the Contractor's Rancho Bernardo site and with the implementation of a disaster recovery solution, multiple geographically diverse sites shall have the capability to provide print services for the County. Print jobs shall be easily routed to any location. **Error! Reference source not found.**The table below summarizes the specific types of printing provided at each location.

Types Printing Provided at Each Location by Contractor

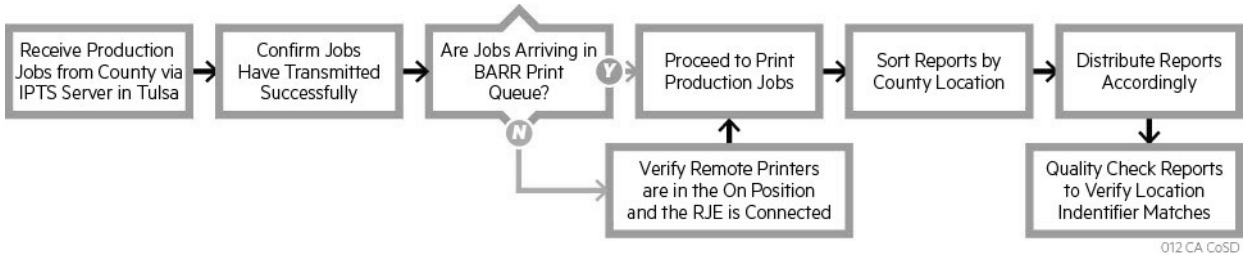
TYPE OF PRINTING	LOCATION
Laser and Impact Print	Rancho Bernardo
Annual tax bills, supplemental (small volume) tax bills, and tax bills that require manual intervention of the Treasurer-Tax Collector's (TTC) office.	Rancho Bernardo, with backup at Rancho Cordova
One-stop document and tax bill management—folding, envelope stuffing, and mailing	Rancho Cordova
Laser Print and Tax Bills (Dev/Test)	Troy, Michigan (trial) Rancho Bernardo Rancho Cordova

Contractor's dedicated staff shall work in the print center at the Rancho Bernardo site with responsibility for printing, distribution, and delivery of daily work.

- Key methodologies and processes in solution including year-to-year continuous improvement

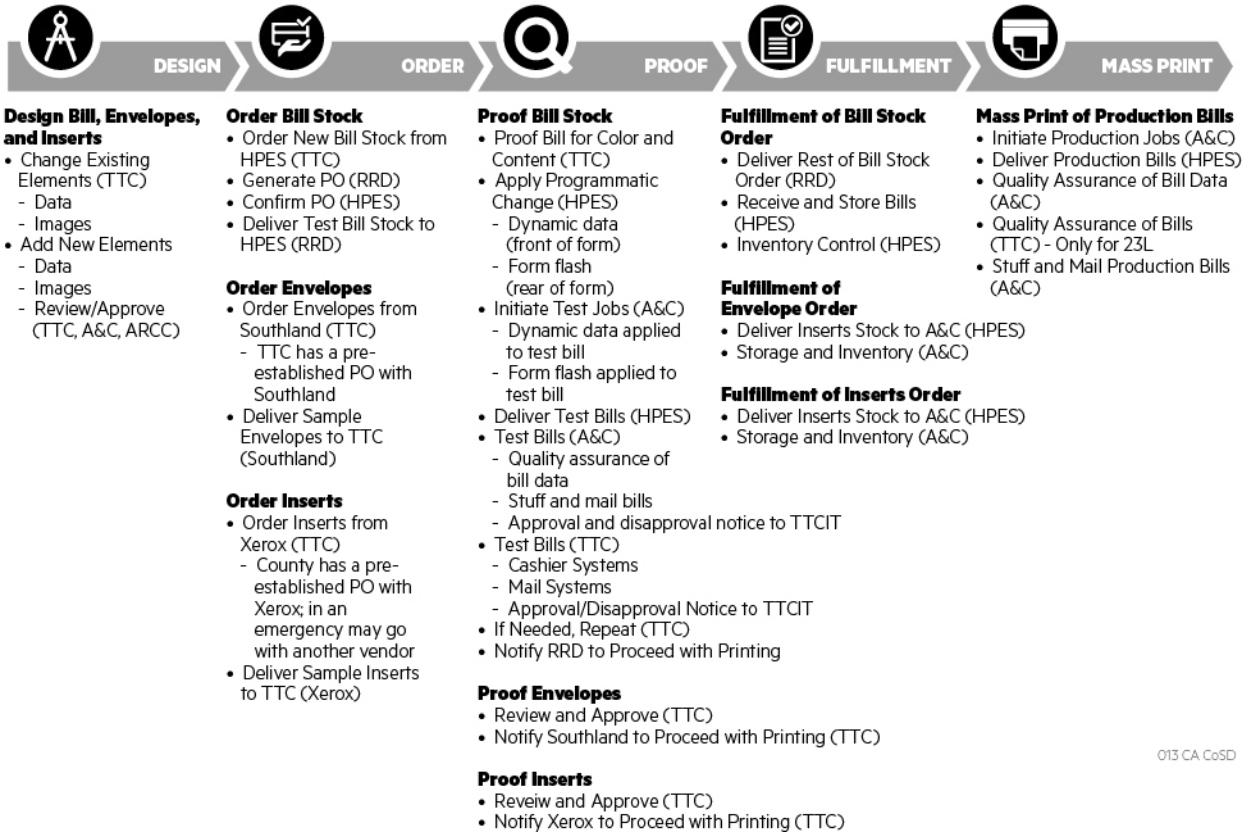
The figure below illustrates the process Contractor shall follow to receive print requests and print the reports for distribution to the County within the prescribed timeframe in Service Levels.

Contractor Process for Receiving and Printing Reports



Contractor shall follow the process checklist shown in the figure below and documented in the Standards and Procedures Manual.

Tax Bill Generation Process



Contractor shall use the BARR Systems Print Server to automate and control print and document output.

6.15. Public Key Infrastructure (PKI) Services

6.15.1. Process and Procedures

- Description of solution to meet the requirements

Contractor shall leverage the current MPKI 8.13 solution and use that as the foundation for additional PKI services. This solution shall be a fully extensible and redundant platform sized for the current project as well as future functionality. Key features and benefits of the Managed Symantec PKI solution shall be:

Key Features

- **Trusted, Cloud-Based Infrastructure:** Monitors, manages, and escalates across the globe with full DR and is certified as part of a SAS-70 security, WebTrust and specialized Government audits.
- **Broad Application Support:** Issuance of X.509 certificates that interoperate with operating systems, devices, VPN, mail, and web browser software. Certificate profiles for common applications are for email encryption and signing, and Adobe PDF signing.
- **Automated Certificate Life Cycle Management:** Automates configuration of authentication, encryption, and signing applications across platforms and browsers. Managed PKI service can automatically configure an End-User's browser, VPN client, mail client, or other application to use certificates. PKI Client also automates renewing certificates and prevents expired certificates from interrupting business continuity.

- **Enterprise Integration:** Integrate Managed PKI Service with a corporate directory to populate certificate meta-data, select and enforce certificate and application policies, and publish issued certificates. PKI Enterprise Gateway functions as a local registration authority integrating with hardware security modules to protect key material.

Key Benefits

- **Reduces PKI Cost and Complexity:** Managed PKI service's cloud-based approach dramatically lowers cost and complexity by eliminating the facilities, hardware, software, personnel, training, and maintenance expenses associated with deploying traditional in-house PKIs.
- **Simplifies the Administrator and End-User Experience:** Eliminates administrator tasks, and automates the process of provisioning certificates and configuring applications to use those certificates.
- **Maximizes Deployment Flexibility:** Not only can organizations deliver multiple certificate-based security applications from a unified platform, but they can also tailor the deployment to meet their needs.
- **Delivers Proven, Scalable, Reliable PKI:** Symantec's procedures, policies, and infrastructure have been proven with large enterprises, governments, and manufacturers around the world

Self-service via the Service Portal shall be made available for specific use cases, for optional services or functions, such as certificates required for digital signing of expense reports.

The approved County solution for digital signing is the existing ARX/CoSign document. Contractor shall work with ARX/CoSign to develop and implement previously identified changes in the document signing solution to utilize the Symantec PKI certificates as part of transition.

Contractor shall integrate Symantec PKI with DocuSign CoSign. Currently the internal CoSign CA is used to generate and revoke certificates. This shall be replaced by a web service invocation to Symantec Cloud-based PKI. Today the enrollment process automatically occurs when a County End-User on a County machine attempts to sign a document or open any application that uses the CoSign client plugin (e.g., Word, Excel, Adobe Reader/Acrobat). This process shall remain unchanged. During the enrollment process, the CoSign appliances shall invoke a web service against the Symantec Cloud-based PKI to fulfill the certificate creation request. Once complete, the private key of the certificate shall be stored in the appliances' internal store (as is done today). Subsequent requests to sign documents shall be fulfilled by the appliances only with no need to invoke Symantec services. This approach has already been successfully developed and deployed between CoSign and Comodo with production use by a number of customers. In addition to firmware changes, CoSign shall have to recertify their appliances if Federal Information Processing Standard (FIPS) compliance is required. Firewall rule changes at the County shall need to be created to allow connectivity between the appliances (currently in the data center zone) and Symantec PKI cloud. No changes are anticipated for Symantec. Additionally, no changes should be required for the CoSign clients residing on County desktops/laptops.

Contractor shall support the PKI solution using a combination of Contractor local resources and Contractor leveraged resources as part of the Identity Access Management solution. The PKI shall be supported per the Data Center support model as stated in Infrastructure Services. PKI functionality shall be supported by the local Security team and the Contractor Identity Access Management team, which shall support Active Directory and ADFS as well as other AD integrated solutions. Operational support functions shall include monitoring certificate status to identify when they are to be revoked or renewed as well as administrative management of certificate profiles and users.

- Deployment plan for resources and use of facilities

Contractor staff shall be located at the following sites to support the County:

- Rancho Bernardo. Primary location of dedicated Contractor staff specifically assigned to support the County. It includes centralized meeting space for engagements between the County and its contractors and Contractor

personnel, including security staff and Contractor executives, and is the initial point of contact for the County. Test environments, training, and video conferencing are also housed at this site.

- Contractor Tulsa Data Center. This is the core data center that shall house the majority of the County IT infrastructure and delivery of core IT services as well as security services.

Certificate Practice Statements (CPS) state the terms and conditions associated with certificate use between County and external entities and typically come into play into the event of perceived misuse. The County needs to complete the CPS, and Contractor shall facilitate that process.

7. APPLICATIONS SERVICES

7.2. Application Maintenance and Operations Services

- Deployment plan for resources and use of facilities

Contractor shall utilize Contractor's Rancho Bernardo office, County locations as requested/required, and application development centers in El Paso, TX and Pontiac, MI.

7.2.1.1. Process and Procedures

Applications Maintenance & Operations (M&O) Services

Contractor shall provide a bundled approach. Applications shall be bundled based on level of service appropriate to each bundle. On a quarterly basis, or as requested by the County, Contractor shall review the application portfolio with the County to determine growth or reduction of applications and determine if a bundle adjustment is required. As a part of the review, Contractor and County shall establish an Application Review Board (ARB) to evaluate the activity and provide "move forward" recommendations. The ARB shall consist of County representatives and Contractor representatives, as further detailed in the Standards and Procedures Manual. The Application Review Board, with participants determined by County CIO and Contractor AE, shall review all impacted billing low-orgs to determine if growth or reduction adjustments are required to either one or more Applications M&O FFP bundles or the FFP Dev/Test RU. Annual pricing reductions to the FFP M&O shall be 2% beginning Contract Year 2.

The applications are separated by bundles types into three groups—(full support, coordinated support, and Software as a Service (SaaS) support) across the five business areas.

	Concept Considerations	**Concept Considerations**
By County	3 RUs (one for each bundle type)	Allocation to be determined/executed by County
By Business Group	15 RUs	Further allocation would be determined/executed by the County.
By Low Org	131 RUs	Assumes 47 depts., some may not have all 3 RUs. Low-org may be a better grouping as some departments often uses a single low-org regardless of department or division.

Applications M&O Services shall include all services (e.g., labor), software, hardware, and required system environments. For example, Contractor is responsible to provide Break/Fix environments to support an application (e.g., to test new patches or versions), that is included in the FFP Apps M&O RU, and FFP Dev/Test RU.

High Level Key Benefits to the FFP Apps M&O

- Predictability of costs
  - One monthly charge (by County, Group or Low-org)
  - Discount offered by Group or by County options
- Predictability of budgeting
- Cost reduction Year-Over-Year beginning CY3
- All PA-IDs are covered
- Maintenance of applications are more timely
  - Not reliant on additional department funding for standard/routine application patches and updates (including 3rd party)
- No limit to skillset utilized to resolve issues
  - Eliminating the dispute when a break-fix incident requires an architect or engineer yet the NDSR does not support that skill
- Contractor assumes the risk of increasing costs

The priority levels assigned to all Portfolio Applications as of the Contract Effective Date (CED) shall remain the same for the Term of the Agreement unless otherwise agreed upon by the parties in accordance with the Agreement.

- Solution to meet the requirements

Contractor's solution shall include the transition of all of the County's Applications M&O (M&O) activities to the FFP model. In Contractor's discussion below of 10 high-level M&O requirements that follow, Contractor shall distinguish between Applications M&O activities and Application development activities.

Contractor shall develop process improvements automation to reduce the cost of M&O services over time. All application patches for routine maintenance and/or restoration of services shall include UAT.

Contractor has assembled the County applications into 3 options/bundles where each option may have 3 support models full support, coordinated support and cloud-based Software as a Service (SaaS) support.

	Concept Considerations	**Concept Considerations**
By County	3 RUs (one for each bundle type)	Allocation to be determined/executed by County
By Business Group	15 RUs	Further allocation would be determined/executed by the County.

By Low Org	131 RUs	Assumes 47 depts., some may not have all 3 RUs. Low-org may be better grouping as some departments often uses a single low-or regardless of department or division.

Full support comprises a full range of application activities from Break-Fix incidents response, restoration of service, M&O activities such as installation of patch/upgrades for routine maintenance activities. Full support includes those applications where Contractor has the access and ability to affect change either with or without the participation of a third-party vendor.

Coordinated support applies to applications where Contractor hosts the application but does not have security access or the ability to affect change. Contractor shall engage with the vendor and coordinate the necessary change(s). When possible**,** provided by 3rd party and approved by the County, M&O activities such as coordination of Break-Fix incidents response, restoration of service, installation of patch/upgrades for routine maintenance activities shall be performed.

SaaS Support are cloud-based applications where Contractor does not host the application and has no ability to affect a change. Contractor shall contact the SaaS provider and keep the County informed of the status of the issue or change.

On a quarterly basis, the ARB shall review the Applications Portfolio to evaluate the number of applications that have been added or retired and determine whether the RU warrants adjustment. This review shall also occur upon County request or in the event Contractor identifies a material change, as that term is defined below.

Material changes are additions or deletions of Portfolio Applications that affect the M&O support or server environment and that meet any of the following criteria:

1. Fifty (50) or more End-Users
2. Adding or deleting five (5) or more servers to Dev/Test
3. Adding or removing an app representing >30% of a billing low-org

As needed upon recommendation of the ARB, the County CIO and Contractor AE shall review all impacted billing low-orgs to determine if growth or reduction adjustments are required to either one or more Applications FFP bundles or the FFP Dev/Test RU.

Unless modified by a Service Request, Portfolio Applications shall be added into the appropriate FFP M&O bundle immediately upon implementation into production or upon the expiration of a stated warranty period, whichever is later.

For addition of a large application (e.g. ConnectWellSD) or a complex enhancement to an existing application (e.g. adding Open Enrollment to PeopleSoft), which requires 1500 hours or more of labor, the County shall deliver a Service Request to Contractor to perform M&O activities for up to six (6) months as time and materials. During this time, Contractor shall provide a report of M&O support, "actuals," and a detailed report of hours and tasks performed to determine the future adjustment to the appropriate FFP bundle. The ARB shall review the report of the six (6) month sampling for reasonableness and shall then provide a recommendation to the County CIO and Contractor AE.

Restore Service Levels

First, Contractor shall validate the restoration requirements for each application and structure Contractor's team to meet those requirements. If an application requires 24x7 onsite support for restoration of services, Contractor shall staff and schedule the response team to be sure M&O staff is available 24x7. If an application requires 24x7 on-call support, Contractor shall schedule staff to be standing by to respond to an outage 24x7. Applications that require less than 24x7 shall be supported in accordance with priority to specific County business needs. Contractor shall provide a Monday through Friday, 6:00 a.m. – 6:00 p.m. support window for all other applications;

Contractor shall build and enhance applications to prevent outages. As part of application portfolio maintenance, Contractor shall design and develop applications to be hardened and not fail. Contractor shall evaluate the supporting software middleware, and hardware for the application to verify the application's supporting components deliver required Service Levels without disruption. Contractor's team shall thoroughly test the application's new functionality, regression test unchanged functionality, and performance test the application executing simulations in a Dev/Test environment before implementing a change.

Contractor shall operate to restore applications functions as quickly as possible in the case of outage, whether application or infrastructure based. Contractor shall follow the Incident Management process detailed in, Cross Functional Services. Technical support shall triage as soon as they are notified by the Service Desk, and work the issue until functionality is restored. For mission-critical outages, the support staff shall use additional SMEs as needed and reach back to vendors and suppliers when necessary to resolve the outage. The Service Desk, with information from the technical support staff, shall notify Contractor management of the outage, and Contractor management shall notify County management.

When a change to the application is required to resolve the outage, Contractor shall perform the necessary application changes, data updates, and/or third-party software patching, to restore services in accordance with County emergency fix process. All application patches for routine maintenance and/or restoration of services shall include End-User acceptance testing, as desired by the County.

Contractor's application services team shall build new applications and enhance existing ones to prevent outages. Contractor shall make recommendations for changes to applications, and perform monthly analysis to identify defect rates, annual cost, and technical obsolescence within applications. As part of the ARB, Contractor staff shall work closely with the County board representatives and present outage incidents, provide recommendations regarding technical obsolescence, and review portfolio additions and deletions. A standard agenda shall be developed and reviewed at each meeting.

Production portfolio applications maintenance

Contractor's plan to maintain the portfolio focuses on keeping production up and running with a goal of no disruption to the County. In addition, Contractor shall continually improve applications to optimize performance and apply patches from third-parties.

Contractor shall make maintenance changes to production applications upon a County-approved request for change (RFC). Contractor shall meet weekly with the County to review the pool of RFCs and determine the priority and whether it can be approved for implementation. Contractor shall schedule the implementation of approved RFCs based on County priorities and approval.

When Contractor implements an RFC to fix a bug, install a patch, or implement an upgrade as part of M&O, Contractor shall follow Contractor's existing SDLC methodologies and the County's change and release management processes. Contractor shall functionally test RFC implementations and perform regression and performance tests. While implementing the change, Contractor shall build in warnings, notifications, and processes to provide application support of the RFC during operations if needed.

In conjunction with the County, Contractor shall define the authorization requirements (security) for End-Users, roles, and schemas and shall provide provisioning and de-provisioning of End-User and service accounts for the portfolio applications as authorized.

If a firewall change is required by M&O activity, it is covered under Apps M&O. If the firewall change is required by a new application or new End-User request (adding DA or hospital access), it shall be costed as part of the project.

With every service restoration fix, patch, or minor maintenance implementation, Contractor shall update the appropriate portfolio application documentation in accordance with the new functionality in production and all application document artifacts impacted by the RFC, including application document libraries, configuration management databases, and application management system, known as AppsManager.

Contractor shall evaluate the applications architecture, configuration, and system upgrades and identify opportunities for improvement. When opportunities are identified, Contractor's team shall initiate new RFCs and implement them after approval by the County.

In addition to implementing changes, Contractor's team shall support the application in production. Contractor shall build an application support team with the right number of staff with the right skills set and expertise to support the applications in production. RFCs are implemented in adherence to Contractor's SDLC process, the County's change management and release management procedures, and County governance approvals. Contractor shall provide services based on ITIL-aligned processes, CMMI standards, and other leading practices as appropriate. Contractor's project managers and applications subject matter experts (SMEs) shall work with the County and its delivery and application product owners to build a project plan to provide predictable, repeatable, and successful results.

Contractor's M&O services team shall provide planning, monitoring, and schedules for new applications as they are placed into production. The team shall respond to warnings and notifications generated by the applications and fix the issue that triggered the warning or notification. Contractor's infrastructure support team shall monitor the operating environment supporting the applications. Contractor shall triage application and hardware incidents and take the appropriate action to restore service.

Contractor shall execute End-User administration for the applications following the application's processes and procedures for End-User administration, including the necessary County approvals. Contractor shall update the appropriate portfolio application specific documentation as necessary, as well as Service Desk scripts, application data elements in AppsManager, and the Service Portal.

Contractor shall perform periodic reviews that may result in recommendations for application security improvements, product and software changes, or improved performance and cost savings. Contractor shall provide recommendations to County business owners and CTO to make sure the performance of the applications portfolio is optimal.

As part of M&O activities, Contractor's staff shall perform special testing for events such as public holidays, end of financial year, end of calendar year, and daylight savings time.

Application M&O Scope

M&O activities shall include executing the process to maintain application interfaces and coordinating with third parties to manage those interfaces. M&O includes performing the necessary preventive maintenance, routine system patching, application upgrades and code releases, but only as required for restoration of services, mitigation of security vulnerabilities, and implementation of a maintenance release. Notwithstanding the foregoing, if a routine system patch, restoration of service patch, or

application upgrade includes an Enhancement, as that term is defined below, the implementation of which exceeds reasonable Contractor work effort, Contractor shall have the option to escalate the review of cost allocation to the ARB.

An Enhancement is defined as any product change or upgrade that increases software or capabilities beyond original specifications. It can also be distinguished as an improvement (enhancement) of an existing application capability or a totally new capability.

Applications M&O shall not include County requested Enhancements (including security Enhancements) or County requested application upgrades (e.g. PeopleSoft 9.2 upgrade or SharePoint 2013 upgrade).

