

Tuberculosis (TB) in San Diego County

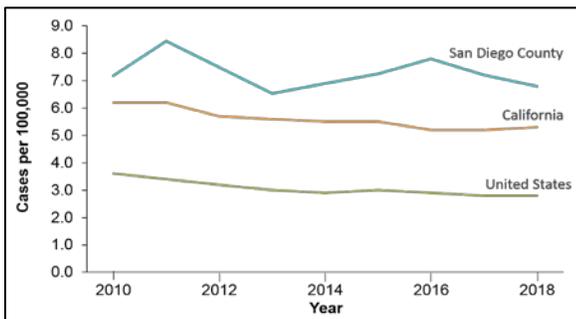

What Is Tuberculosis?

Active tuberculosis (TB) is a disease caused by the bacterium *Mycobacterium tuberculosis*. TB usually affects the lungs and spreads through the air when a person sick with TB coughs. Not everyone infected with the bacteria becomes sick. Those who have been infected, but are not sick, have latent tuberculosis infection (LTBI). Persons with LTBI can become sick with active TB in the future, if they are not treated.

The Human Toll of Tuberculosis

- In 2018, San Diego County reported 226 new active TB cases, compared with 237 in 2017.
- In 2018, San Diego County’s annual TB incidence was 6.8 cases per 100,000 persons, which is higher than the California state rate of 5.3, and more than twice the national rate of 2.8 (Figure 1).
- Active TB has a high associated mortality of approximately 10%.
- Children under age five are at the highest risk of severe complications, including brain and spinal involvement that can lead to lifelong disability.
- Isolation from family, friends, and exclusion from the workplace while infectious results in stigma, lost wages and loss of employment putting those with TB at risk for poverty and homelessness.
- An estimated 80% of active TB cases are due to progression of LTBI to active TB.
- About 170,000 San Diegans have LTBI, which can progress to active TB without treatment. This is two thirds the size of Chula Vista’s population.

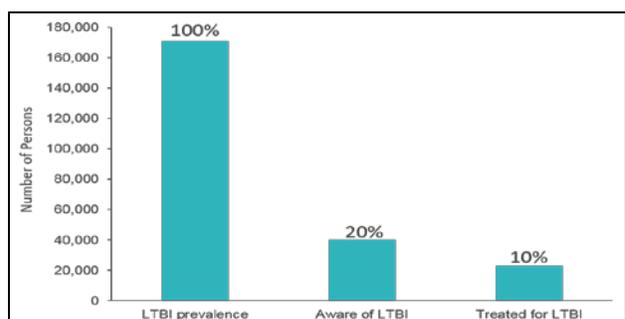

Figure 1. Incidence of active TB disease in San Diego, California and the United States.

TB incidence in San Diego County remains higher than in California and is nearly 2.5 times the overall rate for the United States.

The Highest Rates and Numbers of Tuberculosis Are in the South and Central Regions of the County

- In 2018, 72% of San Diego County TB cases occurred in persons who were born outside the U.S.
- The TB rate among persons born outside the U.S. (22.7) is 9 times higher than the rate among U.S.-born persons (2.5).
- In 2018, the most common medical risk factor was diabetes (23%).

Why Is Now the Right Time to Strive for TB Elimination?

- TB Elimination is defined as less than 1 case of active TB disease per one million population annually.
- Of the estimated 170,000 San Diego County residents with LTBI, only 20% are aware of their infection and only 10% have been treated (Figure 2).
- Because an estimated 80% of cases arise from reactivation of LTBI, treating LTBI will prevent many TB cases in San Diego County.
- In the last decade, there has been widespread adoption of blood tests to diagnose LTBI which are more specific than the traditional TB skin test, resulting in fewer false positives.
- In 2016, the U.S. Preventive Services Task Force – national experts who provide widely accepted evidence-based medical recommendations – recommended new targeted screening for LTBI **in populations at risk**.
- New **short-course treatment** regimens for LTBI are better tolerated by patients, less expensive, and more likely to be completed by patients.
- TB Elimination initiatives have been implemented at the national and California state levels.
