Land Use/Environmental Planner
5510 Overland Avenue, Suite 310
San Diego, CA 92123

Re: San Diego County Draft Climate Action Plan

Dear Ms. Soffel:

We represent the Golden Door Properties LLC (the “Golden Door”), an award-winning spa and resort that opened in 1958. This historic haven is situated on approximately 600 acres on the south side of Deer Springs Road in northern San Diego County (“North County”). It was the highest rated establishment in *Travel and Leisure*’s recent list of world’s best destination spas. Its property encompasses a peaceful array of hiking trails, luxurious spa amenities, tranquil Japanese gardens, and a bamboo forest. Agricultural cultivation on the property includes avocado groves and fresh vegetable gardens as well as citrus and olive trees.

The Golden Door is committed to environmental stewardship and sustainability. It uses sustainable and bio-intensive agriculture practices and has eliminated guests’ use of plastic water bottles. The owners are not seeking to expand the Golden Door, but are seeking to further enhance the Golden Door according to guiding principles, including the extensive sustainable agriculture on the surrounding acres. Reducing greenhouse gas (“GHG”) emissions to combat the threat of global climate change is an important issue for the Golden Door.

As such, we appreciate the opportunity to participate in the Climate Action Plan (“CAP”) process and provide input on the County’s efforts to reduce GHG emissions. The Golden Door is particularly concerned about GHG emissions from the proposed Newland “Sierra” Project (the “Newland Project”), a revised Merriam Mountains project on property located near Deer Springs Road. The Newland Project would implement urban residential density in a rural area of the unincorporated County, far from job and urban centers and from transit infrastructure. This unplanned development would contradict modern planning principles and the County’s General Plan and would result in long single-occupant vehicle trips causing significant GHG emissions in contrast to the County’s stated goal in the CAP. We submit the following comments on the draft CAP and draft Supplemental Environmental Impact Report (“DSEIR”).

I. THE COUNTY SHOULD HALT PROCESSING PROJECTS UNTIL THE CAP IS COMPLETED

As an initial matter, the County should cease processing and approving projects until the CAP is completed. While the CAP provides avenues for General Plan Amendments not already considered within the CAP and considers pending projects within its cumulative impacts analysis, the CAP is in draft form and is subject to revisions following the public comment process.

In particular, the County should refrain from processing the Newland Project prior to the adoption of the CAP, as doing so may result in impermissible tiering. We are concerned that the Newland Project may be attempting to tier off the CAP prior to its approval. An environmental impact report (“EIR”) may not tier off of an incomplete or future environmental document. (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 440.) Newland’s proposed “net zero” mitigation measures—in its draft EIR published in June—do not meet the requirements of the CAP’s offset mitigation measures as currently drafted. Further, the CAP’s offset measures may be revised to provide stronger environmental protection prior to approval. As such, the Newland Project should not be allowed to tier off of the unapproved CAP, and the County should refrain from processing the Newland Project until the CAP is completed.

The Newland Project purports to be “net zero” but does not provide adequate assurances that its offsets will actually achieve the required emissions reductions. The Golden Door provided more fulsome comments on the Newland Project’s draft EIR and its various deficiencies in its August 14, 2017 comment letter on the Newland Project’s draft EIR.

In particular, the CAP’s offset mitigation measures provides geographic priorities for GHG offset projects, beginning with: “1) project design features/on-site reduction measures; 2) off-site within the unincorporated areas of the County of San Diego; 3) off-site within the County of San Diego; 4) off-site within the State of California; 5) off-site within the United States; and 6) off-site internationally.” (DSEIR at p. 2.7-37.) The Newland draft EIR provides a list of priorities for projects, including a “true up” provision for its operational GHG emissions offset requirement. The Newland EIR’s “true up” provision allows the County’s Planning & Development Services (“PDS”) Director to, after Project approval and without additional public input, decrease the volume of operational emissions that Newland is required to offset. This “true up” provision renders the Newland Project’s offset mitigation measure illusory.

In contrast, the CAP does not contain any such illusory “true up” provision. The Newland Project should not be allowed to bypass more stringent offset requirements in the CAP simply by being approved prior to the adoption of the CAP. Such an approach would be improper here, where the CAP is required mitigation for the County’s General Plan EIR from 2011. (*Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 445 [mitigation measures must be implemented, not “merely adopted and then neglected or disregarded”].) Sprawl projects, such as the Newland Project, that cause significant GHG emissions from long automobile trips in contrast to modern planning principles, should not be allowed to bypass any GHG reduction measures in the CAP simply by seeking approval

subsequent to the time in which the County set the requirement for the CAP but prior to actual approval almost seven years later.

The offset requirements and assurances in the CAP provide more certainty of achieving GHG emissions reductions than in Newland's flawed "net zero" approach. Thus, the County should abstain from processing the Newland Project until the CAP is completed.

II. GHG REDUCTIONS SHOULD BE PRIORITIZED WITHIN THE COUNTY

The County's General Plan prioritizes GHG emissions reductions within San Diego County. In 2011, following approximately ten years of substantial input from numerous stakeholders and citizen groups, the County approved an update to its General Plan. (San Diego County General Plan at pp. 1-2.) In the EIR for the General Plan, the County concluded that the GHG and climate change impacts from the County's operations and from community sources were "potentially significant"—that without mitigation the County would fail to comply with AB 32, which requires the State to lower its GHG emissions to 1990 levels by 2020. As a result, the General Plan EIR included mitigation measures for GHG and climate change impacts, including the adoption of a CAP. (San Diego County General Plan, Mitigation Measure CC-1.2.) The CAP, therefore, was intended to mitigate impacts from GHG emissions *within San Diego County*. In addition, Goal COS-20 of the General Plan prioritizes "[r]eduction of *local* GHG emissions contributing to climate change that meet or exceed requirements of the Global Warming Solutions Act of 2006." (Emphasis added.)

The CAP provides the following 2020 and 2030 adjusted reduction targets and 2050 goal for emissions *in the County*: two percent below 2014 levels by 2020; 40% below 2014 levels by 2030; and 77 percent below 2014 levels by 2050. (CAP at 2-11.) "[T]o meet the 2030 target and 2050 goal, the County will need to achieve a reduction of 897,237 MTCO₂e by 2030 and 2,253,066 MTCO₂e by 2050 beyond legislative-adjusted projections. To close the emissions gap shown in Figure 2.3, this CAP proposes 11 strategies and 29 measures that the County would implement to reduce GHG emissions." (CAP at 2-14.)

The State of California has set an example for all other jurisdictions by making bold commitments to reduce greenhouse gas emissions. The County has explicitly made commitments to reduce emissions in the County consistent with its share of reductions needed for the State to achieve its goals. However, we note that the County has not demonstrated substantial evidence to support the availability of offsets within the County. While the language in the CAP states that the County will fund and implement investment projects, there is no evidence or assurance to suggest that the County is making the investment. Allowing payment for offsets to occur outside of the County is akin to the medieval payment for indulgences. A one-time payment should not absolve emitters for their GHG emissions that occur within the County. The County made a promise to reduce emissions within the County; it should uphold that promise for the benefit of its residents who expect a local reduction in GHGs and copollutants based on the County's plans. There must be some assurance that offset projects will occur within the project site or the County. While we understand each project is unique, the County should incorporate a standard into its offset priorities to promote GHG reductions within the County; otherwise project proponents may be incentivized to devote all or almost all of the

resources to offsets occurring outside of the County. The County should consider at least the following methods for ensuring a certain level of offsets occur within the County in addition to any others that would promote offsets within the County:

- A bright-line percentage requirement for offsets to occur within San Diego County, or if this is deemed infeasible, a proportionate dollar amount or fee paid to facilitate GHG emissions reductions within the County;
- A bonus structure similar to a density bonus approach, that allows greater use of offsets for projects located in infill areas or close to existing transit;
- A more regimented set of findings describing the infeasibility of on-site offsets or offsets within the County that the County must make for a proposed project before it is allowed to use offsets outside of the County;
- A requirement that each project must specifically identify available offsets that the project will use within the County prior to approval; or
- A requirement that each project must meet a defined, impartial criteria, such as LEED Platinum.

III. THE CAP MUST PROVIDE ASSURANCES FOR OFFSETS

Regardless of where offsets occur, the County must provide assurances that the offset projects will achieve their projected reductions. The CAP provides, “[a]fter adoption, the CAP will continue to be maintained by the County Department of Planning & Development Services (PDS). Key staff in PDS, with active participation and assistance from the Sustainability Task Force, will facilitate and oversee implementation, monitoring, and reporting on the progress of each measure.” (CAP at 5-2.) It is unclear if such monitoring extends to the offsets, or how the County staff will be able to monitor offset projects that may occur on the other side of the world. In addition, it is unclear if the County has any mechanism to enforce offsets in other jurisdictions; therefore, it is unclear if the mitigation is actually enforceable. The CAP should provide detailed information on how the County will ensure monitoring and reporting of the mitigation projects funded by offsets, as mere funding by itself does not equate to mitigation. (See *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692.)

Moreover, the CAP should ensure that the County is able to meet its 2050 emissions reduction goals that extend to 2050. (CAP at 1-2.) While the CAP maintains that it “demonstrates how the County will achieve GHG emissions targets for 2020 and 2030, and demonstrate progress to 2050,” (CAP at 1-13) it is unclear how the 2050 target will be met if General Plan Amendments approved in the near future only provide mitigation assurances to 2048 (assuming approval of the CAP in 2018). The Appendix B to the DSEIR provides:

Adherence to the protocols listed in this Appendix, as well as any additional protocols subject to the same standards as the protocols

herein, ensures that the carbon reductions generated by CAP Measure T-4.1 are real, permanent, quantifiable, verifiable, and enforceable. Carbon offset registries require projects to comply with approved protocols using rigorous, standardized review processes. The protocols contain rules and procedures governing the retirement or cancellation of carbon offsets. Protocols and processes ensure that offsets retired from County direct investment projects pursuant to CAP Measure T-4.1 and listed on an offset registry satisfy the environmental integrity criteria established by the offset protocols. Carbon offsets achieved through implementation of Measure T-4.1 must be complete and retired before the County can take reduction credits. A registry will ensure that carbon offsets are retired in perpetuity.

(Appendix B at p. i.)

The County should provide similar assurances for General Plan Amendments approved using offsets. The CAP prioritizes “local projects that would offset carbon emissions within the unincorporated county.” (Strategy T-4, DSEIR at p. 2.7-17.) The County must ensure General Plan Amendments are held to the same standards as the County’s own offset projects. Moreover, the County should consider whether and how to ensure mitigation for General Plan Amendment offset projects is continued beyond the 30-year out year. If there are no assurances that the offset projects will continue beyond their specified expiration date or for the full term of the County’s planning period specified in the proposed CAP then, the County is not accurately calculating what the projects’ overall GHG impacts will be for the full term of the County’s planning period specified in the CAP. If the offset projects are no longer operational after their prescribed term or potential expiration date, then the County should carefully consider whether it is still accurate for the County to assume that the GHG emissions from the offset projects can be counted as part of any project’s overall reduction in GHG emissions during the County’s full planning period specified in the CAP.

As such, the County should consider whether to provide assurances that funding for offset mitigation projects will continue, lest the County experience a significant spike in GHG emissions once the funding for offset projects has concluded and they are no longer operational. (See *Cleveland National Forest v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 514 [an EIR must adequately describe the nature and magnitude of the adverse effect].) In any event, if the County is proposing to allow offset projects which expire or may no longer be enforceable before the end of the County’s planning period used in the CAP, then the potential increases when these offset project may “expire” should be counted in the County’s overall numerical calculations in the CAP including expected GHG increases due to expiring offset agreements. As the Court of Appeal stated in *Sierra Club v. County of San Diego* (2015) 231 Cal.App.4th 1152, 1170: “Quantifying GHG reduction measures is not synonymous with implementing them. Whether a measure is effective requires not just quantification, but also an assessment of the likelihood of implementation.” Likewise, if offsets counted on by the CAP as a GHG reduction measure are likely or possibly going to expire before the end of the CAP’s planning

period in 2050, or shortly thereafter, this should be disclosed to the public, since it is relevant to whether the mitigation measure will be implemented for the full planning period.

IV. GHG INVENTORY AND REDUCTION STRATEGIES

A. GHG Inventory

The CAP's business as usual projections include "[g]rowth from General Plan Amendments "GPAs" adopted since adoption of the 2011 General Plan Update are also included in the projections." (CAP at 2-7.) "The GHG emissions inventory for the CAP does not include emissions attributable to proposed GPAs that would increase density/intensity above what is allowed in the General Plan. Even though there were GPAs that were adopted between 2011 (adoption of 2011 General Plan Update) and 2014 (inventory baseline year), none of these GPAs were constructed by 2014 and; therefore, their GHG emissions are not included in the 2014 inventory. The 2014 inventory is based on emissions-generating activities that existed on the ground in 2014." (CAP at 2-14.)

The Draft SEIR's Mitigation Measure GHG-1 applies to all future General Plan Amendments, including those discussed in the cumulative impacts section. The County maintains that with the inclusion of this mitigation measure, all future GPAs will not interfere with the County's reduction targets or 2050 goal. (CAP at 2-14.) The County thus concludes that "General Plan Amendments would, therefore, comply with the threshold of significance, which is consistency with the CAP." (CAP at 2-14.) However, there is not enough information presented in the DSEIR or CAP to ascertain the veracity of this conclusion. A project-by-project breakdown of emissions from each project appears to be missing from the CAP and DSEIR.

B. Transportation Reductions

The County concludes that it "has limited options under its control for implementing transportation-based strategies," despite acknowledging that on-road transportation is the largest source of GHG emissions in the County. (CAP at 3-3.) The County should ensure future projects are located in infill locations close to existing transit, in addition to exploring additional methods of implementing transportation-based strategies to reduce the County's reliance on single-occupant vehicles. The CAP provides strategies to reduce VMTs, and notes that the General Plan provides "a framework to accommodate future development in an efficient and sustainable manner that is compatible with the character of unincorporated communities and the protection of valuable and sensitive natural resources. In accommodating growth, the County focuses on the provision of diverse housing choices while protecting the established character of existing urban and rural neighborhoods." (CAP at 3-9.)

Further, Strategy T-1 provides, "This strategy focuses on preserving open space and agricultural lands, and focusing density in the county villages. By not developing housing in the more remote areas, the county will avoid GHG emissions from transportation and energy use associated with conveyance of water and solid waste services. Reductions in Vehicle Miles Traveled (VMT) resulting from this strategy will also improve air quality through reduced

vehicle emissions and contribute to public health improvements by creating opportunities for active transportation choices.” (CAP at 3-9.)

The County should ensure such strategies are appropriately implemented in all pending and future projects. In particular, the County should not allow the Newland Project, which would add over 28,000 daily trips in an area located far from existing transit, to move forward before the CAP is approved. This contravenes the CAP’s stated strategies and risks thwarting the CAP’s comprehensive approach. If the County allows the Newland Project to progress prior to adoption of the CAP, the County enables the Newland Project to avoid the CAP’s goal of “preserving open space and agricultural lands” by developing on a parcel currently zoned for a much lower level of density—primarily RL-20—than the project currently proposes.

The CAP should also include requirements that land use decisions support smart growth development near existing infrastructure and transit and placing housing near jobs in order decrease GHG emissions from long automobile trips. One potential tool to support this approach would be to require General Plan Amendment projects to be consistent with the land use patterns used by SANDAG to general its Regional Transportation Plan and Sustainable Communities Strategy, which is intended reduce GHG emissions by linking land use and transportation planning pursuant to SB 375.

C. Acquire Open Space Conservation Land

The CAP provides:

Acquisition of land by the County under the MSCP would reduce GHG emissions through preservation of land which can otherwise be developed. GHG emissions reductions are realized from reductions in transportation, energy use, waste, and water consumption. Preservation of these lands also helps protect watersheds, improve water quality, and preserves vegetation, which provides carbon sequestration benefits. Reductions for this measure are quantified based on the reduced development potential associated with preservation of lands. Future acquisitions beyond those targeted in this measure will reduce GHG emissions in the county, the benefit of which will be reflected in the County’s biennial GHG inventory updates.

(CAP at 3-10.)

Additional details for this measure are required. For instance, how will the County calculate the reductions from this measure, but allow GPAs such as the Newland Project to move forward? Further, will the County count implementation of the North County MSCP as a potential reduction? If so, would this include a developed Newland Project? Doing so may amount to de facto project approval for the Newland Project prior to the completion of the environmental process, as the MSCP is currently in draft form. Further, the NC MSCP has not been approved and is not scheduled to go before the Board of Supervisors for a decision for

several more years. The NC MSCP must also be approved by the State and Federal Wildlife Agencies before taking effect. It is improper for the CAP to take credit for emissions reductions to be achieved by a plan or program that has not been approved. (*Vineyard Area Citizens for Responsible Growth, Inc.*, *supra*, 40 Cal.4th at 440.)

We thank you for your time and attention to our comments. Please do not hesitate to contact us should you have any questions or comments.

Re: Problems with the Newland Sierra Cumulative Impacts Analysis

Dear Ms. Smith:

As you know, we represent Golden Door Properties, LLC (“Golden Door”) concerning the proposed Newland Sierra Project (“Project”). We write to inform you of errors and omissions in the cumulative impacts analysis in the Draft Environmental Impact Report (“DEIR”) for the Newland Sierra Project. We hope that by writing to you now regarding these issues, County staff will have sufficient time to respond to our concerns and make necessary changes to the County’s EIR for the project.

In conjunction with several professional consultants, we have reviewed the Newland Project’s DEIR. The Golden Door and its consultants provided comments on the DEIR by the August 14, 2017 deadline set by the County, which allowed the public 60 days to review and comment on the more than 21,000 page DEIR that the County took nearly two-and-a-half years to prepare. We had hoped to send this letter after the County provided members of the public with the documents withheld by the County staff and the County’s consultant, but the County has continued to delay resolving that matter.

Data gaps in the DEIR and the DEIR’s vague and obfuscatory language limited our efforts to fully understand the details of the DEIR and provide meaningful feedback. The County also refused to provide the necessary explanatory technical information used to make significance determinations. As we have explained previously, the DEIR’s structure and over-reliance on appendices makes the document’s analysis and the basis for such analysis impossible to decipher.

The County staff have refused to provide essential information requested by the public to help understand the DEIR’s analysis. This refusal led to months-long fight by the County and Newland’s consultant to withhold key air quality files. As part of this conflict, the County staff attempted to outsource its public disclosure obligation to a third-party private consultant. The

third-party consultant then threatened to sue anyone who requested the information for potential “misuse” of their “proprietary” data. This required the Golden Door to file litigation seeking access to the County’s public records. As of this date, the County has still refused to provide a satisfactory resolution of the matter - though we are hopeful to reach a settlement.

Without adequate data, and without protection from threats of lawsuits by the County’s and the developer’s consultants, our professional consultants were unable to provide a peer review of the methodology used and the conclusions reached in the Draft EIR. They were also unable to review the data that was used as inputs in these models, including the full list of the data used to construct the information on potential cumulative projects that could lead to cumulative impacts.

Despite the County staff’s refusal to provide this basic information under the Public Records Act, we have attempted to use other means to identify the errors and omissions in the DEIR’s cumulative impacts analysis. As described below, it appears to us that the County staff failed to include all of the necessary projects in this analysis as required by CEQA. This exacerbates the DEIR’s flaws as an informational document. In addition, the DEIR’s vague and confusing construction makes it difficult to determine the full scale of prejudice resulting from these errors and omissions. It is possible that when the documents that the County has withheld under the Public Records Act are released to us and other members of the public, under an agreement which assures that no one faces a threat of lawsuits by the County or third party consultants, we or other members of the public may discover additional errors in the cumulative impacts analysis.

Below is a discussion of the errors we have been able to identify, based on the limited data the County has provided to the public. Because of these errors, the County staff must make corrections in a revised document and provide a new comment period under CEQA, so that members of the public can analyze the data and provide comments on the findings related to that data.

I. THE NEWLAND DEIR OMITTS IDENTIFIABLE CUMULATIVE PROJECTS AND MAKES OTHER ERRORS

It does not appear that the Draft EIR has taken into consideration the cumulative impacts of the Williams Riviera Project, the Safari Highlands Project, the Pala Casino Hotel expansion, or the San Marcos Highlands Project. These projects are detailed below:

1. The Williams Riviera Project (**Attachment 1**) located in Valley Center is a 98 acre mixed-use project that includes 214 apartment units, 376 single-family homes, and 108,000 square feet of commercial space.
2. The Safari Highlands Project (**Attachment 2**) located on 1,098 acres in the unincorporated area east of Rancho San Pasqual near the City of Escondido and the San Diego Zoo Safari Park would include 550 single-family homes with supporting commercial areas and recreational amenities.

3. The Pala Casino Resort Expansion (**Attachment 3**) is located on the Pala Indian Reservation off Highway 76 and will include a new 348-room hotel, a new 12,000 square foot gaming floor, and a complete remodel of the existing 100,000 square foot casino area.
4. The San Marcos Highlands Project (**Attachment 4**) is located on 265.8 acres north of Santa Fe Hills in the City of San Marcos and unincorporated County and will include 189 clustered single-family residential lots.

In addition to the projects above, we note that there are no projects in the City of Escondido listed in Table 1-10 or shown on Figure 1-46 of the DEIR. We have attached a list of projects that are under construction, recently approved, and under consideration by the City of Escondido (**Attachment 5**). Some of these projects are quite large and would likely have the potential to add significant traffic to area roadways, including at least some additional traffic on Interstate 15. This additional traffic will add the predicted ambient air quality impacts from cumulative projects. The DEIR must be revised to include new information on these increased cumulative impacts on the roadways and freeways and air quality.

When the DEIR is revised so that these traffic and air quality impacts are added from these missing projects to the cumulative projects analysis, the DEIR must be recirculated for a new public comment period. Even a small increase in traffic on Interstate 15, for example, will be a substantial worsening of the already identified cumulative significant adverse impact on traffic. Under the California Environmental Quality Act (“CEQA”), the addition of information showing a substantial worsening of an already identified impact, such as cumulative traffic or cumulative air quality impacts, requires recirculation of the DEIR as noted below.

It appears that the County did request that the Safari Highlands project be evaluated for cumulative impacts in the Newland Sierra DEIR. However, inexplicably, the Safari Highlands project does not appear in the list of cumulative projects on Table 1-10. In an October 8, 2015 email exchange provided to the Golden Door by the County of San Diego between Darin Neufeld, Project Planning Manager for the County’s Department of Planning and Land Use, and Brian Grover, the EIR writer for the Newland Sierra Project for Dudek and Associates, Mr. Neufeld makes clear that Safari Highlands should be evaluated in the cumulative impacts section (**Attachment 6**). In the email, (subject line “Newland Cumulative – Safari Highlands Ranch”) Mr. Neufeld says, “Brian, please make sure this project is evaluated in cumulative.” The Notice of Preparation of an EIR for Safari Highlands is attached to the email with a description of the project. Mr. Grover requests a copy of the application for the project, but Mr. Neufeld states that he does not have a copy of the application. Despite the fact that the County requested that the Safari Highlands project be included in the cumulative impacts analysis and consultants for Newland Sierra were informed of the specifics of the project, it does not appear that this project was included in the cumulative impacts analysis.

The DEIR was written in a manner to be “strategically vague” in its description of some projects while being hyper-specific in others, so that the public was not informed of which projects were included or excluded, and the size and nature of each project that was included in the cumulative impact analysis. For example, Table 1-10 is so specific as to some projects that it

includes a specific description of a 1,056 square foot kennel for 40 dogs and cats (project 113), but gives no information about project 109 describing it as “North and South of Valley Center Road between Miller Road and Cole Grade Road.” In addition, as we noted above, Table 1-10 also completely ignores at least 95 projects in the City of Escondido¹, including the Escondido Country Club Project, which includes 392 new homes.

These errors and omissions cause the DEIR to fail as an informational document. The extent of additional errors and omissions in the DEIR’s cumulative project inputs is unknown since the County has failed to release documents that could provide further information on the inputs used in the computer models used to generate the amounts of traffic and air quality impacts. It is not reasonable to expect the public to cross-reference the vague descriptions in Table 1-10 with publicly available information to determine the potential impacts from the 199 cumulative projects listed in Table 1-10. It is also unreasonable to burden the public with searching for all cumulative projects omitted from the DEIR. Additional errors and omissions may exist and the public will remain in the dark about such cumulative projects unless and until the County complies with its obligation to provide a full list of cumulative projects and incorporates them into its cumulative impacts analysis.

II. ERRORS AND OMISSIONS IN THE CUMULATIVE PROJECT INPUTS PREJUDICE PUBLIC REVIEW AND SIGNIFICANT CONCLUSIONS

The cumulative projects discussed above will put significant amounts of traffic onto the adjacent County circulation system with accompanying air and GHG emissions. They may also affect wildlife connectivity and preserve design under the North County Multiple Species Conservation Plan, as well as consistency with SANDAG’s Regional Transportation Program/Sustainable Communities Strategy for vehicle miles traveled and GHG emissions. Other potential impact areas affected include water supply availability, fire evacuation routes, and growth inducement.

Beyond a determination of whether the full breadth of cumulative projects were included, without full access to the technical data underlying analysis of various impacts it is impossible to determine the time horizon under which the listed projects were considered or the scope of those projects that were analyzed. It is also impossible to peer review whether the projects in Table 1-10 were actually included in the cumulative impacts analysis. The County’s position of not providing an understandable and accessible DEIR and not releasing pertinent technical data denies the public an opportunity to check the analysis. Instead the DEIR takes a “trust us” approach, and assumes facts without divulging the substantial evidence to support them. Even if a project is listed in Table 1-10, additional cross-checking is required to determine if such project was actually included in the cumulative impacts analysis for specific environmental impacts.

For example, the Lilac Hills Ranch Project which is listed in Table 1-10 as project 171. Although the project is listed on Table 1-10, we lack important information to understand how it was considered in the cumulative impacts analysis. The Lilac Hills Ranch Project is a General Plan Amendment like Newland Sierra. The baseline for any cumulative impacts analysis is the

¹ See Pending Projects at: <https://www.escondido.org/planning.aspx>.

existing General Plan land uses, so any change to the baseline for a General Plan Amendment must be changed in the model to accommodate the potential new project when assessing cumulative impacts. In the case of Lilac Hills Ranch, the baseline SANDAG model would need to have been adjusted to include impacts from this project, because the SANDAG model is based on the County General Plan which does not include the Lilac Hills Ranch Project—and similarly does not include the Newland Project.

It is difficult to understand how the addition of this very large project requiring a General Plan Amendment has impacted the baseline model. For example, Dawn Wilson of STC Traffic, Inc., noted in her comment letter that while the Lilac Hills Ranch is included in the cumulative projects table in the traffic study for the Newland DEIR, the analysis differs from the analysis the County provided as part of the Lilac Hills Ranch EIR. The County staff has an obligation to explain the discrepancies between two separate County documents. It appears that there are substantial discrepancies between the cumulative projects analyzed for each project. The County must revise the Newland DEIR to explain these discrepancies, and provide an accurate, detailed, and complete list of all the projects in the region that would further worsen the identified significant air quality and traffic impacts.

In addition, there is a temporal component to determining when cumulative impacts will occur that cannot be understood without the technical data. The traffic study looks at the near-term and horizon year impacts, and may also look at interim phasing to determine when certain road and intersection mitigation will be required. Therefore, there is a significant difference in the modeling, and determination of when infrastructure would be needed if Lilac Hills Ranch—or any other cumulative project—is projected to start construction in 2020 versus 2050. Without an understanding of the technical inputs and amendments to the baseline traffic model it is not possible to fully understand if the DEIR adequately evaluates the cumulative impacts of the Lilac Hills Ranch among other cumulative projects.

In addition, the scope of a project used to amend a baseline model could determine the difference between a *significant* or *insignificant* impact. Even when General Plan land uses are applied within a baseline model they sometimes need to be altered to reflect an actual project moving forward. There is a significant range of development allowed in the General Plan that can generate vastly different numbers of units and commercial square footage, and therefore different impacts to areas such as traffic, air quality and GHG generation are possible. The County has considerable information about the number of units or total square footage being proposed in areas where a range is possible, and those specifics should be applied in the cumulative impacts analysis.

III. REVISION OF THE EIR IS REQUIRED TO ADDRESS THE CONCERNS RAISED BY THE COURT OF APPEAL AND THE GHG AND VMT MITIGATION MEASURES TO BE IMPLEMENTED BY THE COUNTY THAT WERE ADOPTED BY SANDAG

The Court of Appeal's recent opinion in *Cleveland National Forest Foundation v. San Diego Association of Governments*, Case No. D063288 filed on November 16, 2017, (attached hereto as **Attachment 7**). On page 17-18, the court stated that SANDAG's own EIR for its 2010

RTP/SCS included mitigation measures related to land use planning and land use decisions that SANDAG expected that the “County of San Diego” and “San Diego region cities” would undertake to implement SANDAG’s overall plan for GHG reductions. The court also stated that SANDAG adopted a mitigation measure that agencies in the San Diego region would “require the use of best available control technology to reduce greenhouse gas emissions during the construction and operations of projects.” (*Id.* at p. 18.)

The County’s Draft EIR for the Newland Project fails to consider these mitigation measures adopted by SANDAG, and the role that was specified by SANDAG for the County in their implementation by SANDAG’s EIR that was reviewed by the Court of Appeal. The County should withdraw the current Draft EIR for Newland and add a discussion of how the Newland Project complies with these mitigation measures. Among other things, the County has not required the Newland Project to require the use of “best available control technology” (“BACT”) for GHG emissions. Instead, the County has allowed Newland to “offset” its way out of meeting these BACT requirements. This new discussion of SANDAG’s specified mitigation measures will be a significant new analysis that should be recirculated for a new public review period.

Additionally, the *Cleveland National Forest Foundation* court recognized the importance of considering transit-oriented developments to reduce GHG emissions impacts for an EIR to be adequate as an informational document::

Missing from the EIR is what CEQA requires: a discussion of mitigation alternatives that could both substantially lessen the transportation plan’s significant greenhouse gas emissions impacts and feasibly be implemented. A few examples of potential alternatives identified in the Climate Action Strategy include supporting the planning and development of smart growth areas through transportation investments and other funding decisions; offering incentives for transit-oriented developments in smart growth areas; coordinating the funding of low carbon transportation with smart growth development; and encouraging parking management measures that promote walking and transit use in smart growth areas. Given the absence of any discussion of such mitigation alternatives, we conclude there is not substantial evidence to support SANDAG’s determination the EIR adequately addressed mitigation for the transportation plan’s greenhouse gas emissions impacts. The error is prejudicial because it precluded informed public participation and decisionmaking.

(Slip Opinion at pp. 21-22.)

The County’s Draft EIR for Newland also fails to include a discussion of these same mitigation alternatives, and fails to analyze whether the Newland Project will be consistent or inconsistent with SANDAG’s and the County’s smart growth policies. It may be that the County staff will ultimately decide that these smart growth policies are irrelevant, and instead conclude

that Newland will be allowed to purchase out of County or out of state offsets instead of complying with these smart growth policies. (We hope that the County staff will not make that decision, of course.) However, as the *Cleveland National Forest Foundation* court notes, the EIR must include a discussion of these policies in order to be adequate as an informational document under CEQA.

IV. RECIRCULATION OF THE DEIR IS REQUIRED

The CEQA requires that a project's EIR fulfill the basic informational purpose of disclosing and evaluating environmental impacts for the public and decision makers. This includes cumulative impacts. As discussed above, the Golden Door has identified multiple projects that should have been—but were not—included in the Newland DEIR's cumulative impacts analysis. These projects necessarily add to the already identified significant adverse impacts in the DEIR. In addition, there may be additional projects omitted or errors involving the included cumulative projects. The County must revise the EIR to include all appropriate cumulative projects.

This revision necessarily requires recirculation of the DEIR for public review and comment. CEQA requires a lead agency to recirculate a draft EIR under the following circumstances:

- (1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
- (2) *A substantial increase in the severity of an environmental impact would result* unless mitigation measures are adopted that reduce the impact to a level of insignificance.
- (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project's proponents decline to adopt it.
- (4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

(14 Cal. Code Regs. § 15088.5(a) [emphasis added]; see also *Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal.4th 1112, 1120.)

Here, inclusion of additional cumulative projects would necessarily result in new or more severe impacts. The DEIR has already identified impacts that are considered significant and unavoidable, including for air quality and traffic. Additional cumulative projects would necessarily add to air quality and traffic impacts. (See *Kings Cty. Farm Bureau v City of*

Hanford (1990) 221 Cal.App.3d 692, 718-721 [requiring cumulative impacts analysis to rely on collective significance rather than the “ratio” of additional impacts].)

In addition, providing important information that was omitted from a DEIR triggers recirculation. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 95 [recirculation may be required where initial document omits important information].)

V. CONCLUSION

Based on the foregoing, we request that the County revise the Newland DEIR’s cumulative projects list to include all known projects that could contribute to the Project’s cumulative impacts, clearly disclose which cumulative projects are analyzed for which impacts, and when such projects are assumed to be built out in whole or in part, provide the additional data requested by members of the public, and recirculate the DEIR in full for an additional comment period.

We also believe the County should carefully consider whether the requested technical data - which the County has withheld for several months - should be made available to the public during this additional public comment period on the DEIR.

We thank you for your time and attention to this matter. We ask that you include this letter and your response in the administrative record for the Newland Sierra Project. Please do not hesitate to contact us should you have any questions or comments.

Best regards,

Christopher W. Garrett

±98.3 Acre Mixed-Use Development Opportunity

CBRE, Inc. is pleased to present for sale Williams Riviera Ranch Estates, an exceptional ±98.3 acre mixed-use development opportunity in north San Diego County, California.

Proposed to build 214 apartment units, 376 single-family homes and approximately 108,000 net rentable square feet of commercial space, Williams Riviera Ranch Estates is well diversified to fit the needs of the market and provide a "live, work, and play" lifestyle in a desirable Southern California location.

The development plan includes an attractive mix of multifamily for-rent product, attached for-sale and rental cluster-style homes, and detached for-sale single family residences. Ample open space provides ±17 acres of recreation area and horse trails, along with a common area recreation center. Entitlements are currently being

processed in San Diego County and construction on the first phase commercial portion is expected to begin in mid-2018; the residential entitlements are expected by May 2020.

Williams Riviera Ranch Estates offers the unique opportunity to significantly enhance the community of Valley Center and the overall north San Diego and Southern Riverside Counties. The development will provide housing and commercial support services to a community that is poised to realize its potential as an appealing market in proximity to major employment centers. Area employers, including three local casinos employing ±5,400 employees provide significant demand for residential housing.

Investment Highlights

Unique, One of a Kind Opportunity

This irreplaceable property has been designated by San Diego County as the "Town Center" in Valley Center. Due to a variety of restrictions in other areas of Valley Center, Williams Riviera Ranch Estates is the only site that supports a high-density development. The Property is located at the intersection of Valley Center Road and Cole Grade Road, the only available site in the market that supports a mixed-use project. S/F Project Monument

Live, Work, and Play

The Williams Riviera Ranch Estates development will introduce a completely different walkable master planned community to this market with a "live, work, and play" concept. Schools and community services like the post office and library/community center are already established and in proximity. Valley Center residents currently either patronize small, local businesses or drive to areas such as Escondido where the closest major grocery store is a 20-minute drive away. When completed, onsite community recreational amenities, social activities, and a destination dining/shopping center will attract new buyers to the area while providing much needed retail support for existing residents of Valley Center. The mixed-use component of Williams Riviera Ranch Estates is envisioned to include locally-owned restaurants, boutique shops, a neighborhood grocery store, a drug store, social gathering and event spaces, and office space.

Marketability

The Williams Riviera Ranch Estates Master Plan will offer diverse product types in five distinct neighborhoods, maximizing the marketability and the absorption of these new homes. The current site is planned for a variety of multifamily residential product and cluster-style homes along with the development of 186 single family homes ranging from smaller alley loaded single family detached 3,088 square foot lots to 12,000 square foot lots. These lot sizes are much smaller than typical in area, but are now allowed under updated planning and infrastructure regulations. With a walkable master plan and high home prices closer in, this project will create opportunities to pull buyers seeking an alternative lower cost option without enduring the daily commute to/from metropolitan San Diego and South Riverside County. The size of the master development will serve to create a sense of community with a strong neighborhood feel.

UTILITIES

ACCESS

Approximately 3 years ago, the main highway – Valley Center Road, (which fronts on the commercial development), was rebuilt and altered from a winding two-lane highway to a straighter four-lane highway with a partly landscaped median. That highway (Valley Center Road) now connects Valley Center to the City of Escondido (which is about 9 miles to the south of Valley Center), and additional road improvements from Valley Center Road, which terminates in Escondido and continues to Highway I-15, have now made Valley Center an approximate 35-minute commute to the high employment centers of the City of San Diego and its northern environs.

SEWER

The Valley Center Municipal Water District, (“VCMWD”), after 4 years of planning, expects to complete construction of a new sewer plant in about the second quarter of 2017, (called the Phase 2 sewer plant), capable of sewerage about 1,095 dwelling units or equivalent sewer and/or needs of commercial buildings.

The Williams Riviera Ranch Estates and 120 residential units will have its sewer needs satisfied by the Phase 2 Sewer Plant. Williams Riviera Ranch Estates has received final approvals from the Valley Center Planning Committees and expects to receive entitlements from the County of San Diego by August 2017. Additionally, the Valley Center Municipal Water District is presently planning for a Phase 3 Sewer Plant capable of sewerage another 1,200 dwelling units or equivalent sewer needs of new residential and commercial developments, estimated completion date of about mid-2020, which is adequate timing to sewer the Subject's remaining approximate 300 to approximately 450 residential units. The above sewer plants will provide sewer service to Williams Riviera Ranch Estates residential and commercial property as well as other properties along Valley Center Road. This development opportunity is primarily, due to new sewer availability and new high-density residential zoning, which never existed before.

GAS & ELECTRIC

The project would be serviced by San Diego Gas & Electric

Safari Highlands Ranch Specific Plan

Project/Study Overview:

The proposed Safari Highlands Ranch (SRH) is located on 1,098 acres of vacant land east of Rancho San Pasqual, northeast of the Rancho Vistamonte Community and just north of the San Diego Zoo Safari Park in unincorporated San Diego County. The project site is within General Plan Specific Plan Area (SPA) #4. The proposed project consists of 550 single-family residences, a "Village Core," open space and trail amenities, and other associated amenities.

You can learn more about the Project on this webpage; and review the anticipated schedule [here](#).

How is the City Reviewing the Application:

Escondido plans and regulates the use of land to protect the public health, safety and general welfare of our community. Because the use of land is regulated, the City must review all projects against this policy and regulatory framework before any buildings can be constructed. City staff is currently reviewing submittal items and processing other relevant application material in accordance with all relevant local, state, and federal laws.

An Initial Study was prepared for the project in accordance with Section 15063 of the CEQA Guidelines. Based on the results of the Initial Study, an EIR has been prepared to address potential direct, indirect, and long-term cumulative impacts. The draft EIR has been released for public review and comment.

What is Needed from the Public:

On Monday, October 16, 2017 the City announced the release of a draft EIR for public review and comment. In order to provide sufficient time for public review, the review period has been set for 52 days, ending on December 7, 2017. A direct link to the document can be found [here](#). City staff encourages you to learn more about the project, review the project's anticipated environmental consequences, and to let us know what you think.

To learn more about the planning process, the current status of the Project, or to offer input, please contact Contract Planner, John Helmer at jhelmer@escondido.org or 760-839-4543.

Safari Highlands Ranch Specific Plan Project Description (Revised October 2016)

Parent File Number: SUB15-0019; Sub-Project Files: PHG15-0023, PHG15-0024, PHG15-0025 and ENV15-0009

APNs: 240-270-33; 242-010-2, 36, 37 & 38; 241-060-03

Project Components

The proposed Safari Highlands Ranch (SRH) is located on 1,098 acres of vacant land east of Rancho San Pasqual, northeast of the Rancho Vistamonte Community and just north of the San Diego Zoo Safari Park in unincorporated San Diego County. The project site is within General Plan Specific Plan Area (SPA) #4. The proposed project consists of the following:

1. 550 single-family residences on lots ranging from approximately 8,000 square feet to over 200,000 square feet clustered into seven neighborhoods. Average lot size range among the different neighborhoods from 16,000 square feet to 66,000 square feet.
2. A “Village Core” providing a new 1.9-acre, three bay fire station site, over 9 miles of soft surface meandering trails and associated public parking, a five-acre private recreation center, with pools a fitness facility, community gathering areas, and other associated amenities.
3. Safari Highlands Ranch Road, a new primary access road intersecting at Rockwood Road between Old Ranch Road and Vistamonte Avenue.
4. An internal private street system with street rights of way varying from 49 feet wide with travel lanes, parking and walkways to 82 feet wide with a median, travel lanes, bike lanes and walkways.
5. Approximately 8.3 acres of recreational parks and trails and 769 acres of resource, wildlife corridors, open space and conservation easement areas (totaling approximately 70 percent of the site).
6. Water utilities would include connection to the City of Escondido water system, pumps to boost water to an on-site 80 foot diameter water tank, and an internal water distribution system that would use both pumps, reducing stations, and gravity feed.
7. Extension and connection to the City of Escondido recycled water system for common area irrigation.
8. A stormwater system that includes hydro-modification management practices including the use of biofilters and the use of both retention and detention basins
9. A multi-modal transportation system that emphasizes the integration of vehicular, bicycle, and pedestrian traffic throughout the project.
10. Various off-site improvements including the following:
 - Reconstruction and improvements to Rockwood Road’s intersection with the proposed SHR Road;
 - Improvements along Rockwood Road between Cloverdale Road and San Pasqual Union School to maintain the existing level of service on Rockwood Road;
 - Intersection of Rockwood Road/Cloverdale Road. Install traffic signal and restripe westbound approach to provide one left-turn and one shared left-turn lane.

- Restripe southbound Cloverdale Road to provide an additional receiving lane from Rockwood Road left turning movements;
- Provide a median on Rockwood Road between Cloverdale and San Pasqual Union School to maintain a Level of Service (LOS) B;
 - Intersection of San Pasqual Valley Road (SR 78)/Citrus Avenue. Install new signal and restripe southbound approach to provide one left hand and one right hand turn lane;
 - Intersection of San Pasqual Valley Road (SR 78)/Cloverdale Road San Pasqual Road. Restripe eastbound approach of San Pasqual Valley road to provide dual left-turn lanes (within existing ROW). Restripe northbound section of Cloverdale Road north of the intersection to provide approximate 650 foot long plus a 150-foot transition lane (within existing ROW);
 - Segment of Felicita Road/17th Avenue from Escondido Boulevard to San Pasqual Valley Road (SR 78). Stripe a new eastbound turn pocket at Lendee Drive and extend the two-way left turn lane eastward to the City of Escondido/San Diego County boundary;
 - Two gated emergency access roads: a 2.4 mile road to the northwest connecting to Stonebridge Road and a one mile road to the south connecting to Zoo Road;
 - Gas, electric, cable, and phone system connections at Rockwood Road to existing infrastructure operated by San Diego Gas and Electric, Times Warner Cable, and AT&T;
 - Improvements to the Eagle Crest Golf Course including replacing the existing temporary clubhouse with a new 4,000 square foot permanent clubhouse with restaurant, reconstruction of hole #14, extension of SHR Road and miscellaneous other golf course improvements (all by separate permit).

Seven phases of development are proposed, corresponding to the seven neighborhoods being created. Public facilities and services and phase development would be coordinated so that services are available and ready to serve the residences as need arises.

Project Entitlements/Approvals

The proposed Project consists of the following entitlements and agency approvals, which would be processed concurrently unless noted:

1. Update of the City of Escondido's Sphere of Influence (SOI) to include SHR (SPA #4) as well as other properties as determined by the City to be appropriate to be included as part of a larger SOI update and municipal services review (LAFCO);
2. A Development Agreement to allow residential lots of less than one acre in size and to authorize an increase in the General Plan "maximum theoretical yield" of 284 dwelling units . The applicants request to add an additional 266 dwelling units totaling 550 dwelling units. This increase in density would be in exchange for on-site and/or off site community benefits above and beyond the project's impacts as

- permitted in the General Plan for SPA #4. This request is within the maximum permissible density allowable for the site pursuant to SPA #4.
3. Adoption of a Specific Plan text and map providing development and design standards for the SHR site involving 550 units and other proposed features, community benefits and amenities (i.e. trails, recreational, fire station, landscaping, private pockets parks, open space, and other associated amenities);
 4. Tentative Subdivision Map creating a total of 591 lots consisting of: 550 residential lots; 13 open space lots; 15 Home Owners' Association lots; eight (8) private street lots; one (1) public facilities lots; one (1) fire station lot; one (1) recreation area HOA lot;
 5. Amendment to the Escondido General Plan Circulation Element designating other proposed primary and emergency access route(s) accessing the site;
 6. Amendment to General Plan SPA #3 map (Rancho San Pasqual) to designate Safari Highlands Ranch Road (as described in #5 above) through the Eagle Crest Golf Course fairway between Old Ranch Road and Vistamonte Avenue in the southern portion of SPA #3 in an alignment currently designated as "Emergency Access Road".
 7. Pre-zoning of the SHR property to the category of Specific Plan (S-P) Zone, consistent with the City's General Plan SPA designation;
 8. Annexation of the SHR property and the Beacon-Sun Ranch (underlying property for Emergency Access route to the North) into the City of Escondido corporate limits and into the City's membership of the Metropolitan Water District. Other properties considered in the SOI update may be included in a larger annexation, but such annexations are not a precondition of the SHR project. (LAFCO);
 9. Detachment from the County Communications District (LAFCO);
 10. Detachment from CSA No.113, San Pasqual Fire Protection District (LAFCO);
 11. Optional detachment of a portion of the Specific Plan from the Valley Center-Pauma Unified School District and subsequently reorganize into the San Pasqual Union School District and the Escondido Union High School District.
 12. Requests for multiple grading exemptions: 118 interior lot grading-exempted cut slopes ranging up to 106 feet at 1.5:1 inclination and 220 interior grading exempted fill slopes ranging up to 135 feet at 2:1 inclination.
 13. Standard Urban Storm Water Mitigation Plan
 14. Certification of a Final Environmental Impact Report
 15. The project also seeks associated permits and agreements from agencies including:
 - Agreements with San Diego County and both the US and California Departments of Fish and Wildlife to reassign the Multiple Species Conservation Plan (MSCP), previously approved for the southern approximately one-half area of SPA #4, from San Diego County to the City of Escondido and permits for project related habitat loss.
 - Adoption of a habitat plan management plan for northern portion of project site located outside of adopted MSCP area.
 - Water quality permits from the Army Corps of Engineers and the Regional Water Quality Control Board.

Completion of SOI update and annexations/detachments (items #1, 9, 10 and 11 above) would take place through the San Diego Local Agency Formation Commission (LAFCO) after EIR certification and Project approval by the City Council. LAFCO approval of SOI update and annexations/detachments are necessary for project development to proceed.

Technical Reports/Studies

The following reports, studies and documents have been submitted with the project application:

1. Revised Safari Highlands Ranch Specific Plan, November 2016. This document describes all aspects of the proposed Specific Plan, outlines design and development standards, and provides numerous illustrations of the proposed plan, proposed residences and structures, roadway sections and alignments, landscaping, photos and photo simulations.
2. Revised Biological Technical Report, October 2016, Althouse and Meade, Inc.
3. Revised Archaeological/Historic Study for the Safari Highlands Ranch Project, August 2016, Brian F. Smith and Associates.
4. Geologic Reconnaissance, June 2015, Geocon Incorporated.
5. Revised Traffic Impact Analysis, October 2016, LLG Engineers
6. Revised Stormwater Quality Management Plan, October 2016, Hunsaker and Associates
7. Revised Wastewater Report, October 2016, Dexter Wilson Engineering
8. Revised Potable Water and Recycled Water Report, October 2016, Dexter Wilson Engineering
9. Revised Drainage Study, September 2016, Hunsaker and Associates
10. Slope Analysis and Map, March 2014, Omega Engineering
11. Draft Sample Development Agreement between City of Escondido and multiple parties
12. Zone Change/Prezone Written Statement of Facts
13. Revised Tentative Map (24 pages), October 2016, Hunsaker and Associates
14. Landscape Concept Maps (25 pages), July 2015, McCullough Landscape Architecture. Inc.
15. Updated Preliminary Title Report, October 2016, First American Title Company
16. Grant Deed, March 2015
17. Agreement to Grant Easement for Emergency Access Road, April 2015
18. Memorandum of Agreement to Grant Easement (golf course property), January 2015

Pala breaks ground on \$170 million expansion

news desk | on October 19, 2017

Pala Tribal Chairman Robert Smith drives an excavator through a brick kiosk building to make way for the new expansion.

Officials of Pala Casino Spa & Resort Tuesday held a groundbreaking ceremony to honor the commencement of the resort's \$170 million expansion and renovation project.

Pala Band of Mission Indians Chairman Robert Smith provided the keynote address at the groundbreaking ceremony, which took place at the outdoor resort pool area. To officially break ground, Smith drove an excavator through a 15'x 17' brick kiosk building. The groundbreaking was followed by food and refreshments indoors at Pala's CAVE Lounge.

"Our ability to exponentially expand and refresh Pala Casino Spa & Resort is a true testament to, not only the growth of Pala, but also to the thriving economy and the continued strength of the gaming industry in California," Smith said. "This is a significant milestone for our Tribe and we look forward to continuing to exceed the expectations of our loyal patrons."

The renovation and expansion will include the addition of a new 348-room hotel tower. The resort's existing hotel tower also will be completely remodeled. When complete, Pala will boast 853 rooms including 104 unique suites and 749 deluxe rooms with dramatic views of the resort's multi-pool and entertainment complex, event lawn and Palomar Mountain. To accommodate more hotel guests, the hotel parking structure will be expanded by adding 420 additional spaces.

The conversion of the existing resort pool into a multi-pool and entertainment resort complex will offer guests the opportunity to enjoy four pools, two whirlpools, a new poolside bar, a new poolside restaurant and various outdoor lounge spaces complete with fireplaces for evening cocktails.

Pala's gaming area also will be expanded by 12,000 square feet. Within that expanded casino space, 500 new slot machines, several new table games and a new casino bar and lounge will be introduced. The interior of the entire 100,000-square-foot casino will be remodeled.

5 Property next to Weston Towne Center for sale

Pala's food promenade will be converted into a restaurant complex offering a wide variety of food options in a variety of settings. The restaurants will include casual café dining, Asian dining, a premium sushi restaurant and a sports bar restaurant offering live entertainment and dancing every Friday and Saturday night. The new restaurants will complement Pala's signature Choices the Buffet, Oak Room Steakhouse, the eclectic underground wine cave with its new California-casual restaurant, Bar-Meets-Grill, which will open in January 2018.