In the event of a service outage resulting from application or infrastructure abnormalities, Contractor's M&O staff shall perform necessary code fixes to restore service in accordance with the bundled service. The SDM shall drive incident management activities and provide ongoing communication to the client. As a result of the service restoration, Contractor shall execute the necessary root cause analysis (RCA) to investigate the outage issue, following the RCA process as described in Cross Functional Services. These activities shall include analysis, design, coding, testing, data conversion, documentation, End-User coordination and communication, and production turnover activities and the management of these activities for restoration of service. Based on the RCA findings, Contractor shall recommend modifications to the application to prevent future outages, including those attributable to a Third Party.

Align Maintenance Activities with County architecture standards, guiding principles, and architecture bricks and patterns

All Architecture activities required by Apps M&O shall be included in the Applications M&O RU. Contractor's shall align with County IT architecture standards while participating in the process to improve, refine and enhance them. Contractor shall monitor technology trends, best practices, and products within the IT industry, recommend enhancing County processes when appropriate, and Contractor shall provide a repository to document and manage standards, available through the Service Portal. Contractor shall build any additions into standard processes and practices.

On an agreed to schedule, Contractor shall participate in annual technical and business planning sessions, including bricks, to enhance standards, architecture, and project initiatives.

Contractor shall perform maintenance activities following the Standards and Procedures Manual as updates occur and shall implement all modifications to make sure Contractor's staff is aware and trained.

Provide M&O services for portfolio applications in production environments including servicing middleware and other application supporting components.

Contractor shall maintain both nonproduction and production environments for applications. This maintenance shall include keeping non-production configurations synchronized with production. Contractor's M&O staff shall keep the application and its supporting components, such as middleware, synchronized. Contractor shall accomplish this by updating supporting components using the same processes Contractor uses to update the applications. Contractor's M&O staff shall initiate an RFC to update components and implement the update when approved and scheduled by the County.

Contractor shall put steps in every project schedule to update the non-production environments with any approved component upgrade.

Maintain accurate and continuous prompt updates to asset and system documentation

Each approved Request for Change (RFC) shall include a step to update application documentation. This shall include updating asset and system documentation and tools. M&O staff shall be responsible for the technical accuracy and specific details of the update, and staff leads shall review the changes for accuracy and completeness.

Validate cross-framework integration and communication is conducted for application incidents, outages, maintenance work, planning purposes and all changes

Contractor shall validate cross-framework integration by regression testing application bug fixes and enhancements prior to production implementation. Contractor shall build and maintain test (Break/Fix) environments that include or simulate cross-framework integration, and Contractor shall build Contractor's test plans to include cases to test the frameworks.

Contractor shall keep County stakeholders informed on the full range of application activities from incidents, M&O activities, and changes.

The applications team shall follow the outage management communication process.

Provide services in alignment with ITIL and CMMI standards to ensure predictable, repeatable, and successful results

Contractor shall use industry best practices to enhance effective planning, execution, tracking, and delivery of services to the County. Contractor's repository shall provide the backbone of Contractor's process improvements and includes templates, guidelines, checklists, and lessons learned. It complies with recognized industry standards, including the Project Management Institute's (PMI) Guide to the PMBOK, ITIL, International Organization for Standardization (ISO) standards, and the practices incorporated in CMMI Institute's Capability Maturity Model Integration (CMMI).

Implement new patches and versions (within the current release), prioritizing patches that address security vulnerabilities

Contractor shall implement new patches and versions under M&O following the existing RFC process. Contractor shall create a plan to communicate, test, and implement each patch or version. All patches and versions shall be discussed with the County business owner and CTO to determine criticality, scope of change, priority, and timing. Following successful testing, Contractor shall submit an RFC for approval and scheduling.

When competing patches are released, patches that address security vulnerabilities shall get priority, along with those that fix critical issues. Next priority shall be patches that address minor issues, those which have a workaround available, and lastly patches that address issues that have not impacted County users.

Perform Maintenance Services that include Preventive, Adaptive, and Perfective Maintenance

Contractor shall perform application maintenance as part of M&O service. Contractor understands the objectives of preventive, adaptive, and perfective maintenance with respect to M&O to be as follows:

- **Preventive Maintenance** – Maintain application reliability to prevent issues from emerging in the future
- **Adaptive Maintenance** – Modify the system to adapt to changes in the business environment.
- **Perfective Maintenance** – Modifications and updates to sustain application usability and improve its reliability and performance.

Contractor shall perform preventive maintenance to resolve known problems and defects; perfective maintenance to optimize and tune performance; and adaptive maintenance to remediate impacts resulting from interfacing application changes, changes to application middleware, or changes to the infrastructure.

- Processes in solution including year-to-year continual improvement.

Contractor shall use County-approved procedures and standardized industry processes and governance based on PMBOK, ITIL, and CMMI as well as the Contractor operations excellence support methodology and repository of best practices and lessons learned. By driving the adoption of standards, taking full advantage of developments in technology, and being flexible and agile, Contractor shall help the County transform and manage its environment to achieve a balance of maintenance and innovation, reliability, and change. These methodologies shall enable Contractor's team to prevent outages and defects before they occur by thorough testing during the development phase. In the event of an incident, however, Contractor's methodology provides responsive M&O for fast and effective resolution.

For continual improvement, Contractor shall regularly review incident reports, RCAs, and application performance data so that applications are optimized appropriately. Contractor shall also monitor industry best practices as well as emerging trends and new technologies to determine if a different solution provides a better outcome. All this information shall be shared and reviewed with the CTO.

Contractor shall develop process improvements and automation to reduce the cost of the M&O services.

Process used to migrate developed Applications into (and retire/decommission Applications from) the Applications Portfolio, including the approach, data requirements, timeframes, and analytic approaches to ensure a reasonable fixed price for Applications M&O Services.

Throughout the year, applications are added and retired from the Applications Portfolio. The County initiates additions and retirements as an approved request.

When adding an application to the M&O portfolio, unless otherwise requested by the County through a Service Request, Portfolio Applications shall be added into the appropriate FFP M&O bundle immediately upon implementation into production or the expiration of a stated warranty period, whichever is later.

Addition includes updated Service Desk scripts and entry of application details into the AppsManager tool. Support for the application shall be part of the FFP M&O.

For addition of a large, complex such as Connect Well San Diego or implementation of an additional module to an existing app, a service request shall be delivered to Contractor to perform M&O activities for up to 6 months.

Large, Complex is defined as a Portfolio Application modification estimated at 1500 or more total labor hours.

During this time Contractor shall gather and report M&O support 'actuals' to determine the future adjustment to the appropriate FFP Bundle.

Conversely, if an application is to be removed (retired) from the M&O portfolio, the M&O team shall perform all functions required to retire that application, including decommissioning the infrastructure and updating Service Desk scripts. Applications shall be retired by the direction of the County using a non-billable Service Request.

Contractor shall develop process improvements and automation to reduce the cost of the M&O services.

Third-Party Software packages are updated to current versions. Frequency with which Contractor's organization typically implements upgrades. The process Contractor undertakes from initial testing through production implementation and the value added by this process. Describe the process which shall be followed to keep County representatives aware of the availability of Third-Party Software package upgrades.

Approach. Contractor shall catalog and track all third-party software used by the County to make certain that software is maintained to the current versions. Contractor shall report to the County application primary contact on third-party software with upcoming updates. Contractor shall meet with the County and shall recommend third-party software upgrades. All changes shall follow Change Control Review Board (CCRB) in accordance with County processes and procedures for third-party software.

Frequency. Contractor shall proactively track upcoming updates to third-party software through the Internet, direct contact of third parties, and/or by announced vendor notices or technical updates. Upgrade frequency to third-party software shall depend on the software vendor and County direction.

When patches or upgrades are published for release, Contractor shall notify the County application primary contact that a release exists. Upon approval of the County CCRB, Contractor shall initiate the process for upgrading third-party software as outlined below.

Contractor shall conduct weekly meetings between Contractor and the County CCRB in which decisions on upgrades are addressed. If greater frequency is required, Contractor may request on a case-by-case basis an emergency meeting of the County CCRB specific to any urgent upgrades that Contractor believes require immediate County attention and approval (for example, patches that remediate security vulnerabilities).

Process — Testing Through Implementation. Once Contractor receives an upgrade, Contractor shall stage that upgrade and run tests in accordance with Contractor's Standard Procedures.

Initial testing shall start with the development of a testing plan and installation of the patch release/upgrade in a testing environment. Staff from Contractor and the County shall test the new version of the third-party software.

User acceptance testing (UAT) may include specific testing scripts and scenarios, depending on the application and the amount of enhancement. Once UAT is completed, results shall be presented to the County for approval and signoff.

Upon UAT approval, Contractor shall schedule and prepare for software installation into the production environment. This process shall be consistent with existing County processes and lends itself to a predictable, reliable, and controlled approach for upgrading third-party software for the County.

Upgrade Availability Communication. Contractor shall meet weekly with the CCRB to review the recommended changes. Each proposed change shall be approved by the County CCRB and the County representative. At such time that the proposed change is approved, Contractor shall schedule the change to accommodate the application downtime window.

Applications Services Framework

- Use of Tools

Contractor shall provide automation tools such as Contractor's APM which provides a 360-degree view that verifies the performance of desktop, web, and mobile apps for on premise, cloud, or hybrid environments, as well as Cascade, SCCM, and various other network related tools

- The implementation of APM shall enhance Contractor's ability to:
- Provide end-to-end visibility of transactions including back-end systems and mainframes
- Monitor the End-User application experience and services
- Quickly find and resolve application performance issues
- Collaborate with application development teams to effectively resolve application and transaction issues
- Reduce mean time to repair critical business transactions
- Monitor performance of applications deployed to a cloud or virtual environment
- View application performance alerts anytime, anywhere on the End-User's mobile device.

Contractor shall provide and use Cascade, SCCM, HPE Operations Manager, and other network and system related tools and reports to identify and correct issues in the environment related to applications, desktops, web, mobile applications, and others. The addition of APM shall assist to close the circle of the end-to-end reporting so that Contractor can be proactive in addressing systemic issues and making sure Contractor's solutions are running as expected to support the applications.

The SDMs shall work with the application SMEs, vendors, and the Enterprise Problem Manager to make sure that any and all items identified through these tools and reports are being acted on quickly to reduce the amount of impact to the End-Users as described in Service Delivery Management and Problem Management Services.

Contractor shall provide Project and Portfolio Management (HPE PPM) module for consolidating, prioritizing, and fulfilling application services activities and development projects so the County has visibility into all of the demands on the infrastructure. Its web-based dashboards provide real-time visibility into request status, priority, next steps, and summary views. Service levels are updated automatically as each request is processed.

Contractor shall provide a Service Portal that shall automate Service Desk ticketing, for incident and break/fix resolution.

On an ongoing basis, Contractor shall evaluate additional tools to further automate M&O activities, such as self-healing tools and discuss any recommendations with the County.

- Alternate Time & Materials model to provide Applications Maintenance and Operations services

Time and Materials (T&M) or Non-Discretionary Service Requests NDSR-like ("NDSR") Process

NDSR Rules of Engagement:

- All applications shall have an NDSR
- NDSRs shall be by PAID, Low-org, Department or Group
- Funding amounts shall be established for the County fiscal year
    - Invoicing shall be monthly based on actuals
    - If utilization reaches 80%, Contractor shall notify the County
    - If utilization reaches 90%, Contractor shall submit a Change Request to increase funding*
        - Regardless of available funding, all T&M activities shall be billed to the Low-Org associated with the corresponding NDSR (in the event the change request is not approved in time to cover a break-fix activity)

  - Contractor shall provide estimates (based on actuals) to assist in establishing appropriate NDSR funds on a monthly basis to forecast trending
- NDSRs cannot limit the job classification approved to work on a break-fix
  - Charges to the County are task-based, not person-based

Note: If a NDSR requires chronic changes (meaning the County user set the funding intentionally low, thereby requiring change requests on a regular basis to replenish the funding), Contractor shall notify the County CIO for resolution.

7.2.4. Application Programming

7.2.4.1. Process and Procedures

Application Programming

Application programming are those activities associated with the programming, scripting, and configuring of application modules to support M&O activities.

Contractor shall perform applications programming using and adhering to the County's technical and architectural standards as well as standards and procedures, performing all necessary steps to complete M&O tasks. Contractor shall use Microsoft Team Foundation Server (TFS) to create working directories and store source code.

7.2.5. Application Integration and Testing

7.2.5.1. Process and Procedures

Application integration and testing shall be services that confirm the individual application framework components work together properly and, as a whole, perform its specified functions.

Contractor shall plan and develop Contractor's testing procedures to meet County requirements and policies. Contractor shall document the testing procedures in the Standards and Procedures Manual, including procedures to be followed by an independent testing team as needed. Contractor shall develop an overall test plan for M&O releases that includes the test strategy, coverage, scenarios, test bed, test data, methods, schedule, and responsibilities.

Contractor shall build and maintain an application testing environment that has been refreshed with production data. If necessary, Contractor shall build data masking programs to disguise production data. Contractor shall build test cases to test the new functionality or components based on the requirements and determine which valid data is required to appropriately test the application as well as the various testing phases. Contractor shall create a set of test cases to test the application end-to-end, new and existing functionality, application security and application supporting components, and infrastructure, when needed, to support M&O activities. Benchmark test cases shall also be created and run to properly execute regression testing. Contractor shall provide a reference to link requirements and test cases.

Contractor shall execute the test cases while following the standard testing procedures and verify that the results meet County testing requirements. Contractor shall track defects in a County-approved tracking

tool and shall correct retests functionality to validate repairs. In addition to testing the application, Contractor shall provide an UAT environment, if needed, it shall include the necessary data. Contractor shall provide support to the County in its UAT testing effort and provides access to the defect tool for entering found defects. Contractor shall assess and report potential risks to production of implementing a change and only implement after County approval.

Contractor shall manage the various testing environments including the application data, application releases, and supporting software and components. Contractor shall stage the applications changes in the appropriate system in preparation for production implementation. Contractor shall provide support to these implementations, track their migration status, and verify the implementation of changes into production. Contractor shall define the test-to-production turnover requirements and instructions for each project or release and report the results, which shall be shared with the County.

7.2.6. Application Implementation and Data Migration

7.2.6.1. Process and Procedures

Application integration and testing for M&O activities shall be defined as those activities associated with the installation and migration of new patches and maintenance upgraded components to the production environment.

Contractor shall create a detailed plan for each M&O release. Contractor shall have a "go/no-go" checklist, after approval of UAT. All M&O releases shall include rollback steps and, Contractor shall update any affected application documentation and production application support documents and procedures as needed.

Contractor shall execute, coordinate, and communicate with the County for all releases and associated activities. For each patch and/or upgrade, Contractor shall perform the needed steps of the SDLC such as requirements analysis, design, development, and testing as appropriate for M&O activities. Contractor's deployments shall follow the County's change and release management processes and are compliant with client change management policies. Documentation shall be regularly updated, including the Standards and Procedures Manual and Service Desk scripts. Contractor shall execute the deployment in production once approved by the County and Contractor shall synchronize the production and non-production environments.

7.2.7. Application Documentation

7.2.7.1. Process and Procedures

Application documentation is defined as the development and maintenance of documentation for all applications. Contractor shall continually improve application documentations, providing new and updated documentation when required for system specifications, technical documentation, operational processing flows, system installation, application production support manuals, configuration plans, tuning instructions, release notes, and solution design as needed for M&O upgrades and patches. Contractor shall execute application updates as needed with every release, including patch and update releases as defined in "Production portfolio applications maintenance".

Contractor shall build and maintain documentation folders for each application, which shall be stored online with County controlled End-User access. All documentation created or updated for a release shall be stored in the folder in DocVault and shall be updated at the same time as the release implementation.

This shall help to keep the documentation in sync. Contractor shall store updated code and application components in the code CMDB to maintain the application currency and versioning.

Contractor shall also assist the County with developing, maintaining, and enhancing its application DR process and related documentation.

7.2.8. Application Training

7.2.8.1. Process and Procedures

Application training is defined as the implementation of training programs for contractor personnel to help preserve and enhance their knowledge and understanding of applications.

Contractor shall develop training for new and existing staff on the applications as necessary for M&O activities. When Contractor builds a patch or service restoration release, Contractor shall update the application training plan as needed.

During application operations, Contractor shall provide technical training and knowledge transfer to existing County support personnel, as well as materials related to the technical aspects of applications, as necessary. Contractor shall develop, document, and maintain the Policies and Procedures Manual, training, and knowledge transfer procedures that meet the County's requirements and policies.

In addition to training users, Contractor shall conduct new and refresher training programs for Contractor's personnel to preserve and enhance the knowledge and understanding of the applications and the underlying technologies and frameworks on which they are built. The training shall include industry standard certification as well as external training on the latest releases of databases, middleware, enterprise platforms, and applications as required.

Contractor shall train Contractor's development and M&O staff to support application development and changes when implemented into production. Contractor shall follow ITIL-aligned processes for training documentation. Additionally, Contractor shall develop and conduct cross-training to facilitate smooth transitions between Contractor personnel as required and to make sure backup personnel are in place for each application.

Delivery of End User training, including the location and method of training, frequency of training, and documentation provided with training.

End-User training shall include online training or videos to specialized in-person classes or seminars.

Contractor shall develop online training appropriate to the projects. This may include Adobe Captivate vignettes, videos, or posted documentation and frequently asked questions (FAQs).

For specialized in-person training, the County currently uses the 200-square-foot Contractor/County training center in Contractor's Rancho Bernardo location. Contractor shall continue to maintain and make that space available to the County. The center provides 36 County-imaged desktops hosted on the County of San Diego Network and provides a quiet, controlled environment. The center's simulation environment shall accommodate User Acceptance Testing (UAT) if requested, which allows the County to test features and functionality prior to deployment.

The facility shall provide printing and projection capabilities to support a successful training experience. This facility shall continue to be available as well for County trainers to train County staff.

Major releases may require online and classroom training for the End-User community on a scheduled basis, while minor changes may require only an update to procedures or processes and notification to the End-User to use the new process.

7.2.9. Application Quality Assurance Services

7.2.9.1. Process and Procedures

Application QA services is defined as a systematic, planned set of actions necessary for software update/development processes to conform to established functional technical requirements. It also includes the managerial requirements of keeping the schedule and resources within budgetary confines.

Contractor shall create, update, and maintain a QA management approach for applications updates. This shall include the following QA components:

- Quality management approach
- Effective software engineering technology
- Formal technical reviews applied during the SDLC process
- Multi-tiered application integration and testing strategy and implementation
- Control of software documentation and associate changes
- Procedure to measure compliance with software development standards
- Measurement of QA metrics and reporting mechanisms.

Contractor shall submit Contractor's QA management approach to the County for approval, after which it shall be added and kept current in the Standard and Procedures Manual.

Contractor shall determine QA metrics for each release and reports these to the County. Contractor shall communicate configuration management items, tracking them to Contractor's Systems of Record that accurately depicts the environment. These shall be updated to reflect all new changes, which shall be made with a change record processed through HPE Service Manager that keeps Contractor's information accurate.

7.2.10. Database Administration

7.2.10.1. Process and Procedures

Database administration (DBA) shall be defined as activities associated with the maintenance and support of databases.

Contractor shall define DBA requirements and policies for the application databases, including authorization requirements for end-users, roles, and schemas. Contractor shall develop a Standards and Procedures Manual database administration procedure that meets the County's standards and policies. Contractor shall develop and provide database roadmaps for planning and portfolio management.

Contractor's DBA processes shall document security administration including managing role and End-User database permissions and in accordance with the County security policies. Contractor shall perform database restores when required.

Contractor shall define, document, and execute database creation, configuration, upgrades, patches, refreshes, database system-level changes, schema changes, and definition requirements for applications. Contractor shall maintain documentation for portfolio applications database instance parameters and system settings and manage them across like instances when required during the application change process. Contractor shall provide and execute proactive database performance and tuning scripts and monitor database performance for optimal performance.

Contractor shall implement and manage County-approved appropriate database management tools across application portfolio database instances. Contractor shall capture performance metrics and historical data for trending and reporting. Contractor shall use Oracle Enterprise Manager to manage the Oracle/UNIX enterprise applications. In conjunction with Oracle Enterprise Manager, Contractor shall use the Applications Performance Management (APM) tool to provide a full 360-degree view.

Also, Contractor shall identify and resolve locking conflicts, latch contention, and rollback requirements for database instances and implement database monitoring tools that generate automatic Service Desk trouble tickets for incidents.

Contractor shall provide technical assistance and subject matter expertise to application developers and third-parties. Contractor shall provide data dictionary knowledge, End-User data assistance, data warehouse metadata definition, and data mapping.

Contractor's DBAs shall patch database software as approved and manage database communication software configuration, installation, and maintenance. They also shall provide database storage management and cleanup activities, backup schedules, retention periods and levels, and execute backups and recoveries that adhere to the County's policies.

Contractor's DBAs shall provide database capacity management and availability management, maintain database storage allocation, file systems current usage, and capacity. Contractor shall conduct database installation, de-installation and administration, testing, copying, and security and database server management, as needed and provide administrative account support that shall include provisioning and de-provisioning. Contractor shall create and provide system monitoring and documentation, maintain transactional logs, and backup as scheduled. Finally, Contractor shall provide operational support for the County's public and private cloud databases.

7.3. Application Development Services

- Deployment plan for resources and use of facilities

Staff shall be located at the Contractor's Rancho Bernardo site, El Paso, TX and Pontiac, MI.

7.3.1.1. Process and Procedures

- Applications Development Services

Contractor shall reach out to Third Party providers who can deliver quality apps projects on time and within County budget. Contractor shall work to include applications providers in Contractor's outreach process that currently includes more than 20 different vendors. Contractor shall also reach out to Disabled Veteran Business Enterprises (DVBE) and give them the opportunity to provide services.

Contractor shall continue to work with the County to use COTS and third-party applications where appropriate. On a per project basis, Contractor shall reach out to third-party providers as resources and

expertise is needed. If the County has a requirement for a specific or unique solution, Contractor shall engage with those application providers as described in the "Procurement of Third-Party IT Solution via the ITO" process referenced below.

Contractor shall provide third-party vendors access to the development and test (Dev/Test) environments.

