

PROBABLE SOURCES OF LEAD EXPOSURE

Probable Exposures of Children Receiving CLPPP Services, 2016-2020, N=215

Includes children with a newly identified venous BLL 9.5 mcg/dL or greater. A case may have more than one exposure or there may be no source of exposure identified. Some cases were not assessed because a home visit was not done. In some cases, other potential sources, such as volcanic rock and home construction were found. The sources listed on this slide are not inclusive of all potential sources of exposure.