During the ceremony, Bill Bembenek, Pala's chief executive officer, California State Assemblywoman Lorena Gonzalez-Fletcher, Assemblyman Randy Voepel and Assemblywoman Marie Waldron also provided remarks.

"I am proud to have played even a bit part in this important event for the Pala Band of Mission Indians, the State of California, and the local economy by authoring Assembly Bill 629 to ratify the tribal gaming compact that made today's groundbreaking a reality," said Gonzalez-Fletcher. "This legislation was overwhelmingly supported by representatives from around California because of Pala's commitment to the economic self-sufficiency of its people and to the surrounding community."

"Pala has been a great neighbor to the surrounding communities in our district," said Waldron. "The casino and resort employs thousands of our residents and has had a tremendous impact on the economic prosperity of the Tribe's members. Under the leadership of Chairman Smith, Pala has been a vast economic driver in my district and the surrounding areas. Our region is a better place because of your efforts."

Pala's renovation and expansion project will create 400 construction jobs and, once complete, add over 200 jobs to Pala's current team of 2,000 employees.

Construction is officially underway and will be completed in phases. The first phase will be completed in spring of 2018 and the final phase in late 2019.

The construction company selected for the renovation and expansion is Level 10 Construction with headquarters in San Francisco, CA, and offices in Sunnyvale and San Diego, CA. The architect is Klai Juba Wald of Las Vegas, NV. The contributing architect is Marks Architects of San Diego, CA.

“We are very excited to engage in our third major expansion since our introduction to the Southern California gaming and hospitality market more than 16 years ago. As in the past, we expect elements of this expansion and upgrade to be unique to our property and to set new resort standards,” Bembenek said. “This significant expansion project will complement our already luxurious resort offerings while providing our patrons with new world-class amenities.”

Save Our WATER 

It Will Always be Important to **“Live WaterSmart.”**

Though water supply conditions are good, it will always be important to use water efficiently and avoid wasteful practices such as:

- Hosing Off Hard Surfaces;
- Washing Vehicles with a Hose Not Equipped with an Automatic Shut-off Valve;
- Using Non-recirculating Water in a Fountain or Water Feature;
- Over-irrigating Landscaping and Having Water Run Off Your Property;
- Irrigating During or Within 48-Hours After a Rain Storm;

For Water Use Efficiency Tips, New Landscaping Ideas, or Information About Rebates and Incentives visit the links on right hand side of our Homepage at www.vcmwd.org.

and as always,
Thanks for Your Help and Cooperation!

San Marcos Highlands Project

Project Number: P13-0009 (SP 13-001, TSM 13-001, CUP 13-010, ROZ 14-001, PZ 14-001, GPA 15-002, EIR 15-001)

Project Location: North of Santa Fe Hills at the northern terminus of North Las Posas Road

Project Applicant: Farouk Kubba, Vista San Marcos Ltd.

Project Description

The applicant has proposed a Specific Plan Amendment and Tentative Subdivision Map for 189 clustered single-family residential lots and open space on 265.8 acres located at the northern end of Las Posas Road within the San Marcos Highlands Specific Plan Area, and an additional 27.5 acres of open space contiguous on adjacent properties to the northwest.

The project also proposes annexation of approximately 124.7 acres from the County of San Diego to the City of San Marcos. This action will require approval by the Local Agency Formation Commission (LAFCO) as well as for water, sewer, and fire district boundary adjustments. A pre-zone from County Zoning (A-70) to Specific Plan Area will be required for a 9.7-acre portion of the project site currently in the County.

Additionally, a Ridgeline Development Permit that would allow a portion of the proposed subdivision to be developed in accordance with the Ridgeline Overlay Zone and a Conditional Use Permit for temporary use of a rock crusher(s) during grading operations have been requested. The project includes a General Plan Amendment to modify the acreage and description for the future Buena Neighborhood Park (the project's proposed Park "C") in the

Highlands

University District

Streets Maintenance

Traffic Alerts

Parks, Recreation, and Community Health Element of the General Plan to be consistent with the adopted 1990 Parks Master Plan.

An extension of North Las Posas Road to Buena Creek Road is *not* proposed as part of this project. The narrow strip of property extending up to Buena Creek Road (as shown on the vicinity map) will be preserved habitat as part of the 210.8 acres of conservation open space for the project.

The City of San Marcos Planning Commission held a public hearing on 9/6/16 and recommended approval (7-0 vote) to City Council the San Marcos Highlands project and associated Final EIR. Subsequently, the final decision regarding the project and certification of the Final EIR will be determined by City Council. The City Council hearing date is scheduled for Tuesday, November 15, 2016 at 6:00 pm in the City Council Chambers. [Notice of Public Hearing, 11/15/16, City Council.](#)

Brian,

No County applications...these are other jurisdiction projects. I'll look for the San Marcos Highlands interjurisdictional notice.

Why did you miss the Facebook/Google tour? It was great.

Darin

NOTICE OF PREPARATION OF AN EIR

SAFARI HIGHLANDS RANCH

LEAD AGENCY: City of Escondido

Project Location: 23360 Old Wagon Road, Escondido, San Diego County, California. The proposed project is located on 1 ,098 acres of vacant land east of Rancho San Pasqual, northeast of the Rancho Vista Monte Community and just north of the San Diego Zoo Safari Park in unincorporated San Diego County. The project site is within the City's General Plan Specific Plan Area (SPA) #4.

Project Description:

- 10/7/15
1. 550 single-family residences on lots ranging from approximately *City of Escondido* 8,000 square feet to over 200,000 square feet clustered into seven neighborhoods. Average lot size range among the different neighborhoods from 16,000 square feet to 66,000 square feet.
 2. A "Village Core" providing a new 2.6-acre, three bay fire station site, a five-acre public park and trails, private recreation center, small convenience retail store and community gathering areas.
 3. Safari Highlands Ranch Road, a new primary access road intersecting at Rockwood Road between Old Ranch Road and Vista Monte Avenue.
 4. An internal private street system with street rights of way varying from 49 feet wide with travel lanes, parking and walkways to 82 feet wide with a median, travel lanes, bike lanes and walkways.
 5. Approximately 14 acres of recreational parks and trails and 784 acres of resource, wildlife corridors, open space and conservation easement areas (totaling approximately 69.6 percent of the site).
 6. An on-site satellite sewage treatment facility (also referred to as a water factory) providing reclaimed water consistent with Title 22 requirements for a portion of the project's common landscaped

and open areas irrigation. Remaining solids would be discharged into the City sewer system via a new connection in Rockwood Road.

7. Water utilities would include connection to the City of Escondido water system, pumps to boost water to an on-site 80 foot diameter water tank, and an internal water distribution system that would use both pumps, reducing stations, and gravity feed.

8. A storm water system that includes hydro-modification management practices including the use of bio filters and the use of both retention and detention basins.

9. A multi-modal transportation system that emphasizes the integration of vehicular, bicycle and pedestrian traffic throughout the project.

10. Various off-site improvements including the following:

- Reconstruction and improvements to Rockwood Road's intersection with the proposed SHR Road;
- Improvements along Rockwood Road between Cloverdale Road and San Pasqual Union School to enhance the school's student pick up and drop off locations;
- Intersection of Rockwood Road/Cloverdale Road. Install traffic signal and restripe westbound approach to provide one left-turn and one shared left-turn lane.

Restripe southbound Cloverdale Road to provide an additional receiving lane from Rockwood Road left turning movements;

- Restripe Rockwood Road between Cloverdale and San Pasqual Union School to provide additional westbound lane;
- Intersection of San Pasqual Valley Road (SR 78)/Citrus Avenue. Install new signal and restripe southbound approach to provide one left hand and one right hand turn lane;
- Intersection of San Pasqual Valley Road (SR 78)/Cloverdale Road San Pasqual Road. Widen eastbound approach of San Pasqual Valley road to provide dual left turn lanes. Widen northbound section of Cloverdale Road north of the intersection to provide approximate 650 foot long plus a 150-foot transition lane;
- Segment of Felicita Road/17th Avenue from Escondido Boulevard to San Pasqual Valley Road (SR 78). Stripe a new eastbound turn pocket at Lendee Drive and extend the two-way left turn lane eastward to the City of Escondido/San Diego County boundary;
- Two gated emergency access roads: a 2.4 mile road to the northwest connecting to Stonebridge Road and a one mile road to the south connecting to Zoo Road;

- Gas, electric, cable, and phone system connections at Rockwood Road to existing infrastructure operated by San Diego Gas and Electric, Times Warner Cable, and AT&T;
- Improvements to the Eagle Crest Golf Course including replacing the existing temporary clubhouse with a new 4,000 square foot permanent clubhouse with restaurant, reconstruction of hole #14, extension of SHR Road and miscellaneous other golf course improvements (all by separate permit).

Seven phases of development are proposed, corresponding to the seven neighborhoods being created. Public facilities and services and phase development would be coordinated so that services are available and ready to serve the residences as need arises.

COURT OF APPEAL, FOURTH APPELLATE DISTRICT

DIVISION ONE

STATE OF CALIFORNIA

CLEVELAND NATIONAL FOREST FOUNDATION et al., Plaintiffs and Appellants, v. SAN DIEGO ASSOCIATION OF GOVERNMENTS et al., Defendants and Appellants; THE PEOPLE, Intervenor and Appellant.	D063288 (Super. Ct. No. 37-2011-00101593- CU-TT-CTL)
CREED-21 et al., Plaintiffs and Appellants, v. SAN DIEGO ASSOCIATION OF GOVERNMENTS et al., Defendants and Appellants; THE PEOPLE, Intervenor and Appellant.	(Super. Ct. No. 37-2011-00101660- CU-TT-CTL) ORDER MODIFYING OPINION AND DENYING REHEARING NO CHANGE IN JUDGMENT

THE COURT:

It is ordered that the majority opinion filed on November 24, 2014, be modified as follows:

1. On page 18, line 2 of footnote 8, after the words "explained the Guideline," the words "which supplanted any earlier, informal technical advice from the Governor's Office of Planning and Research" are added." Footnote 8 now reads:

Indeed, in its statement of reasons for adopting the Guideline, the Natural Resources Agency explained the Guideline, which supplanted any earlier, informal technical advice from the Governor's Office of Planning and Research, "reflects the existing CEQA principle that there is no iron-clad definition of 'significance.' [Citations.] Accordingly, lead agencies must use their best efforts to investigate and disclose all that they reasonably can regarding a project's potential adverse impacts." (California Natural Resources Agency, Final Statement of Reasons for Regulatory Action (Dec. 2009) p. 20 < http://resources.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf > (as of Nov. 21, 2014).)

Justice Benke's dissenting opinion, filed November 24, 2014, is modified as follows:

1. On page 8, in the last sentence of the first full paragraph, the words "should be a" are deleted and the word "is" is added following the word "determination." The sentence shall now read:

To the extent thresholds of significance *other* than the three expressly provided in subdivision (b) apply, that determination is made by an agency in the proper exercise of its discretion.

2. On page 8, after the first full paragraph ending with the words "exercise of its discretion," the following paragraph is added:

In its petition for rehearing, SANDAG contends that the Natural Resources Agency (NRA) has specifically forgone any recommendation for use of the Executive Order as a CEQA standard in Guidelines section 15064.4, which SANDAG notes was specifically developed at the direction of the Legislature to guide analysis of GHG impacts. (Petn. for reh., pp. 4-5.) The history of Guidelines section 15064.4 is significant. Following issuance of the Executive Order, in June of 2008, the Governor's Office of Planning and Research (OPR) issued a detailed 20-page technical advisory (<<http://opr.ca.gov/ceqa/pdfs/june08-ceqa.pdf>> [as of Dec. 2014]; hereafter Advisory.) Noting that many public agencies were striving to determine the appropriate means by which to evaluate and mitigate the impacts of proposed projects on climate change, the Advisory set forth directions and step-by-step guidance aimed at assisting practitioners and lead agencies. The Advisory expressly recognizes that the most difficult part of climate change analysis is the determination of significance. (Advisory, p. 4.) The Governor's office thus stated, "To this end, OPR has asked [C]ARB technical staff to recommend a method for setting thresholds which will

encourage consistency and uniformity in the CEQA analysis of GHG emissions throughout the state. Until such time as state guidance is available on thresholds of significance for GHG emissions, we recommend the following approach to your CEQA analysis." (Advisory, pp. 4, 8-9.) In its "Recommended Approach," the Advisory is clear: It is *lead agencies* that are charged with selecting and implementing significance thresholds. (Advisory pp. 5-7.) Important to our purposes, in the selecting and implementing of significance thresholds, the Advisory gives no authority to the courts and claims no such power for the Governor. At the conclusion of the Advisory, the Governor's office states its intent is to deliver a package of CEQA Guidelines amendments to the Resources Agency by July 1, 2009. (Advisory, p. 9.) As a result of the Advisory, in March of 2010, Guidelines section 15064.4 was passed. It fully implements the intent and language of the Advisory, which nullifies my colleagues' expansive interpretation of the Executive Order.

3. On page 8, in the paragraph beginning with "It is apparent," the words "history and" are added to the second sentence, so that it now reads:

Despite the clear history and language of Guidelines section 15064.4, subdivision (b) and the obvious intent of that section, the majority asserts a right to determine that a gubernatorial policy statement, which does not qualify as a threshold of significance, is to be included among the "other factors" and then *orders* SANDAG on remand to develop an undefined "consistency analysis" between the lead agency's plan and the policy statement.

4. On page 14, in the second sentence of the first full paragraph, the words "Office of Planning and Research (OPR)" are replaced with "OPR" and the words "Natural Resources Agency (NRA)" are replaced with "NRA," so that the sentence now reads:

SB 97 directed the OPR to prepare and submit to the NRA "guidelines for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions . . . including, but not limited to, effects associated with transportation or energy consumption."

There is no change in the judgment.

San Diego Association of Governments et al.'s petition for rehearing is denied.

McConnell, P. J.

INTRODUCTION

After the San Diego Association of Governments (SANDAG) certified an environmental impact report (EIR) for its 2050 Regional Transportation Plan/Sustainable Communities Strategy (transportation plan), CREED-21 and Affordable Housing Coalition of San Diego filed a petition for writ of mandate challenging the EIR's adequacy under the California Environmental Quality Act (CEQA) (Pub. Resources Code, § 21000 et seq.).¹ Cleveland National Forest Foundation and the Center for Biological Diversity filed a similar petition, in which Sierra Club and the People later joined.

The superior court granted the petitions in part, finding the EIR failed to carry out its role as an informational document because it did not analyze the inconsistency

¹ Further statutory references are also to the Public Resources Code unless otherwise stated.

between the state's policy goals reflected in Executive Order S-3-05 (Executive Order) and the transportation plan's greenhouse gas emissions impacts after 2020. The court also found the EIR failed to adequately address mitigation measures for the transportation plan's greenhouse gas emissions impacts. Given these findings, the court declined to decide any of the other challenges raised in the petitions.

SANDAG appeals, contending the EIR complied with CEQA in both respects. Cleveland National Forest Foundation and Sierra Club (collectively, Cleveland) cross-appeal, contending the EIR further violated CEQA by failing to analyze a reasonable range of project alternatives, failing to adequately analyze and mitigate the transportation plan's air quality impacts, and understating the transportation plan's impacts on agricultural lands. The People separately cross-appeal, contending the EIR further violated CEQA by failing to adequately analyze and mitigate the transportation plan's impacts from particulate matter pollution. We conclude the EIR failed to comply with CEQA in all identified respects. We, therefore, modify the judgment to incorporate our decision on the cross-appeals and affirm. In doing so, we are upholding the right of the public and our public officials to be well informed about the potential environmental consequences of their planning decisions, which CEQA requires and the public deserves, before approving long-term plans that may have irreversible environmental impacts.

DISCUSSION

I

A

General Role of an EIR

"The Legislature has made clear that an EIR is 'an informational document' and that '[t]he purpose of an environmental impact report is to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment; to list ways in which the significant effects of such a project might be minimized; and to indicate alternatives to such a project.' " (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 391 (*Laurel Heights*); Guidelines, § 15002.)² "The EIR is the primary means of achieving . . . the policy of this state to 'take all action necessary to protect, rehabilitate, and enhance the environmental quality of the state.' [Citation.] The EIR is therefore 'the heart of CEQA.' [Citations.] An EIR is an 'environmental "alarm bell" whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return.' [Citations.] The EIR is also intended 'to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action.' [Citations.] Because the EIR must

² All references to Guidelines are to the CEQA Guidelines, which are located in title 14 of the California Code of Regulations beginning at section 15000. "In interpreting CEQA, we accord the Guidelines great weight except where they are clearly unauthorized or erroneous." (*Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 448, fn. 4 (*Smart Rail*).

be certified or rejected by public officials, it is a document of accountability. If CEQA is scrupulously followed, the public will know the basis on which its responsible officials either approve or reject environmentally significant action, and the public, being duly informed, can respond accordingly to action with which it disagrees. [Citations.] The EIR process protects not only the environment but also informed self-government."

(Laurel Heights, supra, 47 Cal.3d at p. 392.)

B

Role of a Program EIR

The EIR at issue in this case is a program EIR. A "program EIR" is "an EIR which may be prepared on a series of actions that can be characterized as one large project" and are related in specified ways. (Guidelines, § 15168, subd. (a); *Town of Atherton v. California High-Speed Rail Authority* (2014) 228 Cal.App.4th 314, 343 (*Atherton*)). The use of a program EIR can: "(1) Provide an occasion for a more exhaustive consideration of effects and alternatives than would be practical in an EIR on an individual action, [¶] (2) Ensure consideration of cumulative impacts that might be slighted in a case-by-case analysis, [¶] (3) Avoid duplicative reconsideration of basic policy considerations, [¶] (4) Allow the lead agency to consider broad policy alternatives and program wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts, [and] [¶] (5) Allow reduction in paperwork." (Guidelines, § 15168, subd. (b); *Atherton, supra*, at pp. 343-344.)

"[W]here an agency prepares a 'program EIR' for a broad policy document . . . , Guidelines section 15168, subdivision (c)(2) allows agencies to limit future environmental review for later activities that are found to be 'within the scope' of the program EIR." (*Latinos Unidos de Napa v. City of Napa* (2013) 221 Cal.App.4th 192, 196; accord, *Citizens Against Airport Pollution v. City of San Jose* (2014) 227 Cal.App.4th 788, 801-802.) Further environmental review for such activities is required only where "(a) Substantial changes are proposed in the project which will require major revisions of the [EIR]. [¶] (b) Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the [EIR]. [¶] (c) New information, which was not known or could not have been known at the time the [EIR] was certified as complete, becomes available." (§ 21166; *May v. City of Milpitas* (2013) 217 Cal.App.4th 1307, 1325-1326; accord, *Citizens Against Airport Pollution v. City of San Jose, supra*, at p. 802.)

Because of these limitations, once an EIR is finally approved, a court generally cannot compel an agency to perform further environmental review for any known or knowable information about the project's impacts omitted from the EIR. (*Citizens Against Airport Pollution v. City of San Jose, supra*, 227 Cal.App.4th at pp. 807-808; *Citizens for Responsible Equitable Environmental Development v. City of San Diego* (2011) 196 Cal.App.4th 515, 531-532.) A court also generally cannot compel an agency to perform further environmental review if new regulations or guidelines for evaluating the project's impacts are adopted in the future. (*Concerned Dublin Citizens v. City of*

Dublin (2013) 214 Cal.App.4th 1301, 1320; *Fort Mojave Indian Tribe v. Department of Health Services* (1995) 38 Cal.App.4th 1574, 1605.)

Hence, "[d]esignating an EIR as a program EIR . . . does not by itself decrease the level of analysis otherwise required in the EIR. 'All EIR's must cover the same general content. [Citations.] The level of specificity of an EIR is determined by the nature of the project and the "rule of reason" [citation], rather than any semantic label accorded to the EIR.' " (*Friends of Mammoth v. Town of Mammoth Lakes Redevelopment Agency* (2000) 82 Cal.App.4th 511, 533.) Consequently, in considering a challenge to a program EIR, "it is unconstructive to ask whether the EIR provided 'project-level' as opposed to 'program-level' detail and analysis. Instead, we focus on whether the EIR provided 'decision makers with sufficient analysis to intelligently consider the environmental consequences of [the] project.' " (*Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, 1052.)

*Standard of Review in CEQA Cases*³

"[I]n a CEQA case, as in other mandamus cases, [our review] is the same as the trial court's: [we review] the agency's action, not the trial court's decision; in that sense [our review] is de novo. (*Vineyard, supra*, 40 Cal.4th at p. 427.) However, our inquiry extends " 'only to whether there was a prejudicial abuse of discretion.' ([§ 21168.5].)" (*Vineyard*, at p. 426.)

"[A]n agency may abuse its discretion under CEQA either by failing to proceed in the manner CEQA provides or by reaching factual conclusions unsupported by substantial evidence. (§ 21168.5.) Judicial review of these two types of error differs significantly: While we determine de novo whether the agency has employed the correct procedures, 'scrupulously enforc[ing] all legislatively mandated CEQA requirements' [citation], we accord greater deference to the agency's substantive factual conclusions." (*Vineyard, supra*, 40 Cal.4th at p. 435.) "In evaluating an EIR for CEQA compliance, then, [we] must adjust [our] scrutiny to the nature of the alleged defect, depending on whether the claim is predominantly one of improper procedure or a dispute over the facts.

³ The California Supreme Court is currently reviewing the standard and scope of judicial review under CEQA. (*Sierra Club v. County of Fresno* (2014) 226 Cal.App.4th 704 [172 Cal.Rptr.3d 271], review granted Oct. 1, 2014, S219783.) Pending further guidance, we endeavor to apply the review dichotomy most recently articulated by the Supreme Court. (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 426-427, 435 (*Vineyard*); accord, *Save Tara v. City of West Hollywood* (2008) 45 Cal.4th 116, 131; *In re Bay-Delta etc.* (2008) 43 Cal.4th 1143, 1161-1162 (*Bay-Delta*); *Ebbetts Pass Forest Watch v. California Dept. of Forestry & Fire Protection* (2008) 43 Cal.4th 936, 944.)

For example, where an agency failed to require an applicant to provide certain information mandated by CEQA and to include that information in its environmental analysis, . . . the agency 'failed to proceed in the manner prescribed by CEQA.' [Citations.] In contrast, in a factual dispute over 'whether adverse effects have been mitigated or could be better mitigated' [citation], the agency's conclusion would be reviewed only for substantial evidence." (*Ibid.*)

II

Appeal

A

Background

1

In 2005 then Governor Arnold Schwarzenegger issued the Executive Order establishing greenhouse gas emissions reduction targets for California. Specifically, the Executive Order required reduction of greenhouse gas emissions to 2000 levels by 2010, to 1990 levels by 2020, and to 80 percent below 1990 levels by 2050.⁴

⁴ "[A]n executive order is generally regarded as 'a formal written directive of the Governor.'" (75 Ops.Cal.Atty.Gen. 263 (1992).) The Executive Order provided in relevant part: "I, ARNOLD SCHWARZENEGGER, Governor of the State of California, by virtue of the power invested in me by the Constitution and statutes of the State of California, do hereby order effective immediately That the following greenhouse gas emission reduction targets are hereby established for California: by 2010, reduce [greenhouse gas] emissions to 2000 levels; by 2020, reduce [greenhouse gas] emissions to 1990 levels; by 2050, reduce [greenhouse gas] emissions to 80 percent below 1990 levels" (<http://gov.ca.gov/news.php?id=1861> [as of Nov. 21, 2014].)

The Legislature subsequently enacted the California Global Warming Solutions Act of 2006 (Health & Saf. Code, § 38500 et seq.), referred to by the parties as Assembly Bill No. 32 (AB 32). Among its provisions, AB 32 tasked the California Air Resources Board (CARB) with determining the state's 1990 greenhouse gas emissions level and approving an equivalent emissions level to be achieved by 2020. (Health & Saf. Code, § 38550.)

The Legislature intended for the emissions limit to "continue in existence and be used to maintain and continue reductions in emissions of greenhouse gases beyond 2020." (Health & Saf. Code, § 38551, subd. (b).) The Legislature also intended for the emissions limit to work in concert with other environmental protection laws, expressly stating AB 32 does not "relieve any person, entity, or public agency of compliance with other applicable federal, state, or local laws or regulations, including state air and water quality requirements, and other requirements for protecting public health or the environment." (Health & Saf. Code, § 38592, subd. (b).) The Legislature further intended for "the Climate Action Team established by the Governor to coordinate the efforts set forth under [the Executive Order] continue its role in coordinating overall climate policy." (Health & Saf. Code, § 38501, subd. (i).) Thus, the Legislature, through AB 32, effectively endorsed the Executive Order and its overarching goal of ongoing greenhouse gas emissions reductions as state climate policy. (See, e.g., *Professional Engineers in California Government v. Schwarzenegger* (2010) 50 Cal.4th 989, 1000, 1043-1044, 1051 [subsequent legislative endorsement operates to ratify and validate provisions in Executive Order].)

Bolstering this conclusion, the Legislature also enacted the Sustainable Communities and Climate Protection Act of 2008 (Stats. 2008, ch. 728; Stats. 2009, ch. 354, § 5), referred to by the parties as Senate Bill No. 375 (SB 375). In enacting SB 375, the Legislature found automobiles and light trucks are responsible for 30 percent of the state's greenhouse gas emissions. (Stats. 2008, ch. 728, § 1, subd. (a).) Accordingly, SB 375 directed CARB to develop regional greenhouse gas emission reduction targets for automobiles and light trucks for 2020 and 2035. (Gov. Code, § 65080, subd. (b)(2)(A).) The targets established by CARB for the San Diego region require a 7 percent per capita reduction in carbon dioxide emissions by 2020 and a 13 percent per capita reduction by 2035 (compared to a 2005 baseline).⁵ CARB must update these targets every eight years until 2050, and may update the targets every four years based on changing factors. (Gov. Code, § 65080, subd. (b)(2)(A)(iv).)

2

The transportation plan, which SANDAG must prepare every four years (23 U.S.C. § 134, subd. (c); Gov. Code, § 65080, subs. (a) & (d)), "serves as the long-range plan designed to coordinate and manage future regional transportation improvements, services, and programs among the various agencies operating within the San Diego region." In enacting SB 375, the Legislature found the state's emissions reductions goals cannot be met without improved land use and transportation policy. Consequently, SB 375 (Gov. Code, § 65080, subd. (b)(2)(B)) mandates the transportation

⁵ The transportation plan meets these limited scope targets (see part II.C.1, *post*).

plan include a sustainable communities strategy to, as the EIR states, "guide the San Diego region toward a more sustainable future by integrating land use, housing, and transportation planning to create more sustainable, walkable, transit-oriented, compact development patterns and communities that meet [CARB's greenhouse gas] emissions targets for passenger cars and light-duty trucks." Once the sustainable communities strategy is approved, some transit priority projects consistent with the strategy are exempt from CEQA requirements. Other transit priority projects, residential projects, and mixed-use projects consistent with the strategy are subject to streamlined CEQA requirements. (§§ 21155-21155.4, 21159.28; Guidelines, § 15183.3.)

B

Greenhouse Gas Emissions Impacts Analysis

The EIR acknowledged the transportation plan's implementation would lead to an overall increase in greenhouse gas emissions levels; however, the EIR did not analyze whether this consequence conflicted with the Executive Order, or would impair or impede the achievement of the Executive Order's goals. As it did in the EIR and below, SANDAG contends on appeal its decision to omit an analysis of the transportation plan's consistency with the Executive Order (consistency analysis) did not violate CEQA because CEQA does not require such a consistency analysis. Whether the EIR's analysis complies with CEQA depends on whether the analysis reflects a reasonable, good faith effort to disclose and evaluate the transportation plan's greenhouse gas emissions impacts. We review the sufficiency of the analysis in light of what is reasonably foreseeable. (Guidelines, § 15151; *City of Maywood v. Los Angeles Unified School Dist.*

(2012) 208 Cal.App.4th 362, 386 (*City of Maywood*); *City of Long Beach v. Los Angeles Unified School Dist.* (2009) 176 Cal.App.4th 889, 897-898 (*City of Long Beach*.) As the focus of SANDAG's contention is whether the EIR's analysis was reasonable and not whether the EIR violated a specific statute or regulation, the contention presents a predominately factual question and our review is for substantial evidence. (*Vineyard, supra*, 40 Cal.4th at p. 435.)

Substantial evidence for CEQA purposes is "enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached." (Guidelines, § 15384, subd. (a).) Substantial evidence includes "facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts." (*Id.*, subd. (b).) It does not include argument, speculation, unsubstantiated opinion or narrative, clearly erroneous or inaccurate evidence, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment. (*Id.*, subd. (a).)

"In reviewing for substantial evidence, [we] 'may not set aside an agency's approval of an EIR on the ground that an opposite conclusion would have been equally or more reasonable,' for, on factual questions, our task 'is not to weigh conflicting evidence and determine who has the better argument.' " (*Vineyard, supra*, 40 Cal.4th at p. 435; *Laurel Heights, supra*, 47 Cal.3d at p. 393.) Rather, we must resolve any reasonable doubts and any conflicts in the evidence in favor of the agency's findings and decision. (*Laurel Heights*, at p. 393; *Citizens for Responsible Equitable Environmental Development v. City of San Diego, supra*, 196 Cal.App.4th at pp. 522-523.)

In this case, SANDAG's decision to omit an analysis of the transportation plan's consistency with the Executive Order did not reflect a reasonable, good faith effort at full disclosure and is not supported by substantial evidence because SANDAG's decision ignored the Executive Order's role in shaping state climate policy. The Executive Order underpins all of the state's current efforts to reduce greenhouse gas emissions. As SANDAG itself noted in its Climate Action Strategy, the Executive Order's 2050 emissions reduction goal "is based on the scientifically-supported level of emissions reduction needed to avoid significant disruption of the climate and *is used as the long-term driver for state climate change policy development.*" (Italics added.)

Indeed, the Executive Order led directly to the enactment of AB 32, which validated and ratified the Executive Order's overarching goal of ongoing emissions reductions, recognized the Governor's Climate Action Team as the coordinator of the state's overall climate policy, and tasked CARB with establishing overall emissions reduction targets for 2020 and beyond. The Executive Order also led directly to the enactment of SB 375, which tasked CARB with establishing regional automobile and light truck emissions reduction targets for 2020 and 2035. CARB is required to revisit these targets every eight years through 2050, or sooner if warranted by changing circumstances. (Gov. Code, § 65080, subd. (b)(2)(A)(iv).) Thus, the Executive Order, with the Legislature's unqualified endorsement, will continue to underpin the state's efforts to reduce greenhouse gas emissions throughout the life of the transportation plan. The EIR's failure to analyze the transportation plan's consistency with the Executive Order, or more particularly with the Executive Order's overarching goal of ongoing

greenhouse gas emissions reductions, was therefore a failure to analyze the transportation plan's consistency with state climate policy. As evidence in the record indicates the transportation plan would actually be inconsistent with state climate policy over the long term, the omission deprived the public and decision makers of relevant information about the transportation plan's environmental consequences. The omission was prejudicial because it precluded informed decisionmaking and public participation. (*Smart Rail, supra*, 57 Cal.4th at p. 463; *City of Long Beach, supra*, 176 Cal.App.4th at p. 898.)

SANDAG contends the EIR cannot analyze the transportation plan's consistency with the Executive Order because there is no statute or regulation translating the Executive Order's goals into comparable, scientifically based emissions reduction targets. However, we do not agree the lack of such targets precludes the EIR from performing a meaningful consistency analysis in this instance. "Drafting an EIR . . . necessarily involves some degree of forecasting. While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can." (Guidelines, § 15144.) Although SANDAG may not know precisely what future emissions reduction targets the transportation plan will be required to meet, it knows from the information in its own Climate Action Strategy the theoretical emissions reduction targets necessary for the region to meet its share of the Executive Order's goals. It also knows state climate policy, as reflected in the Executive Order and AB 32, requires a continual *decrease* in the state's greenhouse gas emissions and the transportation plan after 2020 produces a continual *increase* in greenhouse gas emissions. With this knowledge, SANDAG could have reasonably analyzed whether the

transportation plan was consistent with, or whether it would impair or impede, state climate policy.⁶

SANDAG's attempts to disavow its responsibility for performing this analysis are unavailing. The Legislature specifically found reducing greenhouse gas emissions cannot be accomplished without improved land use and transportation policy. Accordingly, the transportation plan plays both a necessary and important role in achieving state climate policy. By failing to adequately inform the public and decision makers the transportation plan is inconsistent with state climate policy, the EIR deterred the decision makers from devising and considering changes to favorably alter the trajectory of the transportation plan's post-2020 greenhouse gas emissions. When the decision makers are inevitably faced with post-2020 requirements aligned with state climate policy, their task of complying with these requirements will be more difficult and some opportunities for compliance may be lost. As SANDAG explained in its Climate Action Strategy, "Once in place, land use patterns and transportation infrastructure typically remain part of the built environment and influence travel behavior and greenhouse gas emissions for several decades, perhaps longer." In this regard, the EIR falls far short of being "an

⁶ We do not intend to suggest the transportation plan must achieve the Executive Order's 2050 goal or any other specific numerical goal. Our concern is with the EIR's failure to recognize, much less analyze and attempt to mitigate, the conflict between the transportation plan's long-term greenhouse gas emissions increase and the state climate policy goal, reflected in the Executive Order, of long-term emissions reductions. In fact, the EIR does not even discuss the transportation plan's failure to maintain emissions reductions after 2020, which is AB 32's minimum expectation. (See Health & Saf. Code, § 38551, subd. (b).)

'environmental "alarm bell" whose purpose it is to alert the public and its responsible officials to environmental changes before they have reach ecological points of no return.' " (*Laurel Heights, supra*, 47 Cal.3d at p. 392.) It also falls far short of " 'demonstrat[ing] to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its actions.' " (*Ibid.*)

We are likewise unpersuaded by SANDAG's assertion the EIR's analysis of the transportation plan's greenhouse gas emissions impacts fully complies with CEQA because it utilized significance thresholds specified in Guidelines section 15064.4, subdivision (b).⁷ This Guideline states in relevant part: "A lead agency should consider the following factors, *among others*, when assessing the significance of impacts from greenhouse gas emissions on the environment: [¶] (1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting[.] [¶] (2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project. [¶] (3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution

⁷ "A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant." (Guidelines, § 15064.7.)

of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project."

(Guidelines, § 15064.4, subd. (b), italics added.)

Although this Guideline specifies three means of determining whether a project's greenhouse gas emissions impacts are significant, the "among others" qualifying language indicates these means are not exclusive.⁸ Moreover, "the fact that a particular environmental effect meets a particular threshold cannot be used as an automatic determinant that the effect is or is not significant . . . a threshold of significance cannot be applied in a way that would foreclose the consideration of other substantial evidence tending to show the environmental effect to which the threshold relates might be significant." (*Protect The Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1109 (*Amador*)). Consequently, the use of the Guideline's thresholds does not necessarily equate to compliance with CEQA, particularly where, as here, the failure to consider the transportation plan's consistency with the state climate policy of ongoing emissions reductions reflected in the Executive Order frustrates the state climate policy and renders the EIR fundamentally misleading.

⁸ Indeed, in its statement of reasons for adopting the Guideline, the Natural Resources Agency explained the Guideline "reflects the existing CEQA principle that there is no iron-clad definition of 'significance.' [Citations.] Accordingly, lead agencies must use their best efforts to investigate and disclose all that they reasonably can regarding a project's potential adverse impacts." (California Natural Resources Agency, Final Statement of Reasons for Regulatory Action (Dec. 2009) p. 20 < http://resources.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf > (as of Nov. 21, 2014).)

We are also unpersuaded by SANDAG's assertion it was not required to analyze the transportation plan's consistency with the state climate policy reflected in the Executive Order because SANDAG has broad discretion to select the criteria it uses to determine the significance of the transportation plan's impacts. While we agree SANDAG has such discretion (*North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. of Directors* (2013) 216 Cal.App.4th 614, 624), SANDAG abuses its discretion if it exercises it in a manner that causes an EIR's analysis to be misleading or without informational value. (See *Smart Rail, supra*, 57 Cal.4th at pp. 445, 457.) "A lead agency cannot avoid finding a potentially significant effect on the environment by rotely applying standards of significance that do not address that potential effect." (*Rominger v. County of Colusa* (2014) 229 Cal.App.4th 690, 717, citing *Amador, supra*, 116 Cal.App.4th at p. 1111.)

By disregarding the Executive Order's overarching goal of ongoing emissions reductions, the EIR's analysis of the transportation plan's greenhouse gas emissions makes it falsely appear as if the transportation plan is furthering state climate policy when, in fact, the trajectory of the transportation plan's post-2020 emissions directly contravenes it. "[O]mitting material necessary to informed decisionmaking and informed public participation" subverts the purposes of CEQA and "precludes both identification of potential environmental consequences arising from the project and also thoughtful analysis of the sufficiency of measures to mitigate those consequences." (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 658.) Such an omission is particularly troubling where, as here, the project under review involves long-term,

planned expenditures of billions of taxpayer dollars. No one can reasonably suggest it would be prudent to go forward with planned expenditures of this magnitude before the public and decision makers have been provided with all reasonably available information bearing on the project's impacts to the health, safety, and welfare of the region's inhabitants. We, therefore, conclude SANDAG prejudicially abused its discretion by omitting from the EIR an analysis of the transportation plan's consistency with the state climate policy, reflected in the Executive Order, of continual greenhouse gas emissions reductions.⁹

C

Mitigation of Greenhouse Gas Emissions Impacts

1

Although the EIR did not analyze the transportation plan's consistency with the state climate policy reflected in the Executive Order, the EIR nevertheless, analyzed the transportation plan's greenhouse gas emissions impacts against three significance thresholds for each of the planning years 2020, 2035, and 2050. Under the first

⁹ Our decision will not necessarily stop any project encompassed within the transportation plan. (See *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 286-289.) Our decision also will not procedurally or substantively expand CEQA requirements in violation of section 21083.1 because the EIR is required to analyze the transportation plan's potential "to degrade the quality of the environment, curtail the range of the environment, *or to achieve short-term, to the disadvantage of long-term, environmental goals.*" (§ 21083, subd. (b)(1), italics added; Guidelines, § 15065, subd. (a)(2), (c).) Rather, our decision is consistent with the intent CEQA "be interpreted to afford the fullest possible protection to the environment within the reasonable scope of the statutory language. (Guidelines, § 15003, subd. (f).)

threshold, the EIR posited the transportation plan's impacts would be significant if the transportation plan's implementation were to increase greenhouse gas emissions compared to existing, or 2010, conditions. Under the second threshold, the EIR posited the transportation plan's impacts would be significant if the transportation plan's implementation conflicted with CARB's regional automobile and light truck emissions reductions targets. Under the third threshold, the EIR stated the transportation plan's impacts would be significant if the transportation plan's implementation conflicted with either CARB's Climate Change Scoping Plan (Scoping Plan) or SANDAG's own Climate Action Strategy.¹⁰

The EIR concluded the transportation plan's greenhouse gas emissions impacts would be significant under the first significance threshold for the 2035 and 2050 planning years because the emissions would be higher in those planning years than in 2010. The EIR concluded the greenhouse gas emissions impacts would be less than significant in all other respects analyzed.¹¹

¹⁰ The Scoping Plan is CARB's roadmap for achieving greenhouse gas emissions reductions. The Climate Action Strategy is SANDAG's guide for addressing climate change. The Climate Action Strategy emphasizes the areas where the greatest impact can be made at the local level, including transportation infrastructure.

¹¹ The People and Cleveland have not challenged these conclusions and their propriety is not before us. Nonetheless, regarding the third significance threshold, we note the Climate Action Strategy expresses far stronger views than the transportation plan on the steps necessary to achieve the state's long-term greenhouse gas emissions reductions goals. For example, the Climate Action Strategy maintains achieving the goals "will require fundamental changes in policy, technology, and behavior" and "[b]y 2030, the region must have met and gone below the 1990 [emissions] level and be well on its way to doing its share for achieving the 2050 greenhouse gas reduction level."

To mitigate the significant greenhouse gas emissions impacts found under the first threshold, the EIR identified three mitigation measures it deemed feasible.¹² The first mitigation measure required SANDAG to update its future regional comprehensive plans, regional transportation plans, and sustainable communities plans to incorporate policies and measures leading to reduced greenhouse gas emissions. The second mitigation measure encouraged the San Diego region cities and the County of San Diego (County) to adopt and implement climate action plans for reducing greenhouse gas emissions to a level the particular city or the County determined would not be cumulatively considerable. The second mitigation measure also identified various provisions the plans should include and stated SANDAG would assist in the preparation of the plans and other climate strategies through the continued implementation of its own Climate Action Strategy and Energy Roadmap Program.¹³ The third mitigation measure stated SANDAG would and other agencies should require the use of best available control technology to reduce greenhouse gas emissions during the construction and operation of projects.

¹² " 'Feasible' means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." (Guidelines, § 15364.)

¹³ According to the record, the Energy Roadmap Program "identifies energy-saving measures that can be integrated into local planning and permitting processes, ordinances, outreach and education efforts, and municipal operations."

According to the EIR, these mitigation measures encourage reduction in greenhouse gas emissions, but they do not provide a mechanism guaranteeing such reductions. Consequently, the EIR concluded the significant impacts found under the first threshold would remain significant and unavoidable.

The EIR also considered and rejected three other mitigation measures deemed infeasible. These mitigation measures were: (1) requiring all vehicles driven within the region to be zero-emission vehicles or to be powered by renewable energy; (2) requiring all future construction to be net-zero energy use; and (3) requiring all future construction activity to include only equipment retrofitted to significantly reduce greenhouse gas emissions.

3

SANDAG contends the EIR adequately addressed mitigation for the transportation plan's significant greenhouse gas emissions impacts. Given our conclusion in part II.B, *ante*, this challenge is at least partially moot as the additional analysis necessary to properly address the transportation plan's consistency with the state climate policy reflected in the Executive Order will likely require revisions to related sections of the EIR, including the EIR's discussion of mitigation measures. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 91 [once a lead agency recognizes an impact is significant, the agency must describe, evaluate, and adopt

feasible mitigation measures to mitigate or avoid the impact].)¹⁴ We, nonetheless, briefly address SANDAG's contention. As this contention is predominately factual, our review is for substantial evidence. (*Vineyard, supra*, 40 Cal.4th at p. 435.)

a

"The core of an EIR is the mitigation and alternatives sections." (*Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564; *Watsonville Pilots Assn. v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1089.) "Section 21002 requires agencies to adopt feasible mitigation measures to substantially lessen or avoid otherwise significant adverse environmental impacts. [¶] The CEQA guidelines state that to be legally adequate mitigation measures must be capable of: '(a) Avoiding the impact altogether by not taking a certain action or parts of an action. (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation. (c) Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment. (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.' [Citation.]

"For each significant effect, the EIR must identify specific mitigation measures; where several potential mitigation measures are available, each should be discussed separately, and the reasons for choosing one over the others should be stated. If the

¹⁴ We do not express any view on precisely how SANDAG must remedy the analytical deficiencies identified in this opinion as we recognize a court may direct SANDAG to comply with CEQA, but a court may not direct SANDAG to exercise its discretion in a particular fashion or to produce a particular result. (§ 21168.9, subd. (c); *Schellinger Brothers v. City of Sebastopol* (2009) 179 Cal.App.4th 1245, 1266.)

inclusion of a mitigation measure would itself create new significant effects, these too, must be discussed, though in less detail than required for those caused by the project itself." (*Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1027.)

For significant greenhouse gas emissions effects, feasible mitigation measures may include: "(1) Measures in an existing plan or mitigation program for the reduction of emissions that are required as part of the lead agency's decision; [¶] (2) Reductions in emissions resulting from a project through implementation of project features, project design, or other measures . . . ; [¶] (3) Off-site measures, including offsets that are not otherwise required, to mitigate a project's emissions; [¶] (4) Measures that sequester greenhouse gases; [¶] [and] (5) In the case of the adoption of a plan, such as a general plan, long range development plan, or plans for the reduction of greenhouse gas emissions, mitigation may include the identification of specific measures that may be implemented on a project-by-project basis. Mitigation may also include the incorporation of specific measures or policies found in an adopted ordinance or regulation that reduces the cumulative effect of emissions." (Guidelines, § 15126.4, subd. (c).)

b

At one extreme, the EIR in this case considered and deemed feasible three measures requiring little to no effort to implement and assuring little to no concrete steps toward emissions reduction. In addition, according to the EIR, many of the suggestions contained in these measures have already been incorporated into the transportation plan and, by implication, the transportation plan's emissions estimates. "A 'mitigation measure' is a suggestion or change that would reduce or minimize significant adverse

impacts on the environment caused by the project as proposed." (*Lincoln Place Tenants Association v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 445.) A mitigation measure is not part of the project. (*Lotus v. Department of Transportation, supra*, 223 Cal.App.4th at p. 656 & fn. 8.) Thus, it is questionable whether these measures even qualify as mitigation measures.

At the other extreme, the EIR considered and deemed infeasible three particularly onerous measures. Each of the measures would be difficult, if not impossible, to enforce and each requires implementation resources not readily available. Unrealistic mitigation measures, similar to unrealistic project alternatives, do not contribute to a useful CEQA analysis. (See *Watsonville Pilots Assn. v. City of Watsonville, supra*, 183 Cal.App.4th at p. 1089; 1 Kostka & Zischke, Practice Under the Cal. Environmental Quality Act (Cont.Ed.Bar 2014) § 15.10, pp. 15-16.) As none of these measures had any probability of implementation, their inclusion in the EIR was illusory.

Missing from the EIR is what CEQA requires: a discussion of mitigation alternatives that could both substantially lessen the transportation plan's significant greenhouse gas emissions impacts and feasibly be implemented. (*Lincoln Place Tenants Association v. City of Los Angeles, supra*, 155 Cal.App.4th at p. 445.) A few examples of potential alternatives identified in the Climate Action Strategy include: supporting the planning and development of smart growth areas through transportation investments and other funding decisions; offering incentives for transit-oriented developments in smart growth areas; coordinating the funding of low carbon transportation with smart growth development; and encouraging parking management measures that promote walking and

transit use in smart growth areas. Given the absence of any discussion of such mitigation alternatives, we conclude there is not substantial evidence to support SANDAG's determination the EIR adequately addressed mitigation for the transportation plan's greenhouse gas emissions impacts. The error is prejudicial because it precluded informed public participation and decisionmaking. (§ 21005, subd. (a); *City of Maywood, supra*, 208 Cal.App.4th at p. 386.)

III

Cross-Appeals

A

Forfeiture

The People's and Cleveland's pleadings and briefs below challenged many aspects of the EIR in addition to the EIR's analysis and mitigation of greenhouse gas emissions impacts. In its tentative ruling, the superior court acknowledged the other challenges, but determined it could resolve the case solely on the greenhouse gas emissions impacts analysis and mitigation issues and, consequently, it did not need to address the other challenges. The People and Cleveland through their cross-appeals now seek rulings from this court on many of the other challenges. SANDAG contends they forfeited these challenges by failing to attempt to obtain rulings on them below.

Even if SANDAG's contention were correct, the application of the forfeiture rule is not automatic and we may excuse forfeiture in cases presenting "an important legal issue." (*In re S.B.* (2004) 32 Cal.4th 1287, 1293.) We are persuaded the legal issues raised in the cross-appeals are sufficiently important we should exercise our discretion to

excuse any forfeiture. Moreover, we are mindful of the Legislature's intent "that any court, which finds, or, in the process of reviewing a previous court finding, finds, that a public agency has taken an action without compliance with [CEQA], shall specifically address each of the alleged grounds for noncompliance." (§ 21005, subd. (c).)

B

Project Alternatives

1

The EIR analyzed seven project alternatives. They were:

1. A no project alternative, which assumed the transportation plan would not be adopted and only transportation improvements under construction or development would be built (Alternative 1);
2. A modified funding strategy alternative, which deleted some highway improvements, delayed other highway improvements, added some transit projects, advanced other transit projects, and increased some transit service frequencies (Alternative 2a);
3. The same modified funding strategy alternative coupled with a modified "smart growth" land use pattern, which assumed added infill and redevelopment to increase residential development density in urban and town center areas and increased employment within job centers (Alternative 2b);
4. A transit emphasis alternative, which advanced the development of some transit projects, but did not add any new transit projects (Alternative 3a);

5. The same transit emphasis alternative, but assuming the modified smart growth land use pattern (Alternative 3b);
6. An alternative implementing the transportation plan's transportation network, but assuming the modified smart growth land use pattern (Alternative 4); and
7. A slow growth alternative, which assumed the application of regulations and/or economic disincentives to slow population and employment and delayed the complete implementation of the transportation plan by five years (Alternative 5).

2

Cleveland contends the EIR fails to comply with CEQA because the EIR did not analyze a reasonable range of project alternatives. As the focus of this contention is whether the analysis was reasonable and not whether it occurred, the contention presents a predominately factual question and our review is for substantial evidence. (*Vineyard, supra*, 40 Cal.4th at p. 435.)

"CEQA requires that an EIR, in addition to analyzing the environmental effects of a proposed project, also consider and analyze project alternatives that would reduce adverse environmental impacts. [Citations.] The [Guidelines] state that an EIR must 'describe a range of reasonable alternatives to the project . . . which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project' [Citation.] An EIR need not consider every conceivable alternative to a project or alternatives that are infeasible. [Citations.]

[¶] . . . [¶]

" 'There is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason.' [Citation.] The rule of reason 'requires the EIR to set forth only those alternatives necessary to permit a reasoned choice' and to 'examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the project.' [Citations.] An EIR does not have to consider alternatives 'whose effect cannot be reasonably ascertained and whose implementation is remote and speculative.' " (*Bay-Delta, supra*, 43 Cal.4th at p. 1163, fn. omitted.) A court will uphold the selection of project alternatives unless the challenger demonstrates " 'that the alternatives are manifestly unreasonable and that they do not contribute to a reasonable range of alternatives.' " (*California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 988.)

In this case, the EIR's discussion of project alternatives is deficient because it does not discuss an alternative which could significantly reduce total vehicle miles traveled. Although Alternatives 3a and 3b are labeled "transit emphasis" alternatives, the labeling is a misnomer. These alternatives mainly advance certain rapid bus projects, but leave the planned rail and trolley projects largely unchanged. In addition, these alternatives do not provide any new transit projects or significant service increases. In fact, the "transit emphasis" alternatives include fewer transit projects than some of the other non-"transit-emphasis" alternatives.

