

AIDS in the South HHSA Region

San Diego County

2007–2011

Total cases: 304

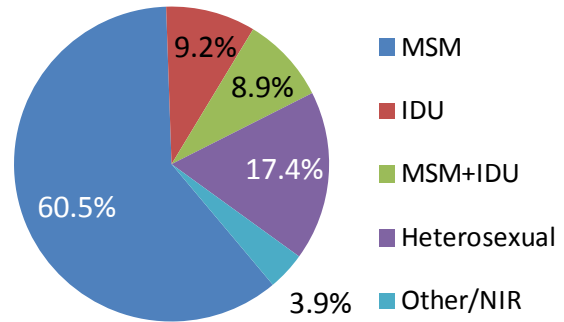

GENDER

Between the years 2007 and 2011, 304 individuals were diagnosed with AIDS while living in the South Region. The overall rate of AIDS for the South Region was 60.9 per 100,000 population. The rate of AIDS for men was higher than rate for women. Of the 304 cases, 90% were male and 10% were female.

MODE OF TRANSMISSION

Rates cannot be calculated for mode of transmission due to a lack of population data. The predominant mode of transmission in San Diego county and the South Region was MSM. Heterosexual contact accounted for 75% of female cases, but only 11% of male cases.

RACIAL/ETHNIC GROUP

As in the county overall, the rate of AIDS was highest among blacks in the South Region, followed by Hispanics and whites. Rates were not calculated for groups with fewer than 25 cases in the five-year period (fewer than five cases per year). Of the 304 cases, 14% were white, 10% black, 73% Hispanic and 3% Asian/other (includes Asian, Native American, and Pacific Islander).

AGE AT DIAGNOSIS

Like the county overall, the rate of AIDS in the South Region was highest in the 40-49 age group, followed by 30-39. Of the 304 total cases, 1% were under 20, 13% were 20-29, 31% were 30-39, 36% were 40-49 and 19% were 50+.