Applications Development Services shall be conducted either on a time & materials basis using Resource Units defined in the Agreement (e.g., labor hours based on the Labor Categories) or on a firm, fixed price basis, at the County's option. A fixed price for Applications Development Services shall be based on defined statements of work, and may include warranty services as negotiated and agreed-upon by the parties.

There shall be two types of estimates for Applications Development Services:

1) Budget Estimate (BE) – A BE shall be generated by Contractor upon County request. The BE shall establish a range, or rough order-of-magnitude estimate based on a statement of work, for County budgeting purposes. Preparation of a BE shall be a non-billable task.

2) Service Request Project Estimate – A Service Request Project Estimate shall be generated by Contractor upon County request. The County shall provide a detailed statement of work and requirements to accompany the request. The County does not anticipate significant overhead to generate estimate, given that the statement of work and requirements are already complete, but solution design, detailed one-time and on-going cost estimates (including the cost and time to bring a development project into the Applications Portfolio), resource breakdowns, and impact analysis shall be billable. Depending on the size of the project, a Service Request Project Estimate may be covered by Service Levels once the project is approved by the County.

When procuring Application Development Services:

1) The County develops a statement of work, either using its own resources or by leveraging Contractor resources using the approved Labor Categories. The result is a specific statement of work to meet the County's business requirements.

2) The County determines the appropriate procurement vehicle, either using the Agreement or pursuing an alternate path (e.g., County Purchasing and Contracting).

3) If the County decides to leverage the Agreement, it may:

    a. **Contractor Estimate:** Issue a Service Request to Contractor either soliciting a time and materials proposal (using the Resource Unit labor rates) or a firm, fixed price proposal. Upon County approval, Contractor shall (a) use its own resources to deliver these services or (b) use its network of Subcontractors to execute the work;

    b. **Request for Information (RFI):** Issue a Service Request to Contractor to conduct a market scan, to be performed by the Acquisition Manager, using the approach set forth in the Standards and Procedures Manual to identify

potential solutions and/or vendors. Contractor shall conduct a market study and provide the results to the County for review. Services performed by Contract and Acquisition Management Services resources shall be covered by the Cross-Functional Services Framework Resource Unit. Assistance by Contractor Applications resources for the purposes of the evaluation shall be billable in accordance with the applicable labor rates upon County approval;

c. **Pre-Approved Vendors Request for Proposal (RFP)**: Submit a Service Request to Contractor and direct Contractor to facilitate a competitive procurement process among a list of pre-approved vendors that have a master agreement with Contractor allowing for rapid execution of Statements of Work ("Pre-Approved Vendors"). Contractor shall provide to County a list of Pre-Approved Vendors as part of Schedule 5.

Contractor shall post County requirements from the Service Request (mechanism to be determined, likely a SharePoint site), alert its Pre-Approved Vendors of the pending opportunity, and require responses within a specific timeframe, which shall be communicated to the County. Pre-Approved Vendors shall be required to respond to Contractor within the stated timeframe with a firm fixed price proposal to complete the Service Request. Contractor shall review the responses and share qualified responses with the County along with a recommendation to proceed (or not). Contractor shall work with the County to select the pre-approved vendor that offers the best value to execute the Service Request based on criteria agreed upon in advance of the competitive process. Upon County approval, Contractor shall contract with the selected pre-approved vendor to execute the Statement of Work (services requested). If this process is used, the Resource Unit labor rates do not necessarily apply for the pre-approved vendor proposal, since the competitive procurement process among Pre-Approved Vendors provides a mechanism for fair and reasonable pricing, assuming multiple offerors. The proposals from the Pre-Approved Vendors shall be submitted to the County at no additional cost to the County; and/or

d. **Request for Proposals (RFP):** Submit a Service Request to Contractor and direct Contractor to facilitate a competitive procurement process among third-party vendors, to be performed by the Acquisition Manager, using the approach set forth in the Standards and Procedures Manual. Contractor shall work with the County to select the vendor that offers the best value to execute the Service Request based on criteria agreed upon in advance of the competitive process. Services performed by Contract and Acquisition Management Services resources shall be covered by the Cross-Functional Services Framework Resource Unit. Assistance by Contractor Applications resources for the purposes of the evaluation shall be billable in accordance with the applicable labor rates upon County approval.

Contractor shall document the foregoing procedures in more detail in the Standards and Procedures Manual.

Pre-Approved Vendors List Management

Contractor shall add Pre-Approved Vendors that (1) are existing vendors that have requested to be Pre-Approved Vendors, (2) have agreed to terms and conditions and (3) have provided proven value to the County. Additional Pre-Approved Vendors shall be added from the larger group of Contractor providers with which Contractor has established master agreements and that provide services applicable to the County. Contractor shall also use all reasonable efforts to add vendors to the Pre-Approved Vendors list in response to County requests requiring frequently used niche skillsets.

Contractor shall maintain no fewer than five (5) Pre-Approved Vendors who are eligible to propose on County applications work. Contractor shall choose vendors based on specialty skills with specific technologies (ex: Captiva, SharePoint) or general skills required by County projects (ex: Project Management).

Contractor shall add Pre-Approved Vendors as identified and compliant; Contractor shall post the current list of Pre-Approved Vendors on the Service Portal

After CY1, Contractor shall add and maintain Pre-Approved Vendors based on County demand as follows:

Number of Service Requests	Minimum Number of Pre-Approved Vendors
< 15	Five (5)
15 - 25	Seven (7)
26 - 50	Ten (10)
51+	Fifteen (15)

At the end of each Contract Year, Contractor shall notify County if Contractor is unable to meet the minimum number of qualifying Pre-Approved Vendors and shall provide County a recommendation on next steps to meet or modify the County's requirements.

- Solution to meet the requirements

Contractor's solution shall use an established Contractor application development framework plan, build, operate to meet deliverables requirements. This framework accommodates Agile, Iterative, and Waterfall methodologies, making sure roles and responsibilities are defined, governance processes are in place, and the work follows a structured approach to achieve its objectives. Contractor's applications team shall tailor the framework.

Contractor's application development framework shall provide a delivery and governance framework covering all aspects of IT-enabled business change. The framework spans the full delivery life cycle, from application development planning through operations. Security shall be managed during the life cycle of the application, from discovery through operations.

Development Process

Contractor's development processes shall follow SDLC, using Agile, Iterative, and Waterfall methodologies as appropriate.

Each project shall:

- Engage key stakeholders
- Identify the business, security and DR, and business continuity and planning requirements
- Analyze the requirements from internal and external perspectives
- Prioritize and select projects that shall be included in the program scope.

For gathering and identifying requirements, Contractor shall leverage the Requirements Determination Process (RDP) that contains five major components: plan/manage, obtain, understand, validate, and evaluate, as delineated in following table. Contractor shall obtain, understand, and validate components make up the core of the RDP. Contractor shall execute these components multiple times, once for each set of requirements.

Five Major Components – Requirements Determination Process

COMPONENT	PURPOSE/ACTIVITIES
Plan/Manage	Contractor builds the plan that Contractor shall follow throughout the process and manage overall execution of the RDP.
Obtain	Contractor collects the information for the business, technical, security and DR, and business continuity planning needs of the County. Contractor shall store the information Contractor obtains for later retrieval and traceability.
Understand	Contractor shall analyze the collected information to make sure Contractor has a good understanding of the requirements. Contractor then evaluates the statements for consistency, completeness, and appropriateness. For each statement, Contractor shall establish traceability and validation criteria and perform RCA.
Validate	Contractor shall confirm a mutual understanding of the implications of the requirements with the County and Contractor SMEs, who shall build and implement the solution.
Evaluate	Contractor assesses how well the process worked and determine the effectiveness of the techniques and the requirements statement. Contractor shall work with the County to prioritize the requirements and establish a roadmap.

During design, project details shall be defined to align with the County's strategic direction.

Requirements are captured and more detailed views of the "As Is" and "To Be" states shall be developed.

For existing applications, Contractor shall review the current state of the architecture and identify the impact of the solution as well as alternative solutions. Contractor shall notify the County of any changes that impacts the current architecture so a decision on solution options can be made early in the development cycle. Contractor shall also conduct industry research to identify any COTS product solutions that may meet the requirements.

The application architecture and its impact shall be reviewed with the County to provide a better understanding of the changes and a solution design document shall be created to document the solution with changes to the application, database and the infrastructure as needed. All design features as well as changes to data models and configurations shall be documented. Detailed procedures to migrate data to the new data models shall be defined.

Once requirements are defined, Contractor shall expeditiously notify external applications providers and invite them to provide a bid for the work.

After selection of an applications provider (Contractor or a third-party), the provider shall develop a detailed project along with an applications roadmap. The following describes various phases and deliverables of the project.

Deliverables for the assets and align phase include:

- High-level application solution design
- Application architecture
- Future roadmap
- High-level project plan.

When the project is implemented, the handover to M&O is executed to include documentation, training, and updated Service Desk scripts.

The project plan shall include details of the application development, testing, integration, and implementation schedules. Contractor shall use Contractor's risk management processes to mitigate risks early in the process. Contractor shall provide detailed project and cost information to the County, and all changes to the plan and cost Contractor shall follow the change management processes established by the County.

Deliverables for the design phase include:

- Detailed design document
- Update architecture document
- Detailed project plan
- Risk and mitigation strategies
- Detailed project cost estimates
- Updated requirements document.

The develop phase shall produce the application code according to the application design. The primary deliverables are application code and test scripts and, when needed, a pilot run of the application. Key activities include:

- Application code development and test
- Gain authorization from the County to proceed to implementation.

During this phase, the needed Dev/Test environments shall be created. As new applications that are targeted to run in the MPC are developed, the Contractor team shall request MPC resources through the provisioning interface, including servers, software, storage, and backup requirements. Once the demand request is received by the system, and the automated parts of the provisioning process complete, the Applications team shall then be responsible for installing, configuring, and testing each application component.

Conversely, as applications are retired or their Dev/Test components are no longer needed for live use, and therefore the associated MPC resources are no longer needed, the Applications team shall submit a service request to de-install the MPC infrastructure for that application. The team shall decommission all of the application components and infrastructure resources for the application environment being retired,

and shall release any licenses through Asset and Configuration Management. If the environment is a Dev/Test environment, the request shall specify whether the environment shall be permanently decommissioned or put into cold storage. If the latter applies, the image shall be preserved on the SAN storage and held in an online inventory, but its compute resources released. Otherwise, all resources shall be released.

Contractor shall not use the MPC for production use, unless an exception is authorized by the County Technology Office. From a Resource Unit (RU)/billing perspective, only moves into and out of MPC for production application environments trigger activity: new RUs are added to billing at the point a production environment is made available for County use. RUs are removed from billing at the point when a request to decommission a production environment is issued and approved (the billing change shall not wait for the decommission process to complete). If a production application moves from a traditionally hosted environment to, the old RUs are removed, and new ones take effect at the point when the MPC environment becomes available for County use. The County shall not be billed for both sets of resource units. The same approach shall apply in reverse if an environment moves from MPC to a traditional environment.

Additions and removals of Dev/Test environments into and out of MPC may trigger a slightly different RU action. Additions of new applications to MPC "draw down" on the pool of available resources. If the application is very large, such that its requirements exceed the capacity available (this scenario shall be the exception rather than the rule), Contractor may need to acquire more resources to expand the cloud. In most cases, the resources shall be available, and the environments shall be added with no change to RU billing. By the same token, removal of applications from the Dev/Test pool shall not trigger a change to RU billing. Moves of existing Dev/Test environments into and out of MPC shall have no billing impact.

During this phase, application developers shall implement the application according to the functional specification and application architecture. The developer shall follow Software Development Lifecycle Standard County process and standards to code, build, and deploy. The configuration changes shall be documented and shall become part of the deployment package. The technical lead shall coordinate integration testing with the developer in the development test environments. The designated testing team shall also perform QA testing and End-User acceptance testing (UAT) and partner integration during this phase.

During the development phase, additional risks may be identified. Contractor's Project Manager shall use the Risk management processes to mitigate these risks. Changes to the project plan and cost shall follow the defined change management processes.

Contractor's project manager shall coordinate with the County to obtain approval for UAT and deployment to the production environment.

Deliverables for the develop phase shall include:

- Application code
- Test scripts, including test plans for the independent test team
- UAT results
- Risk and mitigation strategies.

Implement

After gaining the approval from the County using the successful UAT results, Contractor's deployment team shall prepare the release package for deployment to production. A deployment plan shall be created in coordination with the application users, the integration touch points and the M&O team. The

deployment instructions including the configuration details and the data migration steps shall be outlined and validated before deploying the application.

Deliverables shall include:

- Deployment Plan
- Deployment Package
- Third-party cross-training of Contractor staff to perform required M&O activities, as required.

Manage

Once the application has been deployed in production, Contractor shall provide production support under the Applications M&O Services framework. The project team shall load all documentation, such as the architecture and design documents and the deployment package instructions, to the DocVault site for the M&O team to review. An initial hand-off session shall be provided to the M&O team so that the developers become aware of the changes.

The project team shall coordinate and work with Contractor resources to perform market research and technical trends, and provide new products and services and third-party solutions that may be applicable to the County. The team shall work with the County to evaluate these services and make recommendations. The team's reach-back into Contractor's quality management office shall facilitate the process to provide recommendations on changes to SDLC, leveraging ITIL practitioners and their relationships with Software Engineering Institute (SEI).

High Level Requirements

Alignment with IT strategic plan and roadmaps: Contractor understands the County's strategic plan and transformation roadmap and shall ensure that all technology, innovation, reengineering, and business processes align. The development process shall follow standards and guidelines published by the County's IT governance bodies and the architectures shall comply with County-approved enterprise architecture(s), as well as abide by County security policies and models for system architecture and technology.

Contractor's approach shall begin with analyzing requirements and constraints. Analysis of functional inputs shall inform the business architecture view, which describes the high-level functional composition of the system and shows various actors, usage scenarios, and interdependencies among functional modules. After the first phase of high-level design is complete, the architecture artifacts shall be submitted to County staff, as required, for review and approval. The outcomes of the review shall be addressed by further aligning the architecture with the County's business and technology direction and resubmitted for approval.

Contractor shall recommend updates and revisions to architecture and/or configuration change designs in response to changing requirements, emerging technology, and other activities such as vulnerability assessments and performance analysis. Contractor shall monitor industry trends and best practices and make recommendations to the County for other inclusions in the technology roadmap.

The software development process shall follow the established SDLC process and generate documentation as required by the size and complexity of the project. As required, Contractor shall produce architectural design documents in compliance with the County's requirements and alignment with the County IT strategic plan and applications roadmaps.

Integration with existing data and Applications.

Contractor architects, engineers, developers, and operations support teams shall work in concert to facilitate new components introduced into the environment that are able to function as designed without negatively impacting existing systems or County users.

IT standards, guiding principles, architecture bricks and patterns. Contractor follows all applicable standards and compliance requirements of the County and shall maintain and support applicable CMMI, ITIL, and ITSM standards and industry best practices for the delivery of IT services.

Using Contractor's application development framework, Contractor or a third-party shall design the solutions for the requirements. Contractor shall follow County's IT standards, guiding principles, and architecture bricks. Any deviations shall be identified early in the development cycle.

Planning and Standard Setting: For planning purposes, the Contractor Program Office shall provide budgetary estimates as required and follow standard change control procedures.

Contractor shall follow applications standards and work with the County to refine, improve, and modify as required. Contractor shall use Contractor's Program Quality Office to validate best practices, tools efficiency, and process improvements.

System Documentation. Contractor shall maintain the documents for the County program, with a sustained effort to improve timeliness and accuracy.

Cross-Framework Integration. All of the dependent applications, which are part of the impacted framework(s), shall be identified as stakeholders for developing the new requirement.

Contractor staff shall collaborate with the other framework teams to develop an interface control document, which shall become the guide to perform the integration between the frameworks.

Contractor's independent testing team shall perform integration testing and, where possible, use service virtualization tools to test interfaces.

ITIL/CMMI Practices. Contractor shall operate the County environment using ITIL and CMMI best practices. The Contractor ITSM community provides knowledge, best practices, and lessons learned to everyone supporting the County. Contractor shall leverage these unparalleled qualifications when bringing ITIL and CMMI-based processes to the County and recommend any changes to existing policies and procedures.

Standards

Contractor shall follow County's IT standards, guiding principles, and architecture bricks. Any deviations shall be identified early in the development cycle and communicated to the County. Contractor shall follow existing applications standards and work with the County to refine, improve, and modify as required.

Transition. Contractor's deployment plan shall include a strategy to migrate the application into M&O services. Upon implementing the project in production, Contractor's development team shall complete transition to the M&O team in an orderly, controlled manner that includes reviewing processes and outcomes, capturing lessons learned, and creating formal closure documentation.

- Processes in solution including year-to-year continuous improvement

Contractor shall leverage Agile, Iterative, and Waterfall methodologies as needed for each project. The methodology selection shall be discussed with the County and the necessary process shall be executed based on the needs of each project.

As members of the PMI and ITIL communities, Contractor shall provide training for resources, including acceleration programs for the PMP, CAPM, SPI, ITIL, and other disciplines. Contractor participates in global, regional, and Community of Practice (CoP) groups, including the USPS PPM Community, State/ Local Government/Education (SLED) Community of Practice, and the USPS Business Analyst Community of Practice. In addition, Contractor shall monitor industry standards for emerging methodologies and discuss Contractor's findings with the County.

Processes, procedures and use of tools in new systems planning, SDLC, project management, testing (including methods to engage the County) implementation (including methods to engage the County), post-implementation evaluation/review and transition (including transition support for newly implemented applications). Processes followed by Contractor organization that shall minimize disruption to business operations.

Software Development Lifecycle Methodology and Processes

Contractor shall perform full software development lifecycle (SDLC) process activities for developing and implementing new systems and major scope enhancements to existing and evolving systems.

Contractor shall comply with its governance and enterprise architecture principles as well as its procedures.

For each development project, Contractor shall work with the County's project sponsor to create a project plan. The plan shall detail the customized development approach to deliver the desired results with the best quality in the shortest time. Contractor shall provide a proven development model that are widely practiced in the industry and that Contractor has used previously at the County and on other successful projects.

The following table list software development models along with the general characteristics of each and the type of projects for which each model Contractor shall provide:

Application Development Models

DEVELOPMENT MODEL	CHARACTERISTICS	SUITABLE FOR PROJECTS WHEN –
Agile	• Software is developed and tested in short iterations (1 to 4 weeks) • Adaptive • Iterations are usually time-boxed to limit risk • Software is the principal measure of progress, with less emphasis on intermediate artifacts • Face-to-face communication is preferred to documentation	• Requirements are not well known but can be evolved through short cycles • The project team is relatively small so that developers and customers can easily communicate and incorporate feedback into the next interaction
Waterfall	• Sequential process that flows through requirements capture, analysis, design, coding • Plan driven • Predictive • Low risk • Expected results clearly defined up front	• Requirements are well defined up front and changes are expected to be minimal • System reliability is critical • Documentation requirements are high

DEVELOPMENT MODEL	CHARACTERISTICS	SUITABLE FOR PROJECTS WHEN –
	• Generally, artifact intensive (models, plans, documentation)	• Project team is large and incorporates many disparate organizations

Contractor's applications team adheres to County procedures that can be applied to Waterfall, Agile, or, alternatively, Agile/Scrum.

Contractor shall use the following activities that are common to nearly all projects:

- Business Modeling
- Requirements
- Analysis and Design
- Implementation
- Testing
- Deployment
- Configuration and Change Management
- Project Management
- Environment

Project Management

Overall governance of development projects shall be managed by Project Management. Contractor's ITIL-aligned project management methodology supports recognized industry standards, including the CMMI Institute's Capability Maturity Model Integration (CMMI), Projects IN Controlled Environments (PRINCE2), and the Project Management Institute's Project Management Body of Knowledge (PMI PMBoK) Guide.

Contractor shall use a proven set of tools (like HPE's Project and Portfolio Management Center (PPMC)) to plan, budget, and track cost, scope, and schedule performance data. Contractor shall engage the County in each step of the system development process—from evaluation to deployment.

Contractor shall provide a Service Portal that include access to the County on Contractor service level performance, project schedules, and cost.

Testing

Contractor shall leverage the Contractor's Enterprise Testing (ET) Methodology to plan, develop, and conduct an integrated Test Program. The methodology shall provide County visibility, traceability, and accountability in requirements management and verification; it shall also provide risk identification, management, and timely resolution in support of the County development and maintenance activities, as shown in

Using Contractor's ET Methodology—a comprehensive framework that provides the structure, processes, tools, and templates—Contractor shall align to the County SDLC.

Contractor's test team shall conduct the Test and Evaluation (T&E) program, including managing the creation of test plans and procedures, testing, and developing test reports; communicate the result of testing and recommendations to the team and to the client; and provide input to Contractor's Program Manager on cost, schedule, and staffing for meeting requirements in this area.

Contractor shall prioritize high-risk, high-value business requirements and concentrate testing activity on those requirements to minimize risk and deliver the most value to the County for the application implementation. Contractor shall set the testing strategy based on the value of a business function as well as the potential for failure and the associated risk. The testing strategy applies the highest levels of test coverage to the highest-risk, high-value functions.

Contractor's risk-based, requirements-driven testing has the following components, shall be executed iteratively:

- **Ambiguity Analysis –** Contractor shall conduct an ambiguity analysis to make sure that the requirements document is deterministic (with randomness removed), unambiguous, correct, complete, and testable. Contractor shall systematically analyze ambiguities in the requirements that drive application design, development, and testing to minimize inconsistencies and maximize requirements clarity.
- **Risk Analysis –** Contractor shall systematically analyze risks in those requirements to reduce chances of misdirected or incomplete test coverage, with focus on isolating and mitigating the most critical risks first—those that most negatively affect the highest-priority aspects of an application or system.
- **Systematic Test Design –** Contractor shall use methodical activities focused on managing and mitigating risks, Contractor shall apply test design techniques to plan, choose, and develop the most effective tests to verify from the bottom up to integrated functional areas and interfaces within the complete system for operational configurations and environments.
- **Requirements Traceability –** Contractor shall provide throughout test development and execution, Contractor use a Requirements Traceability Matrix (RTM) to comprehensively depict test coverage and keep testing focused on high-risk, high-priority requirements.
- **Testing Metrics Collection/Reporting –** Contractor testing reports offer ongoing insight into testing progress, coverage, and defect resolution; they offer timely opportunities for acting to mitigate risk before it causes irreversible harm.
- **Testing Close-Down Activities –** While testing ends with all tests executed, all defects resolved, and a system unquestionably ready for release, defects can outlast time and budget limits. Contractor shall focus on satisfying high-risk, high-priority requirements first through risk-based testing, leaving as the last priority tests and defects for only low-risk, low-priority requirements, as agreed upon in the Test Plan.