The omission of an alternative which could significantly reduce total vehicle miles traveled is inexplicable given SANDAG's acknowledgment in its Climate Action Strategy that the state's efforts to reduce greenhouse gas emissions from on-road

transportation will not succeed if the amount of driving, or vehicle miles traveled, is not significantly reduced. The Climate Action Strategy explained, "Lowering vehicle miles traveled means providing high-quality opportunities to make trips by alternative means to driving alone such as walking, bicycling, ridesharing, and public transit, and by shortening vehicle trips that are made. This can be accomplished through improved land use and transportation planning and related measures, policies and investments that increase the options people have when they travel." Accordingly, the Climate Action Strategy recommended policy measures to increase and prioritize funding and system investments for public transit and transit operations, increase the level of service on existing routes and provide new public transit service through expanded investments, and improve the performance of public transit with infrastructure upgrades. Given these recommendations, their purpose, and their source, it is reasonable to expect at least one project alternative to have been focused primarily on significantly reducing vehicle trips.

Instead, it appears the project alternatives focused primarily on congestion relief. The Climate Action Strategy provides evidentiary support for the consideration of congestion relief alternatives as it notes, "Eliminating or reducing congestion can lead to more efficient travel conditions for vehicles and greenhouse gas savings." However, the transportation plan is a long-term plan and congestion relief is not necessarily an effective long-term strategy. As the Climate Action Strategy explains, "Measures to relieve congestion also may induce additional vehicle travel during uncongested periods, particularly over the long-term, which can partially or fully offset the greenhouse gas reductions achieved in the short-term from congestion relief. Induced demand

(sometimes called the rebound effect) in transportation refers to the increase in travel that can occur when the level of service on a roadway or other facility improves. Travelers sometimes respond to faster travel times and decreased costs of travel by traveling more, resulting in increased vehicle miles traveled." (Fns. omitted.) Given the acknowledged long-term drawbacks of congestion relief alternatives, there is not substantial evidence to support the EIR's exclusion of an alternative focused primarily on significantly reducing vehicle trips. The error is prejudicial because it precluded informed public participation and decisionmaking. (§ 21005, subd. (a); *City of Maywood, supra*, 208 Cal.App.4th at p. 386.)

C

Air Quality Impacts

1

Eleven air quality monitoring stations throughout the region measure ambient air pollutant concentrations to determine whether the region's air quality meets federal and state standards. The region does not meet the state standards for emissions of respirable particulate matter with an aerodynamic resistance diameter of 10 micrometers or less (PM₁₀) and fine particulate matter with an aerodynamic resistance diameter of 2.5 micrometers or less (PM_{2.5}).¹⁵ The EIR forecasted the daily tonnage of on-road mobile emissions of PM₁₀ and PM_{2.5} from the transportation plan's transportation network

¹⁵ According to the EIR, "respirable" means the particulate matter can "avoid many of the human respiratory system defense mechanisms and enter deeply into the lung."

improvements would steadily and substantially increase from 2010 to 2050. The EIR did not forecast whether there would be any increase in these emissions from regional growth or land use changes associated with the transportation plan. Instead, the EIR indicated such forecasting would be done during the next tier of environmental review.

Five of the region's air quality monitoring stations also sample toxic air contaminants (TACs), which are contaminants known or suspected to cause cancer or serious health problems, but for which there are no federal or state ambient air quality standards. State law also requires facilities to report any emissions of TACs in order to quantify the amount released, the location of the release, the concentrations to which the public is exposed, and the resulting potential health risk. (Health & Saf. Code, § 44300 et seq.) In 2009, annual emissions of TACs in the region were estimated to be more than 64.9 million pounds.

According to the EIR, exposure to TACs can cause cancer and other serious health problems. This is especially true of exposure to diesel particulate matter, which is respirable (see fn. 15, *ante*). The EIR further explained, "The carcinogenic potential of TACs is a particular public health concern because many scientists currently believe that there is no 'safe' level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of contracting cancer."

One of the thresholds the EIR used to determine the significance of the transportation plan's air quality impacts was whether sensitive receptors would be exposed to substantial pollutant concentrations. For purposes of this threshold, "sensitive

receptors" included children, the elderly, and communities already experiencing high levels of air pollution and related diseases.

As to PM₁₀ and PM_{2.5} emissions, the EIR indicated sensitive receptors could be significantly impacted if they were located near congested intersections. As to TACs, the EIR indicated TACs emitted from highway vehicles and nonroad equipment tend to impact those closest to the emission sources. The EIR explained, "[a] growing body of scientific evidence shows that living or going to school near roadways with heavy traffic volumes is associated with a number of adverse effects. These include increased respiratory symptoms, increased risk of heart and lung disease, and elevated mortality rates."

Although the EIR recognized regional growth and land use changes associated with the transportation plan had the potential to expose sensitive receptors to substantial localized pollutant concentrations, the EIR stated the level of exposure could not and would not be determined until the next tier of environmental review when facility designs of individual projects became available. The EIR made identical statements regarding proposed transportation improvements associated with the transportation plan.

The EIR summarized several studies linking proximity to heavily traveled roads and freeways to harmful health effects to children. The EIR also noted CARB had estimated the region's health risk from diesel particulate matter in 2000 was 720 excess cancer cases per million and had recommended sensitive land uses not be sited within 500 feet of a freeway, urban roads with 100,000 vehicles per day, and rural roads with 50,000 vehicles per day.

Cleveland contends the EIR's air quality impacts analysis violates CEQA because the EIR's description of existing conditions does not adequately depict the public's existing exposure to TACs. Cleveland contends the existing conditions description also fails to identify the approximate number and location of sensitive receptors near planned transportation projects. SANDAG, however, asserts its existing conditions description is sufficiently detailed for a program level EIR. As these contentions focus on the reasonableness of the EIR's analysis, they present predominately factual questions and our review is for substantial evidence. (*Vineyard, supra*, 40 Cal.4th at p. 435; accord, *Smart Rail, supra*, 57 Cal.4th at pp. 447-449; *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 328.)

To fulfill its information disclosure function, "an EIR must delineate environmental conditions prevailing absent the project, defining a baseline against which predicted effects can be described and quantified." (*Smart Rail, supra*, 57 Cal.4th at p. 447; see *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal.App.4th 931, 953 [without an adequate baseline description, "analysis of impacts, mitigation measures and project alternatives becomes impossible"]; Guidelines, § 15125, subd. (a).)¹⁶ If the description of the environmental setting "is inaccurate, incomplete or

¹⁶ Guidelines section 15125, subdivision (a), provides: "An EIR must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and

misleading, the EIR does not comply with CEQA. [Citation.] "Without accurate and complete information pertaining to the setting of the project and surrounding uses, it cannot be found that the [EIR] adequately investigated and discussed the environmental impacts of the development project." ' ' " (*Clover Valley Foundation v. City of Rocklin* (2011) 197 Cal.App.4th 200, 219.)

In this case, for TACs exposures, the record shows there was available data from monitoring stations and mandatory reports with which SANDAG could have developed a reasoned estimate of the region's existing TACs exposures. Likewise, for sensitive receptors, the record shows SANDAG has data showing current population and land use patterns and current transportation infrastructure from which it could have developed a reasoned estimate of the number and location of sensitive receptors adjacent to highways and heavily traveled roadways.

The fact more precise information may be available during the next tier of environmental review does not excuse SANDAG from providing what information it reasonably can now. (Guidelines, § 15144.) Moreover, if known impacts are not analyzed and addressed in a program EIR, they may potentially escape analysis in a later tier EIR. (§ 21166; *Citizens Against Airport Pollution v. City of San Jose, supra*, 227 Cal.App.4th at pp. 807-808; *Concerned Dublin Citizens v. City of Dublin, supra*, 214 Cal.App.4th at p. 1320; *Citizens for Responsible Equitable Environmental Development v. City of San Diego, supra*, 196 Cal.App.4th at pp. 531-532; *Fort Mojave Indian Tribe v.*

regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant."

Department of Health Services, supra, 38 Cal.App.4th at p. 1605.) We, therefore, conclude there is not substantial evidence to support SANDAG's determination it could not reasonably provide additional baseline information in the EIR about TACs exposures and the location of sensitive receptors. The error is prejudicial because it precluded informed public participation and decisionmaking. (§ 21005, subd. (a); *City of Maywood, supra*, 208 Cal.App.4th at p. 386.)

3

Both the People and Cleveland contend the EIR's analysis of air quality impacts fails to comply with CEQA because it fails to correlate the transportation plan's adverse air quality impacts to resulting adverse health impacts. SANDAG again contends its disclosure efforts are adequate for the program level of environmental review and producing additional information at this level is infeasible. As with the parties' other contention, this contention is predominantly factual and our review is for substantial evidence. (*Vineyard, supra*, 40 Cal.4th at p. 435.)

"Guidelines section 15126.2, subdivision (a) requires an EIR to discuss, inter alia, 'health and safety problems caused by the physical changes' that the proposed project will precipitate." (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1219 (*Bakersfield Citizens*)). Accordingly, an EIR must identify and analyze the adverse health impacts likely to result from the project's air quality impacts. (*Id.*, at p. 1220; *Berkeley Keep Jets Over the Bay Com. v. Board of Port Comrs.*, *supra*, 91 Cal.App.4th at pp. 1367-1371.)

Here, the EIR identified in a general manner the adverse health impacts that might result from the transportation plan's air quality impacts. However, the EIR failed to correlate the additional tons of annual transportation plan-related emissions to anticipated adverse health impacts from the emissions. Although the public and decision makers might infer from the EIR the transportation plan will make air quality and human health worse, at least in some respects for some people, this is not sufficient information to understand the adverse impact. (*Bakersfield Citizens, supra*, 124 Cal.App.4th at p. 1220 [EIR analysis of air quality impacts deficient where public would have no idea of the health consequences of increased air pollution].)

While SANDAG contends it is not feasible to provide more definite information at this juncture, we have not located nor has SANDAG identified any evidence in the record supporting this contention. Instead, SANDAG impermissibly relies solely on its own bald assertions of infeasibility contained in the EIR. (*City of Maywood, supra*, 208 Cal.App.4th at p. 385 [an EIR must contain facts and analysis, not just the agency's bare conclusions].) Certainly, we recognize there are limitations to the precision of a program-level analysis. SANDAG is nonetheless obliged to disclose what it reasonably can about the correlation, it has not done so, and there is not substantial evidence showing it could not do so. The error is prejudicial because it precluded informed public

participation and decisionmaking.¹⁷ (§ 21005, subd. (a); *City of Maywood, supra*, at p. 386.)

4

a

To mitigate the transportation plan's air quality impacts, the EIR identified the following mitigation measures:

1. Local jurisdictions should incorporate into their land use decisions certain measures recommended by the California Attorney General for reducing greenhouse gas emissions.

2. At the next tier of environmental review, SANDAG will and other implementing agencies should incorporate certain dust control measures into project specifications for transportation network improvements.

3. At the next tier of environmental review, SANDAG will and other implementing agencies should require any heavy duty off-road vehicles used to construct transportation network improvements to utilize all feasible measures to reduce specified emissions to a less than significant level.

4. At the next tier of environmental review, SANDAG will and other implementing agencies should evaluate potential impacts from carbon monoxide, PM₁₀

¹⁷ Given this conclusion and its bases, we need not decide the People's conditional motion for judicial notice of examples of correlative information contained in comparable EIRs from other jurisdictions.

and PM_{2.5} emissions and their health risks and, if required, add one or more recommended mitigation measures to reduce the emissions.

The EIR further concluded these were the only mitigation measures available at the program-level of environmental review.

b

Both the People and Cleveland contend these measures, except for the second, violate CEQA because they improperly defer mitigation of the transportation plan's significant air quality impacts. SANDAG once more counters these measures are adequate for the program level of environmental review.

This issue, like the issue involving the mitigation of greenhouse gas emissions impacts, is at least partially moot given our conclusion in parts III.C.2 & 3, *ante*, as the additional analysis necessary to correct the noted deficiencies will likely require revisions to related sections of the EIR, including the discussion of mitigation measures.

(*Communities for a Better Environment v. City of Richmond*, *supra*, 184 Cal.App.4th at p. 91.) However, we briefly address the People's and Cleveland's contentions. As these contentions are predominantly factual, our review is for substantial evidence. (*Vineyard*, *supra*, 40 Cal.4th at p. 435.)

"An EIR shall describe feasible measures which could minimize significant adverse impacts. (Guidelines, § 15126.4, subd. (a)(1).) An EIR may not defer the formulation of mitigation measures to a future time, but mitigation measures may specify performance standards which would mitigate the project's significant effects and may be accomplished in more than one specified way. (*Id.*, subd. (a)(1)(B).)

"Thus, ' " 'for [the] kinds of impacts for which mitigation is known to be feasible, but where practical considerations prohibit devising such measures early in the planning process (e.g., at the general plan amendment or rezone stage), the agency can commit itself to eventually devising measures that will satisfy specific performance criteria articulated at the time of project approval. Where future action to carry a project forward is contingent on devising means to satisfy such criteria, the agency should be able to rely on its commitment as evidence that significant impacts will in fact be mitigated.' " ' [Citation.] Conversely, ' "[i]mpermissible deferral of mitigation measures occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR." ' " (*Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 280-281.)

In this case, with one exception, the EIR defers the analysis of appropriate mitigation measures. It also fails to set performance standards and commit SANDAG to complying with them. Although SANDAG contends no other mitigation is feasible at the program level of environmental review, we have not located nor has SANDAG pointed to any evidence in the record supporting this contention. Accordingly, we conclude there is not substantial evidence to support SANDAG's determination the EIR adequately addressed mitigation for the transportation plan's air quality impacts. The error is prejudicial because it precluded informed public participation and decisionmaking. (§ 21005, subd. (a); *City of Maywood, supra*, 208 Cal.App.4th at p. 386.)

D

Agricultural Impacts

1

The EIR evaluated the transportation plan's agricultural impacts under two significance thresholds. Under the first threshold, the EIR evaluated the impacts to land designated prime farmland, unique farmland or farmland of statewide significance under the California Resources Agency's Farmland Mapping and Monitoring Program.¹⁸ The EIR concluded implementation of the transportation plan would result in the conversion of 3,485.09 acres of such farmland by 2050.

Under the second threshold, the EIR evaluated impacts to all land with existing agricultural uses regardless of classification, lands subject to Williamson Act contracts, and lands designated under the California Farmland Conservancy Program Act.¹⁹ The EIR concluded implementation of the transportation plan would result in the conversion

¹⁸ According to the EIR, the Farmland Mapping and Monitoring Program is used to identify agricultural resources of 10-acres or more. "Farmlands are classified according to soil factors, including available water holding capacity, temperature regime, acidity, depth to the water table, electrical conductivity, flooding potential, erosion hazard, permeability, rock content, and rooting depth. The best quality land is identified as Prime Farmland and Farmland of Statewide Importance."

¹⁹ According to the EIR, "the Williamson Act [Gov. Code, § 51200 et seq.] enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or related open space use. In return, landowners receive property tax assessments that are much lower than normal because they are based upon farming and open space uses as opposed to full market value."

The California Farmland Conservancy Program Act (§ 10200 et seq.) encourages "the long-term, private stewardship of agricultural lands through the voluntary use of agricultural conservation easements."

of 7,023.07 acres of such land by 2050. The conclusion was based on data from the Farmland Mapping and Monitoring Program augmented with data from SANDAG's own geographic information system.

2

a

Cleveland contends the EIR violates CEQA by understating the transportation plan's growth-induced impacts on agricultural lands. As this contention is predominantly factual, our review is for substantial evidence. (*Vineyard, supra*, 40 Cal.4th at p. 435.)

As we have previously indicated, when reviewing the adequacy of an EIR's disclosures, we are chiefly concerned with whether the EIR reasonably fulfills its function of facilitating informed decisionmaking. An analysis which understates the severity of a project's impacts "impedes meaningful public discussion and skews the decisionmaker's perspective concerning the environmental consequences of the project, the necessity for mitigation measures, and the appropriateness of the project approval." (*Citizens to Pres. the Ojai v. County of Ventura* (1985) 176 Cal.App.3d 421, 431.)

In this case, both of the data sets used to analyze the transportation plan's agricultural impacts have important limitations. The Farmland Mapping and Monitoring Program does not capture information for farmland under 10 acres. In addition, according to SANDAG, its own geographic information system's inventory of agricultural land may not include any agricultural lands that went into production after the mid-1990s. The combined effect of these limitations is that there is not substantial evidence to show the EIR's analysis accounted for impacts to farmland of less than 10

acres put into production within the last 20 years. The error necessarily prejudiced informed public participation and decisionmaking because 68 percent of the farmland in the County is between one and nine acres, with the average farm size being four acres. (§ 21005, subd. (a); *City of Maywood, supra*, 208 Cal.App.4th at p. 386.)

While SANDAG correctly points out CEQA permits the use of data from the Farmland Mapping and Monitoring Program to analyze a project's agricultural impacts (Guidelines, Exhibit G), CEQA does not mandate the use of such data nor does it insulate an EIR from further scrutiny if the EIR relies on the data. Moreover, because the transportation plan included the sustainable communities strategy, SANDAG was required by statute to "gather and consider the best practically available scientific information regarding resource areas and farmland in the region" (Gov. Code, § 65080, subd. (b)(2)(B)(v).) By choosing a methodology with known data gaps, SANDAG produced unreliable estimates of the amount of existing farmland and, consequently, unreliable estimates of the transportation plan's impacts to existing farmland. Accordingly, SANDAG failed to comply with its statutory obligation as well as CEQA's information disclosure requirements.

b

Finally, in addition to Cleveland's general contention that the EIR understated the transportation plan's agricultural impacts, Cleveland raises two specific contentions: (1) the EIR failed to disclose and analyze the transportation plan's impacts to small farms; and (2) the EIR's discussion of impacts to agricultural land from growth inaccurately assumed land converted to a rural residential designation would remain farmland.

SANDAG counters Cleveland is precluded under section 21177, subdivision (a), from raising these two specific contentions because Cleveland never exhausted its administrative remedies as to them.²⁰ Except to the extent the specific contentions are subsumed within the general contention, we agree.

"A CEQA challenge is not preserved 'unless the alleged grounds for noncompliance with [CEQA] were presented to the public agency orally or in writing by any person during the public comment period provided by this division or prior to the close of the public hearing' [Citation.] 'Exhaustion of administrative remedies is a jurisdictional prerequisite to maintenance of a CEQA action.' [Citation.]

" 'To advance the exhaustion doctrine's purpose "[t]he 'exact issue' must have been presented to the administrative agency" [Citation.] While " 'less specificity is required to preserve an issue for appeal in an administrative proceeding than in a judicial proceeding' because, . . . parties in such proceedings generally are not represented by counsel . . . ' [citation]" [citation], "generalized environmental comments at public hearings," "relatively . . . bland and general references to environmental matters" [citation], or "isolated and unelaborated comment[s]" [citation] will not suffice. The same is true for " '[g]eneral objections to project approval' [Citations.]" [Citation.]

²⁰ Section 21177, subdivision (a), provides: "An action or proceeding shall not be brought pursuant to Section 21167 unless the alleged grounds for noncompliance with this division were presented to the public agency orally or in writing by any person during the public comment period provided by this division or prior to the close of the public hearing on the project before the issuance of the notice of determination."

" [T]he objections must be sufficiently specific so that the agency has the opportunity to evaluate and respond to them.' " ' [Citation.]

" ' "The petitioner bears the burden of demonstrating that the issues raised in the judicial proceeding were first raised at the administrative level. [Citation.]" [Citation.] An appellate court employs a de novo standard of review when determining whether the exhaustion of administrative remedies doctrine applies.' " (*Citizens for Responsible Equitable Environmental Development v. City of San Diego, supra*, 196 Cal.App.4th at p. 527.)

Cleveland has not met its burden in this case. Before SANDAG approved the EIR, Cleveland submitted a letter commenting on the EIR's analysis of agricultural impacts from growth as follows: "[T]he [EIR] states that approximately 10,500^[21] acres of agricultural land will be impacted due to regional growth and land use change by the year 2050. [Citations.] The [EIR] also acknowledges that its regional growth projections are based on current planning assumptions for San Diego County and the jurisdictions therein. [Citation.] However, the EIR for the County's current General Plan update, which by definition reflects current planning assumptions (as of 2011), shows that the General Plan expects 55,963 acres of agricultural land to convert to non-agricultural uses by the year 2030. [Citation.] Even though they account for conditions expected to exist 20 years sooner, these impacts are more than five times greater than the impacts identified in the [transportation plan's EIR].

²¹ This figure apparently represents the combined total of the impacts identified under both significance thresholds (see part III.D.1, *ante*).

"It is not clear how the [EIR] could use current planning assumptions for growth and determine that there will be only 10,500 acres of agricultural land impacted, when the current plans on which it bases its assumptions assume there will be more than five times as many acres impacted. SANDAG must explain if there is a basis for this discrepancy. Without any such explanation, the [EIR] appears to severely underestimate the amount of agricultural land that will be impacted, in contravention of CEQA. [¶] In sum, the [EIR's] failure to accurately account for impacts to agricultural land renders it inadequate as a matter of law."

Even read liberally, Cleveland's comment letter did not fairly apprise SANDAG that Cleveland had specific concerns about the EIR's handling of impacts to small farms and lands redesignated rural residential. Instead, Cleveland's comment letter focused on the discrepancy between SANDAG's estimate of overall growth-induced impacts and the County's estimate of overall growth-induced impacts. Cleveland cites to no other place in the record where any other person or organization raised specific concerns about the EIR's handling of impacts to small farms and lands designated rural residential. Consequently, Cleveland has not demonstrated exhaustion of administrative remedies as to these concerns.

DISPOSITION

The matter is remanded to the superior court with directions to modify the judgment and writ of mandate to incorporate our decision on the cross-appeals. The judgment is affirmed as so modified. The People and Cleveland are awarded their appeal and cross-appeal costs.

McCONNELL, P. J.

I CONCUR:

IRION, J.

BENKE, J., Dissenting.

My colleagues and I have vastly different views on the extent to which this court can and should control environmental review of the planning decisions of a regional transportation agency such as the San Diego Association of Governments (SANDAG). Where the majority, as a result of the alleged inadequacy of the environmental impact report's (EIR) analysis of greenhouse gas (GHG) impacts, would strike down the EIR implementing SANDAG's regional transportation plan (RTP) calling for investment of about \$214 billion over the next several decades in the San Diego region, I would not. Where the majority purports to enforce the California Environmental Quality Act (CEQA) and its Guidelines,¹ I believe my colleagues weaken and confuse the law. Thus, although I conclude that substantial evidence supports the finding SANDAG's GHG impacts analysis is CEQA-compliant, I preface that substantial evidence analysis with the following observations and concerns.

In order to understand the full impact of my colleagues' decision regarding the adequacy of SANDAG's assessment of the GHG impacts of the project, it is first necessary to define a "threshold of significance." CEQA requires "[a]ll public agencies . . . adopt by ordinance, resolution, rule, or regulation, objectives, criteria, and procedures for the evaluation of projects and the preparation of environmental impact reports." (Pub. Resources Code, § 21082.)² Such "objectives, criteria, and procedures" are also known

¹ Citations to "Guidelines" refer to California Code of Regulations, title 14, section 15000 et seq., which are the guidelines for the application of CEQA. (Cal. Code Regs., tit. 14, §§ 15000, 15001.)

² All further statutory citations refer to the Public Resources Code unless otherwise indicated.

as "thresholds of significance" and are used by an agency as a benchmark in determining the significance of environmental effects of a project. (Guidelines, § 15064.7, subd. (a).) A threshold of significance for GHG impacts *may* be accompanied by a plan to achieve the reduction or mitigation of GHG emissions, but the plan *must* be adopted through a public review process. (Guidelines, § 15064.4, subd. (b)(3).)

Executive Order No. S-3-05, signed in 2005 by then Governor Arnold Schwarzenegger (Executive Order), does not unilaterally qualify as a threshold of significance. To reach this conclusion, one need go no further than our Supreme Court's opinion of *Professional Engineers in California Government v. Schwarzenegger* (2010) 50 Cal.4th 989 (*Professional Engineers*). In *Professional Engineers*, the court concluded that an executive order, which attempted to implement a mandatory furlough program during our state's fiscal crisis, had no foundation in the state constitution or existing statutes. In particular, the court noted "the Governor fails to cite any judicial decision or other supporting authority holding or suggesting that the power under the California Constitution to establish or revise the terms and conditions of state employment, even in a fiscal emergency, resides in the Governor (or any other executive officer or entity) rather than in the Legislature. To the contrary, the following is well established: (1) Under the California Constitution it is *the Legislature*, rather than the Governor, that generally possesses the ultimate authority to establish or revise the terms and conditions of state employment through legislative enactments, and (2) any authority that the Governor or an executive branch entity . . . is entitled to exercise in this area emanates from the Legislature's delegation of a portion of its legislative authority to such executive officials or entities through statutory enactments." (*Id.* at p. 1015.)

The court in *Professional Engineers* likewise rejected the Governor's argument that his power to impose a mandatory work furlough program through an executive order was supported by statutes, including several specific statutory provisions. Among the factors noted contrary to this position, the court recognized that "the Legislature has demonstrated a special interest in retaining . . . [the] ultimate control over the salary and wages of such employees." (*Professional Engineers, supra*, 50 Cal.4th at p. 1024.) The court held that the mandatory furlough program was valid *only* because the Legislature, "through the exercise of its own legislative prerogative," independently adopted the program. (*Id.* at p. 1047.)

Similarly, the Executive Order at issue in this case, which includes *statewide* GHG reduction targets for 2020, 2035 and 2050, was at its inception merely a broad policy statement of goals issued by the Governor. Like the order at issue in *Professional Engineers*, it too does not have an identifiable foundation in the constitutional power of the Governor or in statutory law.

The majority cites no judicial decision or other supporting authority holding or even suggesting that the power to establish thresholds of significance, qualitative or quantitative, resides in the Governor rather than in the Legislature. Nor is there any authority supporting the view that the Legislature has delegated to the Governor any power to enact or establish thresholds of significance, including with respect to GHG at issue in this case.

To the contrary, as I discuss, the Legislature has clearly demonstrated it intends to retain ultimate control over the regulation of environmental planning. It has vested in the California Air Resources Board (CARB) the responsibility for coordinating efforts to

attain and maintain ambient air quality standards, to conduct research into the causes of and solution to air pollution, and systematically attack the serious problem caused by motor vehicles. (Health & Saf. Code, § 39003.) It also has limited by statute the ability of courts to add substantive or procedural requirements to CEQA provisions. (Pub. Resources Code, § 21083.)

The majority is either unable or unwilling to expressly declare its position on whether the Executive Order is a threshold of significance as that term is employed in CEQA analysis. I sympathize with their apparent uneasiness. If the majority declares the Executive Order *is* a threshold of significance, it is faced with the reality that the Executive Order simply does not meet the requirements necessary to have attained that status. If it expressly acknowledges that the Executive Order is *not* a threshold of significance, then it must also acknowledge that SANDAG is quite correct that it was not required to employ it as a CEQA measuring stick in assessing compliance.

My colleagues attempt to avoid the dilemma altogether. They offer that the *policy* underlying the Executive Order is of such overarching importance that it *must* be included within the significance factors listed in Guidelines section 15064.4, subdivision (b), and, therefore, SANDAG was *required* to consider that policy in what they euphemistically refer to as a "consistency analysis" involving the GHG impacts of its project and the Executive Order. Because SANDAG failed to provide such a policy analysis in its EIR, my colleagues conclude SANDAG abused its discretion. By this exercise in linguistics, the majority in contravention of *Professional Engineers* has elevated the Executive Order to the status of a threshold of significance without ever having to expressly declare they are doing so. Its action is judicial fiat, pure and simple.

The majority seeks support for its new formulation of the law by noting that important legislation has sprung from the Executive Order, and they offer that the Executive Order will continue to be the springboard for legislative action. Relying on *Professional Engineers*, the majority also concludes the policy underlying the Executive Order has been "ratified" by subsequent legislation. (Maj. opn. *ante*, at p. 14.) If, by this reasoning, the majority implies that subsequent environmental legislation somehow bestowed on the Executive Order a power it did not have, I believe it is mistaken. As *Profession Engineers* recognizes, our Legislature acts independently. As I discuss, the fact that the Legislature has enacted environmental legislation in recognition of the Executive Order's goals does not bestow on the Executive Order any more power than it had before the Legislature acted.

Moreover, although the Legislature has exercised its own independent prerogative by tasking CARB with adopting regional GHG reduction targets for 2020 and 2035, it has not done so for 2050. As I also discuss, the Legislature is currently considering a comprehensive and complex plan for 2050 that tasks the CARB to establish regional targets. It is possible the Legislature may alter the Executive Order's 2050 goals or reject them altogether. Using the majority's own logic, the Legislature has not ratified the Executive Order's qualitative or quantitative goals for 2050.

It is true, of course, that *qualitative* thresholds of significance are acceptable in assessing significance. (See Guidelines, § 15064.7, subd. (a).) However, qualitatively addressing the policy and sciences underlying the Executive Order—if this in fact is what the majority means by a "consistency analysis"—adds little if any meaning to the discussion of the significance of GHG impacts. SANDAG considered in its EIR the

important public policy of GHG emissions reduction in implementing its project. It acknowledged the Executive Order and its goals. It concluded the 2050 goal in that order was not at this time applicable. The purpose of remand is therefore unclear to me if the majority merely requires additional, undefined consideration of the qualitative aspects of the Executive Order.

Quantitatively speaking, as noted, SANDAG in its EIR considered, but did not use, the 2050 GHG reduction targets set forth in the Executive Order. Until the Legislature independently acts and tasks the CARB with adopting regional 2050 GHG emissions reduction targets, SANDAG in my view was not required to consider in its EIR the broad 2050 statewide goals set forth in the Executive Order. (See *Professional Engineers, supra*, 50 Cal.4th at p. 1047.)

The majority states that it is not requiring SANDAG's project to "*achieve* the Executive Order's 2050 goal or any other specific numerical goal" in undertaking the now-required "consistency analysis." (Maj. opn. *ante*, at p. 15, fn. 6.) This comes as little surprise, inasmuch as an EIR is merely an "informational document." (See Guidelines, § 15003, subd. (i).)

Nonetheless, whether qualitative or quantitative, it is not clear to me how, in assessing the significance of GHG impacts of the project—including for 2050—a lead agency is supposed to adopt from the Executive Order *regional* GHG emissions reduction targets. The majority appears to answer this question by stating SANDAG can determine its "share" of GHG emissions reduction responsibility from theoretical targets. With respect to SANDAG's share of responsibility, it is important to emphasize what the majority has not acknowledged: SANDAG is responsible only for its "*fair share*" when

assessing significance. Establishing an agency's "*fair share*" is a complex and science-based process. It begins by recognizing that the level of GHG emissions is a statewide problem encompassing a diverse array of emitters. Included in the array is not only transportation but also, for example, land use and development, agriculture, electricity generation, forestry, and industrial sectors. The analysis of GHG impacts thus involves emissions across sectors both within SANDAG's planning discretion (i.e., transportation and land use) and outside SANDAG's planning discretion (i.e., heavy industry). SANDAG is not empowered or equipped to offer and use analyses in statewide sectors over which it has no control.

The point is SANDAG, unlike the CARB, is a *regional* and not a state agency. Without a model addressing *regional* GHG emissions reduction targets between 2035 and 2050, it is impossible for SANDAG in its RTP to conduct a "consistency analysis" for these years of study.

As the lack of substance in the now-required "consistency analysis" attests, there is little to say except that, in the world of GHG emissions, "more of them are bad and less is good." It is a reasonable conclusion here that the SANDAG Board of Directors, comprised of locally elected officials from San Diego County and the 18 cities in the region, are already well aware of this. The EIR in any event recognizes the important policy goal of reducing GHG emissions.

As I discuss, there is legislation currently pending tasking the CARB with setting state and regional targets for 2050. This pending legislation further demonstrates my point that the Legislature has not yet independently adopted the Executive Order's 2050 statewide GHG emissions reduction goals. Once the CARB sets these regional targets,

which incidentally, may be different than the Executive Order's statewide goal, SANDAG and the other 18 metropolitan planning agencies (MPO's) throughout the state can then use them to determine their "*fair share*" of GHG emissions in analyzing the significance of GHG impacts of their projects. I fear the majority's demand that SANDAG "do more" *now* based on mere policy goals and/or theoretical targets, and without providing any guidance as to what more should be done, will in effect require SANDAG to set unilaterally 2050 regional GHG reduction targets in order to try to satisfy, somehow, the majority's "consistency analysis." In doing so, it may take action that ultimately conflicts with requirements set by CARB.

Perhaps the most profound harm arising from the majority's finesse of CEQA is the lasting damage it does to Guidelines section 15064.4. This section gives a lead agency substantial discretion to determine both the amount of GHG emissions from a project and whether such emissions are significant. Subdivision (b) of Guidelines section 15064.4 in particular states that in assessing GHG impacts, the lead agency *should* consider three factors, *among others*. One such factor expressly gives a *lead agency* the discretion to determine the thresholds of significance that should apply to its project in determining significance. (Guidelines, § 15064.4, subd. (b)(2).) To the extent thresholds of significance *other* than the three expressly provided in subdivision (b) apply, that should be a determination made by an agency in the proper exercise of its discretion.

It is apparent to me that identifying and selecting thresholds of significance is not a judicial function. Despite the clear language of Guidelines section 15064.4, subdivision (b) and the obvious intent of that section, the majority asserts a right to determine that a gubernatorial policy statement, which does not qualify as a threshold of significance, is to

be included among the "other factors" and then *orders* SANDAG on remand to develop an undefined "consistency analysis" between the lead agency's plan and the policy statement.

This insinuation of judicial power into the environmental planning process and usurping of legislative prerogative is breathtaking. Now we, the courts, without institutional planning expertise or knowledge, get to tell a lead agency what it must use as a threshold of significance. As a consequence of not being prescient enough to know what a court might select, the EIR's of projects such as this RTP, which, as noted, calls for investment of about \$214 billion in the San Diego region over the next few decades, are invalidated and sent back to the lead agency to anticipate what we, the court, might next decide is or has become of such critical policy significance that the agency must use it as a threshold of significance. There is no legal support for our action, which strips lead agencies of the discretion vested in them by the Legislature and reposes that discretion in the courts. To be clear, I do not believe our action expands Guidelines section 15064.4; instead, I believe it destroys the integrity of that section. (See Maj. opn. *ante*, at p. 20, fn. 9.)

The mischief caused by the majority would not be confined to the SANDAG region. The majority would have each of our states' six appellate districts, and multiple divisions within many of them, instructing the 18 MPO's regarding whether a "consistency analysis" is required based on, for example, the Executive Order, and, if so, what it should contain. It does not take much energy to foresee the permutations possible as each MPO receives judicial instruction. Chaos in environmental planning comes to mind.

The Legislature, in its wisdom, has foreseen the kind of damage we do today, and it has taken steps to forbid such judicial interference. First, the Legislature vested one agency, CARB, with creating the targets and metrics in assessing, and ultimately reducing, GHG emissions regionally and statewide. (Health & Saf. Code, § 39003.) Second, it has, in CEQA itself, expressly prevented courts from selecting what "other factors" an agency should consider in assessing significance of GHG impacts.

Indeed, section 21083.1 provides the legislative intent underlying CEQA and the interpretation of its statutes and guidelines by our courts: "It is the intent of the Legislature that courts, consistent with generally accepted rules of statutory interpretation, shall not interpret this division or the state guidelines adopted pursuant to Section 21083 in a manner which imposes procedural or substantive requirements beyond those explicitly stated in this division or in the state guidelines." Judicial imposition of significance thresholds does precisely what the statute prohibits.

As I discuss in more detail *post*, I conclude substantial evidence in the record shows SANDAG made a good faith and reasonable effort to analyze in its EIR the GHG impacts of its project. In its 39-page GHG impacts analysis, SANDAG, as noted, analyzed the targets set by the CARB for 2020 and 2035 under three thresholds of significance, in compliance with Guidelines section 15064.4. I thus would *reverse* the trial court's order finding SANDAG's GHG impacts analysis of the project was inadequate, including because SANDAG did not address the 2050 GHG *statewide* reduction goals set forth in the Executive Order.

As to the cross-appeal, because the trial court declined to reach those issues and because the majority in any event is remanding the matter with respect to the EIR's

treatment of GHG impacts and mitigation measures of the project, I would defer the issues raised in the cross-appeal to the trial court for consideration in the first instance. I do, however, note that our instructions on remand include what appears to be a directive that SANDAG consider further analysis of mass transportation. This directive, coupled with the vague requirement of a "consistency analysis," leaves me with an uncomfortable feeling that some might believe that, in sending this case back, we are *sub rosa* directing SANDAG to shift the emphasis in its plan to mass transportation. If that is a direction in which we inadvertently venture, I would only comment that it is not a journey we are empowered or equipped to undertake.

DISCUSSION

I

GHG Impacts

A. *Regulation of GHG by the CARB*

On June 1, 2005, at the United Nations World Environment Day in San Francisco, Governor Schwarzenegger signed the Executive Order in front of hundreds of international leaders. The Governor told his invited guests, which included mayors from more than 70 cities from around the world, that the "debate" over global warming from GHG emissions was "over." (Marshall, *Schwarzenegger Issues Plan to Reduce Greenhouse Gases* (June 2, 2005) N.Y. Times <http://www.nytimes.com/2005/06/02/national/02arnold.html?_r=0> [as of November 2014].)

The Executive Order established the following *statewide* reduction targets for greenhouse gas emissions: by 2010, to 2000 levels; by 2020, to 1990 levels; and by 2050, to 80 percent below 1990 levels. It also directed the California Environmental Protection

Agency (Cal-EPA) to develop strategies to meet these targets. In response, the "Climate Action Team," comprised of representatives from various agencies and commissions including the Cal-EPA and the CARB, was created. (See *Rialto Citizens for Responsible Growth v. City of Rialto* (2012) 208 Cal.App.4th 899, 938; see also Comment, *Quantifying an Uncertain Future: The Demands of the California Environmental Quality Act and the Challenge of Climate Change Analysis* (2012) McGeorge L.Rev. 1065, 1068-1069.)

Although the Executive Order provided the "power" for its issuance was derived from "the Constitution and statutes of the State of California," that order did *not* identify any article, section and/or statute as the source of this alleged authority. In any event, as noted, I do not believe our Constitution, including article V, vested the Governor with the authority to singlehandedly issue and enforce the Executive Order. (See, i.e., *Professional Engineers, supra*, 50 Cal.4th at p. 1015 [rejecting the argument the governor had the unilateral authority to implement a mandatory furlough program].) I also do not believe that our Legislature expressly granted that authority to the Governor. (See *id.* at p. 1000.) Therefore, I believe the GHG statewide emission reduction targets set forth in the Executive Order are nothing more than mere policy recommendations unless and until our Legislature independently acts to adopt such targets, which, as I explain, it has done for 2020 and 2035, but not for 2050. (See *ibid.*)

The Executive Order was by no means the first attempt in our state to address GHG emissions. In 2002, our Legislature passed a law regulating GHG vehicle emissions. (See Stats. 2002, ch. 200, enacting Assem. Bill No. 1493 (2001-2002 Reg. Sess.) (AB 1493).) Under this law, the CARB was required to develop and adopt, by

January 1, 2005, "regulations that achieve the maximum feasible and cost-effective reduction of greenhouse gas emissions from motor vehicles." (Health & Saf. Code, § 43018.5, subd. (a).) In enacting this law, our Legislature noted that the "control and reduction of emissions of greenhouse gases are critical to slow the effects of global warming." (Stats. 2002, ch. 200, § 1(c).) Thus, AB 1493 shows that our state policy of reducing GHG emissions did *not* originate with the 2005 Executive Order, as the majority appears to suggest, but rather was in existence before the Executive Order was issued.³

The California Global Warming Solutions Act of 2006 (Health & Saf. Code, § 38500 et seq., added by Stats. 2006, ch. 488, § 1, enacting Assem. Bill No. 32 (AB 32)) implemented the 2020 reduction target set forth in the Executive Order. (See Health & Saf. Code, § 38550; see also *Rialto Citizens for Responsible Growth v. City of Rialto*, *supra*, 208 Cal.App.4th at p. 939.) AB 32 directed the CARB to develop a "scoping plan . . . for achieving the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions from sources or categories of sources of greenhouse gases" (Health & Saf. Code, § 38561, subd. (a); see Health & Saf. Code, § 38562, subd. (a) [requiring the CARB to "adopt greenhouse gas emission limits and emission reduction measures by regulation . . . to become operative beginning on January 1, 2012"]; see also *Association of Irrigated Residents v. State Air Resources Bd.* (2012) 206 Cal.App.4th 1487, 1490 [noting AB 32 designated the CARB as "the state agency

³ Our Legislature as early as 1975 tasked the CARB with the responsibility of "coordinating efforts to attain and maintain ambient air quality standards, to conduct research into the causes of and solution to air pollution, and to systematically attack the serious problem caused by motor vehicles, which is the major source of air pollution in many areas of the state." (Health & Saf. Code, § 39003.)

charged with monitoring and regulating sources of emissions of greenhouse gases that cause global warming in order to reduce emissions of greenhouse gases' . . . and imposes numerous directives and timelines on the [CARB]".)

To assist an agency in its analysis of GHG emissions in CEQA review, our Legislature in 2007 enacted, among other provisions, section 21083.05 (added by Stats. 2007, ch. 185, § 1, enacting Sen. Bill No. 97 (SB 97)).⁴ SB 97 directed the Office of Planning and Research (OPR) to prepare and submit to the Natural Resources Agency (NRA) "guidelines for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions . . . including, but not limited to, effects associated with transportation or energy consumption." (Former § 21083.05, subd. (a).) SB 97 further provided that the OPR and NRA "shall periodically update the guidelines to incorporate new information or criteria" established by the CARB pursuant to AB 32. (*Id.*, subd. (c).)

The NRA adopted regulations on the significance of GHG emissions for CEQA, which were then incorporated into the CEQA Guidelines including, as perhaps most relevant here, Guidelines section 15064.4, discussed *post*.⁵

In 2008, our Legislature passed the Sustainable Communities and Climate Protection Act of 2008 (Sen. Bill No. 375 (2007-2008 Reg. Sess.)). As the majority recognizes, SB 375 supports the state's climate action goals to reduce GHG emissions through coordinated transportation and land use planning. Under SB 375, the CARB—

⁴ SB 97 was amended effective January 1, 2013. (Stats. 2012, ch. 548, § 5.)

⁵ "In interpreting CEQA, we accord the Guidelines great weight except where they are clearly unauthorized or erroneous." (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 428, fn. 5.)

once again—was directed to provide each region by no later than September 30, 2010 with GHG emission "reduction targets for the automobile and light truck sector for 2020 and 2035, respectively." (Gov. Code, § 65080, subd. (b)(2)(A).) Once these targets were established by the CARB, each of the state's MPO's was required to prepare under Government Code former section 65080, subdivision (b)(2) a "sustainable communities strategy" (SCS) as part of the MPO's RTP. (See Gov. Code, former § 65080, subd. (b)(2).)⁶

In developing the SCS, SB 375 required each MPO to "conduct at least two informational meetings . . . within the region for members of the board of supervisors and city councils" on the SCS. (Gov. Code, § 65080, subd. (b)(2)(E).) The purpose of the meetings was to "discuss the [SCS] . . . , including the key land use and planning assumptions to the members of the board of supervisors and the city council members in that county and to solicit and consider their input and recommendations." The SCS, if and when implemented, would allow the MPO to reach the GHG reduction targets established by the CARB. If those targets were unmet, the MPO would be required to prepare an alternative planning strategy to the SCS. (Gov. Code, § 65080, subd. (b)(2)(E).)

As *the* agency responsible for "target-setting" GHG emissions reductions, the CARB in 2010 created reduction targets for SANDAG's MPO region for 2020 and 2035.

⁶ Government Code section 65080 was amended effective January 1, 2010 (Stats. 2009, ch. 354, § 1) and again effective January 1, 2011 (Stats. 2010, ch. 328, § 95). The requirement of an SCS as part of an MPO's RTP remains in the current version of Government Code section 65080, subdivision (b).

SANDAG used these targets in addressing in its EIR the GHG impacts of the project. However, as SANDAG properly recognized in its EIR impact analysis, the CARB has not yet set 2050 GHG emissions reduction targets for the MPO's. As noted and as I discuss, there is legislation currently pending, Assembly Bill No. 2050 (AB 2050), that would require the CARB to do so.⁷

Thus, our Legislature has recognized the strong public policy of GHG emissions reductions in our state and has fully occupied this enormously complex field by delegating the "target-setting responsibility" of such reductions to the CARB through a series of comprehensive legislative enactments, including in AB 32, SB 97 and SB 375.⁸

⁷ According to a recent summary prepared by the Senate Appropriations Committee, AB 2050 would amend SB 32 by requiring "the California Air Resources Board (CARB) to develop greenhouse gas (GHG) emissions reductions goals for 2050, including intermediate goals, and to perform a number of analyses of the strategies that would be required to reach those goals" for purposes of the next scoping plan update. (Sen. Appropriations. Com., analysis of Assem. Bill No. 2050 (2013-2014 Reg. Sess.) p. 1.)

⁸ This list is not exhaustive. For example, in 2010 legislation was enacted requiring the Department of Transportation to update the federally mandated California Transportation Plan (CTP) by December 31, 2015 and every five years thereafter. (Gov. Code, §§ 65070, subd. (a) & 65071.) The CTP requires identification of a "statewide integrated multimodal transportation system" that includes among other requirements the incorporation of all SCS and/or alternate planning strategies required by SB 375. (Gov. Code, § 65072.2) "In developing the [CTP] . . . , the department shall address how the state will achieve maximum feasible emissions reductions in order to attain a statewide reduction of [GHG] emissions to 1990 levels by 2020 as required by [AB 32] and 80 percent below 1990 levels by 2050." (*Ibid.*) The CTP must include: "(a) A policy element that describes the state's transportation policies and system performance objectives. These policies and objectives shall be consistent with legislative intent described in Sections 14000, 14000.5, 14000.6, and 65088. [¶] (b) A strategies element that shall incorporate the broad system concepts and strategies synthesized from the adopted regional transportation plans prepared pursuant to Section 65080. The California Transportation Plan shall not be project specific. [¶] (c) A recommendation element that includes economic forecasts and recommendations to the Legislature and the Governor to

The CARB in response has then set reduction targets for each of the 18 MPO's in our state.

Against this backdrop, I disagree with the majority's conclusion that SANDAG acted unreasonably in refusing to engage in a "consistency analysis" using the Executive Order as a CEQA measuring stick when assessing the GHG impacts of its regional project. (See *Professional Engineers, supra*, 50 Cal.4th at p. 1000.) Instead, in my view, the record contains more than sufficient evidence showing SANDAG acted in good faith and properly exercised its broad discretion under Guidelines section 15064.4 in assessing the significance of GHG impacts of the project.

achieve the plan's broad system concepts, strategies, and performance objectives." (*Id.*, § 65072.) The Legislature in the CTP directly (*id.*, § 14000.6, subd. (b)) and indirectly (*id.*, § 65072.2) referenced the Executive Order and its goal of reducing GHG emissions to 80 percent of 1990 levels by 2050. However, as noted, the Legislature has not yet tasked the CARB to set 2050 GHG regional reduction targets for the MPO's.

B. *Guidelines Section 15064.4*⁹

As noted, CEQA requires that public agencies "adopt by ordinance, resolution, rule, or regulation" criteria for the evaluation of a project and the preparation of an EIR that are consistent with the statutory provisions of CEQA and its Guidelines. (§ 21082.)

Section 21083, subdivision (a) directs the OPR to "prepare and develop proposed guidelines" for implementation by a public agency. Subdivision (b) of that statute states the "guidelines shall specifically include criteria for public agencies to follow in determining whether or not a proposed project may have a 'significant effect on the environment.'" As noted *ante*, section 21083.5 was added by SB 97 to require the OPR to

⁹ Guideline section 15064.4 provides: "(a) The determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in section 15064. A lead agency should make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion to determine, in the context of a particular project, whether to: [¶] (1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use. The lead agency has discretion to select the model or methodology it considers most appropriate provided it supports its decision with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use; and/or [¶] (2) Rely on a qualitative analysis or performance based standards. [¶] (b) A lead agency should consider the following factors, among others, when assessing the significance of impacts from greenhouse gas emissions on the environment: [¶] (1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting; [¶] (2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project. [¶] (3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project."

prepare specific guidelines dealing with CEQA review of GHG.

Adopted after passage of SB 97, Guidelines section 15064.4, subdivision (a) requires a lead agency to make a "good-faith effort" to determine the GHG emissions of a project. In making this determination, a lead agency has the discretion to "[u]se a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use" (Guidelines, § 15064.4, subd. (a)(1)) and/or to "[r]ely on a qualitative analysis or performance based standards" (*id.*, subd. (a)(2)). After choosing a methodology and selecting significance thresholds, the lead agency next is required under Guidelines section 15064.4 to assess the "significance of impacts" of GHG emissions. (*Id.*, subd. (b).)

In assessing the significance of GHG impacts of a given project, Guidelines section 15064.4 states a lead agency "should" consider among others the following factors: (1) the extent to which the project may increase or reduce GHG "as compared to the existing environmental setting"; (2) whether the project's GHG emissions "exceed a threshold of significance that the *lead agency determines* applies to the project"; and (3) the extent to which the project "complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation" of GHG. (Guidelines, § 15064.4, subd. (b)(1), (2) & (3), italics added.) Subdivision (b)(3) of Guidelines section 15064.4 further provides that "[s]uch requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions."

Guidelines section 15064.4 thus "confirms that lead agencies retain the discretion to determine the significance of greenhouse gas emissions and should "make a good-faith

effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of [GHG] emissions resulting from a project." [Citation.]' [Citations.]" (*Citizens Against Airport Pollution v. City of San Jose* (2014) 227 Cal.App.4th 788, 807.)

I therefore disagree with the majority's interpretation of Guidelines section 15064.4: although subdivision (b) of this section clearly states the factors listed in subdivisions (1), (2) and (3) are not exhaustive, that does not ipso facto mean the courts may require an agency to consider additional "factors" (i.e., the Executive Order) in evaluating the GHG impacts of a project, as the majority has done here. In my view, the majority's reading of Guidelines section 15064.4 usurps the broad discretion afforded an agency in analyzing significance and improperly puts courts in charge of determining whether benchmarks other than those expressly provided in subdivisions (1), (2) and (3) must be considered by an agency when undertaking such an analysis.

Here, as I have noted, the EIR used three separate GHG analyses utilizing two of the specific significance criteria authorized by Guidelines section 15064.4. GHG-1, the first analysis, is an "existing conditions" baseline analysis authorized by subdivision (b)(1) of Guidelines section 15064.4.¹⁰ Under this analysis, any increase of GHG emissions over existing conditions (i.e., 2010) was deemed to be a significant impact.

