

# National Infant Immunization Week

## April 21-28, 2025

National Infant Immunization Week highlights the importance of protecting children under two years of age from vaccine-preventable diseases.

- Without vaccines, your child is at risk of becoming seriously ill or even dying from childhood diseases, such as measles and whooping cough.
- Remember to make, and keep, needed vaccine appointments.
- Reach out to your child's doctor for any questions you might have.

### Reasons to Vaccinate

- Vaccines are highly effective and an easy way to keep your family healthy.
- Vaccines help your baby's immune system learn how to fight germs.
- Vaccines go through a lot of testing to make sure they are safe.
- It is always better to prevent a disease than to treat one after it occurs.