Contractor's applications group shall use the following tools from Contractor's Application Lifecycle Management (ALM) tool suite: the HPE Quality Center tool for test management and tracking, HPE Unified Functional Test for automated testing, and HPE Performance Center for performance testing. Contractor shall use these tools to manage and develop a series of test scenarios and test cases that test the entire solution for functional and performance quality. Based on the broad scope of Contractor's testing and tools, Contractor shall use automated and manual test scenarios and cases to fully test the solution. Contractor shall manage the test scenarios and cases with the HPE suite of testing products and then link and trace them to the approved requirements.

Implementation

After Test, Installation, and Validation phases have been successfully completed, the implementation process continues with a final review of success factors, associated risks, and mitigation strategy. All of the primary technical functions shall be documented and targeted, making certain that the applications development team and the County business owner agree with the decision to go to production. As documented in the pre-application cutover phase, each functional area shall be reviewed for completeness, functionality, and readiness.

Contractor shall mitigate risks to integration of systems by applying Contractor's consistent, repeatable system integration and project methodology that provide effective communication, coordination, and collaboration with the County, that shall result in a fully integrated solution.

Contractor shall develop a back out plan for each implementation to provide for rapid rollback to the original state if required. Whenever possible, the source system remains up and running until Contractor is sure that the workload has migrated successfully. This approach provides a fully redundant contingency; immediately after implementation, Contractor's Applications Development team shall test the functionality in the production environment to make sure County users shall not experience any disruption.

Transition to Application M&O Services

Upon successful implementation, the Contractor's application M&O staff shall provide support for the production application. Prior to production cutover, the Applications M&O team shall receive cross-training and documentation to provide a smooth transition from the development team. The development staff shall also review with the M&O staff any changes to the design and deployment document as well as the test results.

Application demand management methodology

Contractor's ITIL-aligned demand management methodology uses frequent communication with the County Technology Office to maintain alignment with the County's strategic priorities and schedules for new or modified application deployment.

Demand Management shall be approached with two methods; PPMC Demand Management module and Demand Growth & Innovation

Demand Growth & Innovated Solutions

The Business Analysts (BA)/Solution Architecture (SA) Service Center shall work with the department to ensure their demands are being managed. BAs shall assist the County in identifying and prioritizing future demand. Embedded with County departments, BAs shall work closely with the County users and have a solid understanding and the ability to articulate the departments business needs. BAs shall detect prospects for driving business innovation, aligning IT initiatives with business goals, to the SA and CTA. In turn, the SA/CTA shall work with the CTO to determine which technologies may be required to meet the business need. From that determination, the applications team shall forecast demand by department, technology, and timeframe.

Contractor shall host road mapping sessions including white board activities to better understand business demands, integrate with Contractor's innovation process and provide technology showcases on a regular basis as determined by the County and Contractor. The objective is to define a multi-year roadmap (over 5 fiscal years) to improve departments' ability to plan for change and influence IT direction in the overall County IT environment. The BA/SA partnership is key for defining their architectural/business road maps. The roadmap shall consider four key components:

- High level County/business objectives
- Technology/Vendor Lifecycle Roadmaps (e.g. Windows/Oracle, SQL)
- KPIs to measure roadmap progress
- Department PAIDs and projects

Contractor shall hold these sessions every 6 months or as otherwise determined by the County and shall review road maps, historical trends and map out business group's strategic plans and adjust road maps to meet the technology and business demands.

Contractor demand management practice shall facilitate staff planning, working with the County to identify slowdowns, provide a predictable forecast for budgeting and keep the business move in the right direction.

Demand Management with PPM

The Contractor's application demand management tool shall be HPE's PPMC Demand Management module. HPE PPMC consolidates, prioritizes, and fulfills the strategic application projects activities so the County can redirect activity based on demands.

The PPMC tool lets Contractor consolidate and prioritize the applications requests and focus on the highest-priority County initiatives.

Because the PPMC Demand Management module captures all IT requests, it enables County stakeholders to have a comprehensive picture of past, present, and future IT demands, grouped by demand category.

The PPMC Demand Management module processes a request based on the best-practice process and business rules for that type of request, after each request is captured. The process behind each request is modeled, automated, enforced, and measured. Automated, out-of-the-box, best-practice processes—including proposed projects, application-related enhancements, project scope change requests, non-project related requests, and others—are easily configured to support the County's specific best practices, using a drag-and-drop process modeler.

The module helps responding to new demands and changing priorities by redeploying resources and provides the automated processes and data necessary to effectively manage status, service levels, and trends. Web-based dashboards provide real-time visibility into request status, priority, next steps, and summary views. Service levels shall be updated automatically as each request is processed.

Business rules define when to send notifications so the PPM module can monitor processes in real time and alert the County and Contractor's applications team when something needs attention.

When priorities change, cycle times may be exceeded, or other requirements possibly may not be met, PPM can trigger an escalation process. With this level of visibility and control, Contractor can focus on the highest-priority requests and know quickly whether a project may be in jeopardy.

How HPE PPM Demand Management Works

Each request type shall have an associated workflow, which specifies the process for reviewing, evaluating, prioritizing, scheduling, and approving the request. Based on the workflow, the Contractor reviewer shall assign the request to a person or team for scheduling and delivery. Notifications defined as part of the process shall be activated at any step to indicate work that needs to be done, has not been done, or is being escalated.

With online access, Contractor managers shall assign tasks, and developers can view and work on tasks assigned. Service levels are updated in real time, and changes are captured for a complete audit trail. Contractor shall link the module to the new Service Portal described.

Contractor shall provide the following key features and benefits of PPM Demand Management:

- **Shared demand repository**

- **Unlimited demand categories**
- **Demand scheduling and prioritization**
- **Drag-and-drop process modeling**
- **Complete audit trail**

Contractor's approach for performing system analysis and design for major new development projects and enhancements. Describe how Contractor expects the County to be involved in the analysis and design process.

Contractor shall work collaboratively with the County during the planning, analysis, and design phases of development projects. Contractor shall include the following activities that Contractor shall perform iteratively throughout the delivery life cycle. Contractor shall adhere to the County Standards and Procedures applicable to all applications development projects.

Collaborative Planning with the County – Analysis and Design

Upon receipt of an approved request, Contractor shall kick off the project by conducting a series of workshops with the County project sponsor. Contractor's team's focus during the planning workshops is to facilitate collaborative dialogue with the County on design of the new system. Contractor's expectation is that the County product owner shall describe the intended result so Contractor's team can understand the requirements, begin to design the architecture, and apply technical standards.

During these workshops, Contractor shall discuss "End-User stories" that encourage the County to visualize the new system as deployed. Analysis of the new system shall include realistic assessment of anticipated improvements, potential limitations, and possible risks. Contractor also shall discuss system business rules needed to facilitate continuity from the existing process to the new system. **Error! Reference source not found.**Contractor shall build a roadmap and next steps with the County that sets realistic target dates for solution design, development, testing, and deployment. The roadmap shall define the County's role throughout the development process.

Contractor's approach allows the County to continue to provide design input throughout Contractor's iterative processes, keeping the new system development aligned to County objectives.

Contractor shall maintain SDLC documentation as the project progresses. This shall include documentation of the County's priorities, the solution design and its characteristics and features, results of the collaborative analysis including risk assessment, and the improvements anticipated upon deployment and all approved changes. Based on the planning workshop discussions, Contractor's team shall refine and document the functional and nonfunctional technical requirements and submit them for County approval.

Cloud and E-commerce solutions. Contractor experience implementing E-commerce and cloud solutions.

Cloud Services

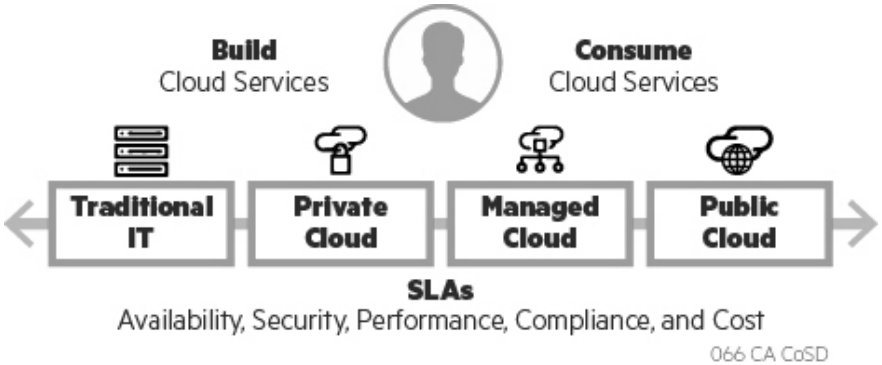
With the planned consolidation to the Tulsa data center, Contractor shall take this opportunity to move the current Dev/Test application infrastructure from a well-performing traditional hosted environment to a more agile, hybrid Managed Private Cloud (MPC) for compatible platforms, and retain the traditional hosted environment where necessary for applications that are not initially cloud compatible. The MPC environment shall be a highly standardized environment with high redundancy and high availability for both infrastructure and applications to eliminate single points of failure. Moving to MPC provides benefits of streamlined server provisioning, enabling Contractor to provision, scale, and de-provision virtual servers in hours instead of days. This shall also include tools that simplify capacity and performance management, monitoring, patching, and security and regulatory compliance and provides the

foundation for the County to take advantage of additional public cloud services. Contractor shall work with the County to identify production applications that are candidates for the MPC environment.

In partnership with AT&T, Contractor shall provide virtualized services for the County. Contractor's network is designed to provide maximum flexibility, enabling adoption of new applications and cloud services while maintaining the highest security and service levels. Acting as an "enabler to the enterprise," Contractor's network shall enable any device managed or unmanaged to be evaluated, authenticated, and allowed policy-based access.

Contractor's solution's End-User-friendly portal shall result in quick adoption, and provide state-of-the-art software for cloud service catalog presentation, automation, management, and orchestration. HPE's Cloud Service Automation (CSA) Portal platform is the End-User entry point into the Cloud Consumer Portal. Users can view service details and subscriptions through an easy-to-use self-service portal.

Full Suite of Cloud and Cloud Broker Services



Contractor's cloud solution shall enable delivery of IT resources as "services"—such as Infrastructure as a Service (IaaS), Platform as a Service (PaaS), and Software as a Service (SaaS)—to consumers using ITIL-based management and operational support processes through a web-based, private Cloud Consumer Portal. Contractor skilled resources shall provide setup, configuration, and ongoing management of the private cloud, so applications development staff can more effectively complete projects.

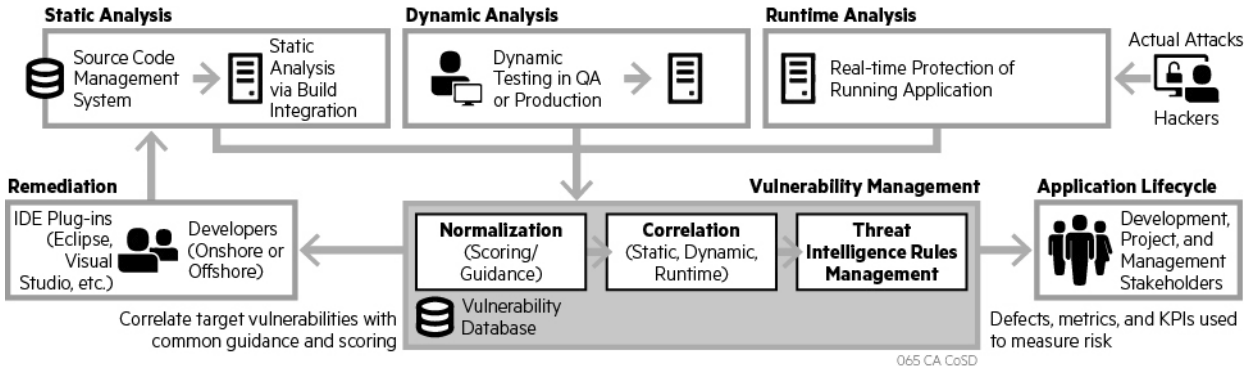
Contractor's CloudSystem shall enable Contractor's development team to build and manage services across private cloud environments on a simplified, integrated architecture:

- Intelligent automation; application-to-infrastructure
- Complete service life cycle management—from provisioning to monitoring to retirement/de-provisioning
- Supports multi-hypervisor, multi-operating system (OS), and heterogeneous infrastructures – now including Kernel-based Virtual Machine (KVM) and Hyper-V support
- Pre-packaged service design tools – HPE Cloud Maps, which are pre-configured and standardized workflow templates for infrastructure deployment, application deployment, and life cycle management;
- Out-of-the-box bursting capabilities broker service delivery across multiple clouds from a single, integrated point of control
- Built on proven and market-leading HPE Converged Infrastructure and HPE Cloud Service Automation (CSA). Combined with Operations Orchestration (OO) and Matrix Operating Environment, CSA automatically enables the design and provisioning of virtual infrastructure services in hours instead of days. Contractor Server Automation software enables Contractor to automatically perform activities such as server discovery to provisioning, patching, configuration management, and script execution to comply with Contractor IT configuration standards.

Security

Contractor's cloud solution shall provide capability to perform Static Code Analyzer (SCA). This service focuses on implementation of the Static Analytics, Remediation, and Vulnerability Management of the architecture in the following figure.

Essential Building Blocks of a Mature, Secure SDLC for Cloud Services



Contractor shall provide a, short-track implementation into the County environment that shall result in a scan of the target application. This shall enable Contractor's team to accomplish the following:

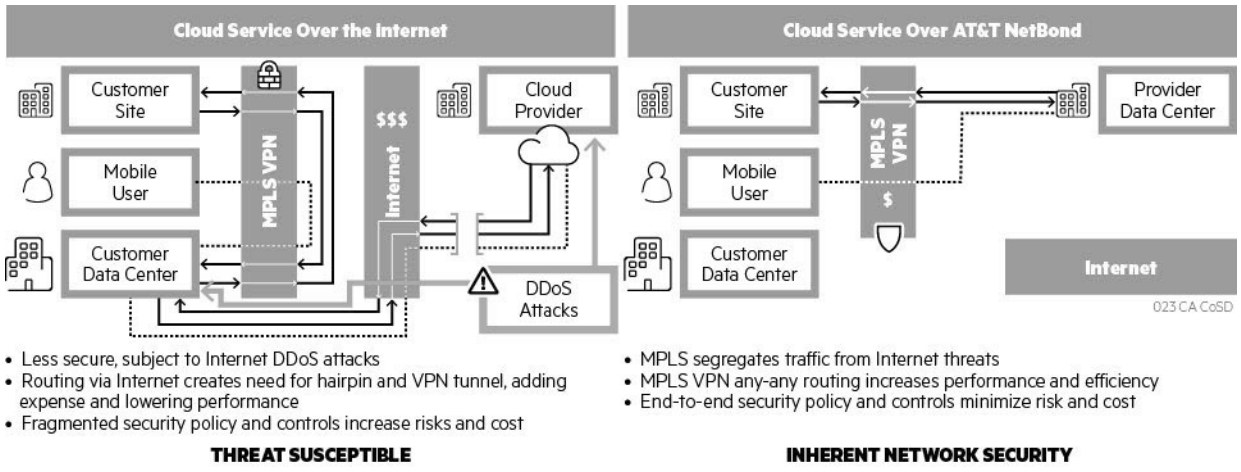
- Produce SCA scans
- Triage scans results to identify and prioritize security vulnerabilities
- Incorporate the Contractor solution for the County into the development process

Embedding Contractor's solution within the software development lifecycle shall enable secure development practices and shall keep applications protected from external threats.

In the background, Contractor's network security is built on AT&T cloud security.

The following figure shows the AT&T NetBond as a basis for cloud services for the County.

Cloud Service over AT&T NetBond



Contractor avoids the security risks of the typical cloud service over the Internet by providing end-to-end security with NetBond.

HPE Cloud Service Automation (CSA) goes beyond traditional IT provisioning; it increases agility and reduces costs. This solution shall offer the following:

- Leverages a modern, easy-to-use self-service portal with an intuitive shopping cart experience for ordering infrastructure and application services across both private and public cloud environments.
- Enables an open, heterogeneous, and extensible architecture supporting OpenStack-based cloud standards, with multi-hypervisor, multi-vendor hardware support that avoids the pain of vendor lock-in.
- Embraces existing automation assets in a highly automated cloud lifecycle management platform that uses an enhanced orchestration engine.
- Designs and orchestrates full-stack services with topology service designs for faster time to value
- Stages complex multi-tier applications with sequential service designs
- Gains enterprise-grade service management with a highly available architecture, providing informed, transparent IT service delivery for secure and compliant services.
- Creates an IT service control point, enabling hybrid IT management across the expansive HPE Helion portfolio of private, public, and hybrid cloud services.

The solution features an open, extensible architecture that supports HPE and third-party management tools, enabling Contractor to quickly adapt to changing business requirements while supporting heterogeneous IT environments.

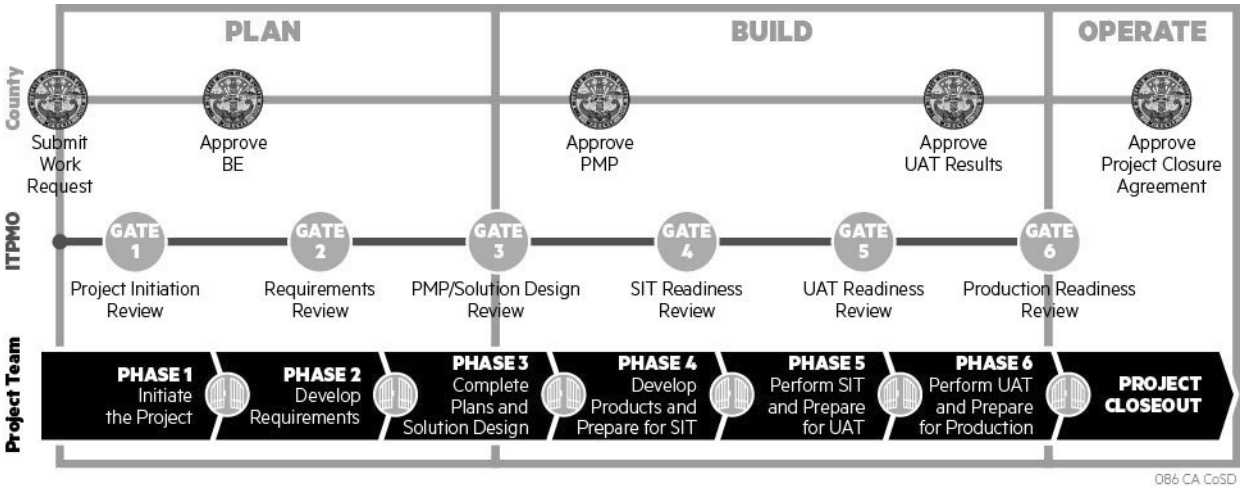
Waterfall and agile development

Contractor shall use Waterfall or Agile approaches based on best fit for the project.

Waterfall Approach

In Waterfall life cycles, each phase (Define and Analyze, Design, Build, Test, Release, and Deploy) is typically executed sequentially, possibly with overlap but with little or no iteration. Contractor shall use Waterfall life cycle development for projects that require a Waterfall approach to deliver business applications or to implement major application enhancements for an existing system.

The County's Waterfall Methodology and Gate Review Approach



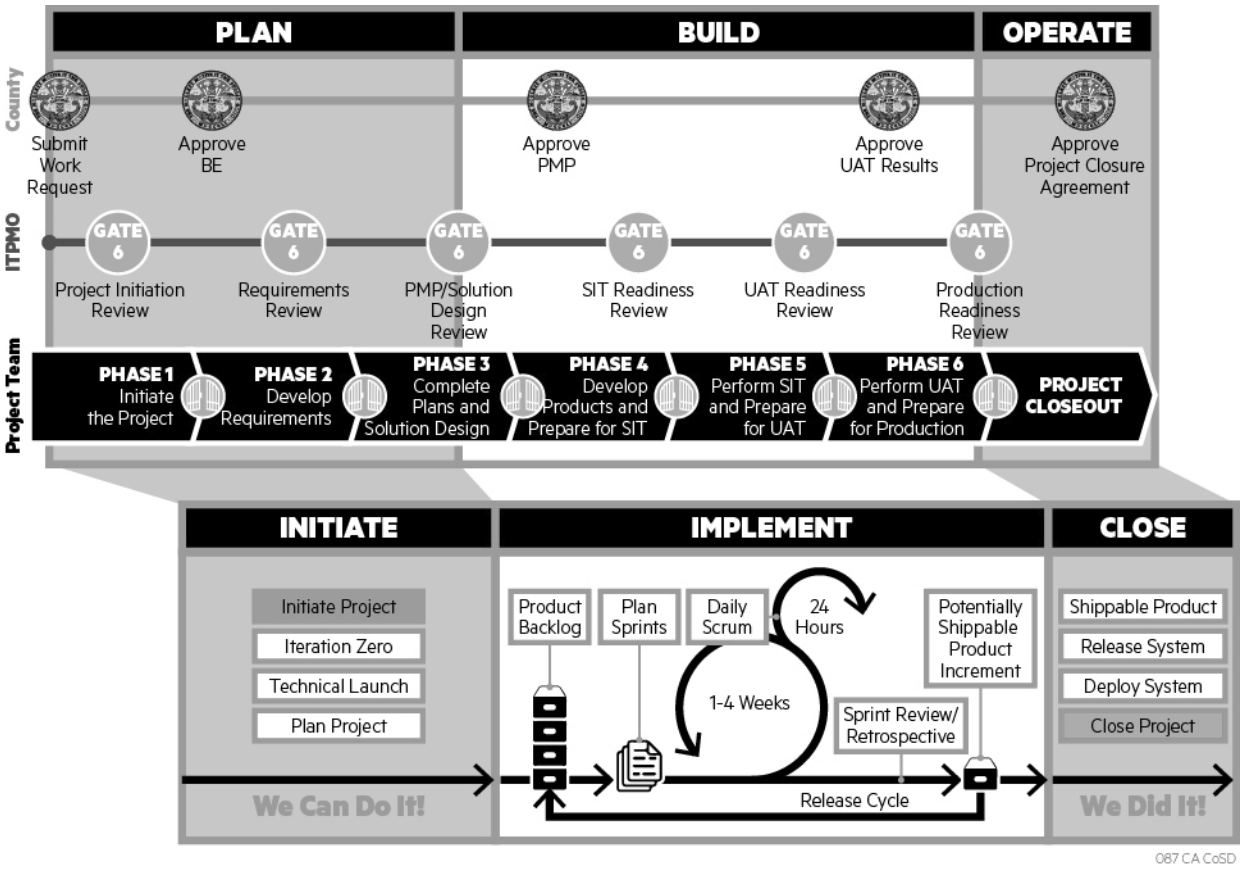
Agile Approach

Contractor tailors an Agile development approach for each project. Based on the Scrum framework, this approach uses an appropriate selection of sound engineering practices from Extreme Programming (XP). It provides a substantial benefit by enabling rapid scalability if required, taking advantage of teams working concurrently in multiple locations, while preserving the ability of rapid response to change.