¹⁰ I note the existing environmental setting "normally constitute[s] the baseline physical conditions by which a lead agency determines whether an impact is significant." (Guidelines, § 15125, subd. (a); see *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 445 [holding that "[w]hile an agency has the discretion under some circumstances to omit environmental analysis of impacts on existing conditions and instead use only a baseline of projected future conditions, existing conditions 'will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant'"].)

The GHG-1 analysis concluded that, although regional GHG emissions would decrease under the project from existing levels until after 2020, they would increase above existing levels by 2035 and increase still further by 2050, largely as a result of population increase and development. The EIR therefore determined the GHG impacts in 2020 would be a less than significant impact but would be significant in 2035 and 2050.

The second analysis, GHG-2, used the GHG reduction targets set forth in SB 375 as a significance criteria. GHG-2 used a narrower range of GHG emissions than GHG-1. GHG-2's approach, in my view, was also fully consistent with Guidelines section 15064.4.

Under SB 375, as I have noted, the CARB prepared regional GHG emission reduction targets, compared to 2005 emissions, for cars and light trucks for 2020 and 2035 for each of the state's MPO's. In response, each of the MPO's, including SANDAG, prepared an SCS as part of its RTP to "reduce GHGs by better aligning transportation, land use, and housing. For SANDAG, the targets are to reduce per capita CO₂ emissions 7 percent below 2005 levels by 2020 and 13 percent below 2005 levels by 2035. Because CARB has not developed a target for 2050, no analysis is provided for that year."

Using this significance criteria, the EIR concluded the project would have less than a significant impact because the project met SB 375's goals, as set by the CARB, for lowered per capital vehicle-related GHG emissions in 2020 and 2035.

The third GHG impact analysis, GHG-3, analyzed whether regional GHG emissions (from both transportation and land use/growth) would conflict with (1) the scoping plan adopted by the CARB pursuant to AB 32, which plan functions as a roadmap to achieve GHG reductions in our state, and (2) SANDAG's own adopted

Climate Action Strategy (CAS), which was created in 2010 under a partnership with the California Energy Commission "as a guide for SANDAG and local governments and policymakers in addressing climate change."

Because the scoping plan time horizon was limited to 2020, the EIR's analysis of whether or not the project under GHG-3 would have a significant impact with respect to GHG was limited to 2020, and no analysis was presented for 2035 and 2050. Although recognizing 2035 and 2050 emission reduction targets for GHG's were established in the Executive Order, the EIR in my view properly concluded the order was not a "plan" adopted through a public review process as required in subdivision (b)(3) of Guidelines section 15064.4. The EIR, however, analyzed transportation and land use/growth in 2035 and 2050 expected as a result of implementation of the project, with respect to the CAS.

The EIR analysis concluded that with respect to transportation, the estimated emissions from transportation in 2020 would be less than required by AB 32 and would constitute a less than significant impact under this threshold. The EIR also concluded that the project would not impede the CAS and its policy of promoting the reduction of vehicle miles traveled and minimization of GHG in transportation, inasmuch as the project also sought to reduce GHG emissions in transportation through a series of projects. Therefore, for transportation, the EIR found the implementation of the project would constitute a less than significant impact under the CAS threshold for 2020, 2035 and 2050.

With respect to land use/growth, the EIR analysis concluded in GHG-3 that emissions of GHG in 2020 were expected to exceed the scoping plan reduction goals. However, it noted several other measures included in the scoping plan were not yet

adopted or implemented, including "cap-and-trade," and, therefore, were not included in the GHG reduction calculations. Because the RTP was itself consistent with its role in the overall scoping plan strategy, SANDAG concluded for land use/growth that for 2020 the impact would be less than significant under this threshold. The EIR further provided for 2020, 2035 and 2050, implementation of the project would not impede the CAS but in fact would promote it and the goals of increasing energy efficiency and reducing energy consumption and, therefore, would constitute a less than significant impact.

C. Substantial Evidence Supports the Finding SANDAG's Assessment of Significance of GHG Impacts in its EIR Satisfied CEQA

Unlike my colleagues, I do not believe SANDAG's failure to discuss the project's consistency with the Executive Order shows a lack of a "good-faith effort" to assess in the EIR the GHG impacts of the project.¹¹ Rather, in my view, there is abundant evidence in the record showing that SANDAG made a "good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions [in the SANDAG MPO region] resulting from [the] project" (Guidelines, § 15064.4, subd. (a)); and that it properly assessed the significance of these emissions under applicable thresholds (*id.*, subd. (b)), including those adopted by the CARB (through enabling legislation) for 2020 and 2035. (See *Citizens for Responsible Equitable Environmental Development v. City of Chula Vista* (2011) 197 Cal.App.4th 327, 335-336 (*City of Chula Vista*).)

¹¹ In finding an alleged lack of evidence in the record of a reasonable, good-faith effort by SANDAG to assess the GHG impacts, the majority, in my view, is in effect applying an independent standard of review, and its contention otherwise is one of form over substance. (Maj. opn. *ante*, at p. 14.)

Moreover, the record also contains substantial evidence showing SANDAG properly exercised its discretion when it decided not to use the Executive Order's 2050 statewide emission reduction target as a CEQA measuring stick for its regional plan. *North Coast Rivers Alliance v. Marin Municipal Water Dist. Board of Directors* (2013) 216 Cal.App.4th 614 (*North Coast*) informs my view on this issue.

There, the petitioners contended an EIR for a project to build a sea-water desalination plant approved by a local water district was deficient because, among other reasons, it contained an inadequate analysis of GHG emissions. Although the trial court rejected this argument, it nonetheless found the EIR lacked substantial evidence to support the water district's conclusion the plant's GHG emissions were not cumulatively considerable. (*North Coast, supra*, 216 Cal.App.4th at p. 650.)

In reversing, the court concluded the EIR's use of AB 32, and its requirement that the CARB "adopt regulations that would require the reporting and verification of statewide GHG emissions and limit statewide GHG emissions to 1990 levels by 2020," was acceptable as a threshold of significance, inasmuch as the EIR properly noted "no CEQA thresholds of significance have been established for GHG[]." (*North Coast, supra*, 216 Cal.App.4th at p. 651.) The court also concluded the EIR used as a threshold a program voluntarily adopted by Marin County, which the water district joined, where GHG emissions would be reduced to 15 percent below 1990 levels by 2020. (*Ibid.*)

The *North Coast* court then reviewed the EIR in light of these thresholds, which focused primarily on energy consumption for plant operations. (*North Coast, supra*, 216 Cal.App.4th at p. 652.) In concluding the EIR's analysis "more than satisfied the requirements of CEQA" (*id.* at p. 652), the court recognized that the petitioners'

disagreement with the district's significance conclusion for GHG impacts was insufficient under CEQA because a ""reviewing court 'may not set aside an agency's approval of an EIR on the ground that an opposite conclusion would have been equally or more reasonable,' for, on factual questions, [the court's] 'task is not to weigh conflicting evidence and determine who has the better argument.'"" (*Id.* at p. 653.)

Similarly, this court in *City of Chula Vista* rejected the petitioner's contention the lead agency (i.e., the city) was required to use three other well-recognized potential thresholds of significance, instead of the goals set forth in AB 32, in analyzing the GHG impacts of a store replacement project. Citing to then-newly enacted Guidelines section 15064.4, this court concluded that this regulation "confirms that lead agencies retain the discretion to determine the significance of greenhouse gas emissions." (*City of Chula Vista, supra*, 197 Cal.App.4th at p. 336.) This court also concluded the lead agency "properly exercised its discretion to utilize compliance with [AB 32] as the threshold" and, as such, *rejected* the petitioner's contention the lead agency erred by not applying different thresholds. (*Ibid.*; see *Citizens Against Airport Pollution v. City of San Jose, supra*, 227 Cal.App.4th at p. 807 [recognizing that Guidelines, § 15064.4 gives a lead agency discretion to determine the significance of GHG emissions based to the extent possible on available scientific and factual data].)

North Coast and *City of Chula Vista*, in my view, provide guidance in the instant case and support the conclusion that SANDAG properly exercised its discretion under Guidelines section 15064.4, subdivision (b)(1), (2) and (3), including when it used the regional target numbers established by the CARB (developed in response to AB 32 and SB 375) in analyzing the impacts of GHG of the project. (See *Citizens for a Sustainable*

Treasure Island v. City and County of San Francisco (2014) 227 Cal.App.4th 1036, 1060-1061 [noting the "core principle" that an EIR is not required to engage in "speculative analysis," and, thus, a lead agency is not required to "'forsee[] the unforeseeable,'" "predict[] the unpredictable or quantify[] the unquantifiable"] (*Treasure Island*.) *North Coast* and *City of Chula Vista* also support the conclusion that, subject to the requirements of Guidelines section 15064.4, lead agencies and not the courts have the discretion to determine the benchmarks to be used for determining the GHG impacts of a project.

Indeed, as I previously noted, there is legislation currently pending, Assembly Bill No. 2050 (AB 2050), that among other purposes would delegate to the CARB the authority to set specific GHG emission reduction targets for the MPO's, including in the SANDAG region, but in this instance, the targets would be for 2050. Regardless of whether AB 2050 ultimately passes, the bill is significant because it shows our Legislature has not yet acted to set 2050 reduction targets (through the CARB). AB 2050 also demonstrates, yet again, the intent of the Legislature to fully occupy the field of regulating GHG emissions in our state. I believe the majority ignores this intent by requiring SANDAG, based on a strained interpretation of Guidelines section 15064.4, to do a "consistency analysis" using the Executive Order as a CEQA measuring stick. I also believe doing so has far-reaching, negative consequences.

By imposing a requirement on SANDAG that does not exist under CEQA, including in the applicable GHG Guidelines, the majority is contravening section 21083.1, as I have already discussed. In addition, as I have noted, the regulation of GHG emissions is better left to our Legislature and government agencies like the CARB in

what is clearly an area that "involves numerous highly technical and novel scientific, technical and economic issues" that will span many decades. (*Association of Irrigated Residents v. State Air Resources Bd.*, *supra*, 206 Cal.App.4th at pp. 1502, 1505 [noting the CARB has been "assigned the responsibility of designating and overseeing the implementation of measures" to achieve the "challenging" goals of reducing GHG emissions in our state].)

The complexity of the issues addressed by SANDAG's RTP, the first of its kind to be approved in this state, cannot be overstated. The sheer volume of the record in this case pays homage to the difficult issues facing a lead agency like SANDAG in preparing a RTP with an SCS component, where transportation planning and land use are linked to regional GHG emissions reduction goals for the next several decades. In contrast, judges "have neither the resources nor scientific expertise to engage in such analysis." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 393.)

Until our Legislature directs the CARB to set regional goals for 2050, I do not believe SANDAG was required to use the Executive Order and/or its 2050 GHG statewide reduction goal as a threshold to assess the significance of the GHG impacts of the project. (See *Treasure Island*, *supra*, 227 Cal.App.4th at p. 1054 [refusing to "fault" an EIR for a project to redevelop a former naval station into a new, mixed-use community because there were many project features that were subject to future revision, and, thus, the EIR "cannot be faulted for not providing detail that, due to the nature of the [p]roject, simply does not now exist"].)

Finally, the majority in my view is unnecessarily interfering with SANDAG's program EIR and tiering, which frustrates the goal of good planning: "Where a lead agency is using the tiering process in connection with an EIR for a large-scale planning approval, such as a general plan or component thereof . . . , the development of detailed, site-specific information may not be feasible but can be deferred, in many instances, until such time as the lead agency prepares a future environmental document in connection with a project of a more limited geographic scale, as long as deferral does not prevent adequate identification of significant effects of the planning approval at hand."

(Guidelines, § 15152, subd. (c).)

Our high court in *In re Bay-Delta etc.* (2008) 43 Cal.4th 1143 rejected a challenge to a program EIR on the basis it lacked sufficient detail regarding water sources to implement a project to restore the ecological health and improve the management of the Bay-Delta region. In so doing, the court noted that the Bay-Delta project was a "broad, general, multiobjective, policy-setting, geographically dispersed" plan (*id.* at p 1171); that at the first-tier program level, the "environmental effects of obtaining water from potential sources may be analyzed in general terms, without the level of detail appropriate for second-tier, site-specific review" (*id.* at p. 1169); that the advantage of a program EIR is it allows a lead agency "to consider broad policy alternatives and program wide mitigation measures at an early time when the agency has greater flexibility to deal with basic problems or cumulative impacts" (*ibid.*, citing Guidelines, § 15168, subd. (b)(4)); and that because the Bay-Delta project "is to be implemented over a 30-year period[,] . . . [i]t is therefore impracticable to foresee with certainty specific sources of water and their impacts" (*id.* at p. 1172).

Much like the Bay-Delta project, the project here is a "broad, general, multiobjective, policy-setting" plan. (See *In re Bay-Delta etc., supra*, 43 Cal.4th at p. 1171.) As such, I believe substantial evidence in the record shows SANDAG in its EIR engaged in a "good-faith effort" to analyze the GHG impacts of the project for purposes of the first-tier stage of what is clearly a long-term planning process that will be implemented over decades, "with the understanding that additional detail will be forthcoming when specific second-tier projects are under consideration." (See *id.* at p. 1172; see also *Rio Vista Farm Bureau Center v. County of Solano* (1992) 5 Cal.App.4th 351, 372 [upholding program EIR against a challenge it was vague and insufficiently described potential future facilities of a county's hazardous waste management plan because the plan, much like SANDAG's project at issue here, served only as an "assessment and overview, with any separate future projects, when identified, to be accompanied by additional EIR's"].)

According to SANDAG, implementation of the project will involve "literally hundreds of individual freeway, highway, local road, public transit, bikeway and other transportation projects, as well as ongoing development of various mitigation, planning and transportation management programs." In addition, many of these projects will occur 10, 20 or 30 years into the future and will be carried out by others including local governments and/or agencies, where baseline conditions may have substantially changed and after the project itself will have gone through multiple mandatory updates on a four-year cycle as currently required under Government Code section 65080, subdivision (d).

Because most, if not all, of these individual future transportation projects and/or land use decisions will be subject to its own project-level review under CEQA, and

because, in any event, SANDAG's EIR considered the public policy of GHG emission reduction and the CARB has not yet established 2050 GHG reduction target numbers for the SANDAG MPO region, I believe there is absolutely no reason to send the EIR back to the trial court for further consideration of GHG impacts utilizing the Executive Order as a threshold. Rather, I believe this is a waste of precious resources and will amount to "endless rounds of revision and recirculation of EIR's" that the Legislature did not intend. (See *Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal.4th 1112, 1132; see also Guidelines, § 15151 [stating that the "sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible" and that "courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure" in analyzing the adequacy of an EIR]; *Treasure Island, supra*, 227 Cal.App.4th at p. 1061 [noting it "has long been recognized that premature attempts to evaluate effects that are uncertain to occur or whose severity cannot reliably be measured is 'a needlessly wasteful drain of the public fisc'"].)

In sum, I conclude there is substantial evidence in the record showing SANDAG acted reasonably and in good faith when it addressed the GHG impacts of its project and properly exercised its discretion under Guidelines section 15064.4. I thus would reverse the trial court order finding SANDAG's GHG impacts analysis insufficient under CEQA.

II

Mitigation Measures

Initially, because I conclude the EIR adequately addressed the GHG impacts of the project, unlike the majority I do not deem moot (or partially moot) (Maj. opn. *ante*, at p. 23) SANDAG's contention that the EIR also adequately addressed mitigation measures

for the project's significant GHG impacts. Also unlike the majority, I conclude the EIR adequately considered reasonable mitigation measures for GHG impacts.

A. Additional Background

As noted, the EIR under the "existing conditions" baseline, GHG-1, concluded that the GHG impacts in 2020 would be a less than significant impact but would be significant in 2035 and 2050. Based on this analysis, the EIR proposed three mitigation measures to reduce impacts related to GHG emissions to less than significant levels.

The first mitigation measure, GHG-A, provided: "SANDAG shall update future Regional Comprehensive Plans and Regional Transportation Plans/Sustainable Community Plans to incorporate policies and measures that lead to reduced GHG emissions. Such policies and measures may be derived from the General Plans, local jurisdictions' Climate Action Plans, and other adopted policies and plans of its member agencies that include GHG mitigation and adaptation measures or other sources."

The second, GHG-B, encouraged the "San Diego region cities and the County government" to "adopt and implement Climate Actions Plans" (CAP's) and other climate strategies by: a) quantifying GHG emissions, "both existing and projected over a specified time period, resulting from activities within their respective jurisdictions"; b) establishing a "level . . . below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable"; c) identifying and analyzing GHG emissions "resulting for specific actions . . . anticipated within their respective jurisdictions"; d) specifying measures, "including performance standards, that . . . if implemented on a project-by-project basis, would collectively achieve the specified emissions level"; e) establishing a mechanism to monitor the "progress toward achieving

that level" of specified emissions and requiring an amendment if such levels are not achieved; and f) adopting such plans "in a public process following environmental review."

GHG-B further provided that, when appropriate, CAP's should "incorporate planning and land use measures from the California Attorney General's latest list of example policies to address climate change at both the plan and project level." At the plan level, GHG-B identified various policies to be considered and, if appropriate, implemented, from the website of the California Attorney General providing examples to address climate change, including "[s]mart growth, jobs/housing balance, transit-oriented development, and infill development through land use designations, incentives and fees, zoning, and public-private partnerships"; "[c]reate transit, bicycle, and pedestrian connections through planning, funding, development requirements, incentives and regional cooperation, and create disincentives for auto use"; [and] "[e]nergy and water-efficient buildings and landscaping through ordinances, development fees . . . and other implementing tools."

GHG-B also identified project-specific mitigation measures available on the website that, if appropriate, should be implemented at the plan level in a CAP's planning and land use measures, including adopting a "comprehensive parking policy" that encourages use of alternate transportation and discourages use of private vehicles; building or funding a "major transit stop within or near development"; providing public transit incentives, such as free or low-cost monthly transit passes to the public; incorporating bicycle lanes and routes into new development; and requiring facilities and amenities for non-motorized transportation, such as secure bicycle parking.

SANDAG in connection with GHG-B stated it would assist local governments in preparing CAP's and other climate strategies plans through implementation of its own CAS, which, as noted, was created in 2010 "as a guide for SANDAG and local governments and policymakers in addressing climate change." The CAS "provides a toolbox of land use, transportation, and related policy measures and investments that help implement the 2050 RTP/SCS [i.e., the project] through reducing GHG emissions. Policy measures also are identified for buildings and energy use, protecting transportation and energy infrastructure from climate impacts, and to help SANDAG and local jurisdictions reduce GHGs from their operations."

The third mitigation measure discussed in the EIR, GHG-C, provided SANDAG and local governments should require "Best Available Control Technology" (BACT) in constructing and operating projects.

SANDAG also considered additional mitigation measures that were found to be infeasible. One such measure was requiring all vehicles in the San Diego region to be either zero-emission vehicles or to be powered by renewable energy. SANDAG found this measure infeasible because of the "rate of turnover of vehicles on the roadway" and because of the limited number of such vehicles available. Another measure found to be infeasible was requiring all future construction to be net-zero energy use. Although renewable energy is available and is an option for a portion of a project's energy needs, SANDAG concluded it was infeasible for all projects to have net-zero emissions (i.e., hospitals).

Finally, SANDAG also found infeasible the requirement that all future construction activity include only "retrofitted equipment." Because certain equipment

does not have "retrofit components," SANDAG concluded this mitigation measure was infeasible.

SANDAG in the EIR noted that implementation of mitigation measures GHG-A through GHG-C "would reduce GHG emissions through adoption of measures and policies that encourage GHG emissions reduction in regional plans, adoption of Climate Action Plans by member agencies, and using BACT during construction and operation of implemented projects." Because of the growth in population, housing, and employment, the EIR concluded implementation of the project "would result in an increase in GHG emissions" and, as such, even with the mitigation measures, GHG-1, the existing conditions baseline, "would remain a significant and unavoidable impact in 2035 and 2050."

B. Governing Law and Analysis

It is axiomatic that an EIR must describe feasible measures that could minimize significant adverse impacts. (Guidelines, § 15126.4, subd. (a)(1).) Feasible means "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." (*Id.*, § 15364.)

However, a lead agency may find that "particular economic, social, or other considerations make the alternatives and mitigation measures infeasible and that particular project benefits outweigh the adverse environmental effects. (Pub. Resources Code, § 21081, subds. (a)(3), (b); Guidelines, § 15091, subd. (a)(3).) Specifically, an agency cannot approve a project that will have significant environmental effects unless it finds as to each significant effect, based on substantial evidence in the administrative

record, that (1) mitigation measures required in or incorporated into the project will avoid or substantially lessen the significant effect; (2) those measures are within the jurisdiction of another public agency and have been adopted, or can and should be adopted, by that agency; or (3) specific economic, legal, social, technological, or other considerations make the mitigation measures or alternatives identified in the EIR infeasible, and specific overriding economic, legal, social, technological, or other benefits outweigh the significant environmental effects. (Pub. Resources Code, §§ 21081, 21081.5; Guidelines, § 15091, subds. (a), (b).)" (*Federation of Hillside & Canyon Assns. v. City of Los Angeles* (2004) 126 Cal.App.4th 1180, 1198; see *South County Citizens for Smart Growth v. County of Nevada* (2013) 221 Cal.App.4th 316, 336 [noting that "'CEQA requires the appropriate public agency 'to find, based on substantial evidence, that the mitigation measures are 'required in, or incorporated into, the project'; or that the measures are the responsibility of another agency and have been, or can and should be, adopted by the other agency; or that mitigation is infeasible and overriding considerations outweigh the significant environmental effects'"].)

Claims concerning the feasibility or effectiveness of mitigation measures are reviewed for substantial evidence, which is defined as "enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached." (*Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 477, 486.) In reviewing an agency's decision for substantial evidence, courts "must indulge all reasonable inferences from the evidence that would support the agency's determinations and resolve all conflicts in the evidence in favor of the agency's decision." (*California Native Plant*

Society v. City of Santa Cruz (2009) 177 Cal.App.4th 957, 985.) This standard of review flows from the fact that an "agency has the discretion to resolve factual issues and to make policy decisions." (*Save Our Peninsula Committee v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 120.)

""As with all substantial evidence challenges, an appellant challenging an EIR for insufficient evidence must lay out the evidence favorable to the other side and show why it is lacking. Failure to do so is fatal. A reviewing court will not independently review the record to make up for appellant's failure to carry his [or her] burden."" (*Pfeiffer v. City of Sunnyvale City Council* (2011) 200 Cal.App.4th 1552, 1572.)

Here, I conclude petitioners have not met their burden of showing the mitigation measures for GHG emissions described by SANDAG in its program EIR were inadequate. As noted, the EIR discussed three separate mitigation measures in connection with impact analysis GHG-1. Each such measure complies with Guidelines section 15126.4, subdivision (c)(5), which was adopted in response to SB 97 and which provides the GHG mitigation measures proposed in connection with adoption of a long-range plan, such as the instant project, "may include the identification of specific measures that may be implemented on a project-by-project basis."¹²

¹² Subdivision (c) of Guideline section 15126.4 provides in part: "[L]ead agencies shall consider feasible means, supported by substantial evidence and subject to monitoring or reporting, of mitigating the significant effects of greenhouse gas emissions. Measures to mitigate the significant effects of greenhouse gas emissions may include, among others: [¶] (1) Measures in an existing plan or mitigation program for the reduction of emissions that are required as part of the lead agency's decision; [¶] (2) Reductions in emissions resulting from a project through implementation of project features, project design, or other measures, such as those described in Appendix F; [¶] (3) Off-site measures, including offsets that are not otherwise required, to mitigate a project's emissions; [¶] (4) Measures that sequester greenhouse gases; [¶] (5) In the case of the

Moreover, the record shows SANDAG considered additional mitigation measures to reduce GHG emissions and found them infeasible. (See *Clover Valley Foundation v. City of Rocklin* (2011) 197 Cal.App.4th 200, 245 [noting that CEQA does not require "an EIR to explain why certain mitigation measures are infeasible"]; see also *Cherry Valley Pass Acres & Neighbors v. City of Beaumont* (2010) 190 Cal.App.4th 316, 351 [noting CEQA does not require an EIR to analyze in detail mitigation measures deemed infeasible].)

At the conclusion of the CEQA review process, the record shows SANDAG adopted both the mitigation measures within its power to implement and a mitigation monitoring program (MMRP) for compliance. (See §§ 21081 & 21081.6.) The mitigation measures and MMRP confirm SANDAG's commitment to implementing GHG mitigation measures described in the EIR.

I do not agree with petitioners that the mitigation measures were insufficiently unenforceable because, particularly with respect to GHG-A and GHG-B, they depended on the cooperation of multiple other agencies. As noted, CEQA allows a lead agency to approve or carry out a project with potential adverse impacts if "[c]hanges or alterations have been . . . incorporated into[] the project" and "[t]hose changes or alterations are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency." (§ 21081, subd. (a)(1) & (2).)

adoption of a plan, such as a general plan, long range development plan, or plans for the reduction of greenhouse gas emissions, mitigation may include the identification of specific measures that may be implemented on a project-by-project basis. Mitigation may also include the incorporation of specific measures or policies found in an adopted ordinance or regulation that reduces the cumulative effect of emissions."

Finally, because SANDAG in my view satisfied its initial burden to consider a range of reasonable mitigation measures in its EIR, I would conclude the burden then switched to petitioners to establish from the record what petitioners describe as other "effective" mitigation measures that allegedly were omitted from consideration in the EIR and to show, again from the record, that such "effective" measures 1) were not only legally feasible but also suitable for discussion in a program EIR involving a project incorporating a broad range of planning measures and policies over the next several decades, *and* 2) would avoid or substantially lessen the project's GHG impacts. (See *San Diego Citizenry Group v. County of San Diego* (2013) 219 Cal.App.4th 1, 14-17 [rejecting the petitioners' contention that unspecified, additional mitigation measures should have been considered in "meaningful detail" in an EIR and noting the general rule that "CEQA does not . . . require discussion of every mitigation measure the agency rejected as infeasible"].) I would conclude petitioners have not met, and cannot meet, this burden in this case. (See *id.* at p. 17 [noting that "[f]easibility under CEQA encompasses desirability to the extent that desirability is based on a reasonable balancing of the relevant economic, environmental, social, and technological factors"].)¹³

BENKE, J.

¹³ Because the trial court never reached the issues raised in the cross-appeal and because the majority in any event is remanding the matter with respect to the EIR's treatment of GHG impacts and mitigation measures of the project, as I have noted, I would defer the issues raised in the cross-appeal to the trial court for consideration. Nonetheless, I feel compelled to state my objection to the majority's conclusion that SANDAG failed to consider a reasonable range of project alternatives.

RE: San Diego County Climate Action Plan (SCH# 2016101055), Newland Sierra Project (SCH# 2015021036), and the CARB 2017 Climate Change Scoping Plan

Dear Ms. Soffel and Ms. Smith:

Endangered Habitats League (EHL) wishes to supplement its comments on the draft Climate Action Plan (CAP) due to new and previously unavailable information released from the California Air Resources Board (CARB). That agency's revised October 27, 2017 Climate Change Scoping Plan (2017 Climate Change Scoping Plan) is highly pertinent to the County's own efforts. See: <<https://www.arb.ca.gov/cc/scopingplan/revised2017spu.pdf>>. As this new information also affects the proposed Newland Sierra project and its draft environmental impact report (DEIR), please submit this letter into the administrative record for that project.

Please note that these comments are also submitted on behalf of California Native Plant Society San Diego Chapter, Environmental Center of San Diego, Escondido Neighbors United, Southwest Wetlands Interpretive Association, San Diego Audubon Society, Preserve Wild Santee, Buena Vista Audubon Society, and San Pasqual Valley Preservation Alliance. All our organizations respectfully request your consideration.

The 2017 Climate Change Scoping Plan identifies how the State may reach its 2030 climate change target to reduce GHG emissions by 40 percent below 1990 levels, and substantially advance towards the State's 2050 climate goal to reduce GHG emissions by 80 percent below 1990 levels. The 2017 Climate Change Scoping Plan seeks to integrate efforts already underway to reduce the State's GHG emissions. Given the importance of the 2017 Climate Change Scoping Plan's guidance in reaching the State's GHG emissions reductions goals, it is critical that the County analyzes its recommendations within the County's environmental review for the County's CAP and the Newland Sierra Project.

It is expected that this 2017 Climate Change Scoping Plan will be adopted in final form by CARB within the next few months, perhaps at CARB's December meetings.¹ Assembly Bill 398 directs CARB to update the Scoping Plan no later than January 1, 2018. Therefore, the new Climate Change Scoping Plan will be in effect before the County considers the proposed CAP and proposed Newland Sierra Project. Rather than simply waiting until after the County finalizes the EIRs for both projects, we submit this letter now to make sure that County staff is aware of all of the information regarding the Scoping Plan that must be included in the County's two EIRs. The relevant information is summarized below.

I. VEHICLE MILES TRAVELED IS AN ESSENTIAL COMPONENT OF REDUCING GHG EMISSIONS

A. CARB Policy

The 2017 Climate Change Scoping Plan states that VMT reduction serves as an essential part of GHG emissions reductions, enabling the State to meet its climate change goals:

Stronger SB 375 GHG reduction targets will enable the State to make significant progress toward the goal of reducing total light-duty VMT by 15 percent from expected levels in 2050, but alone will not provide all of the VMT reductions that will be needed. The gap between what SB 375 can provide and what is needed to meet the State's 2030 and 2050 goals needs to be addressed through additional VMT reduction measures.

(2017 Climate Change Scoping Plan at p. 116.)

The 2017 Climate Change Scoping Plan repeatedly emphasizes the importance of VMT reductions. (2017 Climate Change Scoping Plan at pp. 74 [VMT reductions result in important health benefits]; 113 [transportation sector reduction goals include: "Promote all feasible policies to reduce VMT, including: Land use and community design that reduce VMT; Transit oriented development"].)

With regard to local actions, the 2017 Climate Change Scoping Plan recognizes that local decisions to reduce VMT are necessary to achieve the 2030 target under SB 32:

While the State can do more to accelerate and incentivize these local decisions, local actions that reduce VMT are also necessary to meet transportation sector-specific goals and achieve the 2030 target under SB 32. *Through developing the Scoping Plan, CARB staff is more convinced than ever that, in addition to achieving GHG reductions from cleaner fuels and vehicles, California must also reduce VMT.* Stronger SB 375 GHG reduction targets will enable the State to make significant progress toward needed reductions, but alone will not provide the VMT

¹ The first draft of the Plan was released on January 20, 2017.
https://www.arb.ca.gov/cc/scopingplan/2030sp_pp_final.pdf

growth reductions needed; there is a gap between what SB 375 can provide and what is needed to meet the State’s 2030 and 2050 goals. In its evaluation of the role of the transportation system in meeting the statewide emissions targets, CARB determined that *VMT reductions of 7 percent below projected VMT levels in 2030 (which includes currently adopted SB 375 SCSs) are necessary. In 2050, reductions of 15 percent below projected VMT levels are needed. A 7 percent VMT reduction translates to a reduction, on average, of 1.5 miles/person/day from projected levels in 2030.* It is recommended that local governments consider policies to reduce VMT to help achieve these reductions, including: land use and community design that reduces VMT; transit oriented development; street design policies that prioritize transit, biking, and walking; and increasing low carbon mobility choices, including improved access to viable and affordable public transportation and active transportation opportunities. It is important that VMT reducing strategies are implemented early because more time is necessary to achieve the full climate, health, social, equity, and economic benefits from these strategies

(2017 Climate Change Scoping Plan at p. 150 [emphasis added].)

The 2017 Climate Change Scoping Plan makes clear that VMT reduction stands alone as separate and distinct from any plan for mitigating project GHG emissions impacts or other land use policies, including the potential for allowing the purchase of GHG emissions offsets and “offshore offsets.” Because CARB is “more convinced than ever” that VMT reduction is necessary to achieve State GHG reduction targets, local land use decisions may not mitigate increased GHG emissions resulting from VMT generated by new development projects merely by implementing GHG reduction policies that do not also reduce projects’ VMT. The 2017 Climate Change Scoping Plan does not allow for VMT mitigation through measures, such as purchasing offsets, that do not reduce projects’ VMT.

B. Climate Action Plan

The CAP draft supplemental environmental impact report (DSEIR) fails to describe how the proposed action will affect San Diego County’s overall VMT either by total miles or per person miles. Further, the DSEIR does not provide separate metrics for measuring VMT, nor does it describe how the CAP will impact the region as a whole. While the CAP analyzes GHG emissions impacts sector-by-sector within the County, it should provide an overall consideration of the impacts as a whole to accurately ascertain consistency with the 2017 Climate Change Scoping Plan, and compliance with Assembly Bill (AB) 32, Senate Bill (SB) 32, and other GHG reduction requirements. The DSEIR must provide this information.

For General Plan Amendments (GPAs) approved after the adoption of the CAP, the CAP proposes mitigating GHG impacts through the reliance on offsets that do not result in VMT reductions. GPAs would inherently produce GHG emissions over and above those considered in the General Plan and mitigated in the CAP. Similarly, any VMT from GPAs approved

subsequent to the CAP would be additive and must be appropriately mitigated. This cannot be achieved through the use of offsets alone.

C. Newland Sierra Project

The Newland Sierra Project's DEIR does not describe how the development will affect San Diego County's overall VMT either by total miles or per person miles. Although the Newland Sierra DEIR argues that a VMT analysis is not required, it provides a cursory analysis of the Newland Sierra Project's VMT: it states that the Newland Sierra Project's per capita VMT would be greater than the threshold for the County as a whole but less than the threshold for its rural subregion. Here, the appropriate metric would be the Countywide comparison, which corresponds to SANDAG's jurisdiction and the area to which the RTP/SCS applies. Also, the higher VMT in the subregion than the County as a whole is indicative that the Newland Sierra Project is proposed in a rural area requiring long car trips, which is contrary to smart planning.

Similar to the CAP, the Newland Sierra Project mitigates approximately 82% of its GHG emissions through the use of offsets. The offset program will not result in VMT reduction, and therefore is inconsistent with the 2017 Climate Change Scoping Plan. Moreover, the Newland Sierra Project only proposes Project Design Features, not mitigation measures, aimed at reducing VMT, and is therefore inconsistent with the 2017 Climate Change Scoping Plan.

II. THE CAP EIR AND THE NEWLAND EIR EACH MUST ANALYZE HOW THEY COMPLY WITH THE STATEWIDE METRIC FOR GHG EMISSIONS

A. CARB Policy

As mentioned above: "CARB determined that VMT reductions of 7 percent below projected VMT levels in 2030 (which includes currently adopted SB 375 SCSs) are necessary. In 2050, reductions of 15 percent below projected VMT levels are needed. A 7 percent VMT reduction translates to a reduction, on average, of 1.5 miles/person/day from projected levels in 2030." (2017 Climate Change Scoping Plan at p. 150.) CARB "also recognized that GHG determinations in CEQA should be consistent with the statewide Scoping Plan goals, and that CEQA documents taking a goal-consistency approach may soon need to consider a project's effects on meeting the State's longer term post-2020 goals." (*Id.* at p. 151) As such, CARB has established that local decisions impacting VMT and GHG are key to meeting the State's climate change goals.

B. Climate Action Plan DEIR Deficiencies

The CAP's DSEIR does not provide information which compares how the CAP will result in GHG emission metrics that compare to the GHG metrics in the 2017 Climate Change Scoping Plan. In addition, the DSEIR does not indicate whether the CAP's assumptions are consistent with the projected San Diego County population figures and projections used by CARB to derive the statewide metrics for per person GHG emissions.

The need for this information to be made available to the public is underscored by the fact that the CAP is a mitigation measure for the County's General Plan Update from 2011,

which assumed the amount of growth planned for within the General Plan. By contrast, the current proposed version of the County’s CAP contemplates additional GPAs, which would add population and associated GHG emissions on top of the amounts planned for in the 2011 General Plan as adopted. The CAP’s DSEIR must fully analyze the additional population and GHG emissions that are now going to be authorized by the latest proposed CAP. In addition, the CAP DSEIR must analyze whether GPAs that exceed the metric set forth in CARB’s 2017 Climate Change Scoping Plan may nonetheless be “cured” by the purchase of offsets without separate VMT mitigation.

C. Newland Sierra Project DEIR Deficiencies

The Newland DEIR does not provide information which compares how the development will result in GHG emissions that compare to the GHG metrics in the 2017 Climate Change Scoping Plan. Also, the DEIR does not indicate whether the DEIR’s assumptions are consistent with the projected San Diego County population figures and projections used by CARB to derive the Statewide metrics for per person GHG emissions. The Newland Sierra Project is unplanned growth that was not accounted for in the County’s General Plan. Because SANDAG’s RTP/SCS is based on the County’s General Plan land uses, new emissions and VMT from the Newland Sierra Project were not considered therein, and additional analysis is required. It is unclear whether Newland’s approximately 6,000 new residents will meet the RTP/SCS metric, or if there will be greater emissions. The DEIR must state whether or not the metric may be exceeded but “cured” by the purchase of offsets without separate VMT mitigation. It must also analyze whether the Project’s VMT will comply new Statewide metrics and allow SANDAG to comply with them.

III. THE CAP DSEIR AND NEWLAND DEIR MUST ANALYZE HOW THEY COMPLY WITH SENATE BILL 375 COMPLIANCE EFFORTS

A. CARB Policy

The 2017 Climate Change Scoping Plan describes the compliance efforts and GHG reductions from SB 375 and CARB’s recently released targets² for Metropolitan Planning Organizations (MPOs) such as SANDAG:

Local land use decisions play a particularly critical role in reducing GHG emissions associated with the transportation sector, both at the project level, and in long-term plans, including general plans, local and regional climate action plans, specific plans, transportation plans, and supporting sustainable community strategies developed under SB 375.

(2017 Climate Change Scoping Plan at p. 150.)

Further, CARB recently proposed new GHG emissions reduction targets for MPOs in order to reach the Statewide SB 375 GHG emission reduction targets. The targets are currently

² Available at:

https://www.arb.ca.gov/cc/sb375/final_staff_proposal_sb375_target_update_october_2017.pdf.

slated to take effect in 2018. SANDAG originally recommended a seven percent GHG emissions reduction in 2020 and a thirteen percent GHG emissions reduction in 2035 relative to 2005 emissions. SANDAG now proposes an 18 percent reduction target in 2035 relative to 2005 emissions. SANDAG's current RTP/SCS anticipates cities will continue to grow within existing urban boundaries, bringing people and destinations closer in mixed-use, compact communities that facilitate walking and transit use. SANDAG anticipated the additional GHG reductions would need to come from increasing the cost of driving and the number of zero-emission passenger vehicles, which CARB noted are outside the control of SANDAG and SB 375. CARB recommended a SB 375 target of 15 percent in 2020 and 21 percent in 2035, three percentage points higher than SANDAG's target recommendation due to CARB's quantification of the potential for additional land use and transportation strategies. Of note, CARB's targets for SANDAG (which has jurisdiction that is coterminous with County boundaries) are higher than other regional MPO targets, which indicates SANDAG's GHG emissions reduction efforts must go over and above efforts in other parts of the State. VMT reduction within the unincorporated County, therefore, takes on particular importance. Because of the unincorporated County's rural nature, new development there is likely to add more VMT than new development in the incorporated cities. Allowing unplanned sprawl development in the unincorporated County would thwart efforts throughout the County (SANDAG's jurisdiction) to reduce VMT consistent with SB 375 and CARB's new targets.

B. Climate Action Plan

The CAP must take into account how its adoption may affect SANDAG's ability to adopt a new RTP/SCS that complies with CARB's new targets. Given the increase in reductions from San Diego County under the new SB 375 targets, CARB has indicated that it believes San Diego County has additional work to do to reduce GHG emissions in order to ensure the State reaches its climate change goals. The CAP DSEIR should analyze how the CAP helps or hinders reaching SANDAG's targets, as it cannot merely assume that SANDAG will meet them.

The CAP DSEIR must identify how the CAP and its various alternative strategies and mitigation measures will affect regional compliance with CARB's updated targets, as well as regional VMT. The County's DSEIR fails to do so. Therefore, the public has not been given crucial information as to how the mitigation measures and alternatives in the proposed CAP will affect the SB 375 regulatory regime. The California Supreme Court recently overturned a local agency's project approval for similarly failing to identify potential environmentally sensitive habitat areas (ESHA) under the California Coastal Act, and account for those areas in their analysis of the project's mitigation. (*Banning Ranch Conservancy v. City of Newport Beach* (2017) 2 Cal.5th 918.) The Court concluded the absence of ESHA information failed to provide decision makers with the necessary information on a proposed project, although ESHA impacts were outside of the city's purview. Consistent with the new *Banning Ranch* decision, the CAP DSEIR must identify and analyze how it complies with State regulations which inform the CAP DSEIR's implementation of GHG mitigation measures.

Under *Banning Ranch*, it is crucial that an EIR on a project present information on how "related regulatory regimes" may apply to the proposed project, such as how the various mitigation measures and alternatives may help the County reach compliance with other related regulatory requirements such as SB 375 and CARB's updated GHG emission reduction targets

for SANDAG. In *Banning Ranch*, the Supreme Court stated that “[a]n EIR project description must include ‘[a] list of related environmental review and consultation requirements [found in] federal, state, or local laws, regulations, or policies. To the fullest extent possible, the lead agency should integrate CEQA review with these related environmental review and consultation requirements.’” Failure to present this information results in an information deficiency in the DSEIR, and the County should be able to provide such information regarding VMTs to accurately disclose how the CAP will affect SANDAG’s RTP/SCS process given the proposed land uses under the CAP.

Further, the County’s General Plan itself requires collaboration with local and State agencies, including SANDAG. General Plan Policy COS-20.3 states that the County must “[c]oordinate air quality planning efforts with federal and State agencies, SANDAG, and other jurisdictions.” Therefore, the County should collaborate with SANDAG to analyze consistency with the updated targets in the DSEIR.

C. Newland Sierra Project

The Newland Sierra Project fails to meet SANDAG’s current per capita VMT threshold and will generate new VMT that was not included in SANDAG’s adopted 2015 RTP/SCS, which was based on the assumption that the County would not approve a new urban level of development on the Newland site. In the new 2017 Updated Scoping Plan, CARB has indicated that VMT in San Diego County must be further reduced to comply with SB 375. As a result, if the County were to approve the Newland Sierra Project with its unplanned additional VMTs and the amount of VMT’s per person, the County’s action would cause the San Diego County region to fall short of SANDAG’s updated total VMT and per capita VMT reduction goals set forth in the adopted 2015 RTP/SCS and likely as well the upcoming 2020 RTP/SCS now be being prepared by SANDAG.

The Newland Sierra Project DEIR falls victim to many of the same errors as the CAP DSEIR. The Newland DEIR has failed to present information on how the Project will impact cumulative County-wide VMT averages. The DEIR merely discusses VMT, and provides information on the unincorporated County and the project’s subregion, without providing information on how the Project will impact the overall averages for the County, and therefore whether or not the Project will help or hinder the County in reaching its VMT reduction goals recommended by CARB. Under *Banning Ranch*, the County cannot simply leave this analysis for SANDAG to figure out how it will meet the required targets. Further, based on the limited analysis provided in the Newland DEIR, it appears that the Project would increase the County’s overall per person VMT because it exceeds the County’s VMT threshold. This would make it more difficult to comply with SB 375 and CARB’s new targets, making it even more important that the DEIR analyze the Project’s impacts on SANDAG’s ability to comply with SB 375. The County should have coordinated with SANDAG to ensure the required analysis took place. It does not appear the County has done so, and instead presents the Newland Sierra Project’s approval as *fait accompli*, whether or not it allows SANDAG to actually meet its regional GHG and VMT reduction requirements.

IV. THE CAP DSEIR AND THE NEWLAND DEIR MUST ANALYZE ENVIRONMENTAL JUSTICE IMPACTS

A. CARB Scoping Plan

CARB's 2017 Climate Change Scoping Plan rejects reliance on "offshore offsets" as a primary means for GHG mitigation. CARB explicitly recommends prioritization of on-site design features to reduce GHG emissions and direct investment in GHG reduction within a project's own region in order to achieve co-benefits. CARB also emphasizes the need for project features that reduce VMT and planning new development with access to affordable transit opportunities:

To the degree a project relies on GHG mitigation measures, *CARB recommends that lead agencies prioritize on-site design features that reduce emissions, especially from VMT, and direct investments in GHG reductions within the project's region that contribute potential air quality, health, and economic co-benefits locally.* For example, on-site design features to be considered at the planning stage include land use and community design options that reduce VMT, promote transit oriented development, promote street design policies that prioritize transit, biking, and walking, and increase low carbon mobility choices, including improved access to viable and affordable public transportation, and active transportation opportunities.

(2017 Climate Change Scoping Plan at p. 152 [emphasis added].)

In addition to its focus on on-site features to reduce GHG emissions and VMT, CARB provides examples of regional investment to reduce VMT that also create jobs and benefit the local economy. These include "local building retrofit programs that can pay for cool roofs, solar panels, solar water heaters, smart meters, energy efficient lighting, energy efficient appliances, energy efficient windows, insulation, and water conservation measures for homes within the geographic area of the project." (2017 Climate Change Scoping Plan at p. 152.) Other examples include "financing installation of regional electric vehicle (EV) charging stations, paying for electrification of public school buses, and investing in local urban forests." (*Ibid.*) Further, the 2017 Climate Change Scoping Plan recognizes that VMT and GHG emissions reductions are an environmental justice issue, as the Environmental Justice Advisory Committee recommended that CARB restrict sprawl and examine regional transportation issues. (*Id.* at p. 25.)

Finally, CARB emphasizes that offset investments cannot merely pay lip service to GHG reduction, but must provide clear evidence of follow through and monitoring to make sure such reductions are achieved: "Local direct investments in actions to reduce GHG emissions should be supported by quantification methodologies that show the reductions are real, verifiable, quantifiable, permanent, and enforceable." (2017 Climate Change Scoping Plan at p. 152.) Only if project design features and regional investments are found "infeasible" should a lead agency consider mitigation through retiring carbon credits. (*Ibid.*) CARB's emphasis on GHG

reductions through on-site features and direct investment within a project's region is an important public policy and environmental justice issue and should not be discarded lightly.

B. Climate Action Plan

The CAP fails to meet CARB's criteria for GHG mitigation as described above. As described in EHL's prior comments on the draft CAP, as an *initial* measure, all GPAs should attain a minimum threshold of VMT reduction, for example, at least achieving compliance with regional RTP/SCS VMT reduction targets. While *after* this, offsets might be considered, the CAP provides only a loose priority system for availability of offsets and sets no criteria for a project's analysis of feasibility of on-site reduction activities or regional direct investment. In fact, the CAP does not even disclose whether or to what extent projects exist in San Diego County that would be candidates for local direct investment. As a programmatic document, the County's CAP should provide clear guidance for subsequent project-specific analyses regarding the availability of local direct investment opportunities. The CAP should also require a clear finding of infeasibility, based on up-front standards, for additional on-site measures before a project moves to local direct investment and a clear finding of infeasibility, based on up-front standards, for local direct investment before moving to more distant or "offshore" offsets.

In addition, the CAP does not provide criteria for GPA projects relying on offsets to demonstrate with substantial evidence that reductions are "real, verifiable, quantifiable, permanent, and enforceable." In fact, the CAP lacks provisions requiring that the County as lead agency be a party to any contract relating to offsets or that clarifying the duties of any entity providing such offsets.

The CAP's loose priority structure would allow a project to move forward with 100% "offshore offsets" with little or no certainty that any would ever be achieved. This failure only serves to deprive the citizens of San Diego County of the economic opportunity brought by local direct investment and the health and air quality co-benefits of on-site GHG emissions reductions and local direct investment. This ignores sound public policy and environmental justice. Further, County roadways could become even further clogged with traffic due to greenfield developments that add GHG emissions and VMT while relying on "offshore offset" projects for mitigation.

C. Newland Sierra Project

The Newland Sierra DEIR repeats and builds upon many of the CAP's failings with allowing 100% "offshore offsets" while polluting San Diego County air and adding to San Diego County traffic congestion in exchange for a vague and unenforceable promise to seek GHG reduction activities across the globe. Newland Sierra fails to account for environmental justice in its analysis, and instead proposes a project that would result in greater sprawl rather than more infill development located near transportation hubs. Also, the use of offsets as an apparent replacement for specified on-site mitigation measures to reduce the Project's GHG emissions impacts contradicts the 2017 Climate Change Scoping Plan's emphasis on VMT reductions in order to "contribute potential air quality, health, and economic co-benefits locally." (2017 Climate Change Scoping Plan at p. 152.) The Newland Sierra Project's proposed offset scheme will not reduce the Project's overall VMT, and therefore cannot provide the necessary co-

benefits to the area's health and economy. The DEIR should require real investment in on-site GHG reductions to "generate real demand side benefits and local jobs." (*Ibid.*) Before resorting to the use of offsets, the Newland Sierra DEIR should consider and analyze the options outlined in the 2017 Climate Change Scoping Plan. Further, the Newland Sierra Project is proposed far from any existing or planned transit infrastructure and fails to provide any meaningful proposal to eliminate long automobile trips necessitated by sprawl development.

Newland's proposal is contrary to the public policy and environmental justice principles emphasized in the 2017 Climate Change Scoping Plan. The Newland Sierra Project would set a low bar for efforts in San Diego County and across the State to reduce GHG emissions by opening the floodgates to greenfield development based on vague and unenforceable promises of developers purchasing carbon credits overseas. CARB's emphasis on GHG reduction through VMT reduction followed by on-site measures and local direct investment sets a path forward for responsible balancing of development and GHG emissions reduction. The net zero concept must not become a paper tiger that shirks California's and San Diego County's commitment and responsibility as leaders in the fight to curb the effects of global climate change. The goal should be a carbon efficient economy *in San Diego*.

Thank you for your time and attention to these comments. Please include them in the CAP's administrative record and the Newland Sierra Project's administrative record, and please provide response to the points raised above. While the public comment periods for both the CAP's DSEIR and Newland DEIR have closed, this important development in State and regional GHG emissions and VMT reduction efforts was not available previously and warrants additional comment and response at this time. As always, we would look forward to collaborating with you on solutions. Please do not hesitate to contact me with questions or comments.

Rami Talleh, Deputy Director
Planning and Development Services
County of San Diego
5510 Overland Avenue, Suite 310
San Diego, CA 92123

Re: Response to Your August 24, 2017 Letter re North County MSCP Steering Committee Presentation

Dear Mr. Talleh:

As you know, we represent Golden Door Properties, LLC (“Golden Door”). We appreciate your August 24, 2017 response to our May 22, 2017 letter titled “North County MSCP Steering Committee Presentation.”

