

Keep Mosquitoes Out Of Cryptic Sources!

Mosquitoes can lay their eggs in as little as 1/4" of water, so the source of a mosquito problem can be difficult to locate. Here are some examples of small and often overlooked cryptic mosquito breeding sources.

Tree holes, as well as holes in soil or cement can collect enough water to breed mosquitoes. Fill these holes with sand, cement, or soil to prevent water from pooling.

Water collecting in a tree hole

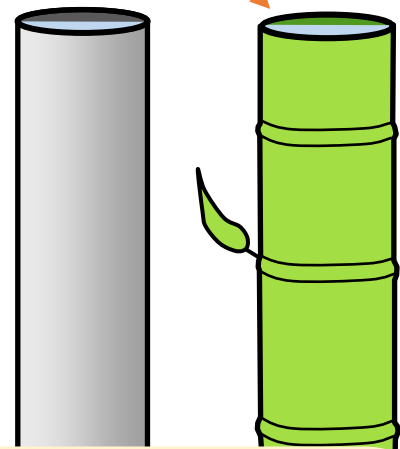

Uncapped fenceposts and bamboo poles can collect rain water quite easily. Cap fence posts or fill these holes with sand or cement.

Clutter like old tires, bottles and cans, or old pots or buckets can also hold enough water to breed mosquitoes. Throw away what you can, and cover the rest tightly with a tarp.