Scrum Framework

Contractor shall use Scrum Framework process for projects that require a Scrum approach to deliver business applications or to implement major application enhancements for an existing system.

Using County Waterfall Gate Reviews with Contractor Agile Development Process



Contractor maintains County procedures during Contractor's Agile/Scrum development.

- Automated Tools – Automated systems and tools involved in solution

Contractor shall use tools such as HPE's ALM and Dell Marketing's Toad for Oracle software. Contractor shall evaluate other tools that can be used to automate application development services activities and make appropriate recommendations. Contractor shall evaluate automation in configuration and release management as well as the use of HPE cloud service automation and HPE Codar to bring in automation for release management and to integrate with server builds to implement DevOps capabilities.

Contractor's applications development team shall use Contractor Project and Portfolio Management (HPE PPM) demand management module to centralize the resource assignment process. This allows Contractor to strategically manage Contractor's workforce to meet the County's demand across the enterprise. Contractor shall use PPM to track actual effort against project work, allowing quick access to level of effort information that shall be used to inform decisions and prioritize work across all county projects. PPM also has a powerful workflow process engine that helps automate business processes.

8. TRANSITION SERVICES

8.1 Transition Services

Schedule 2.1

Executive Overview

Contractor shall use Contractor's transition and transformation methodology (TTM) as the basis for managing the overall transition as well as the transition projects. TTM shall provide a comprehensive yet flexible, ITIL-aligned framework so that every aspect of the transition is accounted for, planned for, and expertly managed. The Transition Services Management Office (TSMO) shall have primary responsibility for planning and executing the Transition Plan. Contractor shall define and identify key linkage points in the County of San Diego organization. Contractor shall assign a senior and experienced Transition Services Manager (TSM), who shall direct and lead all aspects of the Transition and shall work collaboratively and transparently with the County assigned TSM and Contractor's existing Program Management Office (PMO). The TSM shall facilitate daily stand-up calls and issue weekly status reports to provide transparency and make sure that key decision-makers and the County stakeholders are fully aware of progress as the transition program proceeds.

The TSM shall lead a clearly defined TPMO, with full accountability for execution. The TSM shall report directly to Contractor's Account Executive. In partnership, they shall execute on-going operations and the transition projects.

Requirements

- Description of solution to meet the requirements

Solution Summary

8.1.1 Communications/Governance Plan for the County and the Legacy Provider

Contractor shall provide a Communications and Governance Plan as part of the Transition Initiation activities.

8.1.2 Contingency Planning/Risk Mitigation

Contractor's Transition and Transformation Methodology (TTM) shall include a robust process for Risk Management that shall make sure risks are mitigated to the County's satisfaction.

8.1.3 Measurable Success Criteria

Each project shall, at its inception, include a step where Contractor and the County mutually agree on the definition and measurement of success. This shall provide a smooth cutover process as each framework and project is completed. Success criteria are of two types:

- Project management success criteria:
  - Signoff of tasks and deliverables according to the dates in the project plan. This shall be measured and reported weekly according to task completion.
- Project deliverable success criteria:
  - Verification that the business objectives set out for the project were met.

The Transition Services Manager shall be responsible for defining the overall success criteria for the program and submitting it to the County for approval, which approval shall not be unreasonably withheld.

Upon such approval, each Transition Project Manager shall be responsible for managing to and measuring the success criteria for each project under his/her purview. Measurements and tracking against defined criteria for each project shall be reported to the joint Transition Services Management Office (TSMO) weekly. Any measurements that indicate that one or more success criteria are in jeopardy shall be escalated to Contractor leadership for remediation.

Measurement of success criteria may be discrete (pass/fail: either the criterion was met or it was not) or continuous (measurable on a scale, such as a range of percentages). Since project deliverable success criteria is relevant to the County, following are some examples of project deliverable success criteria suggested for this program, along with their measurement approach. This is not intended to be an exhaustive list: as previously noted, actual success criteria shall be established for each aspect of the Transition.

PROJECT	DEFINITION OF SUCCESS	MEASUREMENT APPROACH
Overall Transition Program	Sustainment or improvement in customer satisfaction	• Service Level Measurement, before, during, and after the Transition • Periodic customer surveys, specific to the Transition experience and effectiveness of communications
Disaster Recovery Plan	Completion of one table-top or actual failure exercise according to the new plan	Record levels of participation, scope, and end results and remediation recommendations
Data Center Consolidation	Sustainment or improvement in application performance	Verification by stakeholders that an application migrated to the consolidated data center environment performs as well as or better than it did in its previous environment (as measured by batch job execution times or transaction response times; measurements shall be taken and compared against established baselines conducted and documented prior to Transition, using existing tools such as Autosys or Load Runner or using system based monitors such as performance manager
Email Migration	95% of mailboxes migrated in the first pass without subsequent issues, post-pilot; all remaining issues resolved within 24 hours.	Project team migration results report
Storage Architecture	Zero data loss	Verification from migration tools of successful completion

PROJECT	DEFINITION OF SUCCESS	MEASUREMENT APPROACH
Development/Test Environment	Successfully implemented Broker and Managed Private Cloud, with all assets assigned to the correct pools	Audit of assets before and after project to verify assignment
Service Portal	80% of End-Users trained on Portal features	Measurement of End-User participation in training

8.2 Transition Project Plan

During Transition Initiation, Contractor shall work with the County to develop the lower-level details of the project plan.

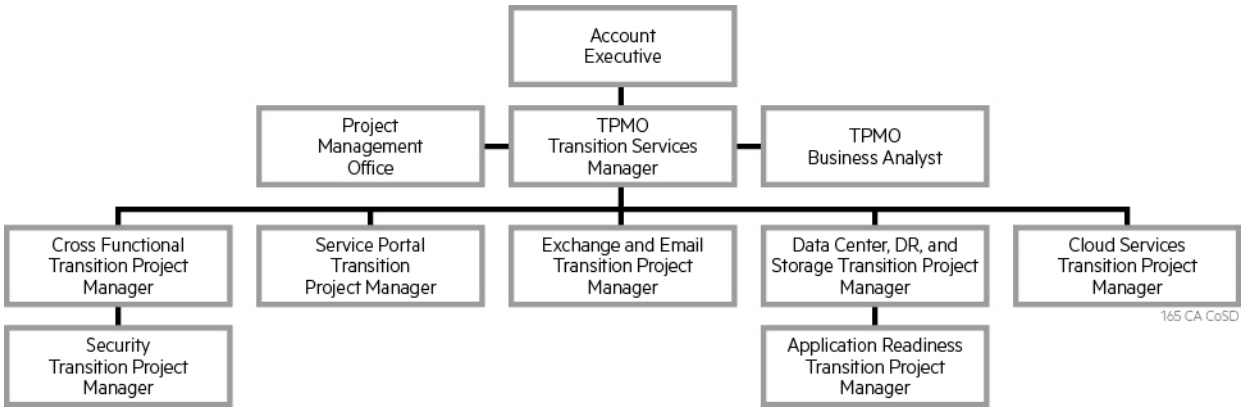
The plan information for each framework can be found as follows:

FRAMEWORK	TRANSITION PLAN
Service Desk	• Cross Functional Transition Schedule and Tasks
Application Services	• Cross Functional Transition Schedule and Tasks Special Cross Functional Projects – Application Services Framework,
End User Services	• Cross Functional Transition Schedule and Tasks
Network Services	• Cross Functional Transition Schedule and Tasks
Data Center Services	• Cross Functional Transition Schedule and Tasks • Special Cross Functional Projects – Data Center Services Framework, • E-Mail Services • Development and Test Environment • Consolidated and Single Data Center • Storage Architecture
Cross Functional Services	• Cross Functional Framework Transition: Activities Aligned to Framework Components • Special Cross Functional Projects

8.3 Transition Staffing

The figure below shows the TSMO structure and the roles, functions, and key responsibilities of each member.

Transition Services Management Office



Dedicated Transition Project Managers shall drive each project's success while managing to the integrated plan.

The TSMO shall create and refine joint program schedules, manage risks, resolve issues, provide proper communication, assess progress, and facilitate on-time transition completion. The TSMO shall serve as a central conduit for information, communication, and cooperation. In addition, the TSMO shall manage all project reporting and quality assurance activities to verify that Contractor follows all established Project Management standards and that project reporting is consistent.

Additional details on roles and responsibilities for the identified TSMO staff are presented in the following table. Each Transition Project Manager shall be responsible for the following items:

- Establishing and documenting progress on their individual sub-project plan(s) within the overall master schedule, and coordinating interdependencies with other projects
- Managing the activities of the technical teams working on their projects, in coordination with the current Contractor support staff and within the established operational delivery processes
- Reporting project status to the TSMO with the Project and Portfolio Management (PPM) tool
- Managing issues and mitigating risks that arise, with escalation when appropriate
- Making sure that their project team meets established success criteria and facilitating handoff of the project's deliverables to operations leadership
- Performing close-down of the program.

The role of each TSMO team member is briefly described in the table below.

TSMO Roles and Responsibilities

TMO ROLES	TRANSITION RESPONSIBILITIES
Transition Services Manager	The Transition Services Manager oversees the Transition results, deliverables, schedules, and dependency tracking across all Transition projects. He is responsible for all Transition activities, including Transition kickoff sessions, program and project management, risk management, communication, reporting, Transition escalations, change management, quality management, operational readiness reviews, and coordination with any in-flight projects. The Transition Services Manager performs quality checks during Transition, working with the Contractor account team to make certain that the team conducts all activities in accordance with established practices.

TMO ROLES	TRANSITION RESPONSIBILITIES
Service Portal Transition Project Manager	Responsible for the project to implement and customize the Service Portal, within the Service Desk Framework.
Data Center Consolidation Project Manager	Responsible for the Data Center Consolidation Transition project within the Data Center Framework. This shall include the following projects: • Buildout and migration to the new Data Center Network compartment in Tulsa, and establishment of connectivity to the disaster recovery (DR) site (Contractor-defined sub-project). • Buildout of the new Storage Architecture. • Establishment of the new DR infrastructure to support subscription services in the Colorado Springs HPE Continuity Center. • Execution of the consolidation of all County Data Center workloads currently residing in Plano into the Tulsa Data Center.
Cloud Services Transition Project Manager	Responsible for setting up and configuring the Managed Private Cloud (MPC) and the Helion Managed Cloud Broker (HMCB) in the Tulsa Data Center and configuring the Development and Test Environment within the Data Center Framework.
Application Readiness Transition Project Manager	Works with the Data Center Consolidation Transition Project Manager to coordinate application migration schedules, plans and testing.
Exchange/Email Transition Project Manager	Responsible for migrating the County to the Office 365 email solution within the Data Center Transition Framework
Cross Functional Project Manager	Responsible for the following projects within the Cross-Functional Framework: • Oversight of the delivery of new Standards and Procedures, Service Level Management and Reporting artifacts (or updating current versions to meet the Agreement requirements) for all Cross-Functional Framework Components, as well as for the other Frameworks • Management of development and implementation of the Cross-Functional Framework Component Management Plans • Coordination of delivery of Disaster Recovery Plans for each Framework.
Security Transition Project Manager	As part of the Cross-Functional Framework, the Security TPM shall be responsible for coordinating execution of Security and Identity Management related projects and changes within the other Frameworks.
TSMO Business Analyst	Responsible for administrative support, such as coordinating status reports and meetings, project schedule change management and integration, and quality management on project deliverables.

Contractor's Transition Management Office shall be staffed and ready to begin as of the Contract Effective Date.

During the Transition period, Contractor shall augment Contractor's technical staff with additional resources to make sure the Transition projects execute successfully, without creating undue constraints on the current support teams. Where appropriate, Contractor may temporarily backfill select members of the

local team supporting the County so that they may lend their expertise and County knowledge to the implementation of some Transition projects. Contractor shall make sure, however, that this does not cause any disruption to the County's current services and projects.

Rationale

Contractor shall manage each sub-project as a project, while continuing to provide excellent service delivery. During the Transition period, Contractor shall successfully plan, communicate, and manage the transition activities collaboratively.

- Deployment plan for resources and use of facilities

Resources. Contractor shall provide dedicated resources for Transition project management and execution to make sure that operational delivery and the County's in-flight projects are not impacted by resource constraints.

Facility. The Contractor Transition teams shall support the Transition from Contractor's Rancho Bernardo site and existing County locations, where appropriate, as well as Contractor's facilities in Tulsa, OK, and Colorado Springs, CO. TSMO resources, including the Transition Services Manager, shall operate out of the Rancho Bernardo site.

- Key methodologies and processes in solution

Contractor shall execute project management, transition, and transformation by using Contractor's Transition and Transformation Methodology (TTM) composed of standardized processes, methods, tools, and governance to deliver repeatable and predictable results. It shall address the people, business processes, and technology issues of transition and provides a step-by-step process for joint planning, communication, post-contract verification, and management.

Contractor TTM Process

Contractor shall use Contractor's comprehensive and proven TTM, a flexible comprehensive framework of robust processes, procedures, best practices and supporting assets that enable the successful planning and execution of a Transition or Transformation program. It shall define what deliverables are to be produced, what work needs to be done, who should do it, how they should do it, and when it needs to be done. It shall also provide supporting assets to complete the work efficiently.

Transition programs and their associated projects shall go through five distinct phases: Initiate, Plan, Execute, Monitor and Control, and Close.

Initiate. Contractor and the County shall set up the program management structure described above, onboard the program team, and start the program. During the first few days of the Transition, Contractor's TSMO shall create draft versions of the Communication Plan, Governance Plan, and the initial master Transition Project Plan and Schedule. Contractor shall start from Contractor's template repository and work with the County collaboratively on these items, but shall also submit a final draft for formal County approval as required. Once finalized and approved, Contractor shall put these plans into action and begin program execution.

Plan. Building on the notional Transition Plan developed during the proposal process, Contractor shall conduct detailed joint planning to elaborate and refine the plan, then conduct a transition kickoff meeting with identified key stakeholders from the County, the current delivery leadership—as represented by Contractor's key personnel—and key leaders from the Transition Technical teams.

The TSMO shall create a master Transition Management Plan along with a corresponding Transition Schedule. This shall serve as the overall foundation for the program and shall address the key program elements, including resources, dependencies, and timeframes. This master plan and schedule shall be augmented for each of the six Transition projects. The figure below provides a high-level timeline of Transition activities, showing the Transition Initiation, the Framework Transitions, and the Final Transition Milestones that follow at the end of the Transition period.

Execute. Within the TTM methodology, each Transition Project Plan shall be executed as described in the sections that follow.

Monitor and Control. Throughout the program, the TSMO shall oversee the Transition activities to produce deliverables on time, remain within budget, and execute Change Management if needed.

Close (Final Transition Milestones). Contractor shall ensure that commitments and success criteria defined in the Transition Management Plan have been met.

- Automated systems and tools involved in solution

The following table lists the tools Contractor shall use to support the Transition program.

Tools Utilized to Support Transition

TOOL NAME AND VENDOR	DESCRIPTION
TTM Templates	• Integrated Transition and Transformation Plan (ITTP) • Transition Specific Risk Register (Excel) • Communication Plan (Word) • Governance Plan (Word) • Transition Daily, Weekly Meeting minutes (Word) • Operational Readiness Checklist / Success Criteria (Word)
Project-specific Tools	• Contractor shall use Microsoft Project to coordinate and manage Transition-related projects and tasks. • Tools used for Transition projects shall be defined and covered in the related sections.

8.3.1. Transition Management Specific Questions

Transitioning licenses, contracts and leases from the Legacy Provider and the County

Contractor shall support and manage all third-party vendor relationships, licenses, contracts, and leases.

Contractor shall create and submit for County approval a process to transfer licenses, contracts, and/or leases, that are included within a Service provided under the Agreement.

Transition resources that shall remain to provide Operational Services for the County versus resources who shall transfer after Transition

Contractor shall provide dedicated resources for each transition project. Contractor shall leverage Contractor resources supporting the County and Contractor's staffing plan shall include subject matter experts (SME) to augment and make sure that there are no impacts to operations activities.

Cross Functional Services

- Description of solution to meet the requirements

Solution Summary

Contractor shall implement Security and Identity Management changes required to meet each framework's delivery model, in those cases where changes are required. The cross functional activities for each framework shall be implemented in parallel but in coordination with that Framework's Transition projects, where applicable. For frameworks that do not have specific transition projects identified, the Cross Functional Transition shall be the only scope of that framework's transition.

During the Transition period, Contractor shall develop a management plan for each of the Cross Functional component areas and train Contractor's teams on the changes. For the Cross Functional components, Contractor shall update the Standards and Procedures Manual, Service Level Management, and Reporting during the 270 days of the Transition period, so these efforts shall follow a similar approach to that of the other frameworks.

- Deployment plan for resources and use of facilities

The Cross Functional Transition activities shall require input and participation from Contractor support staff to make certain that processes and deliverables leverage existing artifacts and methods. The Cross Functional Transition team shall be embedded with each Framework Transition team.

Contractor shall support the Cross Functional Transition primarily from Contractor's Rancho Bernardo site.

- Key methodologies and processes in solution

Transition Schedule and Tasks

The chart below is a high-level example of the Cross Functional activities within a Service Framework: End User Services. The same task structure shall apply to each framework as well as each Cross Functional component.

While the task structure shall be the same across frameworks, task durations shall vary based on the degree of change being introduced by the Agreement requirements.

Although many activities shall happen in parallel, once Contractor creates the schedule for all Cross Functional components and the Cross Functional activities for each framework, the timeline shall expand with the details and dependencies.

The figure below shows the core high-level tasks Contractor shall perform for each framework.

There are no dependencies identified for generation of the Cross Functional Component Management Plans, which shall be developed in parallel with, and as the culmination of, the other component artifacts.

Cross Functional Activities Aligned to Service Frameworks

Within each Service Framework, Contractor shall follow the basic task structure illustrated in the figure below.

Standards and Procedures. Contractor shall inventory and review each procedure document against the Agreement to identify the subset of processes that need to be changed or created (if a new process is needed). Contractor shall then categorize the documents based on the degree of changed required:

- Completely new procedure or standard needed – If a new process is being implemented in support of a new technology, Contractor's Solution Guide documentation for the service offering that Contractor is implementing shall provide a base set of procedure documents. From there, Contractor shall customize and adapt those base documents to the specifics of the County's environment and documentation standards. Contractor shall then test the procedure and further refine the documentation. If a new procedure is needed based on a new business requirement, Contractor can use Contractor's Enabling Delivery and Global Excellence (EDGE) repository to locate a base artifact from which to build the new procedure.
- Updates required to an existing procedure – Contractor shall follow a similar process to the one for a new procedure/standard, but the starting document shall be the existing process. Whether testing is required shall depend on the degree of change.
- Existing procedure continues unchanged – No modifications required.

Once the Standards and Procedures drafts are complete, Contractor shall submit each draft to the County for review and response. The County shall reply within the agreed timeframe if any changes or clarifications are required. Contractor shall then make the final set of modifications, if needed, and finalize the documentation. Documents shall be posted to the appropriate repository reachable from the Service Portal. Any procedures or standards that are no longer valid shall be retired and their documentation archived according to Contractor's Records Management policy.

Where appropriate, Contractor shall provide training in and/or communications about new or modified procedures and standards to Contractor's staff and to County stakeholders who participate in or are customers of the process. Training methods shall range from Frequently Asked Questions (FAQs) and tip sheets, to training videos accessible from the Service Portal, to webcasts or onsite training at Contractor's Rancho Bernardo site.

Service Level Management. During the Cross Functional Transition, Contractor shall adhere to the following steps to implement Service Levels:

For each new or modified Service Level, Contractor shall identify the data necessary to calculate it, the process to verify data quality and scrub exceptions, and any scripting or automation needed to manage the data and its reporting to the Service Level Management process.

Contractor then shall develop and test the new or updated metrics collection process, checking the data and the performance metrics.

Contractor shall identify the appropriate process or service improvements needed to meet the Service Level and test them for an additional month to determine whether this brings Contractor to an acceptable level of performance. Generally, no more than one to three iterations of baseline measurement and adjustment are required to identify the scope of operational change required by the Service Level. The time to complete this process shall be within the time allocated for transition of the applicable framework.

Once Contractor has successfully achieved the new performance target, Contractor shall proceed to update all process and reporting artifacts, and present them for County review and response, according to the steps described above in Standards and Procedures. After finalization, Contractor shall post all deliverables to the appropriate repository, available from the Service Portal.

Once implemented, Contractor's Service Level metrics shall be integrated into the Service Level Dashboard), available from the Service Portal.

Reports/Deliverables. Transition activities for creating new or modified reports shall be similar to the tasks defined for updating Standards and Procedures: Contractor shall inventory and review each report against the Agreement to identify the subset of reports that need to be changed or created. Contractor shall then categorize them based on the degree of changed required:

- New report needed – If a new report is being implemented in support of a new service, Contractor shall create or customize and adapt existing deliverables, or the automated scripts that create them, to the specifics of the County's environment and reporting standards. Contractor shall then test the report and further refine the process. If a new deliverable is needed based on a new business requirement, Contractor can use Contractor's EDGE repository to locate a base artifact from which to design and automate the new report.
- Updates required to an existing report – Contractor shall follow a similar process to the above, but the starting point shall be the existing report process.
- Existing report continues unchanged – No modifications required.