As you are aware, County of San Diego Planning and Development Services (“PDS”) is processing the proposed Newland Sierra project (“Project”). On May 7, 2015, PDS published a scoping letter (“Scoping Letter”) for the Project listing “Major Project Issues. (A copy of the Scoping Letter may be accessed online at <http://www.sandiegocounty.gov/content/dam/sdc/pds/regulatory/docs/newlandsierra/NewlandSierraScopingLetter.pdf>.) One of the Major Project Issues addressed in the Scoping Letter is “MSCP Draft North County Plan and Natural Communities Conservation Program (NCCP) Consistency.” (See Scoping Letter at 4, Attachment A Item 1-2.)

The Scoping Letter specifically addresses the potential for a hardline agreement for the Newland Project:

Please note that if the Wildlife Agencies Hardline Agreement is not approved, the project would be required to comply with the North County Plan and its requirements for projects in Pre-approved Mitigation Areas (PAMA), including avoidance of critical populations of sensitive species and adherence to preserve design and linkage principles. If the North County Plan has not been approved prior to the project moving forward, the project will require compliance with the Habitat Loss Permit (HLP) Ordinance and the County and Wildlife Agencies Planning Agreement.

(Scoping Letter at 4.) The Scoping Letter’s decision in the absence of an approved hardline agreement or approval of the North County Multiple Species Conservation Program (“NC MSCP”), therefore, is to require the Newland Project to comply with the Planning Agreement, including its preliminary conservation objectives and requirements for pre-approved mitigation areas (“PAMA”). The public has received no notice from County staff that the Scoping Letter has been revoked or modified, and it remains posted on the County’s website as of today’s date.

As your letter notes, the U.S. Fish and Wildlife Service (“USFWS”) and California Department of Fish and Wildlife (“CDFW,” together the “Wildlife Agencies”) must agree to any hardline included in the NC MSCP. The Wildlife Agencies have not agreed to the County’s proposed hardline for the Newland Project. Consequently, the County should adhere to the Scoping Letter’s decision and not assume a hardline for the purpose of environmental analysis—in either the project-specific environmental documents for the Newland Project or the County’s draft of the NC MSCP.

The approach set forth in your August 24 letter contradicts the County’s decision contained in the Scoping Letter. Your letter states on page 2 that “if [the Newland Project] is denied by the Board or significantly revised, it will be removed or modified within the Draft Plan.” Under this approach, the hardline is assumed to be approved for the purpose of environmental analysis unless or until it is specifically denied. This assumption of a hardline contradicts the Scoping Letter’s clear directive and decision that a hardline should not be relied upon unless or until it is specifically approved. The Scoping Letter was posted on the County’s website and has been relied upon by members of the public in understanding the nature and scope of the County’s environmental review for the Newland Project.

Further, the Newland Project’s draft environmental impact report (“DEIR”) adopted the same flawed approach as your letter, which contradicted the County’s decision contained in the Scoping Letter. The DEIR determined the Project would result in a less than significant impact with regard to preventing or precluding preparation of the NC MSCP based on the DEIR’s improper assumption of a hardline and the remainder of the future NC MSCP as the reason why there would be no significant adverse effect. (See Newland Sierra DEIR at 2.4-82, available at <http://www.sandiegocounty.gov/content/sdc/pds/ceqa/SP-15-001/NSDEIR.html>.) This assumption is inconsistent with the Scoping Letter’s decision and represents completely circular logic in assuming a hardline for the purpose of environmental analysis for the Newland Project, even though no hardline has been approved by the County and the County has not completed any environmental review for its proposed NC MSCP or any hardline that may be proposed within the NC MSCP.

To break this “chain” of circular logic, the County must either: (1) first finish and certify the County’s DEIR for the proposed NC MSCP containing the hardline before completing the Newland DEIR; or (2) rewrite the Newland DEIR to contain “standalone” biological analysis for potential impacts, including cumulative biological impacts and regional wildlife corridors, without assuming approval of the (as yet unapproved) NC MSCP and using the NC MSCP as a substitute.

The Golden Door submitted a comment letter and reports from expert biologists describing the flaws in the DEIR's biological analysis, improper assumption of a hardline, and inconsistency with the Planning Agreement's preliminary conservation objectives. A copy of the Golden Door's letter and attachments, as well as reports from expert biologists Megan Jennings and Schaefer Ecological Services, are provided on a disk included herein. Because the Newland DEIR and the NC MSCP are proceeding concurrently, and many comments on the DEIR are also relevant to the NC MSCP and its treatment of the Newland project site, we submit this material on the record with the County for consideration with respect to the NC MSCP.

In addition, various environmental organizations and public agencies also submitted comments on the Newland DEIR, which are relevant to the NC MSCP and its treatment of the Newland project site. We have included herein a second disk with these materials, which we also submit for the County's record and consideration of the NC MSCP. The comment letters on the second disk are from CDFW, USFWS, the California Department of Transportation, Endangered Habitats League (a letter and a report from expert biologist Hamilton Biological, Inc.), Sierra Club (San Diego), Environmental Center of San Diego, and the California Native Plant Society (San Diego).

Because the County is processing the Newland Project and the NC MSCP concurrently as separate projects, we are providing you these materials to ensure the County staff processing the NC MSCP is able to consider the same material as the County staff processing the Newland DEIR.

Thank you for your time and attention to this matter. Please do not hesitate to contact me at 858.523.5400 or christopher.garrett@lw.com if you would like to discuss these matters further.

Best regards,

Christopher W. Garrett

Re: Newland Sierra Failure to Comply with County Scoping Letter Requirements

Dear Ms. Smith:

As you know, we represent Golden Door Properties, LLC (“Golden Door”) in opposing the proposed Newland Sierra Project (“Project”). As you also know, we have been pro-actively communicating with the County of San Diego (“County”) staff and the applicant for several years concerning this project, including extensive comments on the Notice of Preparation (“NOP”) in March 2015 and Draft Environmental Impact Report (“DEIR”) in August 2017.

On May 7, 2015, the County issued a Scoping Letter to the Project applicant.¹ The Scoping Letter identified “issues” with the Project—including a more than 170-page Project Issues Checklist—that must be resolved by the applicant. Among the issues to be resolved, the Scoping Letter identified at least five “Major Project Issues,” which “may require substantial redesign of the proposed project or, if not resolved, would result in a recommendation for project denial by PDS.” The due date for the applicant to submit evidence of resolution of such issues was July 7, 2015.

The Project’s DEIR was published in June 2017, almost two years after the due date for resolution of the issues identified in the Scoping Letter. Throughout our years-long correspondence with the County about this Project, the County and applicant at various times refused to provide details about the Project to us—and many other members of the public. We were told that such details would be provided in the DEIR. Now that the DEIR has been published, however, not all of the promised information has been disclosed. In particular, the DEIR does not demonstrate that the issues identified in the County’s Scoping Letter have been

¹ The Scoping Letter has been made available online since 2015 at <http://www.sandiegocounty.gov/content/dam/sdc/pds/regulatory/docs/newlandsierra/NewlandSierraScopingLetter.pdf> and remains posted as of December 18, 2017. There are no revisions or updates to this letter.

adequately addressed. Before pointing out the crucial unresolved issues that remain from the Scoping Letter, the important point should be noted that in the interests of transparency and public notice, the County staff should post written copies of any updates or changes that were made to the Scoping Letter in subsequent correspondence with the applicant. It is unfair to the public for the County staff to announce one set of policy decisions in its Scoping Letter, and post the Scoping Letter for public examination, but then for the staff to secretly change the policy decisions they may have made in the Scoping Letter in subsequent private discussions with the applicant that were never documented and provided to the public.

Therefore, we ask that the staff post on the County's website, along with the Scoping Letter, written documentation of any decisions or changes that staff made to the Scoping Letter. We also ask that the County staff update the Newland EIR to include the original May 7, 2015 Scoping Letter, as well as any subsequent written correspondence from the staff to the applicant that may have changed the Scoping Letter.

To emphasize that the Newland DEIR's failure to follow the Scoping Letter is not a minor technicality or problem for the public, we would like to review the important policy decisions which staff made in the Scoping Letter, that appear to have been disregarded in the DEIR released to the public. For the sake of brevity and emphasis, this letter will focus on the five Major Project Issues identified by the County.

County Scoping Letter Major Project Issue #1 - Consistency with the San Diego County General Plan. The Scoping Letter requires further analysis of the Project for General Plan consistency and to ensure the Project "is in the public interest and would not be detrimental to public health, safety, and welfare." As discussed in more detail in the Golden Door's comment letter on the Project's DEIR, the Project is not consistent with County's General Plan, and the DEIR fails to provide adequate analysis.

The County Board of Supervisors has twice determined that the Project Site should remain rural. In 2010, the Board voted against the similar Merriam Mountains proposal, which would have added over 2,500 residential units to rural Twin Oaks Valley. Then, in 2011, after almost a decade of stakeholder input and millions of taxpayer dollars, the Board approved a General Plan that reduced the number of residential units permitted on the Project Site to approximately 100. That 2011 General Plan has provided the basis for other agencies' infrastructure planning—including SANDAG's 2015 Regional Transportation Plan/Sustainable Communities Strategy ("RTP/SCS"), which is necessary for meeting State reduction targets for greenhouse gas ("GHG") emissions and vehicle miles traveled ("VMT"). Notably, SANDAG's RTP/SCS does not include infrastructure improvements on I-15 to accommodate urban growth in the rural areas north of Escondido. Further, in previous staff reports on density increase proposals on the Project Site, County staff indicated that density increases that are less than what Newland proposes would require amendments to the General Plan's Guiding Principles and additional environmental review of the General Plan and recirculation of the General Plan EIR.

Now, before the County has even come close to building out the housing units designated in its General Plan, Newland has proposed to urbanize rural Twin Oaks Valley with over 6,000 new residents—a population the size of the City of Del Mar. Despite the drastic density increase

in this rural area and the divergence from the General Plan's principles, the Project's DEIR incredulously finds no significant land use impacts. No information provided to the public indicates that the Project has been revised since issuance of the Scoping Letter to comport with the General Plan. Instead, the DEIR's analysis relies on the conclusory premise that by seeking a discretionary amendment to certain selected parts of the County's General Plan to add the Project's proposed density, it automatically becomes General Plan-compliant. This is not so. This Project would open the backcountry to large-scale development in contrast to the balanced principles described in the General Plan and the emphasis on protecting rural community character.

In addition, the Project runs afoul of several specific General Plan policies. For example, the Project constitutes leapfrog development in violation of General Plan Policy LU-1.2. A previous staff report for another density increase on the Project Site raised this very issue. In addition, the DEIR relies on a "village" designation on part of the Project Site in its land use analysis; yet, no part of the Project Site is within a designated village boundary in the North County Metro Community Plan—which is part of the General Plan.

Further, the DEIR does not support a finding that the Project is in the public interest and would not be detrimental to public health, safety, and welfare. The Project's opening of the backcountry to massive sprawl development is contrary to the public interest as set forth in the General Plan. Project construction would pose various health risks, including the potential risk of subjecting construction workers and nearby residents to Valley Fever—which was not even studied in the DEIR. The Project also poses safety risks, as it is located entirely in a Very High Fire Hazard Severity Zone and would add thousands of vehicles to the area's evacuation routes for regional fire emergencies. These evacuation routes are already predicted by the traffic analysis to be at a standstill during normal days.

County Scoping Letter Major Project Issue #2 - MSCP Draft North County Plan and Natural Communities Conservation Program Consistency. The Project's DEIR and several letters from County staff indicate that the Newland Project proposes to achieve consistency with the North County Multiple Species Conservation Plan ("NC MSCP") by means of a so-called "hardline designation." The Scoping Letter specifically addresses the potential for a hardline agreement for the Newland Project:

Please note that if the Wildlife Agencies Hardline Agreement is not approved, the project would be required to comply with the North County Plan and its requirements for projects in Pre-approved Mitigation Areas (PAMA), including avoidance of critical populations of sensitive species and adherence to preserve design and linkage principles. If the North County Plan has not been approved prior to the project moving forward, the project will require compliance with the Habitat Loss Permit (HLP) Ordinance and the County and Wildlife Agencies Planning Agreement.

(Scoping Letter at 4.) The Scoping Letter's approach in the absence of an approved hardline agreement or approval of the NC MSCP, therefore, is to require the Project to comply with the Planning Agreement, including its preliminary conservation objectives and requirements for pre-

approved mitigation areas ("PAMA"). As you are aware, a hardline designation in the NC MSCP requires the agreement of the United States Fish and Wildlife Service and the California Department of Fish and Wildlife. Neither of these Wildlife Agencies has agreed to a hardline designation.

Consequently, the DEIR's statement that there will instead be County reliance on an unapproved hardline agreement conflicts with the statement contained in the Scoping Letter.

County Scoping Letter Major Project Issue #3 – Deer Springs Road. The Scoping Letter notes that Deer Springs Road is classified as a six-lane Prime Arterial in the General Plan's Mobility Element, but that Newland proposes Option A, which would reclassify Deer Springs Road as a two- and four-lane road and construct it as such, and Option B, which would not reclassify Deer Springs Road but would only build to four lanes.

The version of Option B described in the Scoping Letter would include grading a portion of Deer Springs Road to the ultimate six-lane configuration; however, Option B was later revised—subsequent to the public's opportunity to review and comment on the NOP—to eliminate the requirement to grade a portion to six lanes. Newland and the County have not provided any explanation of the revision or analysis of the change in impacts. The Scoping Letter notes disagreement between County staff and the applicant regarding Deer Springs Road's proposed configuration and requires further study and analysis of various options so that County staff can make a final recommendation.

As discussed in more detail in the Golden Door's comment letter on the Newland DEIR, the DEIR's analysis of Deer Springs Road is inconsistent and misleading and fails to provide adequate information about various options for its alignment. The analysis of Option B assumes six lanes of capacity although only proposing to construct four. No analysis of traffic impacts from Option B's proposed four-lane capacity is provided in the DEIR. Yet, the analysis of other impacts (e.g., biology, air quality, noise, property) for Deer Springs Road Option B only considers grading and building four lanes—despite the assumption of extra capacity for a six-lane road in the traffic analysis. In addition, the DEIR's traffic analysis improperly applied trip reduction credits for mixed land uses and an illusory transportation demand management program that inaccurately reduce the number of Project trips on to Deer Springs Road. As such, the impacts of various options for Deer Springs Road have not been analyzed as required by the Scoping Letter.

Further, the Scoping Letter requires that the Project's "Traffic Impact Study should include future Year 2040 and Buildout traffic volumes approved by the County and Caltrans." It appears that the traffic analysis for Deer Springs Road does not analyze impacts in 2040. Further, traffic volumes for Deer Springs Road were not "approved by Caltrans." In fact, Caltrans submitted a comment letter on the Project's DEIR noting that the DEIR inaccurately states that Caltrans has an interchange project at I-15 and Deer Springs Road that would mitigate traffic impacts and that the DEIR's analysis should not rely on such mitigation. The traffic analysis for Deer Springs Road, therefore, has not been "approved by Caltrans," but instead has been discredited.

County Scoping Letter Major Project Issue #4 - Off-Site Improvements. The Scoping Letter requires Newland to provide “suitable evidence” that it possesses the necessary property rights to construct off-site improvements without eminent domain. No such evidence was provided in the DEIR. In fact, the DEIR alludes to the potential for eminent domain on Sarver Lane, Deer Springs Road, and Camino Mayor. Eminent domain may be required in additional off-site locations. Further, we understand representatives of Newland are currently approaching various property owners in the area seeking to acquire property rights—more than two years after Newland was due to resolve issues in the Scoping Letter.

The Golden Door has submitted ample evidence to the County of potential property impacts due to proposed widening of Deer Springs Road as part of the Project. In August 2016, DELANE Engineering produced a technical study detailing property impacts from widening Deer Springs Road to both a four- and six-lane alignment—impacts that had been omitted from Newland’s plans provided by Fuscoe Engineering. DELANE also identified various errors in Fuscoe’s work. After release of the Project’s DEIR, DELANE followed up with an additional report confirming DELANE’s previous analysis and describing property impacts along Deer Springs Road that remained unaddressed—including impacts to private driveways and from proposed drainage channels.

Moreover, on Camino Mayor, Newland proposes significant improvements to a private road across property not owned by Newland. Property owners on Camino Mayor provided the County with extensive comments on the DEIR describing Newland’s lack of property rights. In addition, DELANE submitted a report describing property rights impacts and other issues with Newland’s proposals for Camino Mayor.

County Scoping Letter Major Project Issue #5 - Resource Protection Ordinance. The Project’s DEIR fails to adequately address the County’s Resource Protection Ordinance (“RPO”) as required by the Scoping Letter. Fifty-five percent of the Project Site contains RPO-defined slopes, and the Project would result in impacts to the California Coastal gnatcatcher and RPO-wetlands in violation of the RPO. Yet, instead of analyzing adequate mitigation for the Project’s RPO impacts, the County has proposed to simply exempt the 1,985-acre Project Site from the RPO. Simply changing the applicability of the ordinance does not mitigate impacts to the physical environment. It also fails to provide any analysis of RPO consistency as required by the Scoping Letter.

Further, even the proposed RPO exemption described in the DEIR is inadequate. As described in the DEIR, the proposed RPO exemption would exempt RPO compliance for impacts on the 1,985-acre Project Site. The exemption would not apply to any off-site impacts caused by the Project. The DEIR discloses temporary and permanent significant impacts to off-site RPO resources, including southern willow scrub, mulefat scrub, arundo dominated riparian, coast live oak woodland, and southern coast live oak riparian forest. Moreover, as discussed in more detail in the Golden Door’s comment letter on the DEIR, the County’s analysis significantly underestimates the Project’s off-site impacts, including impacts from grading and constructing a six-lane configuration for Deer Springs Road and an as yet undisclosed design for an interchange at I-15 and Deer Springs Road—as well as operation thereof. The Project’s RPO exemption does not exempt these off-site impacts from RPO-compliance; yet mitigation has not been

analyzed or proposed. Therefore, the DEIR has failed to provide the analysis of consistency with the Resource Protection Ordinance that the County staff specified in the Scoping Letter. The mere fact that the applicant has simply proposed an amendment from the RPO does not mean that the DEIR should omit the analysis of consistency that was specified in the Scoping Letter.

Finally, the Scoping Letter calls for a “Comprehensive Resource Management and Protection Program” to accompany any proposed RPO amendment; yet, none was provided in the DEIR. The DEIR provides a Resource Protection Plan (“RPP”) as Appendix H-2. This RPP, however, is not an actual plan, but merely regurgitates that biological analysis found elsewhere in the DEIR. It lacks performance standards and prescriptive statements against which Project consistency could be measured. Also, while the DEIR mentions a Resource Management Plan (“RMP”), mitigation measure M-BIO-8D defers RMP preparation to the future. M-BIO-8D notes the existence of two “conceptual” RMPs attached as Appendices L and M to Appendix D of the DEIR, but does not provide any specific and enforceable standards for a comprehensive RMP. Although the applicant had more than two years since issuance of the Scoping Letter to prepare a “Comprehensive Resource Management and Protection Program,” none has been provided in the DEIR to justify an RPO exemption. This further underscores that the DEIR has failed to provide any analysis of how the Newland project will comply with the RPO’s policies.

The absence of any details of the “Comprehensive Resource Management and Protection Program” indicates that an essential part of the applicant’s proposed project has not yet been provided to the public for review and analysis. Providing this missing part of the project in the Final EIR for the first time will deprive the public, and the federal and state resources agencies, of the opportunity to review and comment on the Plan, and to compare it to the protections that would have applied to the property if the applicant had not decided to ask for an exemption from the County’s RPO for its project.

* * *

Please provide evidence that the issues identified in the County’s Scoping Letter have been resolved and explain why such evidence was not included in the DEIR circulated for public review and comment earlier this year. Any written staff decisions and revisions to the Scoping Letter should be posted online for the public to examine. Otherwise, it appears that the DEIR has failed to comply with the County staff’s own Scoping Letter.

Without resolution of the Major Project Issues and all other issues on the Project Checklist, the County cannot treat the application for the Newland Sierra Project as complete and must cease processing the Project.

LATHAM & WATKINS LLP

We thank you for your time and attention to this matter. We ask that you include this letter and your response in the administrative record for the Newland Sierra Project. Please do not hesitate to contact us should you have any questions or comments.

Best regards,

Christopher W. Garrett

Re: Report from Reax Engineering re Fire Modeling of Newland Sierra Impacts to Surrounding Area During Santa Ana Wind Events (Log No. PDS2015-ER-15-08-001; SCH No. 2015021036, Project Numbers: PDS2015-GPA-15-001, PDS2015-SP-15-001, PDS2015-REZ-15-001, PDS2015-TM-5597, PDSXXXX-HLP-XXX)

Dear Ms. Smith:

As you know, we represent Golden Door Properties, LLC (“Golden Door”) in opposing the proposed Newland Sierra Project (“Project”). This letter transmits a report prepared by Reax Engineering that is included as **Attachment A**. The Reax report analyzes the fire risk from the proposed Project to the Golden Door and other surrounding properties. It provides a fire modeling analysis that takes into account Santa Ana wind conditions—conditions that were not analyzed in the County’s draft environmental impact report’s (“DEIR”) for the Project.

County staff did not make it clear that Newland DEIR’s wildfire analysis did not consider potential Santa Ana winds when the DEIR was released to the public. Recent events have caused the Golden Door to reassess existing and potential dangers from wildfire for the Golden Door property. During the Lilac Fire, the Golden Door chose to evacuate all of its guests due to the fire’s uncertain path. The Golden Door is continuing to update its planning for potential risks due to the spread of fire.

The recent Lilac Fire and several other major fires that burned hundreds of thousands of acres across the State occurred during Santa Ana winds and demonstrate how quickly fire can spread under such conditions, especially in sparsely developed rural areas. As you know, the Newland Project is proposed almost entirely in a Very High Fire Hazard Severity Zone. It is now clear that the DEIR did not analyze the potential for the spread of wildfire that might occur under similar conditions to the Lilac Fire, with potential Santa Ana wind gusts. The DEIR’s failure to include an analysis of fire risks during Santa Ana winds is a fatal omission under the California Environmental Quality Act (“CEQA”), and the County should recirculate the DEIR to analyze this important public safety issue.

In the absence of any information or wildfire modeling that could be performed by County staff or consultants in the DEIR, the Golden Door was forced to retain an expert to

LATHAM & WATKINS LLP

prepare an overview report, which is Attachment A. The Golden Door's August 14, 2017 comment letter discussed flaws in the DEIR's fire modeling methodology, and this report provides further information with respect to this issue that the Golden Door has already raised. County staff should review and consider additional evidence regarding the fire risk associated with the proposed Project, including the recent article published in the Voice of San Diego discussing development proposals in the County's high fire risk areas. (See **Attachment B**.) We have also attached a stand-alone .pdf document of a map that was included as part of the article depicting the location of proposed development projects in relation to the recent Lilac Fire and previously mapped high fire risk areas. (See **Attachment C**.) The County Planning staff may also wish to retain their own independent wildfire modeling consultant to perform an independent analysis of the cumulative wildfire risk associated with pending projects. In doing so, we would recommend that the staff retain a consultant who will include the potential for Santa Ana winds in the analysis.

The recent fires are a tragic reminder of the risks associated with locating new unplanned development in fire-prone rural areas. As a local business and member of the Twin Oaks Valley community, the Golden Door is concerned about risks to its property and that of its neighbors that would be caused by the Newland Sierra project. Although the formal comment period for the Project's DEIR closed prior to this new information, we ask that you provide responses to this letter and its attachments, recirculate the DEIR, and include this letter and attachments (as well as the County's response) in the County's administrative record to ensure the Planning Commission, Board of Supervisors, and general public are informed about the significant fire risks posed by the Project. In light of recent events highlighting the importance of protecting people and property from wildfires in the backcountry and given that the DEIR for Newland Sierra omits analysis of fire during Santa Ana wind conditions, full consideration of this material and the County's response to it is warranted. It is important for all concerned that these issues be publicly raised and discussed now, rather than waiting until hearings before the County Planning Commission or the County Board of Supervisors.

We thank you for your time and attention to this matter. Please do not hesitate to contact us should you have any questions or comments.

Sincerely,

Andrew D. Yancey

Subject: Fire risk impacts of Proposed Newland Sierra Project on The Golden Door and Surrounding Area

At your request, dated October 14, 2017, I have reviewed the May 2017 Draft Environmental Impact Report (DEIR) and Fire Protection Plan (FPP) associated with the planned Newland Sierra development and analyzed potential fire/life safety impacts of this planned development to your property as well as the surrounding area.

Santa Ana winds

The biggest fire threat to The Golden Door associated with the Newland Sierra development involves ignition on land owned by Newland Sierra under Santa Ana winds. Santa Anas are hot and dry winds that blow through Southern California each year, usually between the months of October and April. Santa Anas occur when high pressure forms in the Great Basin (Western Utah, much of Nevada, and the Eastern border of California) with lower pressure off the coast of Southern California. This pressure gradient drives airflow toward the Pacific Ocean.

As air travels West from the Great Basin, orographic lift dries the air as it rises in elevation over mountain ranges. As air descends from high elevations in the Sierra Nevada, its temperature rises dramatically (~5 °F per 1000 ft decrease in elevation). A subsequent drop in relative humidity accompanies this rise in temperature. This drying/heating phenomenon is known as a katabatic wind. Relative humidity in Southern California during Santa Anas is often 10% or lower. Santa Ana winds typically blow from the Northeast toward the Southwest. Sustained Santa Ana winds of 40+ mph with gusts of 60+ mph are not uncommon in Southern California.

The seasonality of Santa Anas presents a severe fire problem in Southern California which typically sees little rain between May and November. This means that October, November, and December Santa Anas occur after a 6+ month drought when herbaceous surface fuels are completely cured and live woody fuel moisture (*i.e.*, water in shrub-like vegetation) is at yearly lows. Much of the existing vegetation in Southern California is mixed chaparral which is characterized by rapid rates of fire spread and is highly conducive to spotting due to large-scale ember generation. Newland Sierra's DEIR acknowledges that chaparral is the primary type of vegetation within the project footprint. See DEIR, Appendix C, Part 2, Section 1.3.2, page 6 which states "Vegetation onsite consists of large blocks of densely vegetated, senescent southern mixed

chaparral with limited patches of Diegan coastal sage scrub, live oak woodlands, and southern willow scrub.”

Given that hot dry Santa Anas occur in part of California that is vegetated by highly flammable chaparral at a time of year when fuel moisture content is at annual lows, it is not surprising that dozens of large loss fires have occurred in Southern California under Santa Ana winds. A partial list of historical damaging fires that have occurred in Southern California under Santa Ana winds is shown in Table 1.

Table 1. Partial list of fires damaging fires occurring under Santa Anas in Southern California.

Relative locations of The Golden Door and Newland Sierra

Golden Door Properties owns just over 600 acres to the South of land owned by Newland Sierra. Figure 1 shows the location of land owned by Golden Door Properties relative to the planned Newland Sierra development with an orthoimagery basemap; Figure 2 is an analogous map with a hillshade background to provide a qualitative sense of the terrain in the area. Deer Springs Road runs East/West between the Golden Door and Newland Sierra. Mesa Rock Road currently dead ends at the Southeast corner of Newland Sierra’s land and, as part of the planned development, would be extended into land owned by Newland Sierra as a primary means of ingress and egress.

Recall from the preceding discussion that Santa Ana winds blow from the Northeast toward the Southwest. Inspection of Figure 1 and Figure 2 shows that fire originating on land owned by Newland Sierra during Santa Ana winds, particularly the Southeastern extent along Mesa Rock Road, would propagate directly toward The Golden Door and its neighbors to the South and West, including several hundred structures along Sarver Lane, Buena Creek Road, and Twin Oaks Valley Road. Given that most of the land owned by Newland Sierra is mixed southern chaparral that hasn’t burned in at least 100 years, fire originating on Newland Sierra land under Santa Ana winds would be characterized by rapid rates of spread toward the Southwest with large scale ember production and long-range (> 1 mile) spotting cause by ember showers blown by winds out of the Northeast.

One thing that is not immediately apparent from Figure 1 or Figure 2 is the elevation difference the planned Newland Sierra development and The Golden Door and its neighbors. As shown in Figure 3, Newland Sierra is located north of the East/West ridgeline North of The Golden Door. A view from The Golden Door looking up at land owned by Newland Sierra is shown in Figure 4. The significance of this elevation difference is that the effective spotting distance from fire on Newland Sierra land to property owned by the Golden Door and its neighbors is increased, meaning that even weak to moderate Santa Anas could generate embers capable of reaching The Golden Door or its neighbors and igniting vegetation and structures there.

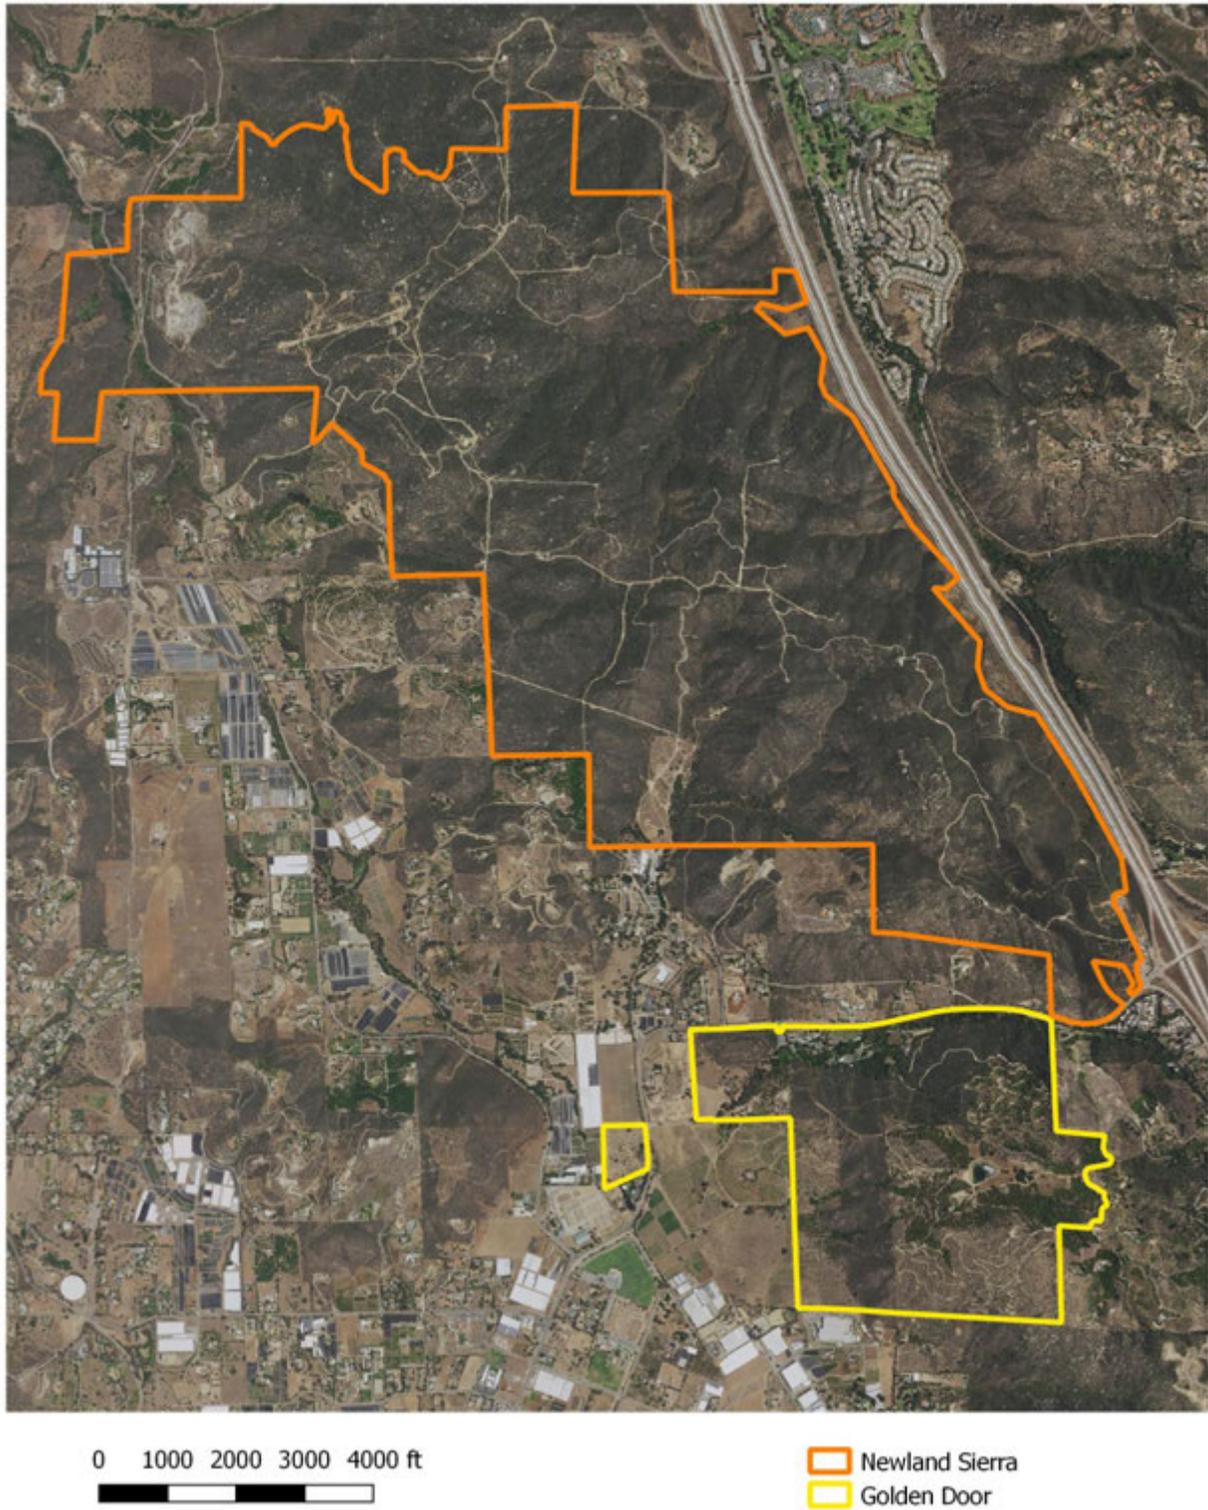

Figure 1. Location of parcels owned by Golden Door relative to parcels owned by Newland Sierra with orthoimagery background.

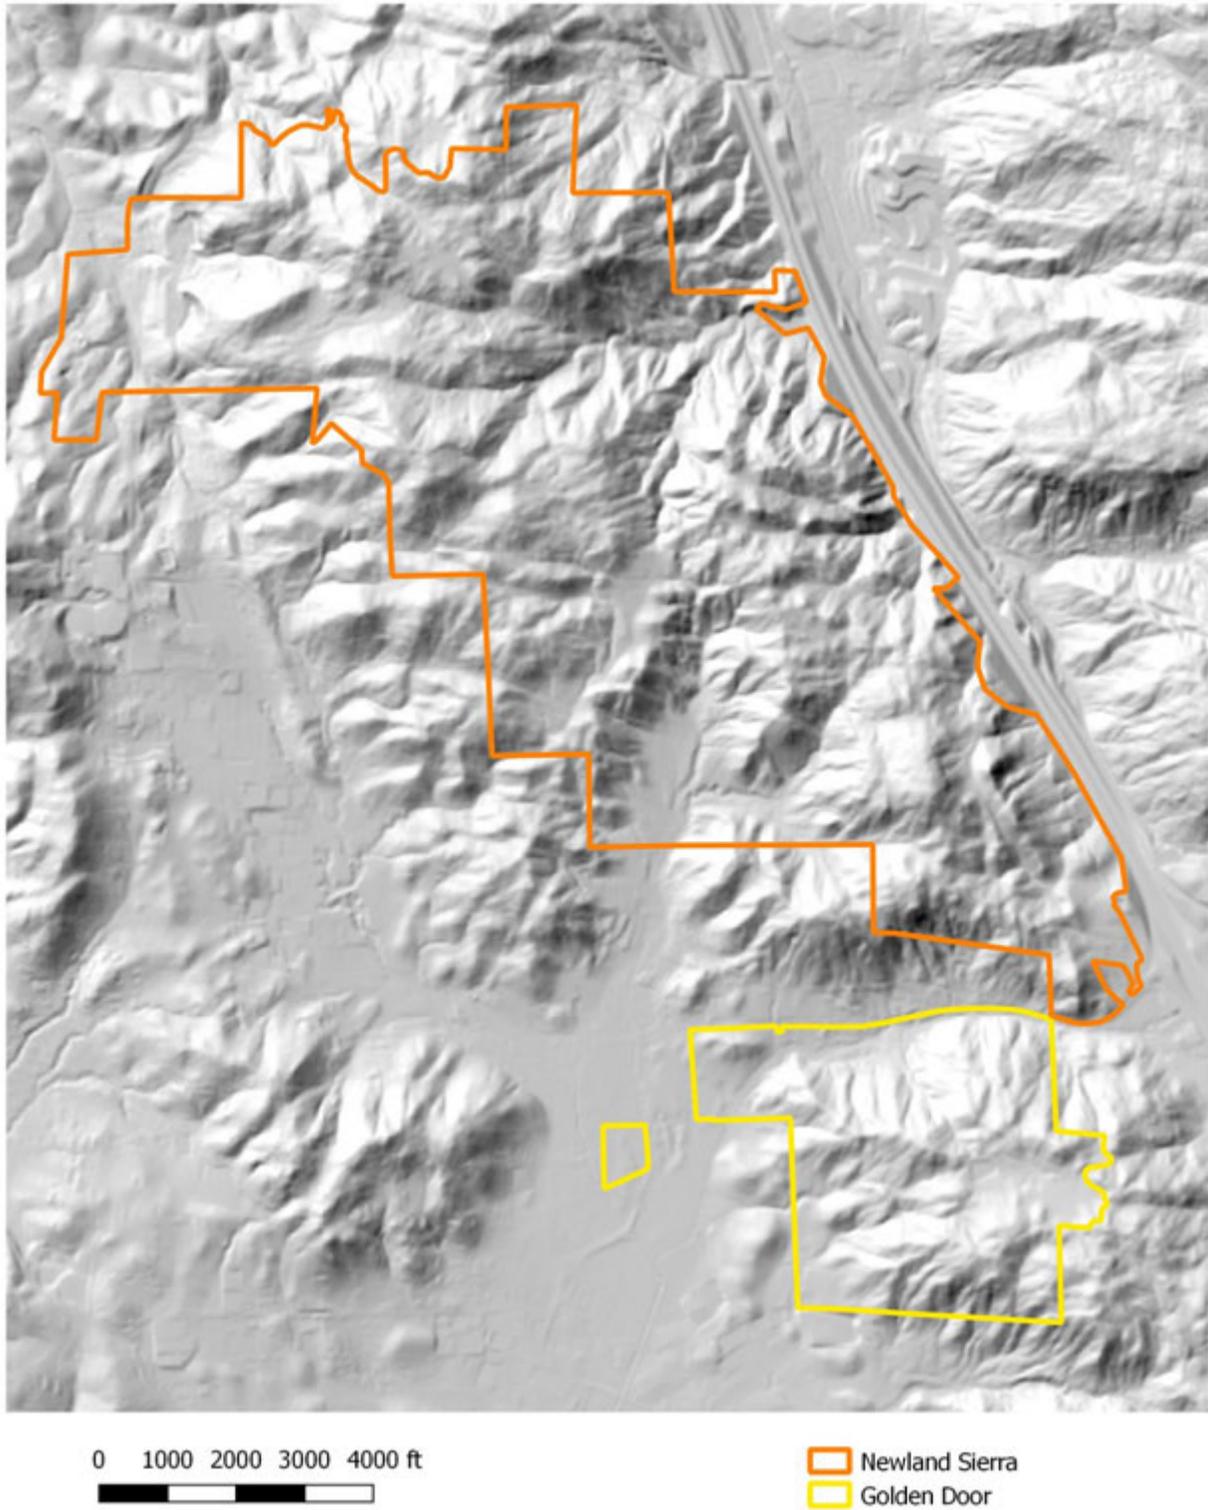

Figure 2. Location of parcels owned by Golden Door relative to parcels owned by Newland Sierra with hillshade background.

Figure 3. Photograph looking Northwest showing relative elevations of Newland Sierra and The Golden Door.

Figure 4. Photograph looking from The Golden Door toward Newland Sierra.

Fire Progression Analysis

Newland Sierra's Fire Protection Plan includes only static (FLAMMAP) fire modeling. FLAMMAP does not actually simulate fire spread across the landscape; it only quantifies potential fire behavior under constant environmental conditions assuming an area burns. The FLAMMAP modeling described in the FPP does not address how ignitions within Newland Sierra's footprint during Santa Anas could impact surrounding properties and neighbors including The Golden Door; rather only shows the change in potential that would be effected due to fuel treatments. However, such fuel treatments do very little to reduce potential fire consequences to The Golden Door and other neighbors.

Due to this oversight in the FPP, I conducted a transient fire progression analysis using ELMFIRE¹, a fire spread simulator that is similar to FARSITE. This fire progression analysis simulates movement of fire across the landscape and was conducted using the same basic assumptions as in Newland Sierra's Fire Protection Plan, *i.e.* 20-ft winds of 40 mph occurring concurrently with low dead and live fuel moistures. Fuel and topography inputs were taken from LANDFIRE 1.4.0 / LF 2014. Although the DEIR did not make available Geographic Information System (GIS) shapefiles showing the locations of roads and structures, a site plan from the DEIR .pdf document was orthorectified so that approximate locations of roads and structures could be determined. Fuels inputs were modified consistent with the presence of structures and fuel treatment zones as described in the FPP to facilitate modeling of post-development conditions. A point source ignition was placed in the Southeast part of the Newland Sierra's property in an area near the planned extension of Mesa Rock Road to simulate an anthropogenic ignition in that area. This is not the only location within the project footprint that ignition could occur, and resultant fire spread and potential impacts to other properties are dependent on the ignition location.

Three hours of simulated fire progression are shown in Figure 5 at half hour intervals. The vantage point is a birdseye isometric view looking over Highway 15 to the West down Deer Springs Road. Newland Sierra's property is shown as an orange outline (right hand side), and The Golden Door's property is shown as a yellow outline (left hand side). The fire perimeter is overlaid as red semi-transparent polygons.

Figure 5 shows that for this particular scenario, fire would reach Deer Springs Road and The Golden Door approximately 30 minutes after ignition. For ignition occurring at a different location, fire would enter other properties in a similar timeframe. Once this occurs, significant impacts to improved property, including structure loss, are likely to occur. Although this analysis does not include the effect of manual suppression on fire propagation, this is by design: fires burning through chaparral under moderate to strong Santa Anas are not amenable to direct attack and will burn until all available fuel is consumed or the winds stop.

¹ Lautenberger, C., "Wildland Fire Modeling with an Eulerian Level Set Method and Automated Calibration," *Fire Safety Journal* **62**: 289-298 (2013).

Figure 5a. Modeled fire progression ½ hour after ignition under Santa Ana conditions.

Figure 5b. Modeled fire progression 1 hour after ignition under Santa Ana conditions.

Figure 5c. Modeled fire progression 1-½ hours after ignition under Santa Ana conditions.

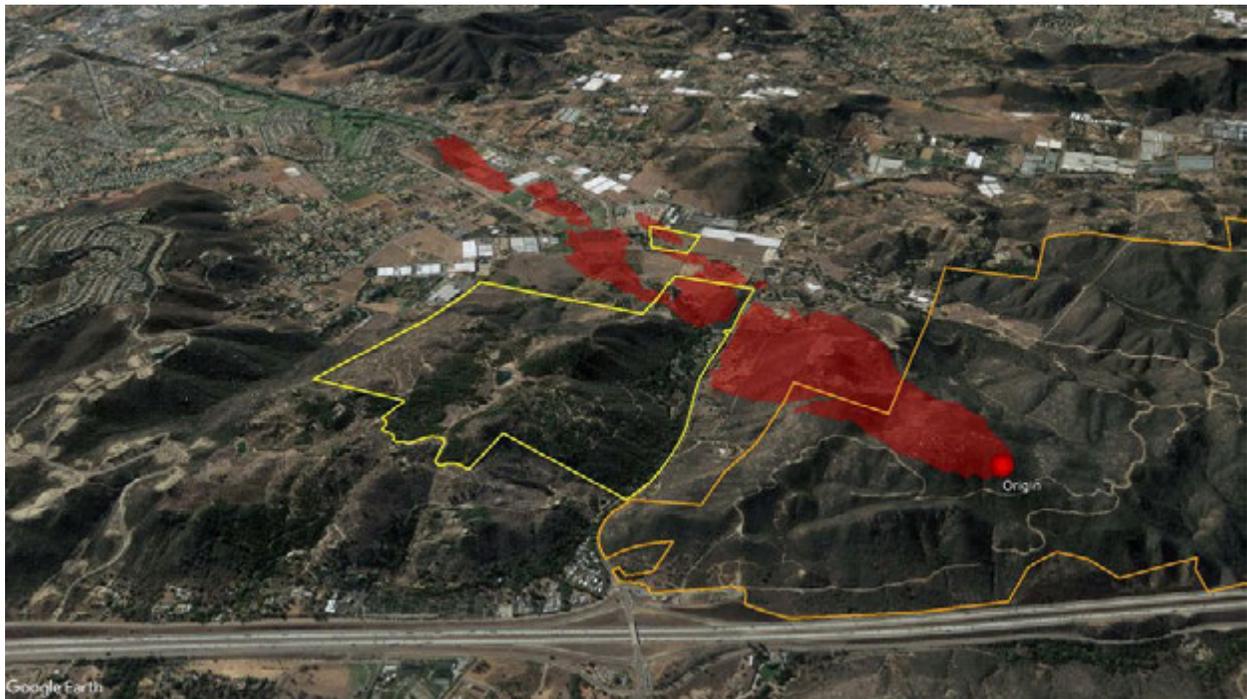

Figure 5d. Modeled fire progression 2 hours after ignition under Santa Ana conditions.

Figure 5e. Modeled fire progression 2-½ hours after ignition under Santa Ana conditions.

Figure 5f. Modeled fire progression 3 hours after ignition under Santa Ana conditions.

Based on this analysis, under moderate to strong Santa Ana winds:

- A fire that escapes initial containment efforts along Mesa Rock Road in the Southeast part of the planned Newland Sierra development will inevitably impact the Golden Door. Similarly, a fire igniting at other locations within Newland Sierra's footprint would be likely to impact other properties in the area.
- Such a fire traveling onto The Golden Door's property or its neighbors from Newland Sierra is likely to cause significant damage to existing vegetation and damage or destroy multiple structures.
- Such a fire is likely to reach The Golden Door within ½ hour after ignition. Entrapment will occur if emergency evacuation is not completed before the primary means of egress – a single road that exits through a gate onto Deer Springs Road – is blocked by fire and/or traffic congestion. A similar scenario may develop at neighboring properties, and it is conceivable that some residents may have less than ½ hour to evacuate.
- The highest risk of entrapment is associated with an overnight ignition under Santa Ana Conditions. Such a scenario would require Golden Door Staff to awaken as many as 42 guests, most of whom would be unfamiliar with their surroundings. Some may have mobility difficulties. Guests and staff (up to 140 workers may be on site at any given point in time) would evacuate in darkness, under high winds, with smoke in the air, in a wind-driven ember shower with multiple spot fires igniting. If entrapment occurs, burnover with multiple fatalities is likely.
- While this analysis was focused on the Golden Door, similar situations could develop at neighboring properties.

It is also important to point out that The Golden Door is not the only property that could be impacted by fire originating on Newland Sierra's land during Santa Ana conditions. Spotting distances for fire burning through chaparral under Santa Anas are on the order of 2-3 miles. Therefore, any properties within a 2-3 mile buffer of the planned Newland Sierra development could also be impacted by embers originating from fire burning there. Figure 6 shows a 2.5 mile buffer from Newland Sierra in the Southwest direction (because under Santa Ana winds this is the direction toward which the wind blows).

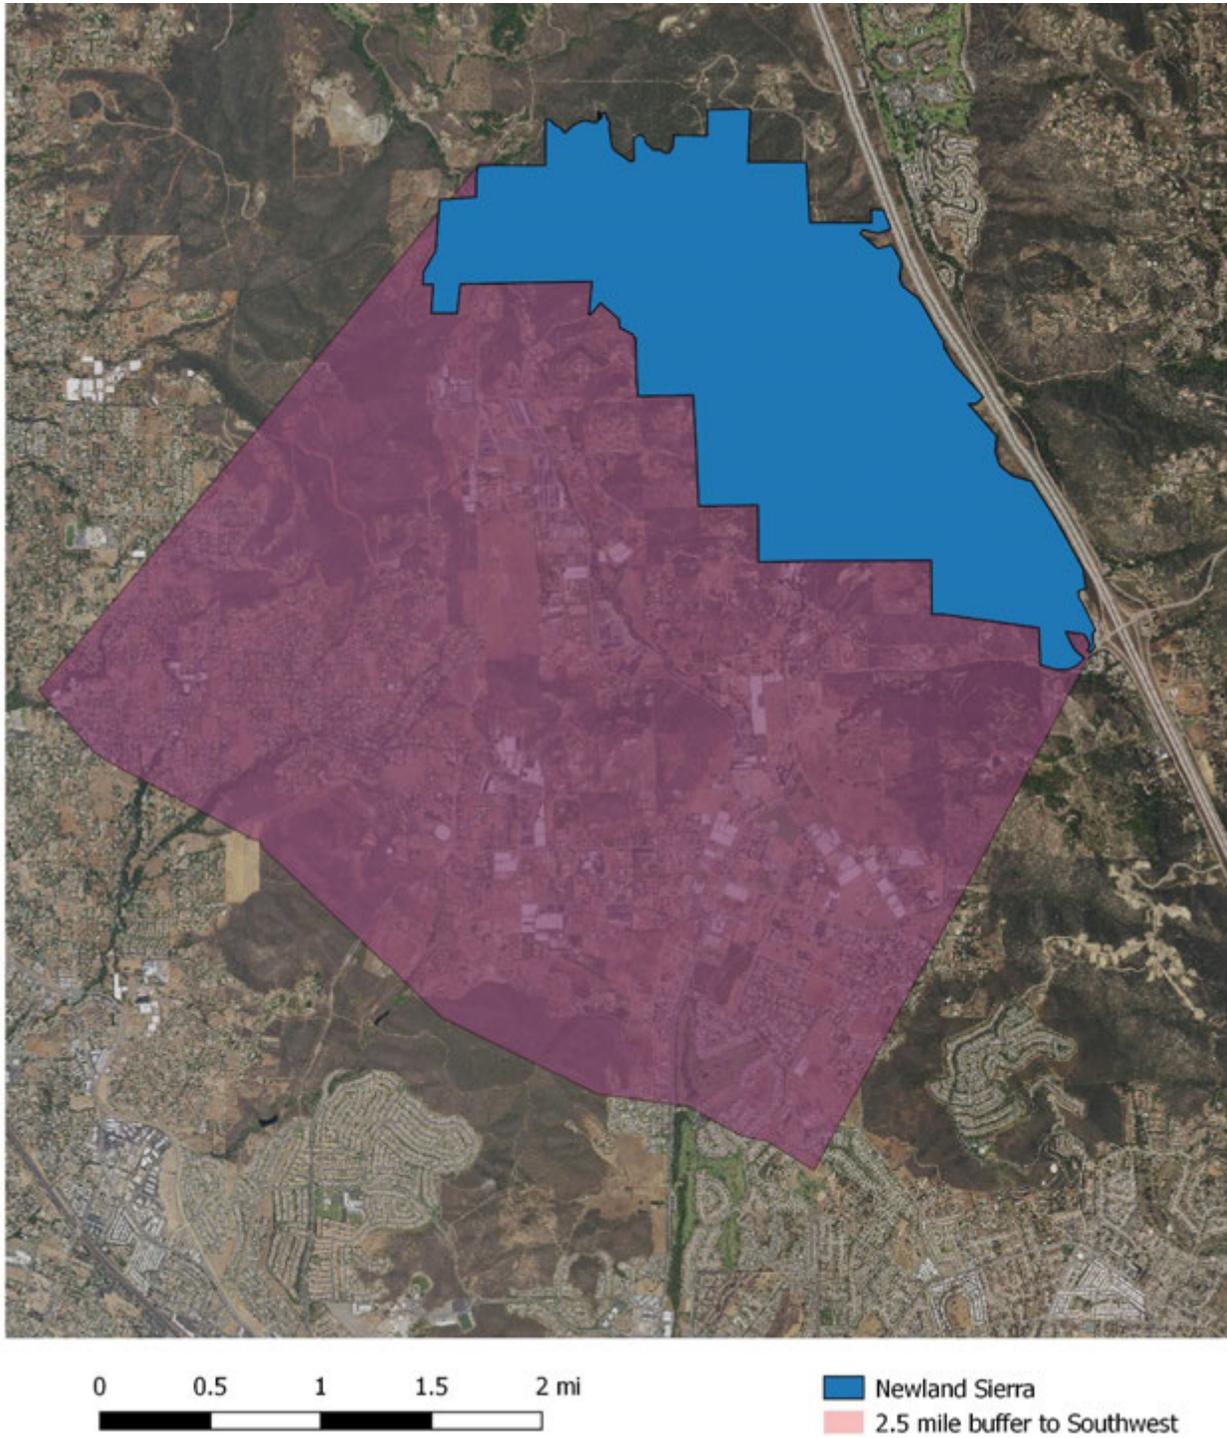

Figure 6. 2.5 mile to Southwest of Newland Sierra land.

