COVID-19 is spread through respiratory droplets produced when an infected person coughs, sneezes, sings, or speaks. Practice social distancing by creating **6 feet of physical space** between yourself and other individuals outside of your household.

Respiratory droplets can travel up to 6 feet before settling to the ground or other surface. Maintaining 6 feet of distance reduces your chance of coming into contact with the virus or breathing it in.

Washing your hands and cleaning frequently touched surfaces can remove these infected droplets. It’s EVERYONE’S Social Responsibility.