Once drafts of the new or modified reports for the framework are ready, Contractor shall submit them to the County for review and response. The County shall reply within the agreed timeframe if any changes are required. Contractor shall then make the final set of modifications, if needed, and finalize the generation procedures and formats, and place the reports into an automated schedule wherever possible. Process documentation shall be posted to the appropriate repository, as described above, and new reports shall be added to the standard reporting cycle.

Where appropriate, Contractor shall provide training in and/or communications about new or modified procedures and standards to Contractor's staff and to County stakeholders who participate in or are customers of the process. Training methods shall range from FAQs and tip sheets, to training videos accessible from the Service Portal, to webcasts or onsite training in Contractor's Rancho Bernardo site.

Security and Identity Management Updates. In general, transition tasks shall follow the steps illustrated in the Gantt chart, but for security sub-projects, Contractor shall add more detail shall to address specific requirements.

Framework Disaster Recovery Plan. Contractor shall add disaster recovery (DR) specialists to augment the team. They shall be dedicated to maintaining these plans and overseeing DR testing. They shall join the Cross Functional team during transition to lead the DR plan updates for each framework. Each framework shall have its DR plan reviewed and updated to support the requirements of the Agreement. The DR plan shall be submitted in draft form for County review and comment, then finalized and delivered to a restricted area of the Service Portal no later than 90 days prior to the framework cutover[1].

Special Cross Functional Projects – Service Desk Framework

No special Cross Functional projects have been identified for the Service Desk Framework. The project to implement the Service Portal is described in the section for Service Portal transition.

Special Cross Functional Projects – Application Services Framework

Two special Cross Functional projects have been identified for the Application Services Framework that are illustrated in the table below.

Special Service Levels: Application Availability and Application Response Time. The process to implement these two Service Levels shall be similar to that described above.

SaaS Application Onboarding: The County has identified in the solicitation 169 applications identified as SaaS applications that Contractor does not currently support. For each of these that the County wishes Contractor to support, Contractor shall need to perform the steps described in the Gantt chart below.

Contractor shall review each application that the County wants Contractor to support, according to Contractor's established process for Third Party Agreements, and determine the level of support possible for each (license transfer, right to use, warm transfer). Once Contractor has a final list, Contractor shall work with the support contacts at that vendor to understand their support process, and create Service Desk scripts that shall enable Contractor's team to field those calls. Contractor shall then train Contractor's Service Desk staff to support them, and prepare communication materials for users of those applications to understand the new support process.

All draft materials shall be submitted to the County for review and comment. The County shall reply with any changes required within the agreed timeframe, after which Contractor shall finalize and post all deliverables to the Service Portal and cut over support for those applications during the Application Services Transition.

Special Cross Functional Projects – End User Services Framework

No special Cross Functional projects have been identified for the End User Services Framework.

Special Cross Functional Projects – Network Services Framework

No special Cross Functional projects have been identified for the Network Services Framework. The re-architecture and refresh of the Tulsa Data Center network is described in the Data Center Consolidation Project.

Special Cross Functional Projects – Data Center Services Framework

A number of security projects have been identified for the Data Center Services Framework. These include the following:

- Projects to re-orient services that are active-active across sites in the two-data-center model, such as Active Directory, Active Directory Federation Services (ADFS), and the Endpoint Threat Protection core.
- Projects in support of the email transition to cloud, such as adaptation of the Security Incident Management process.
- Projects to address heightened security requirements, such as expansion of security information and event management (SIEM) services, design and implementation of a separate Development/Test network zone, and implementation of continuous scanning.
- As part of the Data Center network buildout, Contractor shall convert from Checkpoint firewalls with TippingPoint for intrusion detection/prevention services to Palo Alto devices that support both functions.

Special Cross Functional Projects – Replacement of myRequests

During the Cross Functional Transition, Contractor shall replace the myRequests Service Request system with the Service Catalog and Request Manager that comes pre-integrated with HPE Service Manager. Because this migration takes longer than the Service Portal implementation, during the initial deployment of the Service Portal, the Service Portal shall be linked (using a front page tile or from the "Links" tile, at

the County's discretion) to the myRequests system, and Contractor shall maintain myRequests following Contractor's processes, while the new request manager/service catalog functionality is being configured. Once the new Request Manager system is ready, and End-User training has taken place, Contractor shall disengage the link to myRequests and bring Request Manager online.

Special Cross Functional Projects – Identity and Access Management (IAM)

Contractor shall provide the following Identity and Access Management implementation services as part of Transition, with ongoing support included in the IAM RU:

- Initial IAM plan for County approval
- Identity Provider capability (Oracle Federation Manager) for the initial use case up (i.e. DCSS) for a maximum of five (5) applications
- Attestation functionality for County review of End-User access. Note: this extends past transition since data population is dependent on the automated interface to PeopleSoft part and the On-Boarding of the first five (5) applications utilizing provisioning via automated workflow process.
- Capability for County to track and maintain End User access privileges for County users. Note: this extends past transition since data population is dependent on the automated interface to PeopleSoft part 1 project as well as the implementation of attestation functionality.
- Monthly reporting on changes to the IAM repository. Note: this extends past transition since data population is dependent on the automated interface to PeopleSoft part 1 project and the onboarding of the first five (5) applications utilizing provisioning via automated workflow process.
- Institute an architecture principle in the design phase of new applications that designates IAM as the single solution for County identities and the use of the enterprise sign on function
- "2.18.2.5 IAM Workflow Automation" project for the amount of $1,633,874.113 consists of two parts as follows:
    - "CSRF Replacement Workflow Automation" – Contractor shall complete the Workflow Automation project and associated requirements for a firm fixed price of $1,228,874. High level descriptions are below:
        - An automated workflow to assign access management requests. The automated workflow process shall create the appropriate line items for the access management teams to manually provision the IDs. Note: this extends past transition since data population is dependent on the completion of Phase I (County funded project) of On-Boarding The Computer Service Requests Form (CSRF) shall be retained for future review and reporting functions as an audit trail.
        - Onboarding up to five (5) applications, at County sole discretion, to utilize provisioning via the automated workflow process, after project completion. Note: this extends past transition since data population is dependent on the automated interface to PeopleSoft part and the On-Boarding. Candidate applications must be only provisioned via Active Directory group membership.
    - "PeopleSoft On-boarding Phase II" – County shall fund and Contractor shall complete the PeopleSoft On-boarding Phase II project for a work effort up to and not to exceed

$405,000. Contractor shall make all reasonable efforts to complete the project within the $405,000 to the best of the Contractor ability. Any work effort exceeding $405,000 shall require a County-approved Change Request to be funded by the County. This project is dependent on the completion of the PeopleSoft On-boarding phase I, which is in progress, and it is County funded under County Work Request SD-WR-024804. PeopleSoft On-boarding Phase I is intended to be completed June 2017.

Cross Functional Framework Transition: Activities Aligned to Framework Components

For the Cross Functional Framework components, the Transition shall follow the same basic structure as described above for the frameworks. The table below summarizes the approximate scope of change in each Cross Functional component. The extent of change to each component has been categorized as follows:

- Limited – changes are expected to be minor updates to existing processes and deliverables
- Medium – some new processes or deliverables—generally similar to current practices
- Large – multiple new processes or deliverables—Organizational Change Management applies

Approximate Scope of Change for each Cross Functional Component

FRAMEWORK COMPONENT	EXTENT OF CHANGE	SPECIAL PROJECTS OR CONSIDERATIONS
Contract and Acquisition Management Services	Minimal	None
Integrated Asset Management Services	Limited	Contractor shall integrate data from AT&T Asset Management Systems
Billing Management Services	Limited	Setup of billing processes for new Resource Units
Security Management Services	Large	Multiple Security sub-projects within the Data Center and Network Frameworks, as described above.
Service Delivery Management Services	Medium	New component
Project Management Services	Limited	None
Integration and Testing Services	Medium	New component
Incident Management Services	Limited	New component
Problem Management Services	Limited	New component
Change Management Services	Limited	New component
Release Management Services	Medium	New component
Configuration Management Services	Limited	None
Capacity Planning and Performance	Medium	Metrics collection and reporting from new technologies: Helion Managed Private Cloud (MPC) and Helion Managed Cloud Broker (HMCB)

FRAMEWORK COMPONENT	EXTENT OF CHANGE	SPECIAL PROJECTS OR CONSIDERATIONS
Disaster Recovery Management Services	Large	Implementation of new architectures and addition of Business Continuity specialists to the support team
Identity and Access Management Services	Large	Modification of AD and ADFS architectures to support a single data center model, automation of Access Management Workflows to replace the CSRF form, IDAM transition, and PKI transition.
Reporting Management Services	Large	Implementation of the Service Portal and Data Analytics shall drive significant improvements in this area
Domain Name Management Services	Limited	None
Business Analyst Services	Medium	New Component
Chief Technology Architect	Limited	None
Enterprise Application Architect	Limited	None
Innovation Officer	Limited	None

The basic steps for developing the Cross Functional Component Management Plan shall be the same as those for creating new procedures. Upon County approval, the Cross Functional Component Management Plans shall be published on the Service Portal.

- Automated systems and tools involved in solution

Information feeds from various operational tools shall be used to provide Cross Functional Service deliverables.

No tools beyond those already described for managing the Transition process are required to transition the Cross Functional Framework.

E-Mail Services

- Description of solution to meet the requirements

Solution Summary

Contractor shall move the County to Office 365 Exchange Online.

Contractor shall work with CTO to identify the move groups, determine success criteria and finalize timing. Next, Contractor shall execute a proven HPE methodology, Migration Factory (MF). MF is a standardized service that uses specialized tools running on temporary servers to move email boxes from traditional Exchange servers to the Microsoft Office 365 Government Community Cloud. Contractor shall move County users in waves from Exchange to the MS Cloud over an 8- to 10-week period.

The email migration described above shall cover non-inbox PSTs that are in the current inbox. Contractor shall, in a separate PST Migration Project, migrate users' PST files to their Exchange Online Mailbox.

The PST Migration Project shall parallel that of the inbox migration and complete at approximately the same time.

Rationale

The Service Desk shall own tickets from start to finish in support of both Exchange and Office 365 environments.

This migration shall be accomplished prior to the end of the Transition Period, negating the need to upgrade the existing Exchange 2010 environment, allowing the data center based email infrastructure to be retired when the migration is complete.

- Deployment plan for resources and use of facilities

Members of Contractor's U.S. Messaging Practice, in coordination with CTO, shall both plan and execute the migration, with support from the local. A transition project manager shall guide the entire process, and County users shall be supported by the Contractor's Service Desk.

Contractor shall complete the migration virtually and at the Plano and Tulsa data centers. Microsoft engineers shall use the County ticketing system to support trouble tickets during the migration and provide experts to resolve issues if needed.

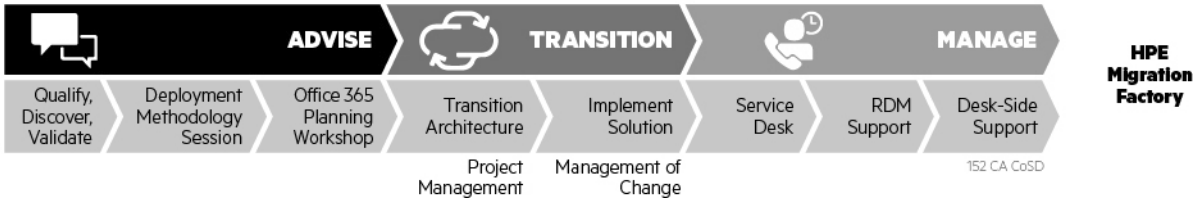
The County's Office 365 environment shall reside in the Microsoft Office 365 Government Community Cloud environment. This a hardened U.S.-based environment that is FedRAMP authorized, and whose support personnel are appropriately screened. It has features that can support Criminal Justice Information Services (CJIS) requirements for law enforcement agencies, and IRS-1075 requirements for customers who handle Federal Taxpayer Information (FTI).

- Key methodologies and processes in solution

Contractor's dedicated E-Mail migration practice shall be built on standard processes, tools, and trained personnel to assess, prepare, implement, and then decommission Exchange.

The Office 365 transformation methodology shall follow Contractor's standard advise, transition, and manage approach that closely follows the County's plan, build, operate formula (see figure below). Messaging engineers shall provide due diligence on the current environment, and prepare the infrastructure and tools that the Migration Factory personnel shall use to move from Exchange 2010 to Exchange Online.

Contractor's Advise, Transition and Manage Approach



Transition Schedule and Tasks

Contractor shall provide the final E-Mail Transition Plan and Schedule for County approval.

PST Migration shall follow a similar high-level methodology but with a simpler work breakdown. The basic process for PST Migration shall be as follows:

- PST Discovery: PST files are scattered among file shares and even local disk drives of End-Users. They shall be found via domain-level discovery of End-User shares and drives.
- PST Harvesting: Those files are then gathered in a central file store, linked to the End-User's Exchange Online account, and readied for import.
- PST Transfer: Whereas PSTs can be imported to Exchange Online via transfer over the WAN, for the large number of mailboxes and potentially large data sets, Contractor shall use Microsoft's Import Service via drive shipping. The data sets are stored on an encrypted drive and transported to Microsoft for import. This significantly reduces the amount of time for WAN transport of 15,000+ separate PST files.
- PST Import: Microsoft shall import the users' PSTs to their individual Archive Mailboxes. There is no size limit to the amount of emails that may be stored in Archive Mailboxes.

Plan and Design. For the Email Migration project, during the planning period, Contractor shall create the detailed migration plan and present it to the County for review and approval. As part of this process, the U.S. Messaging Practice, with advisement from the current email support staff, shall assess the environment, size the migration temporary infrastructure needs, and mitigate any potential or actual issues.

Configure. Contractor shall set up temporary infrastructure, configure the migration tool virtual server, configure DNS and network, and deploy a hybrid server. After system integration testing is successfully completed, Contractor shall perform a pilot launch.

Pilot Program. The Migration Factory shall perform a pilot migration on a subset of users defined by CTO, moving them to Office 365 and seeking feedback on their experience. Contractor shall conduct UAT in collaboration with the County, review results, and adjust Contractor's plan as needed based on the results and End-User feedback.

Documentation and Training. Contractor shall prepare service documentation, training materials, and Service Desk scripts to prepare for the migration waves. The County shall review the deliverables, Contractor shall respond to questions or clarifications, and then seek final approval to proceed. The completed documents and training material shall be added to the Service Portal, and Contractor shall train Contractor's Service Desk agents and other support personnel. Contractor shall review with CTO to determine if other types of training may be required and deliver that training accordingly.

Migration Waves. Contractor's Migration Factory shall then begin executing the migration move groups moving each group's mailboxes from the Exchange servers to the Microsoft Office 365 Government Community Cloud. Contractor shall complete the migration during an 8- to12-week period. As groups are migrated in waves, Contractor shall move into the manage phase, providing support.

Project Completion. Contractor shall request final County approval and sign-off. After all users are migrated and County approval is received, the E-Mail migration shall be complete. Similarly, after all PSTs have been migrated to users' archived mailboxes, the PST Migration shall be complete.

- Automated systems and tools involved in solution

To accomplish migration, Contractor shall provide and use Contractor internally developed software and a migration tool from Binary Tree Company. Contractor shall use a utility available from Microsoft for migrating PSTs.

Automated Tools

TOOL NAME AND VENDOR	DESCRIPTION
E2E by BinaryTree Corporation	• Analysis and migration engine for migrating on-premise Exchange mailboxes to Exchange Online • Allows rapid, low-risk migrations of large Exchange End-User populations. • This is the preferred tool of Contractor's messaging engineers
PST Capture	• Microsoft tool for searching and harvesting PST files

Development and Test Environment

- Description of solution to meet the requirements

Solution Summary

Contractor's solution for Dev/Test shall be tightly linked to the data center consolidation and the evolution of the Data Center to a hybrid environment: it shall use the Helion Managed Private Cloud (MPC), as described in the Data Center Consolidation Transition Project, and Helion Managed Cloud Broker (HMCB) to provide a business-rule defined boundary for Dev/Test capacity. This allows the environment's composition of server sizes and platforms in the hybrid environment to evolve and change over time in response to changing requirements without exceeding the County's established financial parameters. Contractor shall define thresholds to warn when the environment is approaching those limits.

Contractor shall provide a persistent Dev/Test environment for all P1 and P2 applications, so that high-priority County applications are guaranteed the resources needed to conduct testing in support of production issues (Applications Maintenance and Operations) or development projects. Contractor shall also maintain surplus space in the Dev/Test environment beyond that needed for the P1 and P2 applications to accommodate non-persistent Dev/Test capabilities for P3 through P5 applications. The surplus space shall be used on an as-needed basis to support the normal development and test activities of these lower-priority County applications. Contractor shall control the cost of the overall Dev/Test environment while also providing ample capacity for the County's suite of applications.

Contractor shall manage Dev/Test workloads within a SAN-based repository visible to the private cloud and perform tasks such as boot up and shutdown of virtual machine images on demand. Upon the County's request/approval, tasks shall commence. The Dev/Test environment shall have interfaces enabling connectivity to the Production environment to meet business needs. Contractor shall secure these interfaces with virtual local area networks (VLANs) and access control lists (ACLs). Identity access management services shall be applied across all County environments, including Dev/Test.

Contractor shall implement the HPE Codar toolkit to create an automated Release Management Framework in the Dev/Test environment. This shall support the evolution of Contractor's Applications Development Services to adoption of DevOps practices.

Rationale

Transition to MPC and HMCB shall provide an integrated platform for Dev/Test services that mimics the Production environment to streamline application development and deployment. HMCB shall provide the tools to create the hybrid design that the County is looking for in this environment. These tools provide the flexibility to include or exclude any type of platform within the Dev/Test scope, and manage its size based on a financial and business viewpoint instead of having to be concerned about the exact mix of

hardware and software. Contractor can make this definition all-inclusive or create the business rules to be less flexible according to the County's preference, without impacting the project timeline or plan. As the County's environment becomes more standardized, Contractor can collaborate to adjust the Dev/Test environment parameters to suit evolving requirements without reconfiguring the underlying technologies.

Because these tools are used to support applications in both Dev/Test and Production and are a key component of the Data Center Services Framework, transition of Dev/Test is designed to occur in conjunction with the remainder of the framework.

- Deployment plan for resources and use of facilities

The Data Center Consolidation Transition Project Manager (TPM) shall be directly responsible for activities associated transition of the Dev/Test environment. The Data Center Consolidation TPM shall be supported by the Cloud Services TPM, responsible for the MPC and HMCB services portion of the Transition. Contractor's virtual support team shall include architects, engineers, and migration specialists with expertise in cloud services and experience building out these environments for other clients.

The existing data center facilities in Tulsa and Plano shall support transition of Dev/Test until migration of all workloads is complete.

- Key methodologies and processes in solution

Transition Schedule and Tasks

Those tasks unique to the Dev/Test environment begin where Contractor configures the HMCB to establish virtual boundaries for the Dev/Test environment and other resource pools as needed. The preceding tasks are shown for context.

Planning and Build Phases. During the Consolidation Assessment task, Contractor shall build a migration roadmap detailing the placement, plan, design, and execution of migrations of development and testing workloads residing in Tulsa and Plano.

Once the hybrid architecture is built out, the Contractor's engineering and applications team shall collaborate with the County to define and size the composition of the Dev/Test portion of the environment, defining the financial parameters for each type of environment to be included. Dev/Test traditional servers already resident in Tulsa shall be included immediately; as servers from Plano migrate into the environment, they shall be imported into HMCB.

HPE Codar Environment Tasks. Once the Dev/Test environment is defined and built, Contractor shall design the environment for automated release management. This shall include design and configuration of the infrastructure, implementation of the software tools and necessary processes to manage them, and testing with a sample application.

Migration to Dev/Test. Contractor's migration engineers shall coordinate closely with the Application Development team to be aware of in-flight projects and migrate these at the proper time, in a non-disruptive manner.

Contractor shall prioritize move groups, with Plano workloads coming into Tulsa having the highest priority. This shall allow the County to consolidate into Tulsa as quickly as possible, to meet consolidation objectives. Contractor shall migrate all remaining non-production workloads into the Dev/Test environment (either by actual migration into the MPC or by including them in the virtual boundary created by the HMCB).

- Automated systems and tools involved in solution

Contractor shall use the same automated tools as described for, Consolidated and Single Data Center.

Consolidated and Single Data Center

- Description of solution to meet the requirements

Solution Summary

With the consolidation, Tulsa shall become the single production data center, and Contractor shall migrate all services from Plano to Tulsa. Contractor shall build a DR environment for the County at the Contractor's DR site in Colorado Springs, CO. It shall provide failover capability for applications that require DR, core services, and data center security services.