It is notable that the 7 December 2017 Lilac Fire ignited approximately 5 miles north of the Newland Sierra project site and burned toward the Southwest under Santa Ana winds, ultimately destroying 157 structures. The Lilac Fire perimeter relative to Newland Sierra and The Golden Door is shown in Figure 7.

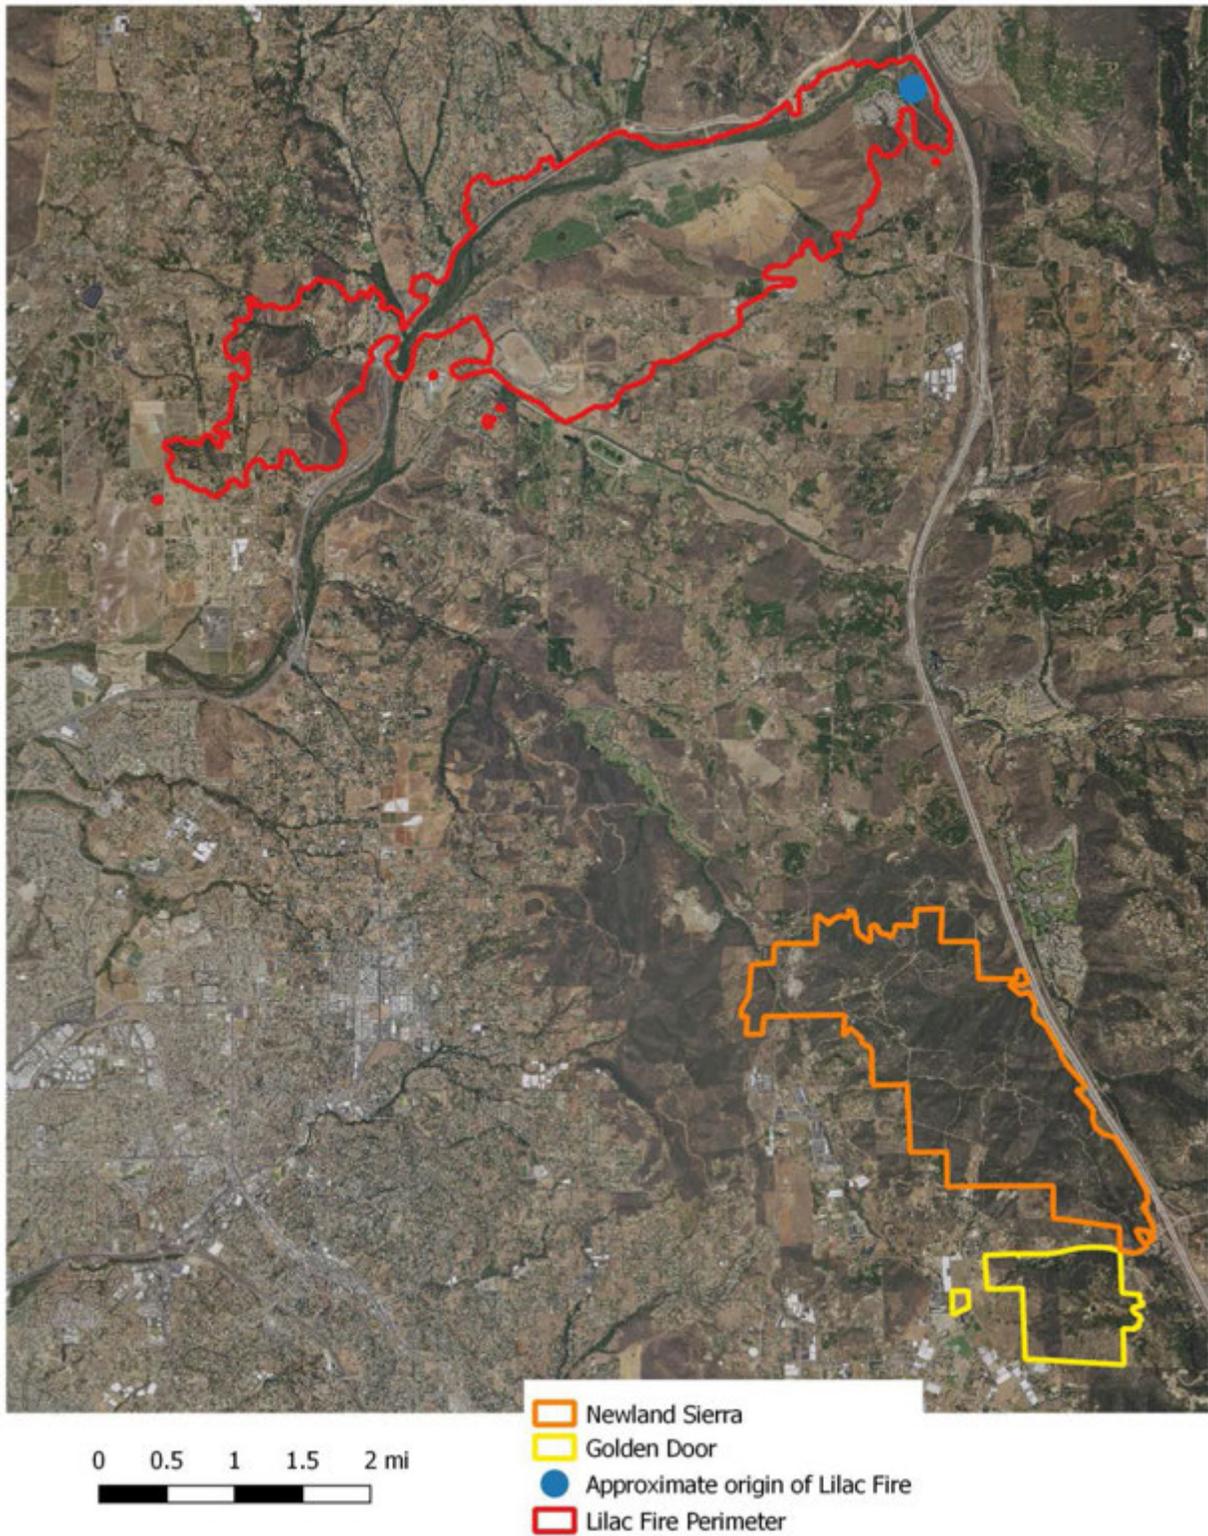

Figure 7. Location of Lilac Fire relative to Newland Sierra and The Golden Door.

Increase in ignition probability associated with Newland Sierra development

The majority of wildland fires are caused by humans as opposed to natural causes such as lightning. Common anthropogenic causes of fire include arson/incendiary, equipment use, debris burning, smoking, vehicles, fireworks, electricity, and outdoor cooking (barbecuing). Structure fires sometimes spread and initiate wildland fires. For these reasons, it should be apparent that the presence of development in the wildland urban interface – which adds roads, structures, vehicles, and people to previously undeveloped areas – results in increased probability of fire starts.

While this conclusion is common sense, multiple scientific studies have concluded the same. A study that analyzed 27 years of data in Canada² concluded “Fire ignition densities decreased exponentially as distance to road or populated place increased, and largest ignition trends occurred closest to both variables.” Similarly, a 2007 study entitled “Human Influence on California Fire Regimes”³ stated:

We found highly significant relationships between humans and fire on the contemporary landscape, and our models explained fire frequency ($R^2 = 0.72$) better than area burned ($R^2 = 0.50$). Population density, intermix WUI, and distance to WUI explained the most variability in fire frequency, suggesting that the spatial pattern of development may be an important variable to consider when estimating fire risk.

For the above reasons, the planned Newland Sierra development greatly increases the probability of ignition occurring within its footprint, which is currently mostly undeveloped land designated for limited residential development (1 unit per 20 acres).

Summary and conclusions

- Risk is the combination (product) of probability and consequence.
- Due to increased presence of humans and vehicular traffic, the planned Newland Sierra development greatly increases the probability of fire occurring within the project footprint.
- Under Santa Ana winds, the consequences associated with a fire igniting within Newland Sierra’s footprint to the Golden Door and other neighbors are severe. Potential consequences include destruction of multiple structures and loss of life. Although Newland Sierra’s fire protection plan discusses fuel treatments that would be implemented, these fuel treatments do very little to reduce potential consequences to The Golden Door and other neighbors.
- Since the Newland Sierra project greatly increases the probability of fire occurrence but does essentially nothing to reduce potential consequences to The Golden Door and other neighbors, it greatly increases overall fire risk to these entities.

Sincerely,

Christopher W. Lautenberger, PhD, PE

County Officials Set to Consider Allowing Nearly 6,000 New Homes in High Wildfire Risk Areas

Posted By *Maya Srikrishnan* On December 12, 2017 @ 8:00 am

The site of the proposed Newland Sierra project, which would bring about 2,100 homes to an area at high risk for wildfires. / Photo by Jamie Scott Lytle

There's an invisible line where human development meets flammable vegetation, and it's where the most destruction from wildfires occurs.

It's called the wildland-urban interface. In San Diego, developers are looking to build nearly 6,000 more homes along this frontline.

"When I heard this fire started where it started, with those weather concerns, I was concerned," North County Fire Protection District Chief Steven Abbott said at a public meeting in Fallbrook Saturday of the Lilac Fire.

The Lilac Fire destroyed more than 180 structures, roughly half of which were homes, considered in the wildland urban interface. Nearly 7,500 residents evacuated and several were injured, including firefighters.

County leaders may soon decide whether to let developers move forward with projects that would be located in areas of extreme wildfire danger, an approval the projects need because they're proposed in areas where far fewer new homes were envisioned in the county's long-term growth plan, approved in 2011.

In Houston, development decisions may have contributed to the devastation ^[1] caused by flooding from Hurricane Harvey.

In Southern California, the same may be true for wildfires.

A 2013 study ^[2] by the U.S. Geological Survey, for instance, found that sprawl projects built far away from existing development, often called leapfrog development, have led to more houses being lost to fire.

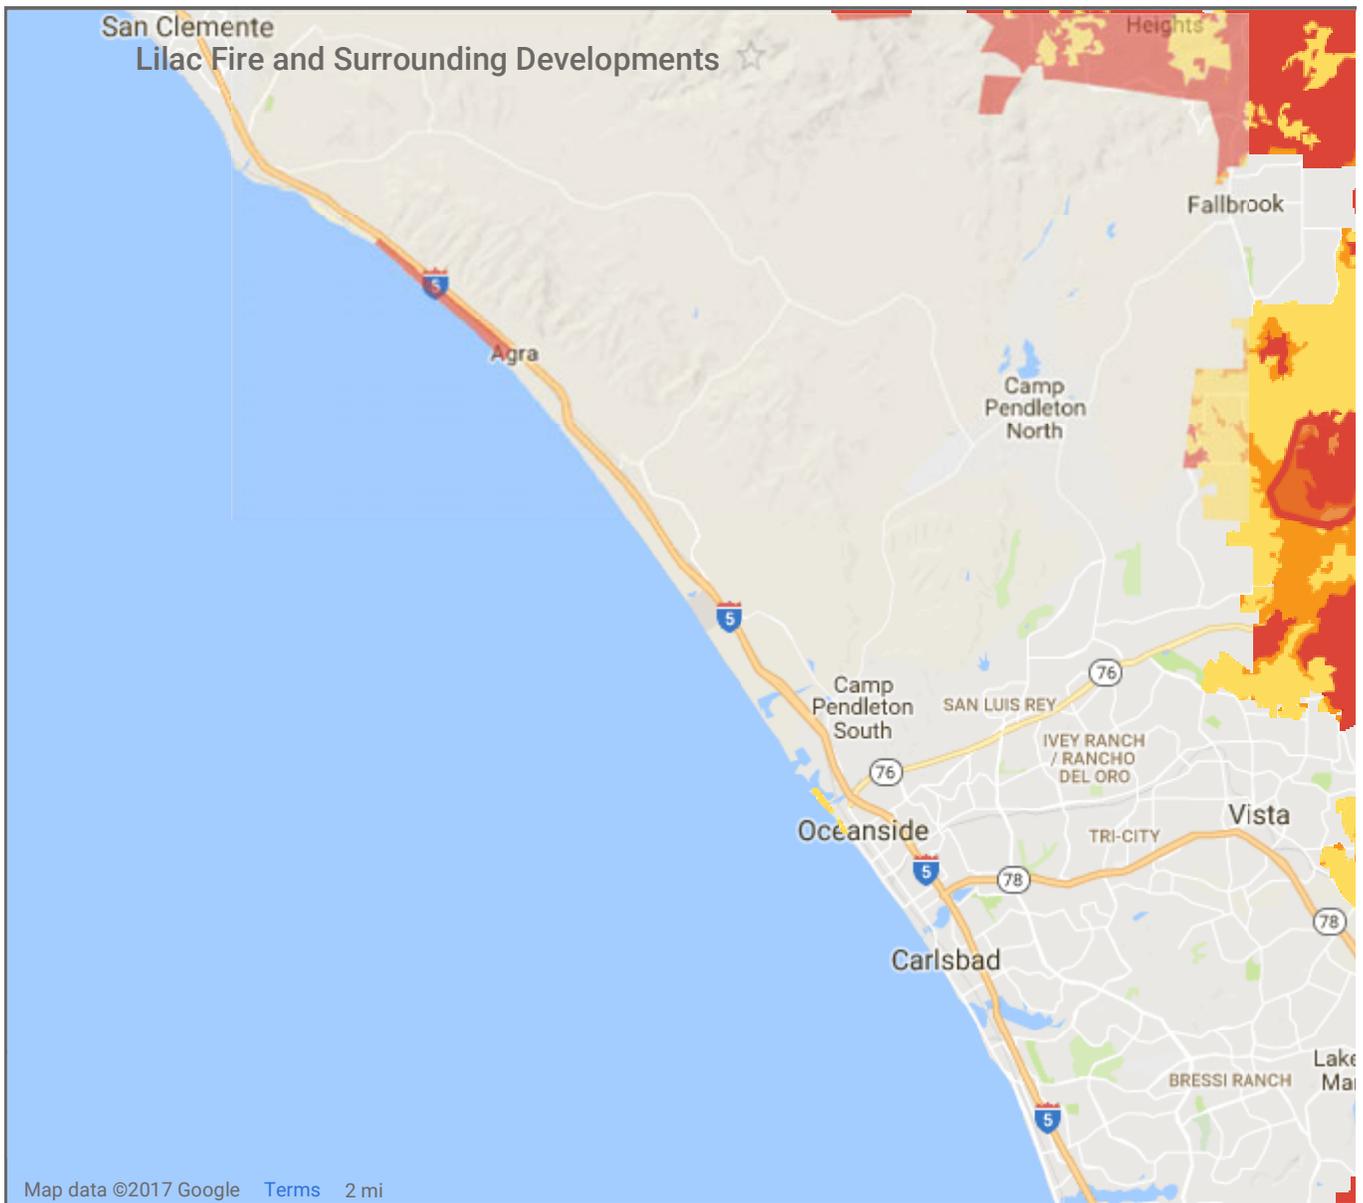

"The first set of homes are going to be in danger because they'll be surrounded by wildland," said Jon Keeley, one of the study's authors. "Leapfrog, without a doubt, leads to the highest loss of homes."

The safest way to build new housing is to build it near existing housing, the study found.

The large development projects still waiting for approval are not just located in severe wildfire risk areas ^[3]. Some are just on the other side of the I-15 from where the Lilac Fire burned. Some are in the same area as the 2014 Cocos Fire, which destroyed roughly 65 buildings ^[4], costing roughly \$28.5 million to contain and incurring an estimated \$29.8 million in property damage. They're also near the 2007 Witch Fire, which amounted to roughly \$1.3 billion in damages ^[5], and the 2003 Cedar Fire, which destroyed 2,820 buildings and killed 15 people ^[6].

The projects are proposed in northeastern San Diego County because it's some of the last bare land for development in the county. But that's exactly why they're concerning, experts say: The risk is highest when the first developments go in, and eventually subsides when there is a much larger mass of buildings and people like in downtown San Diego, Oceanside or Escondido.

One of the projects, [Lilac Hills Ranch](#) ^[7], proposes roughly 1,700 homes on 600 acres of rolling hills in Valley Center. Harmony Grove South would add 463 homes around the corner from Valiano, another proposed development including 326 homes. Another Harmony Grove project of about 700 homes is already under construction. Newland Sierra, between Vista and Valley Center, would bring another 2,135 homes. Warner Ranch, near Pala, proposes another roughly 780 homes.

Keeley said this year's fires in Napa and Sonoma counties, where more than 40 people died and hundreds of homes and buildings were destroyed, showed the dangers of new development.

"That area had fires very similar to the fires they had this year in 1964, but no one died in those fires," Keeley said. "The primary thing that has changed wasn't the fire."

The increase in deaths and destruction was more likely due to the drastic increase in people populating Santa Rosa ^[8], he said.

Richard Halsey, the director of the California Chaparral Institute, said from the minute you build a home in the wildland-urban interface, it becomes more and more dangerous, as

litter builds up, homes age, people accumulate stuff that could be flammable and let dried leaves or other brush build up in their gutters and yards. It's not until you reach a certain density, where most of the vegetation is removed from areas, that the danger diminishes.

Halsey said he's concerned about a project in his backyard in Escondido, Safari Highlands

[9].

"That was in the fire corridor that the 2007 fire raged through," he said. "It's in an area pretty much identical to the area that burned in Santa Rosa, the neighborhoods being taken out by the Thomas Fire right now."

The large projects all require amendments to the county's growth blueprint because they would put more density than is currently allowed. The amendments must go through the county's Planning Commission and Board of Supervisors.

Newland Sierra is expected to come before the board in 2018.

Decision-makers can impose requirements on the developments that could minimize their fire risk. Valiano, for instance, would need to build new roads leading out of the property [10] to help with evacuation, according to its Fire Protection Plan, a document included in the county's development review process. Harmony Grove Village would build a new fire station if approved [11].

Developers for Lilac Hills Ranch, meanwhile, have not yet proposed how they'll ensure fire crews can reach homes in the project's furthest reaches within required fire response timelines – though early phases of the development can begin before they figure it out.

The most common needs for North County projects, according to the San Diego County Fire Authority, mostly deal with adequate roads into and out of the projects.

During the Cocos Fire, traffic gridlocked on Country Club Drive as residents tried to evacuate, according to some accounts [12]. The fire created the same problem for another nearby development, San Elijo Hills, near San Marcos. San Elijo Road led to all three exits out of the development and became gridlocked as thousands of residents fled.

Lilac Hills Ranch, which is roughly less than a mile from the Lilac Fire at the closest point of the two and roughly three to four miles from the center of the fire zone to the center of the

development, already tried to skirt development requirements related to fire and public safety.

A 2015 Voice of San Diego investigation ^[13] found that developers behind the project refused to pay for a new fire station for the more than 3,000 additional residents they would bring in to the area. The project would build 1,746 homes in a mostly rural area where current restrictions allow only 110 homes.

In fall 2015, the county's Planning Commission recommended the Board of Supervisors approve the project, but with several changes – including funding the construction of a new fire station ^[14].

But instead of agreeing to that stipulation, Lilac Hills' developers eventually opted to instead put the project before voters last November as Measure B. The initiative also specified ^[15] ways the project could avoid certain safety investments.

For instance, the developer had asked the county for exceptions to various road standards, so they wouldn't have to flatten hills, or widen country roads to accommodate the influx of traffic the development would bring.

In the initiative, they simply said that West Lilac Road – which was the easternmost boundary of the Lilac Fire, and one of the roads the Planning Commission said needed widening – didn't need to be changed.

The Lilac Hills ballot measure failed, but the project and others that would require amendments to the county general plan are not dead ^[16].

Keeley said there are known avenues to make at-risk developments safer, but politicians need to demand them.

"People already know what the best thing to do in those cases is," Keeley said. "If you ask any fire chief in the county, they'll tell you, you got to have access roads, you're going to need a way to get firefighters in the area. Fire chiefs in San Diego County know pretty clearly what makes development risky, and they do have a lot of suggestions how to make those developments succeed. If developers are trying to avoid that, that's a political question."

Halsey also said politicians should work on retrofitting existing buildings and homes to improve their fire safety – for example, by putting in automatic external sprinkler systems that could wet the entire house during wildfire risk.

“The climate is changing,” Halsey said. “If we’ve built in wildland areas, there are things we can do to strengthen them.”

Subject: FW: Comment on Rancho Lomas Verdes Specific Plan Notice of Preparation

Ashley and Mark,

Below is an email that I just sent to John Hamilton, who is the environmental planner for the Rancho Lomas Verdes Specific Plan, for which the City of Vista received an application in 2011, ---4 years before the now 3 year old Notice of Preparation released for the Newland Project. (City of Vista Project 52, Case Number PC6-057, Application submitted August of 2011) <https://gis.cityofvista.com/PlanningProjects/>

Unfortunately, it doesn't appear that this project was included in the cumulative projects studied in the Newland EIR. With the explosion of new development projects being planned for rural North County San Diego, it is obviously difficult to keep track of them all. It is especially difficult when there are separate Cities each doing their own planning for pieces of unincorporated County land that they propose to annex and convert to more intense development than is proposed in the adopted County General Plan. Perhaps the answer would be for the planning staffs of the North County cities, SANDAG, the County and southeastern Riverside agencies, to attempt to compile a single data base of planning applications, both large and small. Each small project may not individually have a large impact, and the traffic study areas for each small project may themselves be limited, but when added together in a cumulative study, the overall traffic impacts of these small projects, when added to larger projects, may be great. Because of the great number of motorists traveling north and south each day from Riverside, what happens in the 76/East Vista Way corridor also affects Gopher Canyon and the Interstate 15 corridor.

We just learned of this project yesterday, and wanted to get you this information as soon as possible without any delay. For some reason, the City of Vista Notice of Preparation attached does not show the County as a responsible or trustee agency. Therefore, it is quite possible that you did not receive a copy of the notice from the City of Vista. Perhaps you could call and check for other any projects like this that Oceanside, Vista,

San Marcos or Escondido planning staff may be considering that have also been missed from the Newland EIR, or the separately released County PSR EIR.

Once you are sure that you have all the missing projects, like this project, including the ones we referenced in our letter last year, we would suggest that the cumulative impacts analysis in the Newland EIR be revised and recirculated for public comment. Another option would be to work with SANDAG staff to have them prepare an overall regional traffic study that includes all this newly proposed development not considered in the current adopted General Plans, and then use that study for consideration of any County General Plan amendments for the North County area. We are also concerned that the County should work with other agencies to consider whether the wildfire risk planning including in the County's existing Safety Element in the General Plan should be updated. Also, perhaps the County should consider revisions to their draft MSCP, if surrounding jurisdictions have proposed to annex and develop land which the County has designated as PAMA in its planning maps for the unincorporated area.

Regards,
Chris

Subject: Comment on Rancho Lomas Verdes Specific Plan Notice of Preparation

VIA EMAIL
John Hamilton, AICP
Environmental Planner
Community Development Department
200 Civic Center Drive
Vista, CA 92084-6275
Fax: (760) 639-6101

Dear Mr. Hamilton:

We are submitting comments on the attached Notice of Preparation for the Rancho Lomas Verdes Specific Plan Project on behalf of our client the Golden Door Spa.

While the Golden Door Spa is not expressing either opposition or support for the Rancho Lomas Verdes Specific Plan Project, we want to express our concerns about the new planning effort that the City of Vista is undertaking to plan for new intensive development for land which is outside the City's boundaries and outside the City's Sphere of Influence. The Golden Door strongly believes that all agencies should honor the County's General Plan, and not undertake planning efforts which bypass the Board of Supervisors to remove the land covered by the plan and place it within incorporated City boundaries.

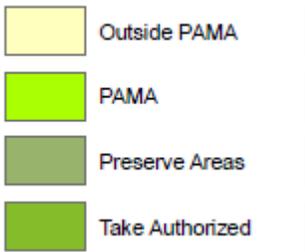

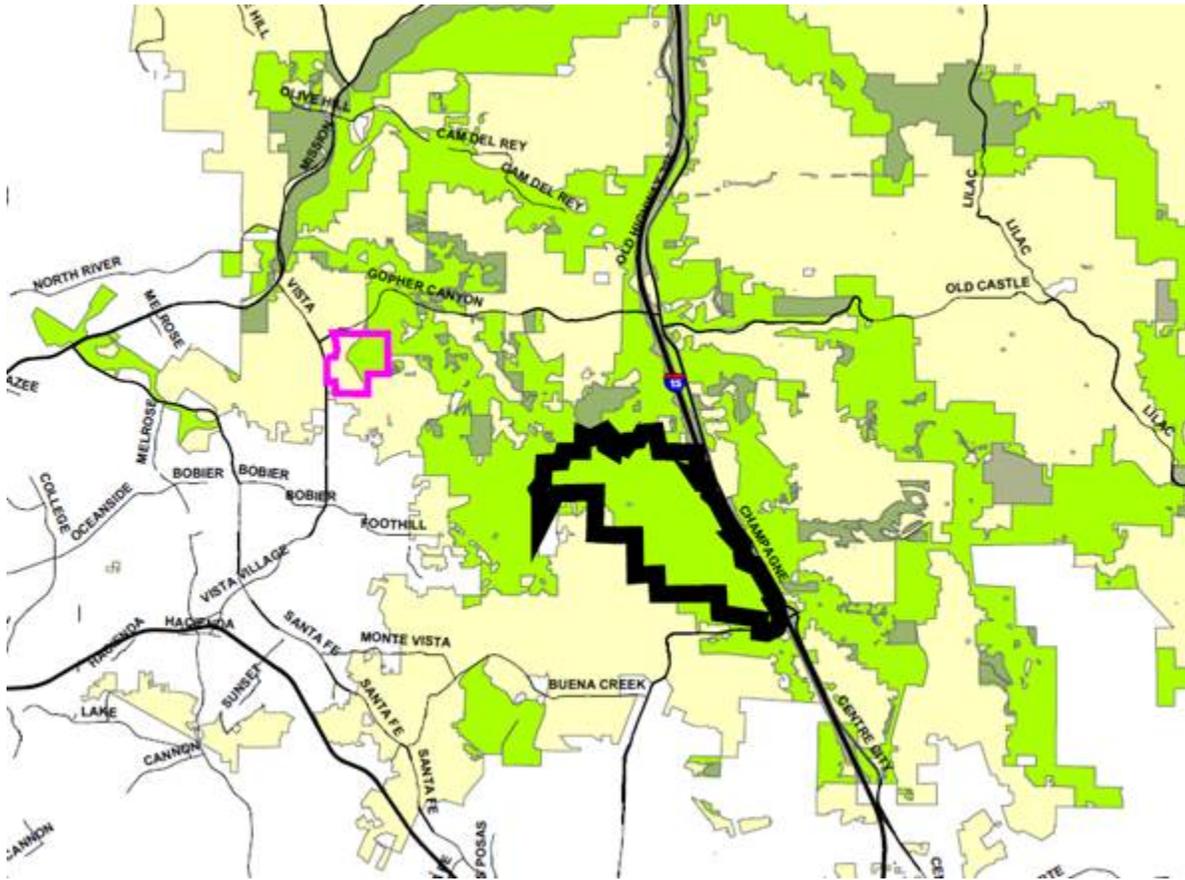

Among other things, this results in fragmented planning by different City and County staff members. For example, even though the City of Vista has been processing this application that was submitted to the City of Vista over 6 and one half years ago, (City of Vista [Project 52, Case Number PC6-057, Application submitted August of 2011](#)) <https://gis.cityofvista.com/PlanningProjects/> ---- this project has been ignored by the County of San Diego in its recently released EIR for the Newland Project, (See attached map of cumulative projects from the Newland EIR.)

North San Diego County faces a crisis in transportation planning. No one single county or city agency is looking at current plans plus the impacts of all the proposals for new urban development of rural North County. For example, when an agency only looks at a single new project, no effort is made to consider the combined impact of all these single projects on regional resources. Interstate 15 is projected to operate at Level of Service F during peak hours by the County of San Diego. This will lead to drivers seeking to avoid Interstate 15 by diverting traffic to SR 76 and connecting surface streets, such as Gopher Canyon Road or East Vista Way. Agencies such as SANDAG and Caltrans can only conduct regional transportation planning and forecasting if they can rely upon the adopted general plans of the County and incorporated Cities. This Rancho Lomas Verdes project has not been included in any of these regional plans, which relied upon the County and City of Vista adopted General Plans. Because so many proposed new projects are being planned outside of adopted plans, it is important that such approvals not go forward for consideration unless and until these regional plans can be updated with consideration of various scenarios that may occur, and facilities that must be expanded, before any project approvals are granted. If the City of Vista is going to go forward without comprehensive regional planning by SANDAG and the County, then the traffic study boundaries for the Rancho Lomas Verdes project must be expanded to extend to cover all these other cumulative projects, extending to Riverside County and down to the 78 corridor, and running from Interstate 5 to Interstate 15, to take into account the thousands of cars heading north and south each day within this region. With such regional comprehensive planning, agencies can determine if new transit facilities, such as light rail or express bus routes, should be built or extended to cover these regional needs.

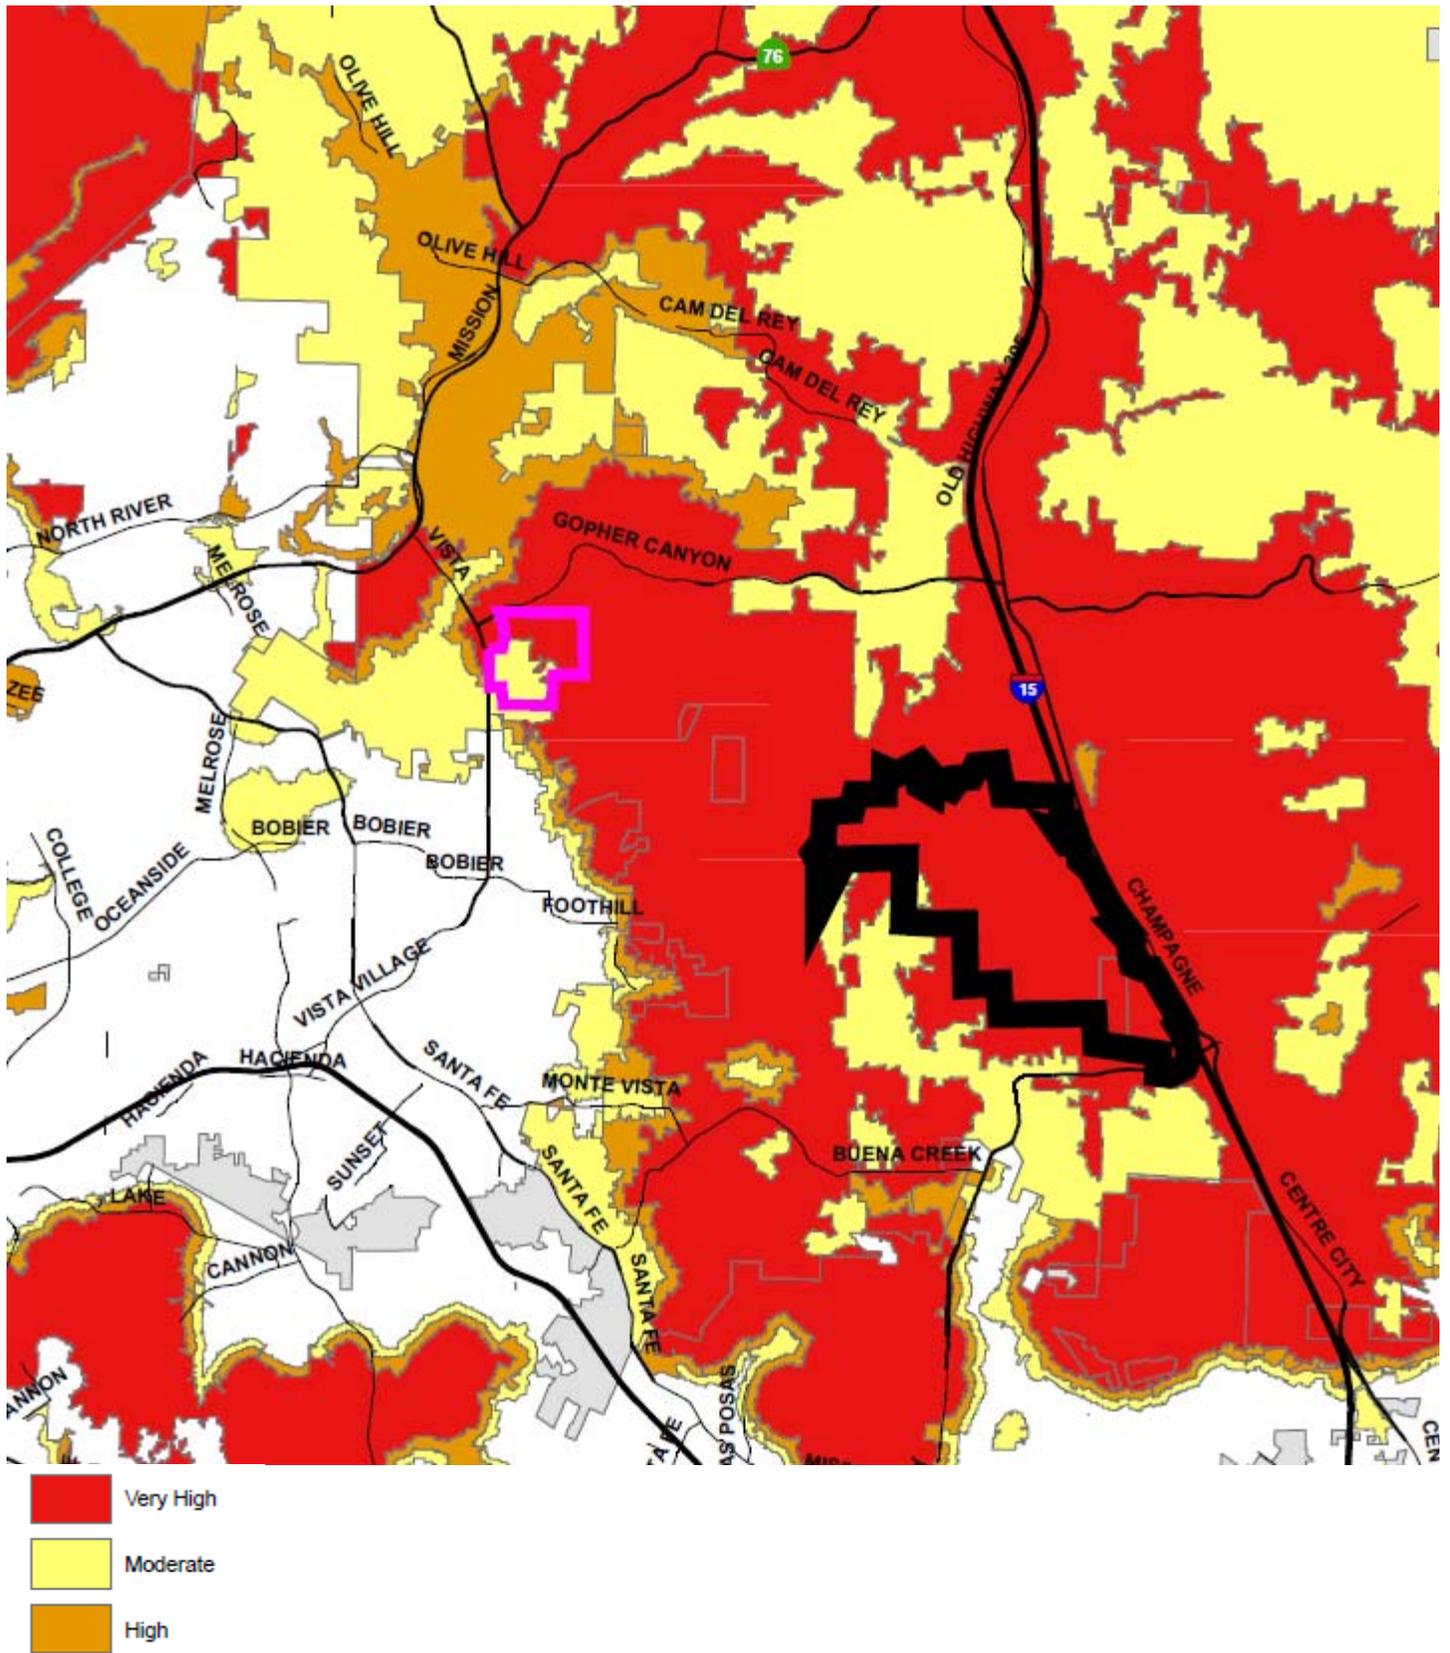

The EIR should also analyze the impact on the vehicle miles traveled (“VMT”) and greenhouse gas emission reduction plans of SANDAG. SANDAG’s current plan, approved by the California Air Resources Board, assumes that there will be no further development in rural areas that are not planned for new growth under existing general plans, and instead growth will occur only in “smart growth” areas designed by SANDAG in its adopted SCS/RTP. This project is not located in those smart growth areas, and will conflict with the attainment of the adopted plan’s VMT reduction goals.

We are also concerned that the project conflicts with the regional plans to address wildfire risk and potential damage to biological resources. The project also appears to be located in an important biological wildlife corridor that extends from the proposed Newland Project development. Below are maps from County planning documents which illustrate that point. Any EIR prepared by the City of Vista should consider the cumulative impacts on wildfire risk, biological resources, traffic and other environmental resources from all the projects listed in the map of cumulative projects from the County’s Newland EIR, and also the nearby Newland project itself, which is marked on the maps below. We urge you to closely coordinate with County staff, as well as staff at the Cities of San Marcos and Escondido which are also moving forward with new projects not previously included in their general plans.

The light green area below is Pre-Approved Mitigation Area (PAMA) in the County’s draft MSCP which was supposed to receive special protection from new development and disruption to biological resources.

Here is a map of the Rancho Lomas Verdes Project outlined in purple. The Project in Black is the Newland Sierra Project. The Red indicates Very High Fire Severity area, Orange is High and Yellow is Moderate.

Regards,

Chris

**NOTICE OF PREPARATION
OF A
DRAFT ENVIRONMENTAL IMPACT REPORT
FOR THE
RANCHO LOMAS VERDES SPECIFIC PLAN**

SUMMARY

The project applicant (So. Cal. Ag. Properties, Inc.) seeks approval of the Rancho Lomas Verdes (RLV) Specific Plan, which proposes development of a residential estate community that would contain 153 residential lots within a 309-acre site. The RLV Specific Plan establishes the comprehensive planning framework, regulations and design guidelines that would direct future development within the Specific Plan Area (SPA). The project site is just north of the city of Vista's legal boundary, within the unincorporated community of Bonsall in the County of San Diego (see Figure 1, *Regional Location* and Figure 2, *Project Vicinity*). However, the southern portion of the site (approximately 71 acres) is within the City of Vista's (City) Sphere of Influence. The project site is generally bordered to the west by East Vista Way, to the north by Gopher Canyon Road, to the east by Elevado road, and to the south by Green Hills Way.

Under the requirements of the California Environmental Quality Act (CEQA) (Public Resources Code (PRC), Section 21000 *et seq.*) and the State Guidelines for Implementation of CEQA (State CEQA Guidelines) (California Code of Regulations, Section 15000 *et seq.*), the City is the Lead Agency for environmental review, which must evaluate the potentially significant environmental effects of the proposed project. Pursuant to State CEQA Guidelines Section 15168, the City has determined that an Environmental Impact Report (EIR) will be prepared to assess the proposed project's effects on the environment, to identify potentially significant impacts, and to identify feasible mitigation measures to reduce or eliminate potentially significant environmental impacts that cannot be avoided.

This Notice of Preparation (NOP) is being circulated pursuant to PRC Section 21153(a) and State CEQA Guidelines Section 15082. Public agencies and the public are invited to comment on the proposed scope and content of the environmental information to be included in the EIR. A 30-day review period is provided to return written comments to the City. Comments will be accepted from December 7, 2017 through January 5, 2018. A public scoping meeting regarding the EIR will be held on December 14 from 6:00 p.m. to 8:00 p.m. in the Vista Community Room at City Hall, 200 Civic Center Drive, Vista, California 92084. All comments should be directed to the City's Environmental Planner at the following address:

John Hamilton, AICP
Environmental Planner
Community Development Department
200 Civic Center Drive
Vista, CA 92084-6275
Fax: (760) 639-6101
jhamilton@cityofvista.com

ENVIRONMENTAL SETTING

Project Site

The SPA consists of six contiguous parcels and has historically supported agricultural uses on the site. The remaining area includes undeveloped hillsides that contain a mixture of native and non-native vegetation habitats. The SPA is characterized by rolling hillsides with moderate topography in the western area of the property and steeper slope features in the eastern portions of the site. An intermittent stream (Little Gopher Canyon Creek) traverses the site in the eastern area flowing north to Gopher Canyon Creek, which then flows to the San Luis Rey River channel.

The SPA currently contains land utilized for berry crop production. The area of the site in active crop production varies from year to year between approximately 75 and 100 acres on average based on operational needs. Other portions of the site remain vacant or fallow. A small commercial fruit stand is operated on the western edge of the site adjacent to East Vista Way. No residential structures are located on site, nor is the property located within an agricultural preserve.

Surrounding Land Uses and Transportation System

The area surrounding the project site is primarily developed with semi-rural residential development. Generally, properties with smaller lots ranging from less than 0.5 acres to two acres in size are located to the south and west. Moderate to larger residential properties ranging from one to four acres in size are located to the north and east.

The project site is bounded by East Vista Way to the west and Gopher Canyon Road to the north. East Vista Way is in the County's jurisdiction between SR 76 and approximately Osbourne Street. This portion of the road is two-lanes, one in either direction. East Vista Way transitions to a four-lane roadway at approximately Taylor Street, which is in the City's jurisdiction. Gopher Canyon Road is a two-lane roadway between East Vista Way and I-15. Interstate 15 is located approximately four miles to the east and State Route 76 is located approximately one mile to the north. The North County Transit District BREEZE Bus Route 306 Fallbrook to Vista line runs along East Vista Way. The San Luis Rey River is located approximately one mile to the north of the site, adjacent to the State Route 76 corridor.

PROJECT DESCRIPTION

The Applicant of the proposed project seeks adoption of the RLV Specific Plan from the City through a General Plan Amendment and Zone Change, approval of an annexation request to the City, and approval of a Tentative Subdivision Map.

The primary objective of the RLV Specific Plan is to provide a residential estate community that preserves environmentally sensitive areas in designated open space and enhances the area's semi-rural character. The RLV Specific Plan proposes estate lots ranging from a minimum of one acre to over five acres in size, with an average project density of 0.5-unit per acre. The residential development within the SPA is designed around a system of private roads, community trails, park spaces, and landscape amenities. Over 28 percent of the SPA would be designated as open space. Development is concentrated on the gentler sloping portions of the site. The RLV Specific Plan provides a transition from the higher density residential areas located to the south and west of the project site to the lower intensity large lot residential and

resort areas located to the north and east. The project site would be divided into three development areas that correspond to the varying lot size characteristics of the surroundings and an open space area, as shown in Figure 3, *Conceptual Site Plan*.

Planning Area 1 (PA-1) consists of 93 lots on approximately 138 acres. This area includes over 16 acres of open space, community trails, private parks, maintained open space, and landscape features. Lots are situated at varying elevations with several positioned to take advantage of the views surrounding the site. The main entry to the project at East Vista Way would be located within PA-1 aligned with Mason Road.

Planning Area 2 (PA-2) consists of 43 lots on approximately 53 acres. This area includes 3.6 acres of community trail features. Lots are organized along a gentle elevation ridge with views to the north and east. An emergency access point for the project is located at the northwest corner of PA-2, connecting to Ormsby Way with access to Gopher Canyon Road.

Planning Area 3 (PA-3) consists of 17 lots on approximately 29 acres in the eastern portion of the SPA. Lots are generally oriented with views to the south and west. PA-3 is surrounded on three sides by the open space area. An existing emergency access point would be maintained in the southeast corner of PA-3, providing neighboring areas an egress route through the area.

The Open Space area includes nearly 87 acres that would be maintained as a part of the RLV Specific Plan. The area, located in the northeast portion of the site, is devoted to wetlands, habitat, steep slope, and natural open space features. Within this area 78.5 acres of land would be dedicated as biological open space to preserve riparian, natural terrain, and other habitat areas. The remaining 8.5 acres of land within the open space area would consist of landscaped manufactured slopes and fuel modification zones supporting naturalized plantings buffering the proposed residential areas.

An additional 6.5 percent (19.8 acres) of land would consist of passive community recreation areas, landscape elements, and homeowner association-maintained open space within Planning Areas 1 and 2. These passive features include private parks, trails, and community landscape elements. The RLV Specific Plan also includes a community trail system that would be offset from the internal road network.

The main access to the SPA is planned via the east leg of the East Vista Way/Mason Road intersection. This access point would be signalized with dedicated left turn lanes. A secondary emergency access point would be located at the northwest corner of the SPA, connecting to Ormsby Way with access to Gopher Canyon Road. The project proposes to make improvements to East Vista Way at the proposed access point and provide frontage improvements.

The RLV Specific Plan also contains guidelines for landscape improvements for each planning area and other infrastructure (water, sewer, and storm drain) improvements. Off-site improvements are anticipated to include roadway improvements at East Vista Way and a sewer force main within East Vista Way to connect the proposed sewer pump station to an existing sewer line at the intersection of Warmlands Avenue. The RLV Specific Plan is anticipated to develop in three phases corresponding to the three planning areas. Phases may develop concurrently with timing and sequence adjusted as necessary in response to community preference and market conditions.

The County of San Diego General Plan designates the property under the Semi-Rural land use category with a corresponding maximum density of 1 dwelling unit (DU)/4 Acres (SR-4). The zoning category for the property is A-70 (Limited Agricultural Use). The project site is proposed for annexation to the city and would ultimately be regulated by the City's land use and zoning ordinances. In conjunction with the proposed annexation, the SOI would be amended to include the entire Specific Plan property with an RR (Rural Residential) – 1 DU/AC land use designation. The project site would be designated with the zoning category of SP - RLV (Specific Plan Rancho Lomas Verdes).

TOPICS TO BE ANALYZED IN THE EIR

Aesthetics. The EIR will address how the proposed project would modify scenic resources and natural landforms, change the visual character of the SPA, or create a new source of light or glare. The analysis will also include identification of key public views, and a discussion of consistency with the City's General Plan 2030 Update, and the proposed Specific Plan design guidelines.

Agricultural Resources. The EIR will analyze the potential impacts associated with the conversion of agricultural uses to residential development. The analysis will identify existing and historic agricultural uses within the project site, and analyze the proposed project's consistency with the City's General Plan 2030 Update and Zoning Ordinance.

Air Quality. The EIR will analyze anticipated emissions associated with construction and operation of the development within the SPA, and discuss the project's potential to expose sensitive receptors (e.g., residences) to substantial pollutant concentrations. The EIR will also discuss project consistency with applicable air quality plans and regulations.

Biological Resources. The EIR will analyze anticipated impacts to sensitive vegetation communities, species, and jurisdictional features within the SPA. Although the SPA is entirely within the County of San Diego's North County Multiple Species Conservation Program (NC-MSCP) Subarea, the site is being proposed for annexation into the City, and the NC-MSCP would not apply to the Specific Plan.

Cultural and Tribal Cultural Resources. The EIR will describe the areas of archeological and tribal sensitivity based on the results of a record search, field survey, and Native American consultation. Potential impacts associated with known and unknown sensitive cultural and tribal cultural resources affected by implementation of the Specific Plan will be addressed.

Energy. The EIR will estimate energy consumed during the future buildout of the RLV Specific Plan, including electrical energy demand, vehicular energy demand, and water and solid waste-related energy demand to assess whether the Specific Plan would employ an efficient use of energy.

Geology, Soils, and Paleontological Resources. The EIR will describe the geologic and seismic characteristics of the SPA. Potential geologic hazards that may result from implementation of the RLV Specific Plan will be identified, as well as any geologic conditions that may affect proposed development. This section will also analyze the potential of the project to directly or indirectly adversely affect paleontological resources.

Greenhouse Gas Emissions. The greenhouse gas emission section of the EIR will describe anticipated emissions associated with Specific Plan construction and operation, along with measures that the RLV Specific Plan would implement to reduce those emissions. This section will also include an analysis of the Specific Plan's consistency with the goals and policies contained within the City's Climate Action Plan and General Plan 2030 Update. The EIR will also evaluate the RLV Specific Plan's compliance with statewide legislation enacted to reduce greenhouse gas emissions such as Assembly Bill 32 and Senate Bill 32.

Hazards and Hazardous Materials. The issue of hazards and hazardous materials will be addressed in the EIR, particularly with respect to potential contamination remaining from previous agricultural activities on the site, and potential hazards related to wildland fires.

Hydrology and Water Quality. The hydrology section of the EIR will evaluate drainage patterns and flows generated as a result of development, the adequacy of downstream drainage features, and potential effects on water quality from implementation of the RLV Specific Plan. The discussion will also identify conceptual water quality control features, biofiltration basins, and Best Management Practices to be implemented during construction and operation of the development within the RLV Specific Plan.

Land Use and Planning. This section will analyze the consistency of the RLV Specific Plan with adjacent land uses, as well as with applicable portions of the Vista General Plan 2030 Update. The analysis will address land use designations and applicable planning policies, and examine factors that the Local Agency Formation Commission considers when reviewing annexation requests.

Noise. The EIR will describe the potential for the project to result in significant temporary and permanent noise increases associated with construction or operation (such as traffic-related noise) of the RLV Specific Plan that may affect noise-sensitive land uses (such as residences) in the site vicinity.

Population and Housing. The EIR will describe the proposed increase in housing availability and associated population from RLV Specific Plan implementation and compare it against regional forecasts. The analysis will address the project's potential to directly or indirectly induce population growth, or to displace substantial numbers of housing or people.

Public Services. The EIR will address potential impacts to fire, police, school, and maintenance of public roads based on the development of the RLV Specific Plan and information provided by each service-providing agency.

Recreation. The EIR will evaluate whether the RLV Specific Plan would include sufficient recreational facilities to serve the planned population, or if it could result in the need for improvements or increased maintenance at off-site recreational facilities.

Transportation and Traffic. The EIR will evaluate the potential short-term and long-term traffic impacts associated with the RLV Specific Plan. The EIR will analyze whether implementation of the project would negatively impact the existing traffic load and capacity of the street system, and identify any roadway improvements needed in the vicinity to reduce impacts.

Utilities and Service Systems. The EIR will address potential impacts to utilities and service systems including the ability to provide adequate sewer, water, storm water, electricity, gas, and solid waste disposal services to the SPA.

Effects Found not to be Significant. The discussion of effects found not to be significant will include a brief statement indicating the reasons that possible effects of RLV Specific Plan implementation were determined not to be significant. It is assumed that Mineral Resources would be addressed in this section.

Growth Inducement. The EIR will discuss the potential development of the SPA to induce, either directly or indirectly, economic or population growth resulting in the need for construction of additional housing or infrastructure beyond that proposed within the project site that could adversely affect the surrounding environment.

Alternatives. As required by State CEQA Guidelines Section 15126.6, the EIR will include a discussion of reasonable alternatives to the proposed project, including a No Project Alternative. Alternatives will be developed that would avoid or lessen the identified significant impacts of the proposed project, while feasibly attaining most of the basic objectives of the project.

Cumulative Impacts. In addition to analyzing the potential environmental impacts of the proposed project, the EIR will also include an analysis of cumulative effects. The EIR will analyze past, present, and reasonably foreseeable future projects within the city and surrounding areas (if applicable) that may contribute to a specific cumulative impact, when considered in conjunction with the impacts associated with implementation of the RLV Specific Plan.

TOPICS EXCLUDED FROM ANALYSIS IN THE EIR

All environmental issue topics required by the State CEQA Guidelines will be included within the EIR.

Responsible and Trustee Agencies

According to State CEQA Guidelines Section 15050, the City is designated as the Lead Agency for the Project. Responsible agencies are those agencies that have discretionary approval authority over one or more actions involved with the development of a proposed project. Trustee agencies are state agencies having jurisdiction by law over natural resources affected by a proposed project that are held in trust of the people of the State of California. The potential responsible and trustee agencies that have been identified as part of the preparation of this document and the required permits, approvals, or associated responsibilities for the proposed project are identified in Table A.

Table A: Potential Responsible and Trustee Agencies

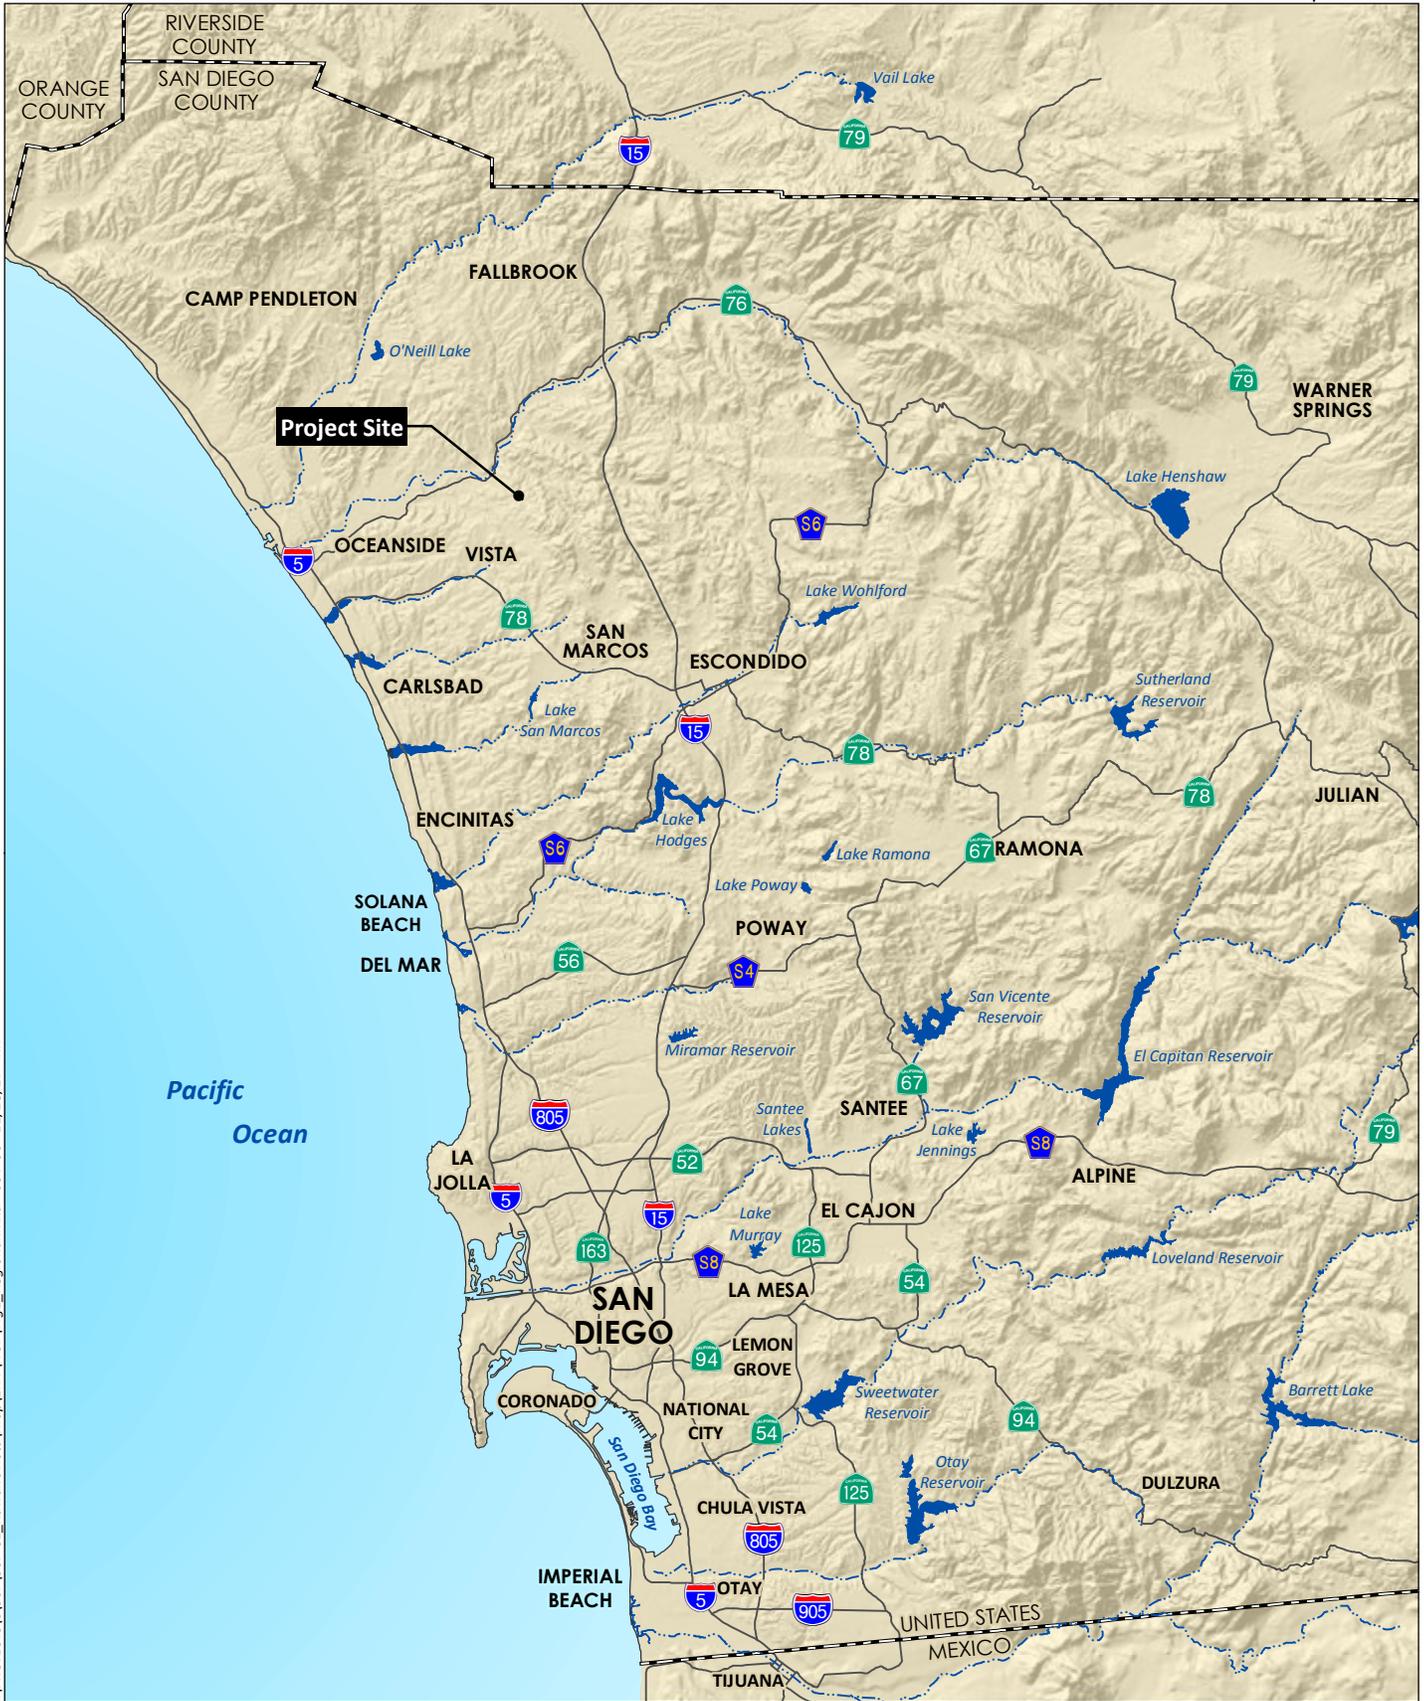

Agency	Potential Permit/Approval
State Water Resources Control Board/San Diego Regional Water Quality Control Board	Notice of Intent to comply with the terms of the National Pollutant Discharge Elimination System General Construction Permit to discharge stormwater associated with construction activity, and Section 401 Water Quality Certification
California Department of Fish and Wildlife	Incidental Take Permit pursuant to Title 783.2 of the California Fish and Game Code
U.S. Army Corps of Engineers	Section 404 Permit for impacts to waters of the United States

ENVIRONMENTAL PROCEDURES

This NOP will be submitted to the State Clearinghouse, which will forward it to potential Responsible Agencies and Trustee Agencies. Other interested parties that have specifically requested notification of this project will also receive a copy of the NOP.

After the 30-day review period for the NOP is complete and all comments are received, a Draft EIR will be completed in accordance with CEQA and the State CEQA Guidelines. Detailed analyses will be conducted to ascertain the proposed project's effects on the environment, and the relative degree of impact prior to avoidance or implementation of mitigation measures. Where impacts are determined to be significant and cannot be avoided, mitigation measures will be prescribed with the purpose of reducing the project's effects on those impacts either completely or to the maximum degree feasible.

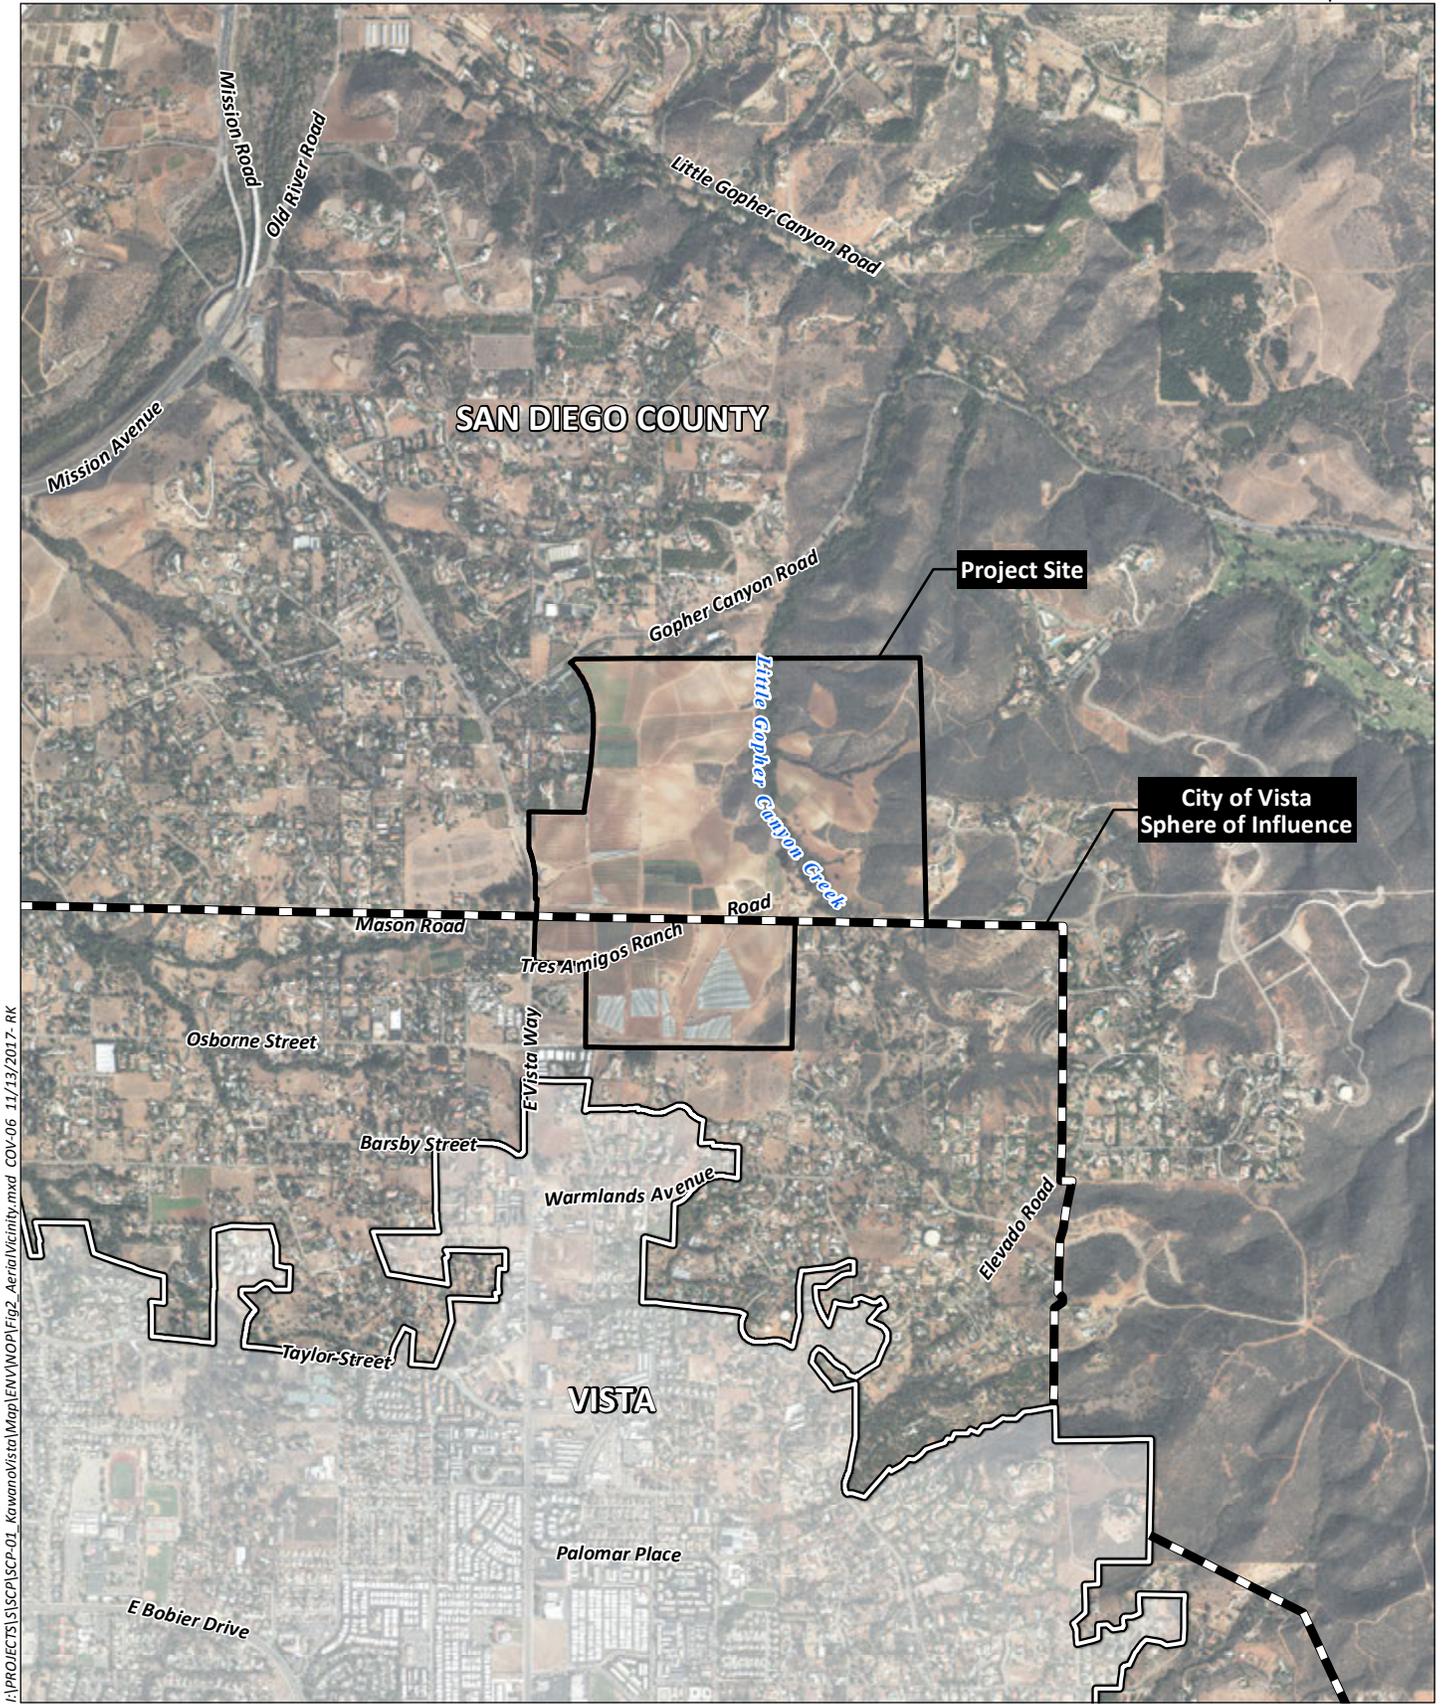

Once the Draft EIR is completed, it will be made available for a 45-day public review and comment period. A Notice of Availability of the Draft EIR will sent directly to those agencies and members of the general public commenting on the NOP. Following circulation of the Draft EIR, the City will prepare the Final EIR, which will include responses to comments on the Draft EIR and identify any changes to the Draft EIR that were made following public review. The Final EIR will then be considered for certification by the Planning Commission and City Council.

**Re: Supplemental Comments on San Diego Climate Action Plan (PDS2015-
POD-15-002), Draft Supplemental Environmental Impact Report for
the Climate Action Plan (PDS2016-ER-16-00-003) and Pending
General Plan Amendments**

Dear Chair Brooks and Honorable Planning Commissioners:

The law firm of Chatten-Brown & Carstens represents the Sierra Club on matters relating to the County's environmental review of its revised Climate Action Plan ("Revised CAP"), Supplement to the 2011 General Plan Update Program Environmental Impact Report ("Supplemental Environmental Impact Report," or "SEIR"), and pending General Plan Amendment (GPA) projects.

The Sierra Club has consistently opposed any new GPAs until the County adopts a legally adequate CAP, and that is particularly important now. The County must act aggressively in attaining the goals that the County adopted in 2011. California is an international leader in addressing climate change and it is particularly important for the state to achieve its goal to prevent an erosion of international efforts. The consequences of the State failing to do so are dire in terms of sea level rise, more extreme weather, fires, water supply, and habitat loss. The CAP acknowledges that transportation is by far the largest contributor (45%) to its GHG emissions, yet the CAP only proposes to implement measures that would produce a 13% GHG reduction from this sector by 2030. The County must not authorize additional development through GPAs until the County demonstrates it has complied with the reductions it agreed to as mitigation for the development previously authorized in the 2011 General Plan Update.

The Sierra Club previously commented on the Draft CAP in its September 25, 2017 letter to the County's Planning and Development Services. (A complete copy of this letter is attached as **Exhibit A**.) Unfortunately, the deficiencies identified in that

letter have not been adequately addressed. The following discussion amplifies the prior points made, but also raises concerns regarding the County's lack of analysis of whether the revised CAP conflicts with CARB's Updated Scoping Plan and Updated Regional SB 375 Targets, and the lack of coordination with the San Diego Association of Governments (SANDAG). Additionally, the Sierra Club is concerned that the County, in its October 20, 2017 Planning Commission informational meeting and after the release of the Draft Supplemental EIR, indicated it was conducting cost-benefit studies for greenhouse gas emission reduction policies and may "de-emphasize some policies versus others."

There has been an undue delay in the County complying with the promises it made in 2011, including to prepare a Climate Action Plan (CAP) within six months of adopting the General Plan Update. After waiting for more than six years, the County proposes to achieve its GHG emission reduction goals primarily through carbon offsets. For the reasons discussed in this letter and the Sierra Club's prior letter, the County's use of out-of-County offsets violates CEQA. While the County has failed to move aggressively in addressing climate change up to the present time, there is now an opportunity for the San Diego County Board of Supervisors and Planning Commission to comply with the County's 2011 promises and show leadership on this important issue.

I. The Sierra Club Endorses the Arguments Made in Detail By Other Organizations.

In addition to the points made in the Sierra Club's initial letter on the Draft Revised CAP and EIR, and those points contained with some detail in this letter, there are numerous reasons given by other commenters why the CAP and EIR are not legally adequate. The Sierra Club endorses those comments, but will not repeat them here except to briefly mention them. The Club believes the County must address these issues in an updated CAP before the CAP is acted upon by the Supervisors. These issues include, but are not limited to, the following:

1. The failure of the County to consider the incompatibility of additional GPA's with the SANDAG Regional Transportation Plan (RTP) and Sustainable Communities Strategy (SCS), which documents are based on the development contemplated in the 2011 GPU. This issue is discussed in considerable detail by counsel for Golden Door, among others.

2. The County's General Plan Land Use and Conservation Elements require coordination of planning efforts with federal and State agencies, SANDAG, and other jurisdictions. The County's Conservation and Open Space Element provides:

COS-20.3. Regional Collaboration. Coordinate air quality planning efforts with federal and State agencies, SANDAG, and other jurisdictions.]

(County of San Diego General Plan, Conservation and Open Space Element, p. 5-39.)
The County's Land Use Element also requires this coordination:

LU-4.1 Regional Planning. Participate in regional planning to ensure that the unique communities, assets, and challenges of the unincorporated lands are appropriately addressed with the implementation of the planning principles and land use requirements, including the provisions of SB375.

(County of San Diego General Plan, Land Use Element, p. 3-26.)

By approving new development outside of the designated Smart Growth areas, which will cause VMT to violate SANDAG's adopted SCS/RTP, the County is failing to participate in the SANDAG regional planning process and the provisions of SB 375. This General Plan inconsistency was not analyzed in the Final Supplemental EIR (FSEIR).

3. Many of the CAP's mitigation measures are speculative and not supported by substantial evidence.

a. The Direct Investment Program.

The Direct Investment Program (DIP) is proposed as a discretionary action. In response to concerns raised by the California Native Plant Society, San Diego Chapter regarding the Direct Investment Program, the County states:

[T]he direct investment program would be established by the County by 2020 as a future discretionary action. If the CAP is adopted the County would determine which protocols would be feasible to implement in the County, and would undertake a separate CEQA evaluation at the time of the establishment of the program if required.

(Response to Comment Letter O9, p. 19.) The County relies heavily on the DIP as a mitigation measure. However, the County would have to ensure the DIP is funded and implemented. There are currently no projects identified for either the DIP or GPA offsets. For the large amount of credits that would be needed to achieve the 2030 targets, it is speculative that a sufficient amount of "in-County" created credits will be available. There is not substantial evidence to support future availability of these offset credits. The County must analyze feasible mitigation measures in advance of adopting the CAP, not after the fact.

b. The California Air Pollution Control Officers Association Registry.

The California Air Pollution Control Officers Association (CAPCOA) is merely a list of credits that one of the member air pollution districts has adopted. CAPCOA has a disclaimer about the use of such credits for CEQA purposes.

The GHG credits listed on the website, the CAPCOA GHG Rx, were validated by an air district of CAPCOA. District validation means that the particular district concluded the GHG credits met the CAPCOA protocol for such credits. Neither CAPCOA nor the district make any representations, warranties or guarantees of any kind as to the use or applicability of any GHG credit listed on the CAPCOA GHG Rx for any specific project, program, plan, compliance with the California Environmental Quality Act (CEQA; Pub. Res. Code § 21000 et seq. and 14 CCR§ 15000 et seq.), or for any other use. Please note that if a GHG credit listed on the CAPCOA GHG Rx is proposed to be used as part of a CEQA mitigation measure, the respective CEQA lead agency for the subject project is responsible for determining if the use of such GHG credit is appropriate (as mitigation) and satisfies its project conditions and other applicable requirements. The CAPCOA GHG Rx only lists available GHG credits so that interested parties may make private inquiries into obtaining those GHG credits. CAPCOA does not offer any other services beyond this listing service. The validation by the district, and the listing of GHG credits by CAPCOA, shall in no way create a property right.

In light of CAPCOA's disclaimer, the County's reliance upon the GHG credits on the CAPCOA GHG Rx is misplaced.

c. Installing Solar Photovoltaics on Existing Homes.

The measure as described is about streamlined permitting, not financial incentives to encourage a transition to green energy. The CAP should show how streamlined permitting will achieve the measure's reductions but in any case commit to implementing the wide range of measures available to encourage the development and installation of clean energy technologies.

II. The County's Contention It Has Limited Options to Control Transportation Emissions Is Belied by Its Control Over General Plan Amendments, Which Would Contribute to Sprawl and Increased VMT.

The CAP states:

On-road internal combustion transportation is the largest contributor to the unincorporated county's GHG emissions. Emissions from on-road

transportation sources accounted for 45% of the unincorporated county's total emissions in 2014.

(CAP, Chapter 3-8.) The CAP continues:

Given that on-road transportation is the largest source of GHG emissions in the county (see Table 2.1), the County has proposed several measures to reduce the number and length of vehicle trips. However, the County has limited options under its control for implementing transportation-based strategies.

(CAP, Chapter 3-3, emphasis added.) The County is wrong.

The County has the discretion to approve or deny General Plan Amendments ("GPAs"), and as the Sierra Club has repeatedly argued, no GPAs to allow greenfield developments which would result in significant GHG emissions should be allowed until the County is on target to achieve the 2030 emission targets.

The County acknowledges the significant role GPAs have on "the ability of the County to meet its targets and goal." (CAP, Chapter 2-14.) Yet, the County concludes that Mitigation Measure GHG-1, which would accomplish GHG reductions primarily through carbon offsets for large projects, including out-of-County, out-of-state, and even international offsets, solves this problem for the County.

With incorporation of Mitigation Measure GHG-1, GPAs listed in the cumulative impact discussion of the Draft SEIR and all future GPAs that propose increased density/intensity above what is allowed in the General Plan will comply with the CAP and; therefore, will not interfere with the County's 2020 and 2030 GHG reduction targets or 2050 goal.

(CAP, Chapter 2-14.) The County's proposed use of out-of-County offsets, which appear to be an easy solution for the County, should not enable the County to continue authorizing large-scale projects, like Newland Sierra, which create sprawl and increase vehicle miles traveled (VMTs). Instead, the County must place strict restrictions on the type of GPAs the County will authorize in order to not dramatically increase emissions through increased VMTs. As described above, the CAP should contain explicit language limiting further growth through GPAs to growth in SANDAG Smart Growth areas.

III. There Is Powerful Evidence That the County's Yet To Be Adopted New CAP Will Not Meet the Requirement to Be Comprehensive.

The December 1, 2017 letter from counsel for Golden Door Spa provided a transcript of statements made by County staff at the October 20, 2017 Planning

Commission informational meeting. These statements indicate that the County is still deciding which measures would be included in the CAP based on a cost-benefit analysis.

Specifically, County staff stated: “When the planning commission considers those measures, you may wish to de-emphasize some policies versus others.” County staff also said:

The County is completing two technical studies to analyze the cost associated with implementing the draft climate action plan. We're preparing a cost effectiveness study to quantify the net benefits received from implementing the proposed measures. The study will develop an estimate of county implementation costs for the CAP and quantify the net benefits received from implementing the proposed measures evaluated against the net cost to participants over the lifetime of all the measures. We're also in the process of conducting an assessment of direct investments to evaluate the cost effectiveness of possible local projects. This study will identify local project types for potential direct investment as detailed in the draft supplemental environmental impact report. And this feasibility study will evaluate the cost effectiveness of direct investments. These studies will be completed before the end of the year and presented to the planning commission and the board in early 2018.

These feasibility studies should have been prepared long ago, before the Draft Revised CAP and EIR were released to the public. A comprehensive plan should be adopted in January or February 2018, as originally represented by the County. Further delays will make it next to impossible to meet requirements for 2020 reductions. While the Sierra Club recognized that preparation of an EIR and a process to prepare a comprehensive plan would take some time, and not meet the County's original commitment, the original commitment the County made in 2011 was for the CAP to be prepared in 6 months. The Court of Appeal in *Sierra Club v. County of San Diego* stated: “As a plan-level document, the CAP is required by CEQA to incorporate mitigation measures directly into the document” [referring to the EIR]. (*Sierra Club v. County of San Diego* (2014) 231 Cal. App. 4th 1152, 1173.) The County's cost-benefit analysis should have been conducted prior to release of the Revised Draft EIR, not after it.

Additionally, the County's suggestion it may “de-emphasize” some mitigation measures is improper if the public does not have an opportunity to comment. The County did not indicate in the Draft EIR that some mitigation measures would be limited or eliminated. Adding or removing mitigation measures may require recirculation. (*See, e.g., Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, see also CEQA Guidelines §15088.5.) Here, the public has not had an opportunity to comment on the additional analysis the County is conducting in its feasibility studies.

Furthermore, there is no such thing as “emphasizing” or “de-emphasizing” mitigation under CEQA. There is a legal standard of definiteness and enforceability and mitigation measures either meet the standard or do not. No sliding scale can be prospectively developed by the County for the degree of “emphasis” to be placed on each mitigation measure. The entire CAP is a mitigation measure – CC-1.2 of the 2011 GPU EIR. Therefore, all of the measures provided must meet the CEQA standards for enforceable mitigation.

The County contends, “[T]he CAP’s GHG reduction measures themselves are not specifically ‘mitigation measures’ as defined under CEQA, nor are they specifically identified as mitigation in either the 2011 GPU PEIR or the Draft SEIR for the CAP.” (FSEIR, p. 8-53.) Here, the County essentially admits in response to comments that the CAP’s GHG reduction measures do not meet the criteria for mitigation measures. This is clear legal error, as the entire CAP is a required mitigation (CC-1.2) for the 2011 General Plan’s climate change impacts.

Though some delay was reasonable in order to prepare an EIR and a more comprehensive list of strategies, the County’s delay has been inordinate. The County has not demonstrated a sense of urgency and has not dedicated the necessary resources to prepare a comprehensive and enforceable CAP. Additionally, there are many other CAPs throughout the state that the County could have drawn from but no evidence that there was a comprehensive review of such plans and adoption of all feasible GHG reduction measures. While we wish the County had done a more thorough job in identifying new strategies within the County to reduce GHG emissions, the Club believes it is important that the County act promptly but that it commit at the same time to strengthening the plan on an accelerated time frame, with new strategies being subject to environmental review.

IV. The County’s Allowance of Out-of-County Offsets Is Inconsistent with the County General Plan’s Requirement to Achieve Specified Greenhouse Gas Emissions Reductions Within the County, and Out-of-County Offsets Are Less Enforceable than Those Within the County and Do Not Generally Achieve the Same Level of Emission Reductions.

Mitigation Measure CC-1.2 of the County’s 2011 General Plan Update provided:

The County Climate Change Action Plan will achieve comprehensive and enforceable GHG emissions reduction of 17% (totaling 23,572 MTC02E) from County operations from 2006 by 2020 and 9% reduction (totaling 479,717 MTC02E) in community emissions from 2006 by 2020.

(SEIR, p. 1-14, emphasis added.) The County specifically agreed that the reductions would be “from County operations” and “community emissions.” The CAP is a

mitigation measure for the 2011 General Plan's climate change impacts. Because the mitigation is for impacts in San Diego County, the County acknowledged that the mitigation need to be in San Diego County.

Leaving no doubt that the GHG emission reductions must occur within the County, the original Climate Action Plan included the following explanation within the section of the CAP entitled "Purpose of the Climate Action Plan":

The CAP was designed to support the following primary functions:

- Mitigate the impacts of climate change by achieving meaningful greenhouse gas (GHG) reductions within the County ...

(County of San Diego Climate Action Plan, Adopted June 2012, p. 3, *emphasis added*.)

In affirming the trial court's conclusion that the County failed to adopt a CAP that complied with the requirements of Mitigation Measure CC-1.2, the Court of Appeal quoted this language, stating: "According to the County, the CAP was prepared for the following purposes: 1. To mitigate the impacts of climate change by achieving meaningful GHG reductions within the County ..." (*Sierra Club v. Cty. of San Diego* (2014) 231 Cal. App. 4th 1152, 1160.)

After adopting the 2011 General Plan Update, the County first attempted to free itself from the constraints of Mitigation Measure CC-1.2 by treating the strategies within the CAP as merely recommendations. (*Sierra Club, supra*, 231 Cal. App. 4th at 1168.) However, the trial court and the Court of Appeal rejected the County's approach. The Court of Appeal stated:

The County agreed to the mitigating requirement of a CAP containing 'comprehensive and enforceable GHG emissions reduction measures that will achieve' the specified GHG reductions by 2020.

(*Ibid.*) As the County now proposes to eliminate the contents of Mitigation Measure CC-1.2 and replace it with entirely new language, we remind the County of its obligation to achieve the GHG reductions *within the County* and to include "comprehensive and enforceable GHG emissions reduction measures that will achieve the specified GHG reductions by 2020." The County's proposal to allow offsets outside of the County, outside of the state, and even outside of the country is not an enforceable mitigation measure and the County has not shown that it is infeasible to achieve such emission reductions *inside* the County. Furthermore, the County has not, and could not demonstrate that it is infeasible to achieve the GHG emission reductions previously required by the County *in* the County.

V. The EIRs for the Newland Sierra Project and the Property Specific Requests General Plan Amendment Show the County Intends to Allow Out-of-County Offsets, Which Does Not Meet the County's Commitment to Emission Reductions in the County and Are Not Enforceable.

Two important events occurred between the release of the Draft SEIR and the Final SEIR on the CAP. First, the County notified members of the public for the first time of the preparation of additional studies after the release of the Draft EIR. At the County's October 20, 2017 Planning Commission informational meeting, County staff indicated that the County is in the process of preparing feasibility studies, despite the fact that the Draft EIR for the Revised CAP had already been released. County staff also suggested that it may "de-emphasize" some mitigation measures, despite the fact that the public would not have an opportunity to comment on this action. Also, the California Air Resources Board (CARB) adopted its 2017 Climate Change Scoping Plan on December 14, 2017, after the release of the County Draft SEIR. The proposed CAP is inconsistent with the Scoping Plan.

As this new information also affects all other projects that require General Plan Amendments (GPAs), please submit this letter into the administrative record for the Newland Sierra Project and all other projects for which GPAs are now pending.

As discussed in Section IV above, Mitigation Measure CC-1.2 of the County's General Plan Update requires the County to achieve specified GHG reductions within San Diego County. However, the Revised CAP and SEIR authorize the use of offsets from outside the County of San Diego. The Draft EIR identifies the County's "priority" list for consideration of GHG reduction features as follows:

- 1) project design features/on-site reduction measures;
- 2) off-site within the unincorporated areas of the County of San Diego;
- 3) off-site within the County of San Diego;
- 4) off-site within the State of California;
- 5) off-site within the United States; and
- 6) off-site internationally.

(SEIR, 2.7-48.)

The Newland Sierra project Draft EIR and the Property Specific Requests General Plan Amendment EIR provide this exact same language quoted above. (Newland Sierra Draft Environmental Impact Report, p. 2.7-48; San Diego County Property Specific Requests General Plan Amendment and Rezone SEIR, pp. 2.17-18, 2.17-19.) The Newland Sierra Draft EIR then adds, "The project applicant or its designee shall first pursue offset projects and programs locally within unincorporated areas of the County of San Diego to the extent such offset projects and programs are financially competitive in the global offset market." (Newland Sierra Draft Environmental Impact Report, p., 2.7-

48.) Allowing developers to purchase out-of-County offsets provided that the developer first concludes that purchasing offsets within San Diego is not “financially competitive in the global offset market” is such a weak standard that defers entirely to the subjective determination of the developer that it provides almost no restriction at all.

The Newland EIR states only 18% of its GHG reductions will come from on-site measures. Thus, 82% of Newland’s GHG emissions reductions would come from outside the County. Additionally, the County has admitted in response to comments that only one project on the CARB-approved registries is in San Diego County and credits are not listed because the trees in the deforestation project have not reached maturity. (Master Response 12 at 8-52.) CEQA’s feasibility requirements have real teeth, and the mitigation measures included in the CAP must be enforceable. The CAP should be revised to address these issues.

Though the County did not prepare the EIR for the Newland Sierra project, CEQA requires that the agency independently perform its reviewing, analytical and judgment functions and to participate actively and significantly in the preparation and drafting process. (*Found. for San Francisco's Architectural Heritage v. City & Cty. of San Francisco* (1980) 106 Cal. App. 3d 893, 908.) Thus, County staff should have rejected the out-of-County approach.

Even if out-of-County offsets were permissible, the offsets analyzed in the CAP and EIRs for County projects would not meet the test to be effective and enforceable. A new report from the European Commission (available at https://ec.europa.eu/clima/sites/clima/files/ets/docs/clean_dev_mechanism_en.pdf) casts serious doubts about international credit schemes, concluding that the vast majority of them likely fail to actually reduce emissions. The report concluded that the international offset system in place in Europe has “fundamental flaws in terms of overall environmental integrity. It is likely that the large majority of the projects ... are not providing real, measurable and additional emission reductions.” (*Id.* at 11, emphasis added.) “Given the inherent shortcomings of crediting mechanisms, [the European Commission] recommends focusing climate mitigation efforts on forms of carbon pricing that do not rely extensively on credits,” the report said, adding that credits should play only a limited role after 2020. (*Ibid.*)

The report examined the Clean Development Mechanism, created under the Kyoto Protocol to allow countries to offset emissions by purchasing credits linked to green-energy projects on an international market. The system allows a power plant in Germany, for example, to buy credits for the emissions savings from a wind farm in India. The problem, the report says, is that the Indian wind farm likely would have been built anyway, even without the credits purchased by the Germans. In emissions-trading lingo, the reduction would be considered not “additional.” “Overall, our results suggest that 85 percent of the projects covered in this analysis and 73 percent of the potential

2013-2020 Certified Emissions Reduction (CER) supply have a low likelihood that emission reductions are additional and are not over-estimated,” said the report. (*Ibid.*) “Only 2 percent of the projects and 7 percent of potential CER supply have a high likelihood of ensuring that emission reductions are additional and are not over-estimated.” (*Ibid.*) In short, the County cannot rely upon out-of-County emissions to achieve the necessary reductions. You might want to add a sentence to say that in-State but out of County reductions may be particularly difficult to obtain because governmental levels throughout the State are struggling with achieving the necessary emission reductions.

Carbon offset credits were included as part of the Kyoto Protocol, but have fallen out of favor after scandals and poor performance. (*Carbon Credits Likely Worthless in Reducing Emissions, Study Says*, available at <https://insideclimatenews.org/news/19042017/carbon-emissions-credits-paris-climate-agreement>.) Some countries now decline to use them and the European Union plans to prohibit international trading after 2020, instead focusing on the European Union’s domestic emissions reduction target. (https://ec.europa.eu/clima/policies/ets/credits_en.) International offset programs may have other unintended environmental and social consequences. Some tree-planting projects in Guatemala, Ecuador and Uganda have been accused of disrupting water supplies; evicting thousands of villagers from their land; seizing grazing rights from farmers; cheating local people of promised income; and running plantations where the soil releases more carbon than is absorbed by the trees. (*The Inconvenient Truth About the Carbon Offset Industry*, available at <https://www.theguardian.com/environment/2007/jun/16/climatechange.climatechange>.)

International offset credits, which may include reductions in deforestation, should not be used to offset GHG emissions from transportation sources, which primarily burn fossil fuels. A Greenpeace report concludes “forests cannot offset fossil fuel emissions” because forest carbon is different than fossil carbon. (*Flawed Logic: Why Forests Cannot Offset Fossil Fuel Emissions*, available at <http://www.greenpeace.org/international/Global/international/briefings/forests/2013/Offsets-briefing-Flawed-Logic.pdf>.) The report explains, “Burning fossil fuel instantly, and almost irreversibly, releases additional CO₂ into the atmosphere. Forests, on the other hand, take up CO₂ only slowly, and even then only a portion of fossil emissions can be taken up. Allowing forests to be used as offsets would set us on a trajectory of burning even more of the fossil fuels that we need to leave in the ground in order to avoid catastrophic climate change. Our only chance to stop climate change is to avoid carbon emissions from all sources, meaning that we need to ultimately end burning fossil fuels while at the same time protecting forests.”

VI. The County's CAP Conflicts with CARB's Updated Scoping Plan and Updated Regional SB 375 Targets.

You have already been advised in a November 30, 2017 letter from the Endangered Habitats League that the CAP needs to account for the California Air Resources Board's (CARB) Scoping Plan. On December 14, 2017, CARB adopted the 2017 Climate Change Scoping Plan, the strategy for achieving California's 2030 greenhouse gas emissions target. (*California's 2017 Climate Change Scoping Plan: The Strategy for Achieving California's 2030 Greenhouse Gas Target*, available at https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf.) Developing and updating this Scoping Plan provides a road map of how the state intends to meet its climate goals with an increased focus on air quality.

The 2017 Climate Change Scoping Plan indicates that reducing vehicle miles traveled (VMT) is essential to reducing GHG emissions and enabling the State to meet its climate change goals. The Scoping Plan provides:

While the State can do more to accelerate and incentivize these local decisions, local actions that reduce VMT are also necessary to meet transportation sector-specific goals and achieve the 2030 target under SB 32. Through developing the Scoping Plan, CARB staff is more convinced than ever that, in addition to achieving GHG reductions from cleaner fuels and vehicles, California must also reduce VMT. Stronger SB 375 GHG reduction targets will enable the State to make significant progress toward needed reductions, but alone will not provide the VMT growth reductions needed; there is a gap between what SB 375 can provide and what is needed to meet the State's 2030 and 2050 goals. In its evaluation of the role of the transportation system in meeting the statewide emissions targets, CARB determined that VMT reductions of 7 percent below projected VMT levels in 2030 (which includes currently adopted SB 375 SCSs) are necessary. In 2050, reductions of 15 percent below projected VMT levels are needed. A 7 percent VMT reduction translates to a reduction, on average, of 1.5 miles/person/day from projected levels in 2030. It is recommended that local governments consider policies to reduce VMT to help achieve these reductions, including: land use and community design that reduces VMT; transit oriented development; street design policies that prioritize transit, biking, and walking; and increasing low carbon mobility choices, including improved access to viable and affordable public transportation and active transportation opportunities. It is important that VMT reducing strategies are implemented early because more time is necessary to achieve the full climate, health, social, equity, and economic benefits from these strategies.

(2017 Climate Change Scoping Plan, p. 150, emphasis added.)

CEQA sets out a fundamental policy requiring agencies to “integrate the requirements of this division with planning and environmental review procedures otherwise required by law or by local practice so that all those procedures, to the maximum feasible extent, run concurrently, rather than consecutively.” (*Banning Ranch Conservancy v. City of Newport Beach* (2017) 2 Cal. 5th 918, 936 (2017), citing Pub. Res. Code § 21003, subd. (a).) The CEQA Guidelines similarly specify that “[t]o the extent possible, the EIR process should be combined with the existing planning, review, and project approval process used by each public agency.” (Guidelines, § 15080.) Thus, lead agencies should integrate CEQA review with related environmental review and consultation requirements found in federal, state or local laws. Here, the County should integrate CEQA review with the environmental review contained in the 2017 Climate Change Scoping Plan.

The Draft SEIR for the CAP does not analyze or provide separate metrics for measuring VMT. It should analyze how adoption of the CAP may impact SANDAG’s ability to adopt a Regional Transportation Plan/Sustainable Communities Strategy that complies with CARB’s new targets outlined above. Allowing unplanned sprawl development in the County would frustrate efforts to reduce VMT consistent with SB 375 and CARB’s new targets.

The failure to analyze the consistency of the CAP with CARB’s Updated Scoping Plan would make the CAP inadequate. Regardless of whether it is legally permissible for the County’s CAP to conflict with CARB’s plan, at a minimum the County has to revise its Draft EIR for the CAP to explain these conflicts with CARB policies, and provide a new public review period on the Draft EIR to inform the public of this issue.

VII. The CAP Should Show Emissions Reductions to at Least 2035, and A Trajectory to Meet the State’s 2050 Emission Reduction Goals.

The CAP should be coordinated with the efforts of SANDAG to reduce transportation emissions. In doing so, the County should consider the impact of the recently published *Cleveland National Forest Foundation v. San Diego Association of Governments* (2017) 17 Cal. App. 5th 413 (hereinafter “*CNFF v. SANDAG*”) opinion on the CAP. As background, the Legislature enacted Senate Bill 32 (2015–2016 Reg. Sess.), adding Health and Safety Code section 38566, which adopts a goal of reducing GHG emissions by 40 percent below 1990 levels by the year 2030. The legislation directs CARB to craft regulations to implement its goal. (Health & Saf. Code, § 38566.) In enacting Senate Bill 375, the Legislature found the state’s emissions reductions goals cannot be met without improved land use and transportation policy. Consequently, Senate Bill 375 (Gov. Code, § 65080, subd. (b)(2)(B)) mandates the transportation plan include a Sustainable Communities Strategy to, as the EIR at issue in *CNFF v. SANDAG*

states, “guide the San Diego region toward a more sustainable future by integrating land use, housing, and transportation planning to create more sustainable, walkable, transit-oriented, compact development patterns and communities that meet [CARB's greenhouse gas] emissions targets for passenger cars and light-duty trucks.” (*CNFF v. SANDAG*, 17 Cal. App. 5th at 429.)

In enacting SB 375, the Legislature found automobiles and light trucks are responsible for 30 percent of the state's greenhouse gas emissions. (Stats. 2008, ch. 728, § 1, subd. (a).) Accordingly, SB 375 directed CARB to develop regional greenhouse gas emission reduction targets for automobiles and light trucks for 2020 and 2035. (Gov. Code, § 65080, subd. (b)(2)(A).) The targets established by CARB for the San Diego region require a 7 percent per capita reduction in carbon dioxide emissions by 2020 and a 13 percent per capita reduction by 2035 (compared to a 2005 baseline). CARB must update these targets every eight years until 2050. (Gov. Code, § 65080, subd. (b)(2)(A)(iv).)

The Court of Appeal in *CNFF v. SANDAG* concluded the Sustainable Communities Strategy EIR at issue in that case was “deficient in several respects – most particularly by focusing alternatives on traffic congestion relief rather than lower vehicle miles traveled.” (*CNFF v. SANDAG*, 17 Cal. App. 5th at 436.) The court added, “The omission of an alternative which could significantly reduce total vehicle miles traveled is inexplicable given SANDAG’s acknowledgements in its Climate Action Strategy that the state’s efforts to reduce greenhouse gas emissions from on-road transportation will not succeed if the amount of driving, or vehicle miles traveled, is not reduced.” (*Ibid.*) The court said it was reasonable to expect “at least one project alternative to have focused primarily on significantly reducing vehicle trips.” (*Id.* at 437.)

This decision highlights the importance of focusing on reducing VMTs to reduce GHG emissions. The CAP EIR’s proposed strategies to reduce VMTs are vague and undeveloped. For example, the CAP proposes to “expand community bicycle infrastructure.” (CAP SEIR, p. 2.7-13.) However, the EIR does not provide the details on how this measure, or other specified measures, would be implemented. Furthermore, the EIR neither commits the funding necessary to achieve the specified objectives, nor provides timelines for each of the measures identified. The County should commit funding now to implement the specified measures, and detail how the funds are to be spent according to a specific schedule. If the County waits until after the Community Plans are updated, this could be years.