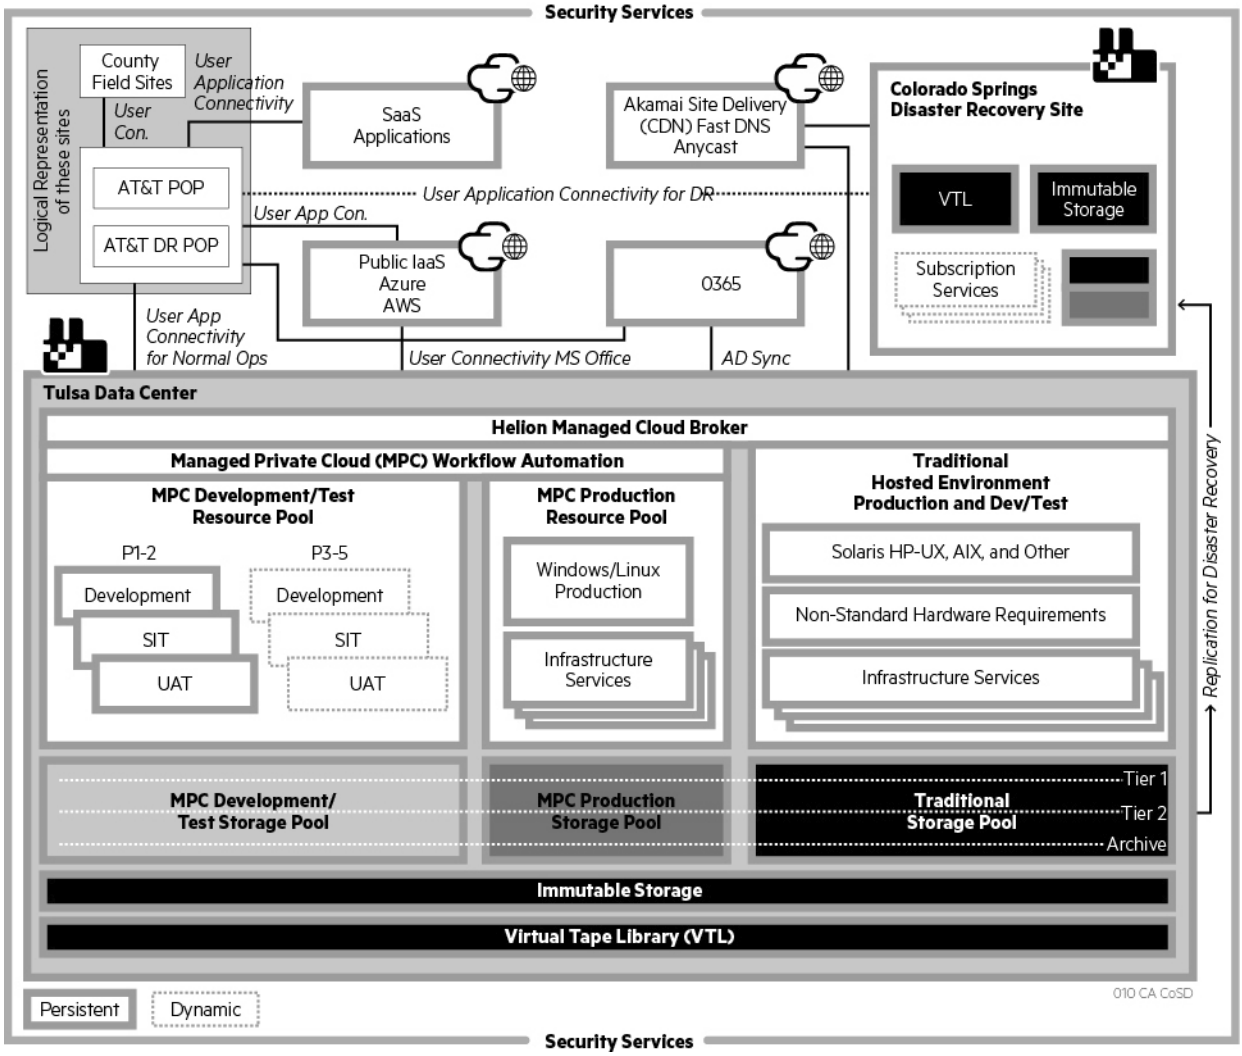
Contractor's structured transition approach for the data center consolidation shall be comprised of the following subprojects. These shall be completed in the sequence listed below to accomplish a smooth and non-disruptive transition.

- Set up and configure the data center network and security infrastructure to meet the new requirements.
- Refresh the data center storage environment to meet the requirements
- Build out the hybrid management capability and prepare the Tulsa data center to receive the server capacity currently resident in Plano. These activities shall be performed in parallel with the instantiation of the DR capability, and shall include the subproject to set up the development and test (Dev/Test) environment.
- Migrate applications, and in some cases, equipment, from Plano to Tulsa, based on a move group schedule provided by Contractor and upon approval by the County.
- Migrate the County's mail presence from the current Exchange environment to the Microsoft Azure Government instance of Office 365. Note that this project is not dependent on the ones above—it can be executed before or in parallel with them—but must be completed before the Plano environment can be decommissioned.

For each component identified above, Contractor shall provide a specific transition plan, interlocked with its related plan and the master schedule that details the tasks, milestones and schedule, for approval by the County. Throughout the project, Contractor shall work collaboratively with the County to develop success criteria, validate the scope and deliverables, and provide regular communication of the project's status, anticipated risks or issues, and Contractor's mitigation approach to make sure potential problems do not interfere with project completion.

The figures below provide an overview of the consolidated data center post-transition and briefly describe each component of the consolidated data center associated with the transition.

Consolidated Data Center Overview

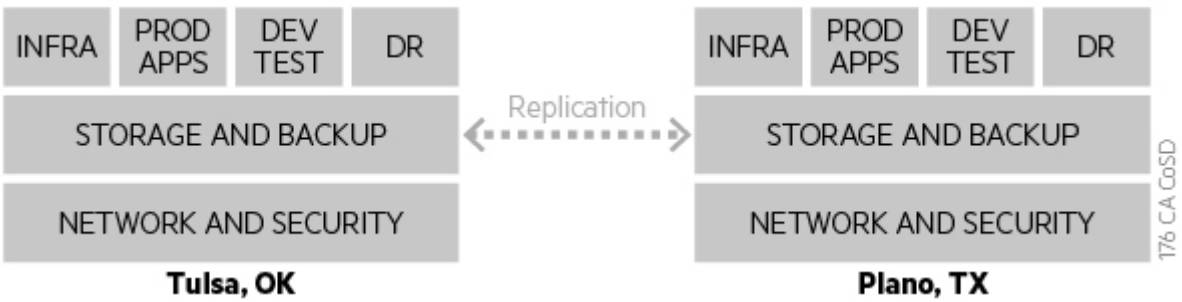


The Data Center Consolidation shall result in a modern hybrid environment.

Data Center Consolidation – Overview of Steps

The figures that follow describe the high-level steps for the consolidation project. The figure below depicts the County Data Center environment (Plano and Tulsa only), showing the basic classifications of servers and infrastructure as they are in place today.

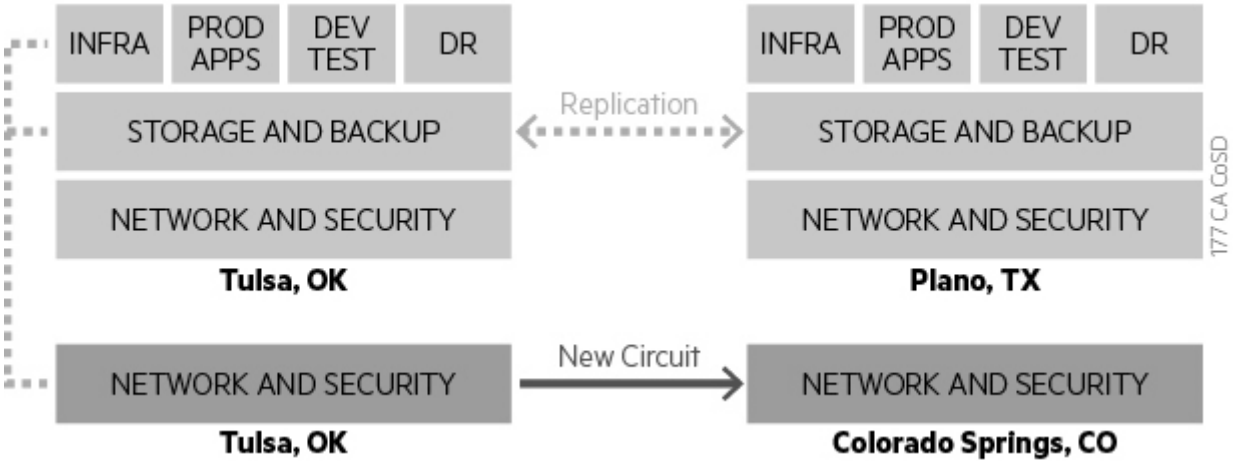
Current Data Center Environment



The first step, shown in the figure below, shall be to build out the new Data Center network compartment with the new network and security components. The new network compartment in Tulsa shall be built out in the same physical room as the current Tulsa environment. Its components are described in the second figure below. In parallel with the Tulsa network buildout, Contractor shall build out the network compartment for the DR environment in Colorado Springs.

The process to refresh/replace the network environment shall follow an "A/B" migration approach. Contractor shall build out the new network infrastructure (e.g., load-balancers, firewalls, switches, routers) reproducing the existing configurations on the new equipment. When Contractor has tested and verified the configurations, it takes a change window to shut down the "A" side of the environment (all traffic seamlessly fails over to the "B" side), and bring up the new equipment's "A" side. Contractor shall reroute the traffic to the new equipment and verify proper operation. Once Contractor is certain that no failback is needed, Contractor shall replace the "B" side of the equipment with the new equipment (again, in a controlled change window), re-test the failover, and once all is operating correctly, remove the old equipment.

New Network Compartments in Tulsa and Colorado Springs



Internet Connection. Leveraged Internet Service (LIS) provides shared Internet connections in a multi-tenant data center. Contractor shall obtain and manage the Internet connectivity to the data-center itself, and then extend that connectivity to applications in the data-center. Each LIS core router shall be connected (using link-aggregation) to both of the two WAN connectivity Layer-Aggregation Switches (WCL-AS) for the data center. Each LIS core router shall also terminate a connection from a separate ISP to provide diverse connections. The WCL-AS connections shall provide the path to the downstream LIS customer environment.

WAN Connectivity. The Contractor's data center shall be connected to the DR site using Ethernet MPLS WAN connectivity to provide high-speed data transmission, connecting back into the County's Points of Presence (POP). Connectivity shall be sized to 250Mbps of bandwidth with the capability to increase up to 1Gbps. Contractor shall have the capability of meeting any annual bandwidth increases should the County require. Within the Contractor's data center, Contractor's support team shall manage the dedicated WAN devices. Within the County POPs, Contractor shall ensure that AT&T manages the dedicated WAN devices. All network traffic between the data center and the POPs shall be encrypted.

The network design associated with the consolidated data center shall facilitate rapidly growing bandwidth and storage needs, reduce the complexity of the infrastructure, and deliver high availability (HA) and redundancy. This shall reduce the manually intensive processes and provide the convergence of networking and storage fabrics. It shall also contain standard 10Gbps and 1Gbps capabilities for attached devices, including servers, firewalls, and IPS devices.

The network shall provide a redundant topology to eliminate network downtime by a single point of failure. Contractor's network design shall provide redundancy for enhanced reliability with multiple connections to network devices. Network reliability shall be achieved through reliable equipment and network designs that are tolerant to failures and faults by reconverging rapidly to bypass faults when these occur. On a redundantly connected network, if a router fails, connectivity shall be preserved by routing traffic through a redundant connection. Furthermore, each router has two or more points, or "legs," to provide additional redundancy.

Contractor's design within the data center shall flatten the layer 2 architecture and provide a low cost capacity switching fabric. This shall be done through the adoption of a spine and leaf topology (2-tier) network design. The L2Spine is a high speed connection between any devices attached to the leaf nodes. It eliminates unused network links and introduces full throughput on all connections between network devices using Contractor's networking technology known as Intelligent Resilient Framework (IRF). Using IRF, multiple switches are grouped and appear as a single logical device that allows all links connected to these devices to forward traffic in a loop-free topology. Each device shall be fully redundant. IRF shall provide a non-blocking architecture within the layer 2 network fabric. It shall enable highly efficient high-bandwidth connectivity and N +1 redundancy. It shall provide up to 40Gbps of server connectivity to the access layer as the standard.

The data center network shall support the applications in Tulsa plus the applications that migrate from Plano. The migration moves a large amount of data across a Plano/Tulsa replication channel, but only at discrete points in time – it is not a continuous flow. Contractor shall provide the bandwidth required for each migration wave to ensure success. Contractor shall provide the bandwidth required for the Data Center consolidation, using diverse channels on the Contractor's Global Services Network (GSN) Transport. This is separate from the existing Plano/Tulsa replication circuits, and therefore has no impact on production replication traffic.

Disaster Recovery. The Tulsa data center shall be connected to the Colorado Springs DR site using a dedicated 10GB circuit, providing data replication for DR and off-site backup redundancy.

Once Contractor has tested the new network, Contractor shall cut over all the current connected equipment, as depicted by the dotted lines in the figure below. This shall be done in a planned change window, and shall be transparent to the County because all components are redundant.

Storage Architecture.

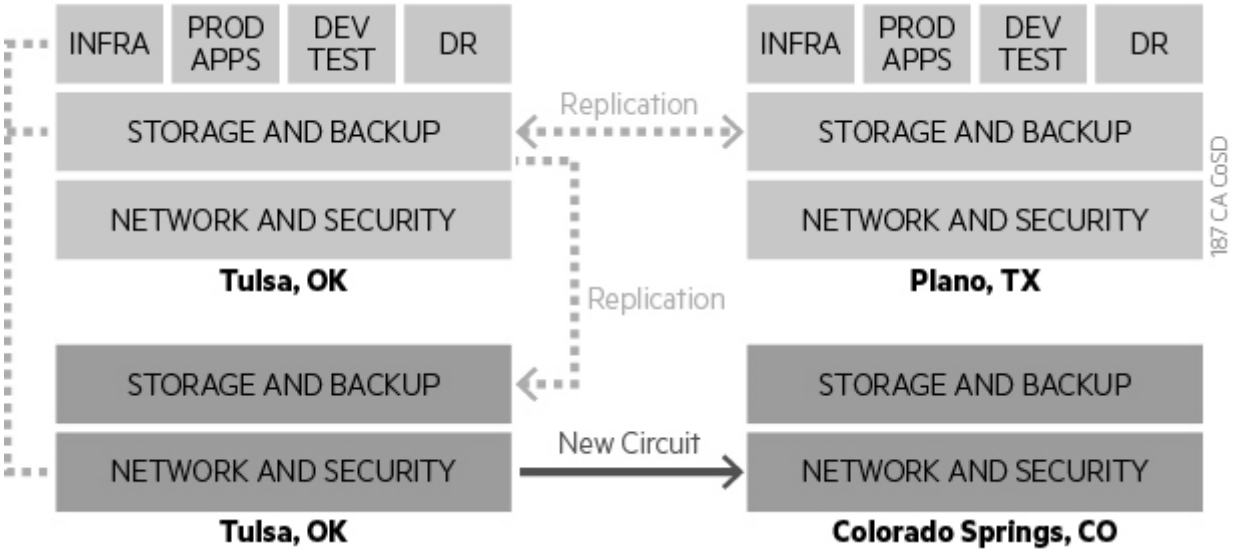
The figure below provides a view of the refresh of storage requirements:

Site	Refresh point
Tulsa (SAN, Immutable, VTL)	Transition
Colorado Springs (SAN, Immutable, VTL)	Transition
View Ridge & Lemon Grove (SAN)	Storage Refresh Schedule
AT&T POP (SAN)	Storage Refresh Schedule
DR POP (direct-attached only)	Server Refresh schedule

Rancho Bernardo (SAN, VTL)	Storage Refresh Schedule

The next step shall be to build out the new storage and backup equipment in Tulsa and Colorado Springs (Rancho Bernardo and other DPC sites shall have their storage refreshed on the normal refresh schedule), and start synchronizing the data between the current storage array and the new one, as shown in the figure below.

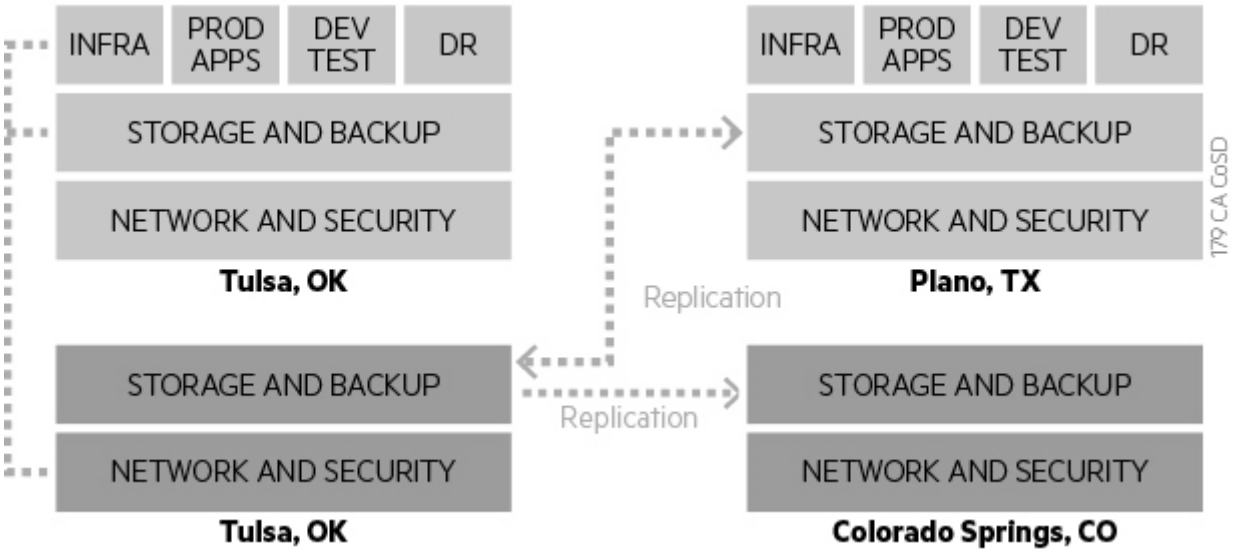
Deploying New Storage, Migrating Data



Once the new storage is fully synchronized with the current production array, Contractor shall cut over the SAN connectivity, re-initiate the replication between Tulsa and Plano, and replicate the DR data to Colorado Springs, as shown in the figure below.

In order to avoid migrating End-Users' Home drive storage twice, the County may wish to migrate this data to OneDrive for Business (ODfB) as defined in the User Data Services Transformation Project prior to the storage migration. Contractor shall accommodate this request, provided that the County can commit to supporting Contractor in achieving the ODfB migration in 6 months or less from CED (the currently planned schedule calls for 7 months), with larger move groups. If the project cannot be completed in that timeframe, Contractor and the County shall permit the Data Center consolidation to proceed on schedule anyway (i.e., do not create a dependency between the two projects) in order to avoid the risk that the Data Center Framework Transition exceeds its allowable timeline due to delays in the OneDrive migration

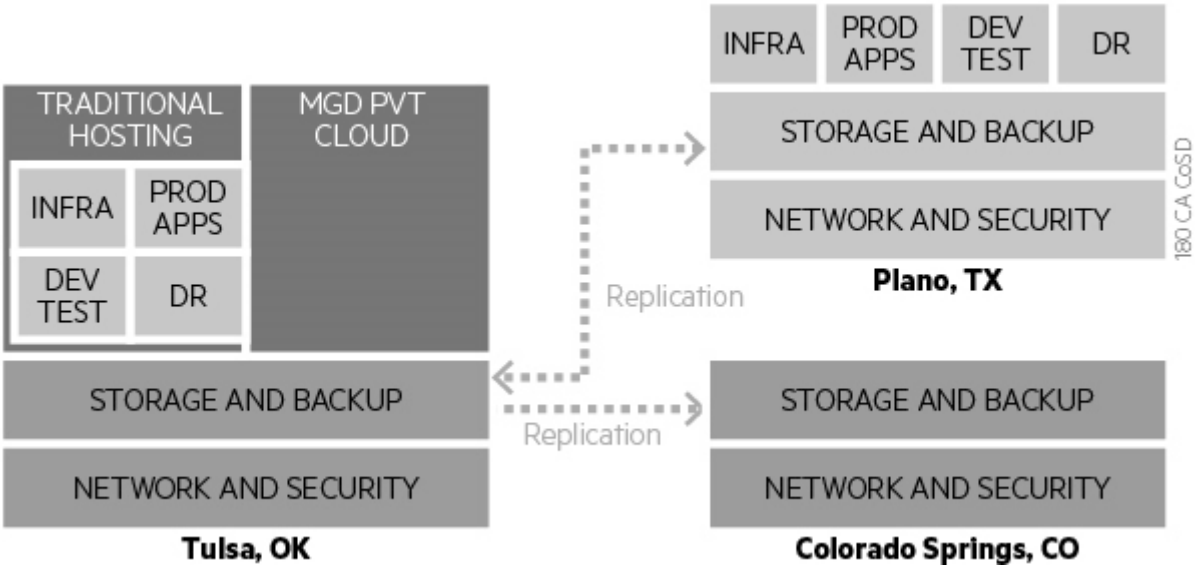
Cutover to New Storage Arrays



Then Contractor shall decommission the old storage and network environments (see figure below).

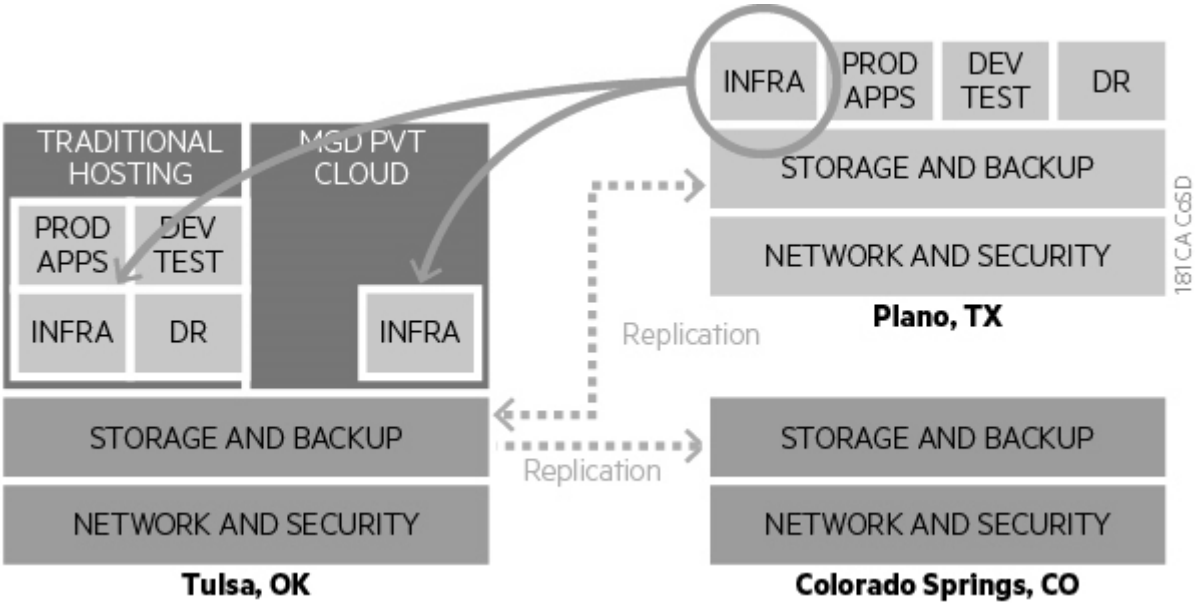
At this point, no migrations have taken place: Contractor has built out the new capacity to support the migration and the hybrid cloud architecture.

Decommission Legacy Network and Storage Hardware in Tulsa



Contractor shall build out the MPC—the County's pre-configured cloud resources—while the migration planning and detailed scheduling is taking place (see figure below).

Migration from Plano to Tulsa



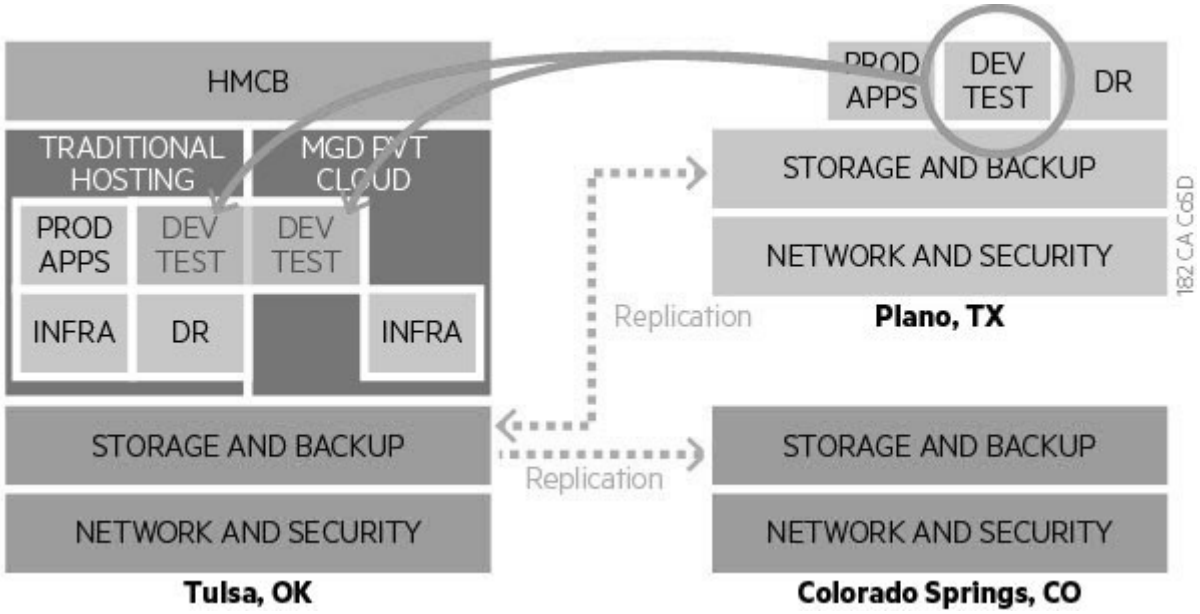
Data Center Hybrid Architecture. Contractor shall deploy hardware and software for a hybrid computing solution that supports applications and infrastructure services for the production and Dev/Test environments. The hybrid architecture shall combine a HPE Helion Managed Private Cloud (MPC) for cloud-compatible applications and traditional hosting for business applications that are not cloud-compatible, resulting in a hybrid environment. The MPC and the traditional hosted infrastructure shall accommodate the combined workloads from Plano and Tulsa, and shall be able to scale as needed to support the County's needs.

Servers with resource needs higher than the predefined sizes can be migrated into the largest size, then scaled up to meet their resource needs. Sixty percent of the servers in the data center environment are already located in Tulsa and technically do not have to move to achieve the County's consolidation goal; however, to gain the benefits of automated provisioning and the ability to turn servers up and down for Dev/Test and Applications M&O "Break/Fix" environments, Contractor has included the cost of moving those that are eligible to be hosted in MPC during the Data Center Transition, to include application regression testing. Sixty-seven percent of the servers in both Plano and Tulsa are eligible to migrate into MPC; however, per the County's request, Contractor shall not migrate the Tulsa production servers during Transition.

Contractor shall work with the application stakeholders' users to identify the best migration windows and methods for each application or related group of applications, and, depending on the platform, Contractor shall either migrate them into the Traditional hosting environment or into the MPC, as depicted in the figure below.

Building out the Cloud Broker shall take place in parallel. As Contractor creates the pool view of the Dev/Test environment, Contractor shall migrate servers from Plano into it, and either keep them live if they are P1/P2 applications or traditional infrastructure, or turn them down if they are P3-P5 in MPC and are not currently being used for a project or active M&O work. See figure below.

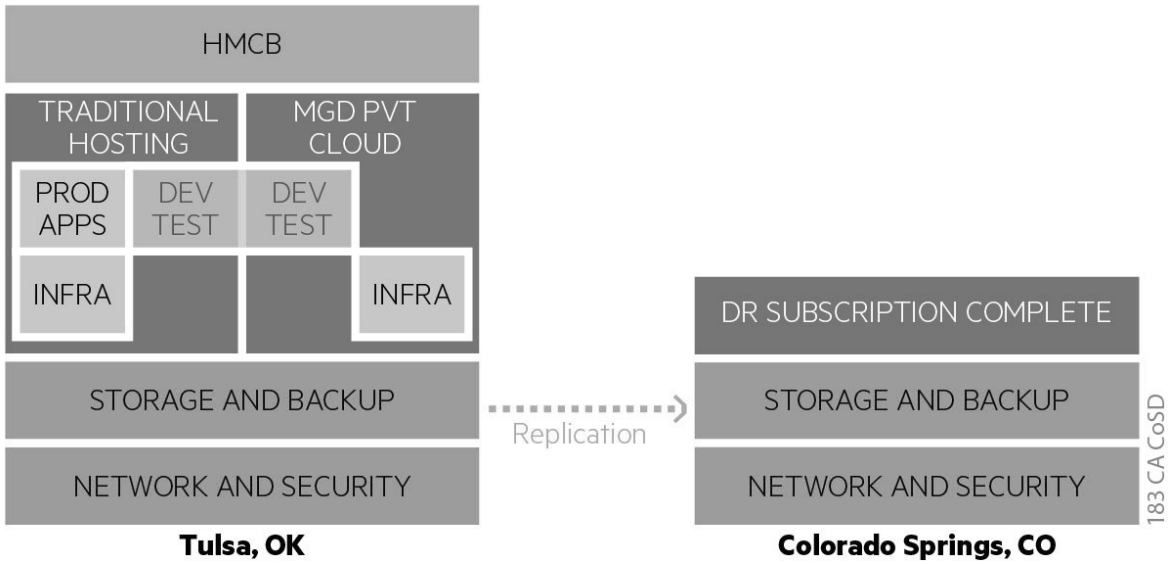
HMCB Deployment, Establishment and Migration into Resource Pools



As Contractor moves the production servers, Contractor shall make sure that their corresponding DR subscriptions are in place before the migration move group executes. That there shall be minimal changes to applications—only what is needed to facilitate the migration and redirect any Internet access from using the County's Internet at the COC and POP to the Leveraged Internet Service.

Once the migration from Plano is complete (or in parallel, as schedules permit), Contractor shall move any eligible Test and Development environments in Tulsa into the MPC. As shown in the project schedule, the migration plan and pricing include moving any eligible Tulsa server environments into the MPC; however, these moves can be deferred to the refresh timeframe, if this is the County's preference.

Future Mode of Operations



The mainframe and AS400 environments shall need to remain intact beyond the end of the Transition period. The infrastructure required to support those environments shall remain in Plano for as long as those systems are needed.

Rationale

Contractor shall enable multivendor support across hypervisors, OS instances, and infrastructure. Contractor shall provide a private cloud environment that consists of server, storage, and networking built for the cloud. It shall also consist of security, automation, and management software designed for hybrid delivery.

Contractor shall consolidate the data center workload that is currently hosted in the Contractor's Plano, Texas data center facility into Contractor's Tulsa, Oklahoma facility.

Contractor's Cloud Broker solution shall provide the County with an enterprise view of all data center platforms, including private cloud, public cloud, and traditional hosting environments. The cloud broker shall give the County the ability to have an enterprise view of system performance as well as financial management across each of the hybrid platform through one pane of glass. It also shall provide a single console for provisioning compute resources across the County's hybrid estate.

- Deployment plan for resources and use of facilities

Contractor shall assign a data center consolidation transition project manager (TPM) that shall report to the Transition Services Manager. The TPM shall have overall responsibility for this project and shall be the primary point of contact for the County in support of all data center consolidation activities. This TPM shall be responsible for maintaining the Contractor's Move Group Plan and collaborating with the County's designated project leader, as well as coordinating activities with the other TPMs and the Contractor Project Management Office. Contractor shall also assign a Contractor account executive sponsor to provide executive visibility throughout the project.

The data center consolidation TPM shall be directly responsible for all activities associated with the DR and storage architecture subproject activities and provide oversight of the team. The TPM shall be assisted by:

- Another TPM that shall be responsible for the buildout and testing of the cloud components
- A TPM whose focus is applications readiness, and shall work closely with the County and the Contractor team to closely manage application testing, remediation (if necessary), and scheduling priorities of the County stakeholders.

Contractor's virtual support shall include architects, engineers, and migration specialists with specialized expertise in each of the disciplines required to deliver the various components of the plan.

The data center facilities at Tulsa, Plano, and Colorado Springs shall support transition. The transition project management teams shall be headquartered at Contractor's Rancho Bernardo site.

- Key methodologies and processes in solution

Transition Schedule and Tasks

As described above, Contractor shall use a phased transition approach to accomplish the data center transition. For each phase, Contractor shall follow a standard process that includes an assessment of the existing environment to adjust for any changes that may have occurred as of the Contract Effective Date and the status of any in-flight projects. Each phase of the plan shall include submission of project deliverables to the County for review, response, and subsequent approval, and all approved project deliverables shall be made available to authorized users via the Service Portal.

Because the data center transition has a number of interdependencies and subprojects, Contractor shall first initiate a planning and governance phase, as part of the overall transition high-level planning sessions, which shall kickoff this set of projects.

Consolidation Assessment. In preparation for the migration of the applications from Plano, Contractor shall classify servers in terms of their migration targets and analyze server mapping.

Following the high-level planning activity, Contractor shall move directly into the detailed design and build phases. The first part of the implementation is the data center network. The draft data center network transition plan is depicted in the second figure below. An early output from the assessment shall be identification/verification of additional network bandwidth needed in the Tulsa data center. Contractor shall use this information to engineer the new network design and identify the specific network devices and configurations to be ordered and installed in Tulsa. Contractor shall submit this plan to the County for approval prior to placing equipment orders. Once approved, Contractor shall develop the final Bill of Materials and order the equipment.

With receipt of the equipment, Contractor shall begin installation of the data center network compartments in both Tulsa and Colorado Springs. In the Tulsa environment, Contractor shall create interconnects between the existing and new network infrastructure, then reroute traffic to the new or upgraded circuits. An integral part of the new network architecture is the establishment of the firewalls/IPS' and security zones needed to support traffic segregation and authorized third-party access. As part of the overall testing process, Contractor shall validate and test third-party access to the new network environment. Once testing is successful, Contractor shall move the network design deliverables to "as-built" documents, update all process documentation based on the new technologies, and submit all required deliverables to the County for review and approval.

As the network design and buildout is taking place, Contractor shall analyze the DR requirements.

As part of the Data Center Consolidation transition design process, Contractor shall seek to optimize County software licensing costs. Existing County software has a variety of licensing models such as site/enterprise, concurrent user, named user, module, managed budget, server, CPU, and core. Licenses based on server, CPU, and core present an opportunity for consolidation and license cost savings. Examples of County vendors that use these types of licensing models for enterprise server software include Adobe, EMC, Microsoft, Oracle, Symantec, IBM, and VMware.

Methodologies to reduce license obligations for server/CPU/core based licenses include switching licensing models between host-based and guest-based metrics (when offered by vendor), eliminating redundant licensed passive environments, restricting guest resources, and reduction of capacity dedicated to headroom at each site versus single site's shared environment.

MPC policy and architecture permits creating clusters similar to the production environment to mitigate potential license cost increases.

Data Center Services DR Plan and DR Architecture Implementation.

During the design phase, Contractor shall review the environment specifications for the Disaster Recovery site, and shall make any updates needed. The final specification shall be conveyed to the Colorado Springs team, who shall put in place any necessary hardware and software to support the subscription contract.

Once the network connectivity between the Tulsa and Colorado Springs is established, Contractor shall begin replicating both live data and virtual tape library (VTL) data and verify that data replication is occurring accurately and as planned. At the end of the phase, Contractor shall perform three tabletop exercises of the DR plan to validate its functionality and address any deficiencies found during the exercise. Following successful completion of these exercises, at least 90 days prior to the cutover date for the data center framework, Contractor

shall submit the draft DR plan for framework to the County for review and comment. Once Contractor has at least a few applications running in the Tulsa environment, Contractor shall schedule an actual failover test. Using the HPE Helion team's established DR testing methods, Contractor shall be able to conduct a failover test without forcing an actual outage to the production applications.

Data Center Hybrid Architecture and Consolidation to Tulsa

Consolidation Assessment. As described above, Contractor shall assess the Plano application and infrastructure environment to identify the migration approach for each. Contractor shall prepare a source-to-target mapping that documents each of the servers that shall be migrated along with the target server characteristics during this stage. Contractor shall also do an assessment of application requirements to the services provided by the MPC to determine compatibility. If there is a match, the application's Dev/Test and/or Break/Fix servers shall be moved into MPC. Contractor shall work collaboratively with the County's business users to determine the most appropriate solution for each application. Contractor's applications team shall review the applications targeted to migrate to verify if they have any common issues that need to be mitigated prior to migration, such as hard-coded IP addresses. If Contractor discover any issues, Contractor shall mitigate them prior to migration, using established change control procedures. From this process, Contractor shall have a clear picture of where Contractor needs new equipment and where Contractor has opportunities for reuse and for migration using a pack-and-ship approach, and can refine and adjust the target server environment solution into a design that reflects the detailed configurations.

Design and Procure Target Server Environment. Contractor shall design the hybrid environment in Tulsa to include:

- MPC and Cloud Broker (HMCB)
- Expansion of the capacity of the existing traditional infrastructure in Tulsa to accommodate workloads from Plano that require traditional hosting.

From the completed design documents, Contractor shall develop Bills of Materials and engineering documents, and submit internal purchase orders for any new hardware and software required. There shall be no additional cost beyond the Transition price for this activity.

Design Migration Plan. During the design phase, Contractor shall also identify move groups that shall organize the servers according to application dependencies, and incorporate other critical factors such as the change "freeze" periods, allowable maintenance windows, and other business priorities. Contractor shall migrate all applications supporting a business process together when possible rather than migrating individual applications. Contractor shall assign a work packet for each server group supporting the same application, which shall be combined into move groups based on the critical factors identified above and application resource availability. Contractor shall create a consolidated move group plan that Contractor shall present to the County for approval.

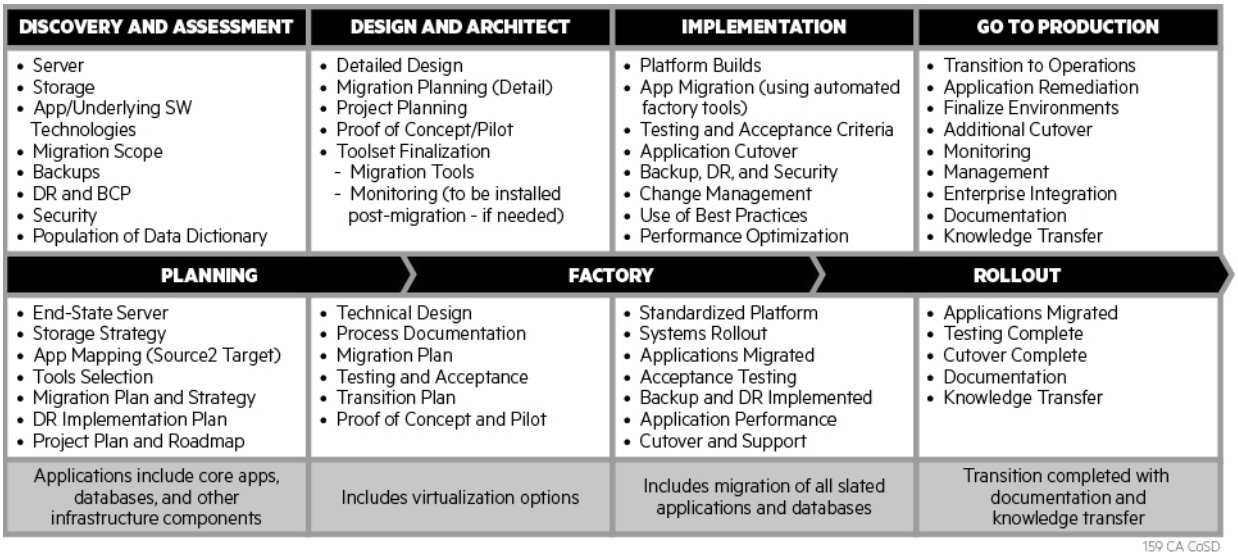
Build-Out Hybrid Environment. The build-out of the hybrid environment shall include installing new racks, power and cabling, installing, and configuring the MPC and traditional hardware and software. Contractor shall also install and configure the HMCB. Contractor shall perform tests on the newly built servers to verify that automation processes as well as traditional connectivity and configurations to existing back-end management and reporting systems are in place, then create or update documentation for the target systems. Note that the storage architecture shall have been built out under a separate but integrated plan: at this point in time, the two schedules converge. Once the build is complete and tested, Contractor shall begin migrating move groups over the network. Tasks to build out the Dev/Test environment capabilities shall also commence during this phase.

During this time, Contractor shall work with County application stakeholders to create the detailed Migration Plan and other sub-deliverables, such as the Back Out plan, and determine the change window to execute the go-live. During this phase, Contractor shall work with and provide guidance to the County to plan the tasks and secure

required resources to successfully execute the Migration Plan. Contractor shall also begin the necessary change management steps and communications processes in conjunction with the County.

Execute Migration Move Groups. An overview of the Contractor's migration methodology phases is provided in the figure below.

Migration Factory Methodology



Adherence to this methodology shall enable Contractor to deliver a flawless data center consolidation.

During the assessment and design phases of the project, Contractor shall build a migration roadmap detailing the placement, design, and execution of workload migration of all workload residing in Plano and Tulsa to achieve the consolidation. Contractor shall prioritize workload migrations, with Plano workloads into Tulsa taking the highest priority. This shall allow the County to consolidate into Tulsa as quickly as possible to reduce the cost and complexity of operating in two data centers.

Pack-and-ship migrations may begin before the hybrid environment buildout is complete, if permitted by the County. If Contractor is able to ship servers before the Broker is in place, Contractor shall import those systems to the governance facility once the Broker is live to make them part of the hybrid environment.

Migration activities shall follow step-by-step processes for the Dev/Test and production environments. During this phase, Contractor shall work with the County, Contractor's technical resources, and Contractor's application SMEs to execute the migrations from the source to the target environment. The migrations shall be in accordance with the approved Migration Plan and approved detailed design documentation according to the migration schedule for each move group. The contents shall be captured in the Migration Plan developed for each application. Tasks performed as part of the Go-To-Production process, such as executing hardening scripts, loading software agents for antivirus and adding the devices to the central repository, are incorporated into the project plan to make sure that the approved Go-To-Production process is followed for all migrations.

During the migration, as assets migrate, their Resource Units shall be recast to the billing structure of this Agreement. The County shall not be billed for both in the same month.

Contractor's migration engineers, with the support of the County-designated project manager and application and infrastructure SMEs, shall execute the Migration Plan according to the project schedule. The business owner of

the application shall provide the final approval during the cutover and is responsible for coordinating End-User acceptance testing and declaring the migration a success.

All migrations shall have contingency plans to invoke a back-out or other service restoration procedure in the event of a failure, or a scenario where the migration is at risk of exceeding its allotted window. The County business owner must approve any criteria for invoking the contingency plan as well as the execution of any contingency plan.

The migration plan shall include County freeze periods and adjust migration move groups accordingly, and shall consider migration alignment with maintenance windows to minimize downtime. Migration of applications impacting critical services shall be reviewed; upon County approval, Contractor may invoke the contingency plan to mitigate impact on critical service supporting County business. Each move group plan shall require County approval and participation by the application stakeholders in acceptance testing.

Automated tools like DoubleTake and PlateSpin shall help mitigate or lower the downtime considerably, as migration can be performed while source servers are live: stakeholders can test on the target servers at a time convenient for them in most cases.

- Automated systems and tools involved in solution

Contractor shall provide the migration tool licenses, such as DoubleTake and PlateSpin. Some applications may be manually installed into the target data center Following the initial seeding, the County application team shall test the application in the target data center.

Contractor's Migration Factory shall use a tool from Binary Tree Company. Contractor shall execute multiple move groups concurrently, consisting of multiple applications and associated components and using software products such as those described in the table below.

Automated Tools

TOOL NAME AND VENDOR	DESCRIPTION
DoubleTake	DoubleTake v7 is a migration tool that shall be used for migration from Plano to Tulsa. DoubleTake performs a complete server copy from the source server onto the target server. It also has an advantage of having an asynchronous replication feature, significantly simplifying the data synchronization effort required during the final go-live process. Data synchronization can be set to certain files, directories, or file systems, optimizing the amount of data being transmitted on the network.
PlateSpin	PlateSpin v11 is a migration tool similar to DoubleTake and shall be used for migrations into the County managed private cloud. PlateSpin performs a complete server copy from the source server to the target server, if needed. It allows source servers to be copied as an image that can be transported using an approved portable storage device and then restored to either a physical or virtual server on arrival at the Tulsa data center.

Storage Architecture

- Description of solution to meet the requirements

Solution Summary