Many other communities have adopted effective CAPs, which could be used as a guide for the County, including, for example, the County and City of San Francisco’s CAP. San Francisco’s CAP has a solid waste diversion goal of 75% diversion by 2010 and zero waste by 2020. In contrast, the County’s CAP proposes 75% diversion in another twelve years and zero waste by 2050, which is 32 years away. Why is the

County unable to achieve the reduction goals set in a comparable county? Yet, the County has not discussed whether staff has reviewed any other CAPs from other jurisdictions, or why similar measures adopted in other jurisdictions could not be implemented in San Diego County.

VIII. The Sierra Club's Proposed Mitigation Measures Are Feasible and Must Be Analyzed.

During the environmental review of the CAP adopted in 2012, the Sierra Club provided specific examples of feasible GHG reduction measures that would actually reduce GHG emissions and could be adopted without delay. (See, e.g., Exhibit A, September 25, 2017 Letter from Chatten-Brown and Carstens, Reference A, *A Plan to Efficiently and Conveniently Unbundle Car Parking Costs*.) These measures include reducing parking, requiring shared parking, and the best practice of unbundling the cost of parking. (*Ibid.*) In *Sierra Club v. County of San Diego* (2014) 231 Cal. App. 4th 1152, 1176, the Court of Appeal agreed with the Sierra Club, stating, "Sierra Club provided feasible mitigation measures. The County rejected these mitigation measures without substantial evidence for doing so."

The County provided the following response to the Sierra Club's proposed mitigation measure:

Upon careful consideration and evaluation, the County determined that a program to unbundle the cost of parking from County employees' salaries, as recommended in this comment and described more fully in comment O22-35, would be infeasible as a GHG reduction measure in the CAP at this time. County employees work in widely varying roles and in diverse locations where parking is either free and plentiful or expensive and precious. Calculating a fair unbundled charge applicable to all County employees would be virtually impossible under these varied conditions. Even if calculating a fair unbundled charge was possible, free or subsidized parking is currently a benefit provided to all County employees; therefore, to institute such a policy would affect County employee's Terms and Conditions of Employment, which would require negotiation and agreement from each of the County's nine labor unions, something that cannot be guaranteed at this time.

(Response to Comment Letter O22, p. 5.)

The County's defense of its refusal to unbundle the cost of parking from County employees' salaries is unavailing. The idea that the County provides free parking for employees is the problem. The fact that the County would have to negotiate with unions is not an excuse not to make this change. The County could

provide free bus passes and phase in parking fees over time, and perhaps run buses for County employees if there are enough employees at certain locations.

The County claims it currently subsidizes monthly transit passes, vanpool, and carpool services for employees in an effort to reduce air pollution, and ease traffic and parking congestion. However, no data to support this contention is provided. This information is necessary to evaluate what percentage of employees are participating in this program and examine its efficacy. Additionally, the County should set VMT reduction goals for its own fleet and set forth strategies for meeting these goals.

IX. Faced with Significant Fire, Water Supply, and Flooding Impacts of Climate Change, the County Must Act Promptly Now to Adopt the Most Effective Climate Action Plan Possible, and Then Provide Regular Updates.

Climate change has significant impacts on fire, water supply, and flooding. A research meteorologist with Scripps Institution of Oceanography at the University of California San Diego concluded that climate change is a major culprit in the wildfires that recently raged across Southern California. (*Climate Change A Major Culprit In Explosive Wildfires, Says San Diego Researcher*, available at <http://www.kpbs.org/news/2017/dec/12/climate-change-major-culprit-explosive-wildfires-s/>.) This conclusion is supported by a body of science that has drawn connections in the West between the prevalence of major wildfires and the rising frequency of earlier springtime conditions followed by hotter and drier summers.

(*Climate Change Expected to Fuel Larger Forest Fires — If It Hasn't Already*, available at <http://www.sandiegouniontribune.com/news/environment/sd-wildfire-climate-change-20170704-story.html>.) The California Department of Forestry and Fire Protection 2017 year-end report shows that five of the top 20 most destructive fires in the state's history occurred last year. (*Cal Fire Report Shows 2017 Nearly Doubled the Number of Wildfires in 2016*, available at <https://www.nbcsandiego.com/news/local/2017-Nearly-Doubled-Wildfires-in-2016-Cal-Fire-467800333.html>; *Top 20 Most Destructive California Wildfires*, available at http://www.fire.ca.gov/communications/downloads/fact_sheets/Top20_Destruction.pdf.)

In turn, these wildfires release powerful pollutants known as black carbon. The U.S. Forest Service estimates that the 2013 Rim Fire in central California spewed out the equivalent of the carbon dioxide emissions from 3 million cars. (*In California's Wildfires, A Looming Threat To Climate Goals*, available at <http://www.kpbs.org/news/2017/dec/20/californias-wildfires-looming-threat-climate-goals/>.) That is a major setback to the state's effort to reduce GHG emissions, and the recent fires in San Diego County, as well as future wildfires in the County, will likewise

frustrate the County's effort to reduce GHG emissions. The massive release of carbon from wildfires not only will make it more difficult for San Diego County to achieve its GHG reduction targets, but wildfires also eliminate trees, which are an excellent natural carbon dioxide absorber. Additionally, these pollutants have significant impact on air quality.

Climate change will have a significant impact on San Diego's water as well, leading to hotter, drier weather in San Diego, but also more frequent floods caused by larger storms. Water supply will be diminished but water demand is expected to increase. (*What Climate Change Means for San Diego's Water*, available at <https://www.newsdeeply.com/water/articles/2016/06/13/what-climate-change-means-for-san-diegos-water>.) A San Diego Foundation report on climate impacts in San Diego, prepared by climate scientists from the Scripps Institution of Oceanography at the University of California, San Diego predicts a 12 percent reduction in the runoff and stream flow that replenish the area's major water sources. (*Economic Resilience: Water*, available at <https://www.sdfoundation.org/wp-content/uploads/2016/04/economic-resilience-water.pdf>.) Meanwhile, by 2035, demand for water is expected to increase by 46 percent. (*Ibid.*) Water shortages affect consumers, wildlife and crop production, and agriculture, ecosystems, and urban areas compete for reduced water. (*Ibid.*) While the San Diego region will experience fewer rainy days, there will be more rain during large, intense storms, which could lead to more frequent flooding. (*Ibid.*)

Climate change has largely been defined as an environmental issue, with the worst effects decades or centuries away. But a new report from a commission convened by the medical journal *The Lancet*, one of the world's most prestigious medical journals, says that climate change is already harming human health on a vast scale. (*Climate Change Is Bad for Your Health*, available at <https://www.nytimes.com/2017/10/30/opinion/climate-change-health-heat.html>; *The Lancet Countdown on Health and Climate Change: From 25 years of Inaction to a Global Transformation for Public Health*, available at [http://www.thelancet.com/journals/lancet/article/PIIS0140-6736\(17\)32464-9](http://www.thelancet.com/journals/lancet/article/PIIS0140-6736(17)32464-9).)

In light of these significant impacts, the County must act urgently to adopt the most effective CAP possible. However, in light of the significant deficiencies described above and in the previous comment letter we submitted to the Planning Department, and based upon points made by others, and the rapidly advancing science of climate change, there should be on-going updates to the CAP every two to three years. The Sierra Club recommends the County develop a Scientific and Technical Advisory Committee to advise the County. Additionally, we recommend there be a Community Advisory Committee formed, including the Sierra Club, that would regularly meet with County staff to discuss and recommend to the Planning Commission and the Board improvements to the CAP.

CONCLUSION

On behalf of all residents of the County of San Diego, the Sierra Club urges the County to adopt the most effective CAP possible, ensuring that the CAP puts measures in place to achieve at a minimum the comprehensive and enforceable GHG emissions reductions the County agreed to as a mitigation measure for the County's 2011 General Plan Update. The Sierra Club believes there should be no new GPAs unless the County can show it can achieved the emissions reductions it committed to pursuant to its previous increases in development. There are fundamental problems with the GPAs currently being considered, and their processing should be shelved. Until a comprehensive CAP is finally in place, no further GPA amendments should be considered.

The Sierra Club wants an enforceable CAP in place as soon as possible and hopes to avoid additional litigation. To that end, we propose the following resolution. First, the County would agree to implement the changes proposed by the Sierra Club and others that would strengthen the CAP prior to the Board of Supervisors' consideration of the CAP. Most importantly, the County must eliminate the use of out-of-County offsets. Second, the County would agree to not further process any additional GPAs until a further revision of the CAP adequately addresses the remaining issues that cannot be addressed in the short-term. Third, the County would commit to further update the CAP within one year, and thereafter reevaluate and update the CAP as necessary every three years. Finally, the County would agree to engage the Sierra Club and other interested groups in an advisory capacity for all future CAP updates.

If the County fails to adopt a plan that addresses the critical issues that have been raised from the Sierra Club and other organizations, refuses to commit to no further GPAs until the CAP is revised to address the issues raised in this letter and the Sierra Club's prior letter, and is unwilling to engage in a process for ongoing review, the Sierra Club will have no option other than to return to court to challenge the County's Revised CAP and any further GPA amendments that allow significant sources of GHG emissions to be constructed in the County. This is not in the best interest of the County, the Sierra Club, or the residents of the County. Therefore, we urge the County to adopt a legally adequate and enforceable CAP that cures the deficiencies identified in this letter, and to act quickly.

Sincerely,

Josh Chatten-Brown

**Re: Comments on San Diego Climate Action Plan (PDS2015-POD-15-002)
and Draft Supplemental Environmental Impact Report (PDS2016-ER-
16-00-003)**

Dear Ms. Soffel:

The law firm of Chatten-Brown & Carstens represents the Sierra Club on matters relating to the County's preparation of its revised Climate Action Plan ("Revised CAP") and Supplement to the 2011 General Plan Update Program Environmental Impact Report ("Supplemental Environmental Impact Report," or "SEIR").

As described more fully below, the Revised CAP and SEIR are legally inadequate by modifying or effectively deleting Mitigation Measure CC-1.2 without additional analysis; erroneously claiming that 2014 is the first year data was available for a greenhouse gas (GHG) inventory; allowing out-of-County offsets; failing to require a reduction in vehicle miles traveled (VMT's) for housing projects; providing only a token annual reduction of VMT's for County employees; and failing to exercise its influence to encourage the San Diego Airport Authority to reduce GHG emissions reductions from airport ground operations, increasing public transit to the airport, and reducing emissions from vehicles serving the airport. Of great importance, no open lands should be annexed or rezoned for greater development until there is an adequate CAP that actually achieves the 2020 emission reduction goals the County agreed to in its 2011 General Plan Update.

In addition to this letter addressing legal issues, we also incorporate herein the September 25, 2017 Sierra Club San Diego comment letter prepared by Mike Bullock, Chair of the Sierra Club San Diego's Transportation Subcommittee. The Sierra Club San

Diego's comment letter, attached as **Exhibit A**, has detailed strategies that must be evaluated to assure a legally adequate Revised CAP and SEIR.

We request the County perform additional analysis of the issues described below and those set forth in Mr. Bullock's letter. Once additional analysis has been performed, this analysis, along with additional enforceable and effective mitigation measures, must be set forth in a Revised SEIR. The SEIR must then be recirculated so that the public and public agencies may comment on this information, as required by CEQA.

I. The Revised CAP and SEIR Eliminates the Specified Greenhouse Gas Emissions Reductions from 2006 Levels by 2020.

Mitigation Measure CC-1.2 of the County's 2011 General Plan Update required the County to:

Prepare a County Climate Change Action Plan with an update[d] baseline inventory of greenhouse gas emissions from all sources, more detailed greenhouse gas emissions reductions targets and deadlines; and a comprehensive and enforceable GHG emissions reduction measures that will achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020.

(SEIR, p. 1-14.)

However, the Revised CAP and SEIR eliminate this requirement and replace it with general reductions of GHG emissions "consistent with state-legislative targets." (SEIR, p. 1-16.) This action is proposed even though Judge Taylor specifically rejected a proposed Supplemental Writ that would have allowed the County to amend or delete GHG mitigation measures adopted in 2011.

While generally mitigation conditions can be modified or deleted, the County made a firm commitment to reducing GHG emissions by 2020 when it adopted the 2011 General plan Update. Further, measures generally can only be deleted if they have become impractical or unworkable and the conclusion that they are is supported by substantial evidence. (*Lincoln Place Tenants Ass'n v. City of Los Angeles* (2007) 155 Cal. App. 4th 425, 449.) If the County continues to seek to modify or effectively delete Mitigation Measure CC-1.2, the SEIR must analyze why this measure has become impractical or unworkable. If the County does not demonstrate that Mitigation Measure CC-1.2 is impractical or unworkable, the County must show that the pro rata share of Mitigation Measure CC-1.2's GHG reductions have been achieved for County operations and community emissions.

II. The County's Claim It Does Not Have Baseline Data for Its GHG Inventory Prior to 2014 Is Belied By Its 2012 CAP, Which States the County Prepared Inventories With Baseline Years of 2005 and 2006.

In preparing its GHG inventory for the Revised CAP, the County uses baseline data from 2014. The County argues, "The County's base inventory of GHG emissions evaluated activities within the unincorporated county in the year 2014, the most recent year data is available." (SEIR, p. 1-6.) However, this conflicts with the 2012 CAP, which states the County prepared inventories with baseline years of 2005 and 2006. The 2012 CAP provides:

The County prepared baseline inventories at the community-wide and local government levels. The community-wide inventory has a baseline year of 2005, and emissions are limited to the County's unincorporated communities. The local government inventory has a baseline year of 2006 and only includes emissions related to County government operations. Each inventory is used to establish a baseline level of emissions, which then serves as the starting point for forming emissions reduction targets and as a tool to gauge the performance of emissions-reduction measures.

(2012 CAP, p. 14, emphasis added.) The SEIR must explain why the County did not use the 2005 and 2006 GHG inventories, as well as provide an analysis of how the 2014 GHG inventory compares to the previously prepared inventories.

The County's decision to use 2014 as the baseline year from which it will establish the 2020 and 2030 CAP targets and 2050 goal must demonstrate that using this baseline will result in reductions that are equal or greater to reductions using a 1990 benchmark. In the event the County argues that data prior to 2014 is inadequate, the County should address the 1990 GHG emissions inventory estimate for San Diego County that has been prepared. That estimate is discussed in the document entitled, "An Analysis of Regional Emissions and Strategies to Achieve AB 32 Targets Revised and Updated to 2010." (Available at <http://catcher.sandiego.edu/items/usdlaw/EPIC-GHG-2013.pdf>). Presumably, the County's share of the total 1990 San Diego County GHG emissions could be developed from that data.

III. The Allowance of Offsets From Outside the County of San Diego Is Inconsistent with the County General Plan's Requirement to Achieve Specified Greenhouse Gas Emissions Reductions in the County.

Mitigation Measure CC-1.2 of the County's General Plan Update requires the County to "achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020."

The Revised CAP and SEIR authorize the use of offsets from outside the County of San Diego. The Draft EIR identifies the County's "priority" list for consideration of GHG reduction features as follows:

1) project design features/on-site reduction measures; 2) off-site within the unincorporated areas of the County of San Diego; 3) off-site within the County of San Diego; 4) off-site within the State of California; 5) off-site within the United States; and 6) off-site internationally.

(DEIR, 2.7-48.) These offset priorities, which allow offsets outside of the County, outside of the state, and even outside of the United States, only have to be considered "to the satisfaction of the Director of Planning Development Services." (SEIR, p. 2.7-38.) This provision would impermissibly purport to give the County wide latitude to allow essentially unrestricted use of international credits to balance out local GHG emissions created by County projects. The use of offsets is inconsistent with the County's Mitigation Measure CC-1.2 to reduce GHG emissions *within the County of San Diego* by specified reduction amounts.

IV. The CAP Lacks A Requirement to Reduce VMT's from Newly Planned Housing Projects.

The CAP identifies Strategy T-1, which is intended to "Reduce Vehicle Miles Traveled." The CAP contains three measures designed to reduce achieve Strategy T-1: Measure T-1.1 - Acquire Open Space Conservation Land; Measure T-1.2 - Acquire Agricultural Easements; and Measure T-1.3 - Update Community Plans.

The CAP's strategy is an important one. The CAP purports to focus on density in the county villages. (CAP, p. 3-9.) "Focusing new development in and around existing unincorporated communities allows the County to maximize existing infrastructure ... By not developing housing in the more remote areas, the county will avoid GHG emissions from transportation ..." (*Ibid.*) The Sierra Club fully supports this goal.

However, none of the three measures the County identifies contains any enforceable requirements to locate residential housing closer to major sources of employment and transit. Mitigation Measure CC-1.15 does not include anything about limiting VMT's from newly planned housing projects. In fact, as discussed below, by allowing developers to purchase "carbon offsets" instead – which may even be based upon GHG emission reductions outside of the United States – the CAP actually facilitates sprawl.

The County may argue that Measure T-1.3 – Update Community Plans will assist in locating residential housing closer to jobs and transit. However, updating Community Plans does not address residential housing on a countywide basis. Additionally, the

County improperly passes responsibility for something that is clearly within its control – land use planning in the County – to individual communities.

The CAP's failure to address VMT's from newly planned housing projects is inconsistent with the Sustainable Communities and Climate Protection Act of 2008 (Sustainable Communities Act, SB 375, Chapter 728, Statutes of 2008), which supports the State's climate action goals to reduce GHG emissions through coordinated transportation and land use planning with the goal of more sustainable communities. The County should use its power to establish land use planning priorities for residential housing development in order to reduce VMT's.

Pursuant to SB 375, Metropolitan Planning Organizations, including the San Diego Association of Governments (SANDAG), are required to adopt strategies that show prescribed land use allocation in their regional transportation plans. SANDAG's Regional Plan (available at http://www.sdforward.com/pdfs/RP_final/The Plan - combined.pdf; October 2015) states, "More than 80 percent of new housing in the region will be attached multifamily" (p. 34). The plan also states, "By 2050, 87 percent of the region's new housing and 79 percent of new jobs will be situated within a half-mile of public transit." (p.75) "The projected increase in new housing capacity is generally higher for areas with densities above 20 dwelling units per acre." (Appendix C, Table C.3.) The County should analyze how SANDAG's estimates are impacted by the County's land use planning.

V. The CAP's 1.5% Annual Reduction of VMT's for County Employees Is Inadequate.

The County is one of the largest employers in San Diego County, and thus, the County has a huge amount of leverage to make significant GHG emissions reductions by taking actions to reduce VMT's for its employees. For example, San Luis Obispo County found that "two-thirds of the county government's greenhouse gas emissions are caused by employees commuting to and from work." ("SLO County Supervisors Approve Flex-time, Telecommuting Policies," available at <http://www.sanluisobispo.com/news/local/article39123279.html>.)

The CAP proposes Mitigation Measure T-2.3 to "[r]educe County employee commute Vehicle Miles Traveled (VMT) by 20% by 2030." However, this amounts to an annual reduction of VMT's of merely 1.5%. Facing a huge challenge to achieve significant GHG emissions reductions, a 1.5% annual reduction of VMT's is minimal and additional reductions of VMT's are feasible and necessary. Please see additional analysis of this issue in the Sierra Club San Diego's comment letter attached as **Exhibit A**.

VI. The Revised CAP and SEIR Must Account for GHG Emissions from County Airport Ground Operations.

San Diego International Airport is owned and operated by the San Diego County Regional Airport Authority. (<http://www.san.org/Airport-Authority/About-the-Authority>.) The Board of Supervisors appoints a representative to that Board. (<http://www.sandiegocounty.gov/dpw/airports.html>.)

Cities and counties that have an airport and an adopted CAP, frequently include the GHG generation of the airports' ground operations. Examples include the County of Sacramento, the City/County of San Francisco, and the cities of Fullerton and Livermore. These emissions are often significant. Sacramento County Airport, owned and operated by the Sacramento County Airport System, provides a useful comparison to San Diego County. The County of Sacramento prepared a CAP that included GHG emissions from airport ground operations in the GHG inventory. (http://www.ca-ilg.org/sites/main/files/file-attachments/sac_030843.pdf, p. 26.) The Sacramento County CAP concluded that 31% of total government emissions in the County came from operation of the Sacramento International Airport, including ground support equipment, roadways, and parking (but excluding aircraft emissions).

San Diego County should include airport ground operations in its GHG inventory, and provide an analysis of what percentage of total government emissions in the County stem from airport ground operations and work with the Airport Authority to reduce those emissions.

VII. The County Should Show Compliance with the 2011 General Plan Update's Mitigation Measures Prior to Annexations or Rezoning of Open Lands.

Finally, until a valid, legally adequate CAP is in place that demonstrably will achieve the 2020 emission reduction goals set out in the 2011 General Plan Update, no lands that are currently "greenfields" should be annexed and no General Plan Amendment should be authorized that would allow more intense development of those lands.

CONCLUSION

The SEIR must be revised with this new information and then recirculated for public comment. (CEQA Guidelines section 15088.5.) Pursuant to Public Resources Code section 21092.2, we request all notifications regarding this Project.

Thank you for your consideration.

Subject: COUNTY OF SAN DIEGO CLIMATE ACTION PLAN (PDS2015-POD-15-002),
GENERAL PLAN AMENDMENT (PDS2016-GPA-16-007), DRAFT SEIR (LOG NO.
PDS2016-ER-16-00-003)

Land Use/Environmental Planner Soffel,

We appreciate the opportunity to comment on this project. At the same time, we regret that the County failed in its first effort to produce an acceptable set of CAP and CEQA documentation. We also regret that our efforts to provide feasible mitigation measures are still being ignored. We are also disappointed that your current efforts seems to plan for and thus enable sprawling, vehicle-miles-travelled-inducing (VMT-inducing) development, beyond what is allowed in the current General Plan.

In your Notice of Preparation (NOP) for this project, the Appellate Court ruling is properly identified. The precedent-setting, published ruling is Reference 1 of this letter.

Your NOP properly stated that the

Fourth District Court of Appeal held that the 2012 CAP did not meet the description set forth in the adopted mitigation measure (GPU PEIR Mitigation Measure CC-1.2) and that an EIR was needed for the plan.

However, there was much more to the ruling. For example, the ruling also said:

The Sierra Club provided feasible mitigation measures. The County rejected these mitigation measures without substantial evidence for doing so.

The County must admit this error and devise a strategy to ensure that it is not repeated. To our knowledge, the County has not admitted this error and is once again ignoring the feasible mitigations we proposed, in detail, during the last effort to produce an acceptable

CAP. We have proposed these mitigations, over and over, since that failed effort. Ignoring measures that might offend the political sensitivities of the Board of Supervisors, for example, is understandable but is also a path to CEQA violation.

Chapter 1 Project Description

On Page 1-1 the Project Description says, “The fundamental purpose of the project is to reduce County GHG emissions consistent with state legislative requirements”.

This stated fundamental purpose is incongruent with CEQA and the anthropogenic climate crisis humanity must confront and solve.

CEQA requires an analysis which uncovers and clearly describes the physical-world results to expect, from doing the project, considering the well-established concept of cumulative impacts of other such projects. The primary question posed by our anthropogenic climate crisis is whether humanity can stabilize the climate at a livable level or whether our greenhouse gas (GHG) emissions will cause our planet’s climate system to destabilize, causing a devastating collapse of the human population, leading to our extinction and the loss of most of the other life forms currently living on our planet. There is nothing provided in the SEIR Documents linking state legislative requirements with the climate stabilization question.

We will now show that the state legislative requirements will not result in avoiding climate destabilization.

From

http://www.arb.ca.gov/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf (with excerpts shown in Reference 2) comes the following ominous information:

1. Scientific research indicates that an increase in the global average temperature of 2°C (3.6°F) above pre-industrial levels, which is only 1.1°C (2.0°F) above present levels, poses severe risks to natural systems and human health and well-being.
2. To have a good chance (not a guarantee) of avoiding temperatures above those levels, studies focused on a goal of stabilizing the concentration of heat-trapping gases in the atmosphere at or below the 450 parts per million (ppm) CO₂-equivalent (CO₂e, a metric that combines the climate impact of all well-mixed GHGs, such as methane and nitrous oxide, in terms of CO₂).
3. The CO₂e target is a somewhat approximate threshold, and the exact level of CO₂e is not precisely known because the sensitivity of the climate system to GHGs has uncertainty. Different models show slightly different outcomes within this range. An example of a pre-IPCC assessment study (Meinshausen et al. 2009)¹⁵ which has synthesized many studies on climate sensitivities, concluded that we would need to stabilize at about 400 ppm CO₂e

Item 3 should bring shivers of fear and tears of regret. We are already at 410 PPM and we are far from reducing our emissions enough to stop atmospheric CO₂e from going up. To do that, the industrial countries would need to reduce their emissions to 80% below their 1990 emission levels, which is the basis for California’s Executive Order S-3-05 (“S-3-05”), which is an order to achieve the 80% below 1990 emission levels by the year of 2050. The problem is that the S-3-05 target is for year 2050 and that is obviously far too late, based on the 3 items above.

Humanity might have a chance to stabilize the climate at a livable level if we achieve emissions that are 80% below our 1990 emission levels by 2030. However, our current state mandate, SB 32, is to reduce our emissions to 40% below our 1990 levels by 2030. To support the achievement of climate-stabilizing targets, California must double its SB 32 mandate, from 40% to 80% or, stated another way, achieve its S-3-05 target 20 years sooner.

Project Background

The section leaves out fact that the County ignored the primary San Diego Sierra Club mitigation measure of installing a car-parking system that gives its employees more choice over how they spend their wage, while significantly reducing the frequency of the choice of arriving at work in a single-occupancy vehicle (SOV). The current project again ignores that mitigation measure, in clear violation of CEQA law, as has been established in the last lawsuit.

We also disagree with the premise of the third purpose stated on Page 1-4. Given that the earth's atmospheric CO₂ is at the outrageous value of 410 parts per million (PPM) and going up significantly every single year, there can be no "GHG Threshold" below which there is some reason that the emission can be deemed "insignificant". Every project must be shown to fall within the General Plan and the Climate Action Plan and the public must be invited to suggest mitigation measures to reduce emissions further. This means all projects must go through a CEQA evaluation. As stated in CARB scoping plan documentation, in all cases, mitigation measures must be adopted if they are "technologically feasible and cost effective".

GHG Emissions Inventory

We thank you for this information and point out that On Road Transportation category, at 45%, is larger than the next three categories of Electricity (24%), Solid Waste (11%) and Natural Gas (9%). Cars and Light duty trucks, or "light duty vehicles" or "LDVs" emit most of the On Road GHG and deserve significant focus. For electricity the achieved target must be 100% renewable by 2035 and we are severely disappointed that the Board recently decided to not participate in a feasibility study of establishing a Community Choice Energy District, under California Community Choice Aggregation (CCA) law.

General Plan Amendment

We appreciate your documentation about what you are proposing. However, it is unfortunate that you are undermining CEQA, or at least making the task of advocates much more difficult, by emitting the important words, "enforceable measures". By doing that you may make the plan a useless exercise, with nothing guaranteed. If measures are not enforceable what good are they? Why leave out those critically important words?

Here is the existing (2011) Goal, with highlights added:

GPU Policy COS-20.1 (Climate Change Action Plan)

Prepare, maintain, and implement a climate change action plan with a baseline inventory of GHG emissions from all sources; GHG emissions reduction targets and deadlines, and **enforceable** GHG emissions reduction **measures**.

Here is what you are proposing:

GPU Policy COS-20.1 (Climate Change Action Plan)

Prepare, maintain, and implement a Climate Action Plan for the reduction of community-wide (i.e., unincorporated County) and County-Operations greenhouse gas emissions consistent with the California Environmental Quality Act (CEQA) Guidelines Section 15183.5.

Guidelines Section 15183.8, which states, “Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level”.

This “substantial evidence demonstrates” standard is much more difficult than the previous “enforceable” standard. This is no time to make climate action plans weaker or more difficult to evaluate.

As we have stated above, the point of CAPs should be ensuring that municipal governments are doing their part to help humanity achieve climate stabilization, not some artificial goal like a state mandate that may not be related to climate stabilization.

In order to comply with CEQA, which is about the physical world (and correct the grammar since “meet or exceed” is for a plural noun), the following new words (shown in ***bold italics***) must be added to COS-20:

GPU Goal COS-20 (Governance and Administration)

Reductions of community-wide (i.e., unincorporated County) and County Operations greenhouse gas emissions contributing to climate change that ***meet or exceed*** requirements of the Global Warming Solutions Act of 2006, as amended by Senate Bill 32 (as amended, Pavley. California Global Warming Solutions Act of 2006: emissions limit) ***and that meet or exceed targets for the industrialized countries of the world that are shown by climate scientists to, with reasonable assurance, stabilize the earth’s climate at a livable level, meaning that there would be no devastating collapse of the human population.***

Likewise:

GPU PEIR Mitigation Measure (MM) CC-1.2

Prepare a Climate Action Plan for the reduction of community-wide (i.e., unincorporated County) and County Operations greenhouse gas emissions consistent with both state-legislative ***and current climate science specified, climate-stabilizing*** targets, as described in General Plan Goal COS-20, and consistent with CEQA Guidelines Section 15183.5 or as amended, as referenced in General Plan Policy COS-20.1. As described in Section 15183.5, the key elements of the Climate Action Plan would include:

“CEQA Guidelines Section 15183.5(b)(1):

(1) Plan Elements. A plan for the reduction of greenhouse gas emissions should:

(A) Quantify greenhouse gas emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;

(B) Establish a level, based on substantial evidence, below which the contribution to greenhouse gas emissions from activities covered by the plan would not be cumulatively considerable;

- (C) Identify and analyze the greenhouse gas emissions resulting from specific actions or categories of actions anticipated within the geographic area;
- (D) Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
- (E) Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels;
- (F) Be adopted in a public process following environmental review."

Once prepared, implementation of the Climate Action Plan will be monitored and progress reported on a regular basis, as follows:

- o Implementation Monitoring Report – prepared annually;
- o Greenhouse Gas Emissions Inventory – updated every two years; and
- o Climate Action Plan – updated every five years.

Guidelines for Determining Significance for Climate Change

Given the nature of our anthropogenic climate crisis, there is no such thing as a GHG emission that is insignificant. All GHG reduction measures must be implemented if they are technologically feasible and cost effective. Our best hope of identifying all such mitigation measures is to subject all projects to the CEQA process.

2.6 Energy

We appreciate your statement that Notice-of-Preparation (NOP) comments received showed "concern" (your word) for a Community Choice Energy (CCE) program and the impacts and location of large-scale renewable energy projects. We believe that support for CCE districts under California Community Choice Aggregation (CCA) law is widespread, for good reason. We understand that there will be concern about any large scale project to generate energy.

The transportation-related measures appear in

2.7 Greenhouse Gas Emissions

This section starts by purporting to summarize the NOP comments you received on this critical topic. However, that summary is contradicted by your Appendix A, which shows comment letters numbered 1 and 18 that point out the need for achieving climate-stabilizing targets. Your summary says nothing about the need to define, explain, and achieve climate-stabilizing targets. Comment letter 18 has significant details on this topic. This topic is the most important in all of our earth's history, because life is sacred and most of it is under threat, by a crisis that humanity can either chose to solve or ignore. The fact that you think that topic (again, whether we will stabilize the climate at a livable level) is so unimportant that it should be ignored is significant.

We agree with the NOP's first paragraph and especially these words, in that paragraph: "significant environmental impacts". "Environmental impacts" are in the physical world, not in the world of laws or executive orders. In this case, the primary negative impact or outcome, that should be avoided, is climate destabilization. Therefore, the term, "climate destabilization" must be defined and also described.

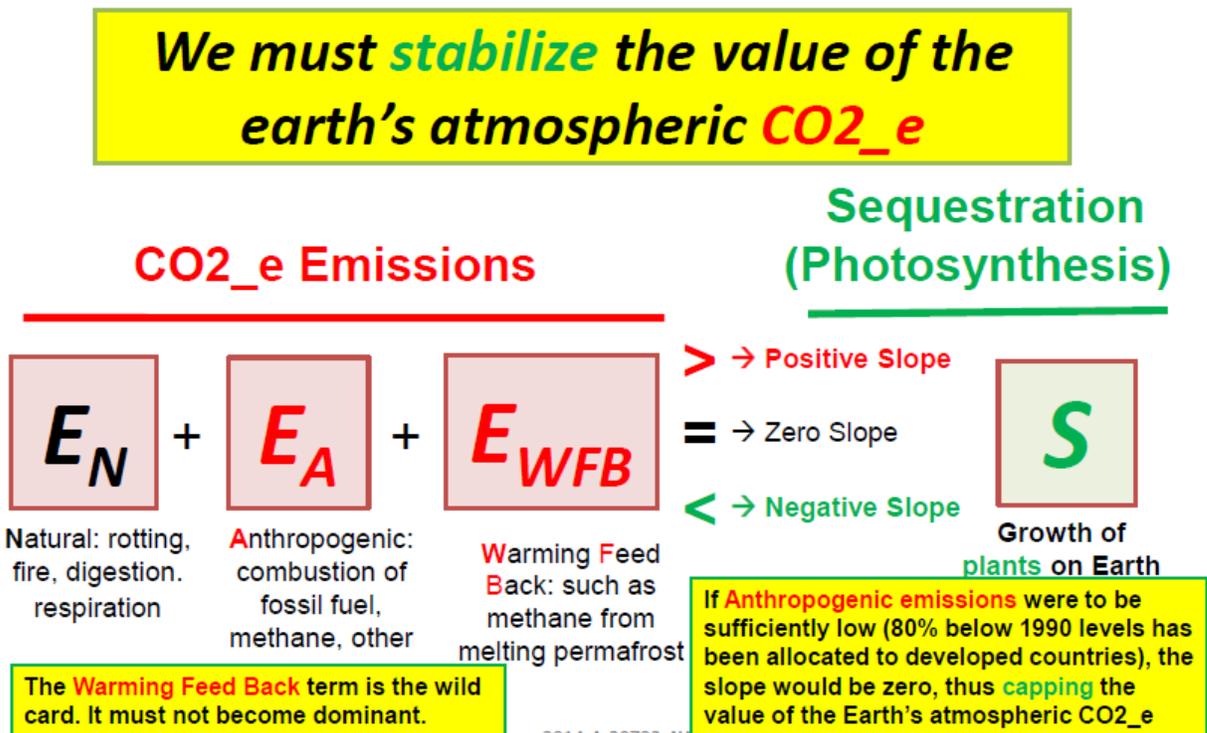

In the first paragraph of the NOP, it is written that the EIR must identify possible ways to mitigate or avoid the significant effects. Again, the “effects” are environmental in nature. This means that what will happen in the physical world must be considered. Besides this, how to avoid what would happen in the physical world must be considered.

What is needed is a description of climate destabilization and how to avoid the catastrophe of climate destabilization. CEQA and common sense require that negative environmental impacts be described, including the negative impact of climate destabilization.

General Plans and CAPs must first describe the difference between stabilizing the climate at a livable level and destabilization, where warming-system-feedbacks, such as methane gas leaking from melting permafrost, a process which is both driven by warming and creates more warming, become dominant. If they become too large, humanity will lose control, and the climate will transition to one which will no longer support most life forms on the planet, including our own species. Failing to provide this description is a CEQA violation. One authoritative source says, “the Earth is on a trajectory to warm by more than 4 degrees Celsius [and this] would be ***incompatible with continued human survival.***”

Avoidances of significant environmental impacts need to be described. Therefore, a discussion of “Greenhouse Gas Emissions” needs to state that there is a need for the EIR to have a description of how a climate is stabilized at a livable level.

We would like to help in this regard. Climate stabilization Step 1 is to get the earth’s atmospheric CO₂_e to stop increasing. This Step is shown in Figure 1.

The **Warming Feed Back** term is the wild card. It must not become dominant.

If **Anthropogenic emissions** were to be sufficiently low (80% below 1990 levels has been allocated to developed countries), the slope would be zero, thus **capping** the value of the Earth’s atmospheric CO₂_e

Figure 1 Stabilizing Atmospheric CO₂_e

It has been written that the industrial world must get its emissions down to a level that is 80% below 1990 levels to achieve the equality sign, which is one of the three possibilities

shown in Figure 1. It was thought that to achieve climate stabilization, humanity could do this as late as 2050 and that the atmospheric level of CO₂_e would then be at 450 PPM, corresponding to a 2 degree Celsius increase. However, it is now known that it is dangerous to allow a 2 degree Celsius change and that, even worse, an earth's atmospheric level of only 400 PPM of CO₂_e corresponds to a 2 degree Celsius change. As we all know, the earth's atmosphere is already at 410 PPM CO₂_e. This information about climate stabilization is shown in References 2 and 3.

In Figure 1, the zero slope condition will cap atmospheric CO₂_e, meaning that it will not go up and not go down. Currently, we have a positive slope condition, because our anthropogenic emissions are too high. We will require a negative slope to return our atmospheric CO₂_e to a safe level. The "wild card" in this problem is the warming feedback term. If it gets too large, we will have no hope of avoiding catastrophe.

You therefore must identify a climate-stabilizing target and then define enforceable measures to *achieve* that target. The principle of cumulative effects is being used here, as it must. The County must do its part. If it doesn't, it must assume that other municipal governments (around the world) will do the same and destabilization will result.

Besides this, to comply with CEQA, the CAP and its SEIR must describe destabilization's impact to our environment, to see if that is the outcome the decision makers want. During the process of destabilization, the earth will lose most of its life forms. This will not be pleasant for us or the animals, from aardvarks to zebras. We will all starve to death. This may take decades. The low-income people will starve first; the billionaires last. Of course there will be food riots; we will need to become a police state; and so on. Mass suicide and cannibalism may occur. A majority of the Board of Supervisors would rather avoid this, I assume. It is your job to make sure they understand this situation. The SEIR covers all of this up by not mentioning it. There is no excuse since it was described in NOP response Letter 18.

To achieve the CAP's identified climate-stabilizing targets, California state actions will be needed, driven by legislation and implemented by such entities as CARB, Caltrans, and the California Road User Charge Technical Advisory Committee (SB 1077.)

However, the County must also take strong actions. The County must show how climate-stabilizing targets can be achieved in each of the categories that emit greenhouse gas (GHG), assuming reasonable California actions, according to reasonable plans. These plans need to be either identified or written.

Cars and light-duty trucks emit the most GHG of any category in the County. Therefore, one thing that is needed to support the EIR is described in Reference 4, which is a sub-plank of the 2016 California Democratic Party (CDP) Platform:

[A] state plan showing how cars and light-duty trucks can hit climate-stabilizing targets, by defining enforceable measures to achieve the needed fleet efficiency and per-capita driving

To show that this is not impossible, as well as to offer a plan that the County may wish to use, we have included Reference 5, *Climate-Stabilizing, California Light-Duty Vehicle Requirements, Versus Air Resource Board Goals*.

Reference 5 shows that a climate stabilizing target is 80% below the 1990 level, by year 2030. Note that this is 20 years sooner than the final target of Executive Order S-3-05 and is double the drop from the 1990 level specified in SB 32, for 2030.

The SEIR, CAP, and GPU are proposing to only achieve legislative requirements, sometimes referred to as our “state mandates”.

However, where is it stated that “consistent with legislative requirement” is enough to avoid climate destabilization? The fact is that it is not stated. It is almost as if the authors hoped the reader won’t notice this.

It is true that the EIR needs to show how to achieve the “legislative requirement” but nowhere is it acknowledged that this is not enough to avoid catastrophe. Laws that happen to pertain to climate change, such as SB 32, do not replace or amend CEQA. CEQA may be humanity’s most important law, given our climate crisis. We must stop ignoring its most important set of requirements, related to climate: The environmental impacts of climate destabilization must be described and avoidance measures must be devised and implemented.

Effects of Climate Change on the Environment (Page 2.7-3)

This section violates CEQA. Your list of effects is incomplete. You fail to mention the fact that this crisis is essentially unbounded in the harm it can and probably will produce to humans and other life forms. This letter has already spelled that out. It shows exactly what needs to be said.

Governor Brown, in the week before the start of the *Paris Climate Talks*, said to the Pope these seven words, “Humanity must reverse course or face extinction”. Governor Brown was not exaggerating. He simply told the truth. CEQA requires the truth.

Executive Order S-3-05 (Page 2.7-5)

The Court ruled that S-3-05 was grounded in science. That is true. However, it is 2005 science. We now know much more. S-3-05 is now known to be too little too late. This was explained above, in this letter.

Assembly Bill 32 Climate Change Scoping Plan and Updates (Page 2.7-6)

This section leaves out the 3 items listed on Page 2 of this letter, showing that our climate crisis is much more urgent than we thought.

Senate Bill 375 (Page 2.7-7)

What this section fails to state is that when CARB assigned driving-reduction targets to the San Diego Association of Governments (SANDAG) and the other Metropolitan Planning Organizations (MPOs), they did not bother to make the targets part of an overall plan to ensure that cars and light-duty vehicles (LDVs) will achieve climate-stabilizing targets. If they had done that, the 2035 targets would have been about a 32% reduction in per-capita driving, with respect to 2005 levels (the SB 375 baseline), even assuming a rapid conversion to zero-emission vehicles (ZEVs). The basis for this is shown in Reference 5.

Proposed GHG Reduction Measures (Page 2.7-17)

These will be discussed in our comments regarding Chapter 3 of the Draft CAP.

CAP Impact Analysis (Page 2.7-22)

We note the words:

As climate change science and policy continues to advance, the County will be able to apply new reductions toward meeting the long-term 2050 GHG emissions reduction goal in future CAP updates, as outlined in Chapter 5 of the CAP.

However, climate science may also find that they have underestimated the reductions needed and/or underestimated the warming feedback of some effect. To comply with CEQA, the County must have a plan that contains a sufficient list of enforceable measures to achieve climate-stabilizing targets.

2.7.5.1 Issue 1: Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment (Page 2.7-36)

These words concern us:

*There are no additional feasible mitigation measures available to mitigate this impact based on information currently known. Therefore, this impact would be **significant and unavoidable**.*

As we have stated and as we will state with more detail in this letter, we have been suggesting a feasible car-parking-system mitigation measure that was ignored during the CEQA process of the last CAP and is being ignored during the CEQA process of this CAP. Also, energy-efficient zoning (not approving more sprawl development) is another mitigation measure that we repeatedly suggest. Again, the County ignores this suggestion by acting as if approving more sprawl development is not particularly harmful to efforts to achieve climate state mandates and climate-stabilizing targets.

It says on Page 2.7-37:

CARB recommends that “lead agencies prioritize on-site design features and direct investments in GHG reductions in the vicinity of the project” (CARB 2017). CARB also recognizes that “[w]here further design or regional investments are infeasible or not proved to be effective, it may be appropriate and feasible to mitigate project emissions through purchasing and retiring carbon credits issued by a recognized and reputable accredited carbon registry” (CARB 2017).

The County is taking the odd position that it might approve additional sprawl developments and offset the additional GHG emissions that will come with the additional driving through purchasing and retiring carbon credits issued by a recognized and reputable accredited carbon registry. But the key on-site design feature, as described by CARB above, is to not approve the additional sprawl development. Obviously, the General Plan Update design is, to a large degree, zoning. Said another way, zoning is a fundamental design parameter. To follow the CARB recommendation is to select a design, primarily zoning, which does not result in a significant increase in GHG emissions. There is nothing infeasible about selecting the design feature of not approving more sprawl development. In fact, the 2016 San Diego County Measure B ballot measure lost, even though a developer outspent the project opposition by over a 10-1 margin. The Measure B ballot measure was to approve a large additional sprawl development. This is an indication that the voters do not favor the approval of an additional sprawl development. We understand that developers who want to get their sprawl developments approved are often big contributors to candidates for the Board of Supervisors. However, casting a vote that will disappoint a big campaign

contributor is not infeasible, however painful it might be to some San Diego County Supervisors.

The discussion on Pages 2.7-37 through 2.7-40 shows a failure to understand that General Plan Updates (GPUs, or zoning changes, or additional sprawl developments) are project design features and they do not have to be approved. They in no way justify purchasing and retiring carbon credits issued by a recognized and reputable accredited carbon registry or any other such off site measure. It is true that CARB recognized if no local design feature is possible it might be acceptable to justify purchasing and retiring carbon credits issued by a recognized and reputable accredited carbon registry or any other such off site measure. However, that is not the case because GPUs do not have to be approved.

If a developer wanted an approval that required a GPU and it was going to pioneer a method of operation that would reduce emissions in a way that could be widely adopted, then it may be reasonable and conform to CEQA to allow it.

Table 2.7-1 County Greenhouse Emissions by Category (2014) (Page 2.7-42)

We note that on-road vehicles are 57% of the total. We know from the work (available on line) of our friends at the Energy Policy Initiatives Center (EPIC) that most of the on-road emissions are from LDVs. For this reason there needs to be a rigorous treatment of LDVs.

Table 2.7-2 County Emissions Forecasts, Reduction Targets and CAP Reductions (MTCO_{2e}/year) (Page 2.7-42)

Often municipal governments have no records of GHG emissions for year 1990, which is a baseline year for S-3-05. S-3-05 requires that 1990 levels are achieved in 2020. The table says that the target for year 2030 is 40% below the 2014 level, which means, since SB 32 calls for a 40% reduction from 1990 levels, that the 2014 level is coincidentally equal to what is being assumed to be the 1990 level. However, if this is true, the -2% in the 2020 column should be 0% and the -77% in the 2050 column should be -80%, to match the S-3-05 target. Please explain the discrepancies.

2.12 Transportation and Traffic (Page 2.7-12-1)

This section attempts to summarize the impacts of the transportation-related measures. We will comment on the measures as described in Chapter 3 of the CAP itself, because it seems to have the most detail. We find much of the discussion of transportation off base because it fails to recognize the overriding need to improve the methods by which we pay for the use of roads and parking.

Section 3 of the CAP

Built Environment and Transportation

Strategy T-1 is described as reducing VMT. It only has 3 measures, which would:

- acquired open space,
- acquire agricultural easements and
- update Community Plans

The first two would only “reduce VMT” in the sense that they would stop additional sprawl development which would increase VMT. If all we do is “hold the line” we have no hope of stabilizing the climate at a livable level. Updating Community Plans could be important.

We will comment on T-2 through T-4 below.

T-1.1 Acquire Open Space

It is clear that this is an on-going program that would happen in any case. The claim is made that it prevents a total of 491 homes. We agree it might, if the Supervisors were so unconcerned about climate change that they would approve additional sprawl development, without this acquisition of land. We understand this to be legitimate if the “baseline” or what is sometimes called the “business as usual” case included these homes. Is that correct or are these savings not real? To compute the GHG savings, what is the average number of trips per year per household and what is the average mileage (MPG) and trip length assumed?

T-1.2 Acquire Agricultural Easements

It looks like this is an on-going program. It is a Purchase of Agriculture Conservation Easement (PACE) Program and it is said to be an acquisition of 443 acres of agricultural easements by 2020 and an additional 4,430 acres between 2021 and 2030. The claim is made that it prevents a total of 198 homes. We agree it would, if the Supervisors were so unconcerned about climate change that they would approve additional sprawl development, without this purchase of land. We understand this to be legitimate if the “baseline” or what is sometimes called the “business as usual” case included the homes that could be approved on this land. Is that correct or are these savings not real? To compute the GHG savings, what is the average number of trips per year per household and what is the average mileage (MPG) and trip length assumed?

T-1.3 Update Community Plans

How do you compute the anticipated GHG Reduction? How do you know that the future Board of Supervisors will take this action? If they take this action, what allows you to assume how useful it will be? How do you quantify “Transit Oriented Development”? Many times the Sierra Club Transportation Chair has urged the San Diego Association of Government to replace “Smart Growth” with “VMT-Reducing Growth”. This would be far better because “VMT-Reducing Growth” can be quantified but “Smart Growth” cannot be quantified. Not one member of SANDAG’s Board or Staff gave any notice of the suggestion. Likewise, it may be that “Transit Oriented Development” has no definition and is not quantifiable in any way.

If a Community Plan has transit service is there any standard for that service to qualify it as being good enough to serve a so-called TOD? If so, what is that standard?

In an attempt to perhaps help you quantify VMT reductions, we offer the following Figure 2.

Are there any standards of density increase or maximum height increase that you are looking for in making these communities a better “TOD”, or, expressed in a more realistic way, more “VMT-Reducing”? Is there a metric for improving the jobs-housing balance or are you operating free of any numerical standards for that consideration?

Why does the County constantly assume that how drivers pay for parking is inconsequential? Every study of the matter finds that if, for example, all employees pay for parking with a reduced wage, whether they drive or not, many more people will drive than if the payment for parking is associated with the choice to drive.

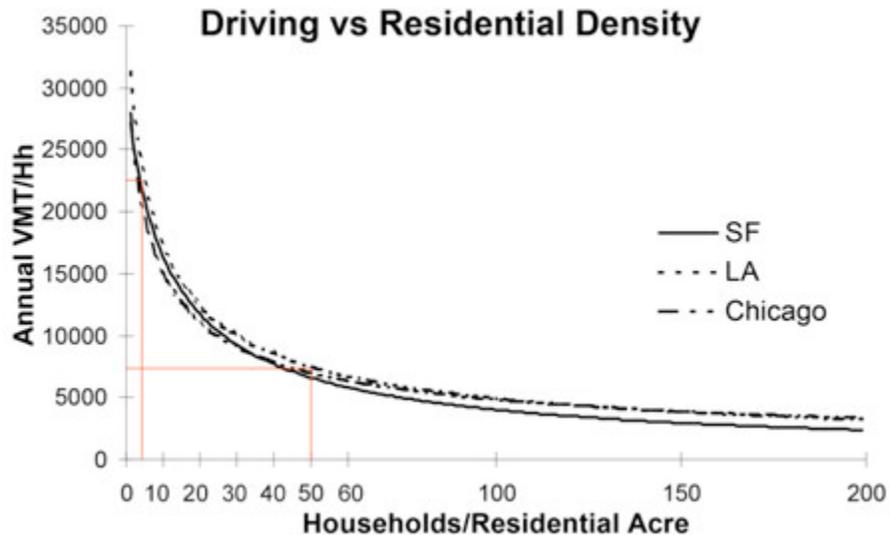

Figure 2 VMT Reductions from Increased Density

Reference 6 describes the modern round-a-bout. It includes a definition, how they improve traffic flow, how they improve air quality and reduce GHG, how they improve safety, and how much they cost. They should be part of any effort to do traffic calming or complete streets. As shown, each round-a-bout can eliminate 189 metric tons of CO2_e per year. Will you replace stop lights in Community Plans with round-a-bouts?

The *Supporting Efforts* table on Page 3-15 is not encouraging. Those are simple things that should have been done years ago. To “study, collaborate, and promote” are not enforceable and show that the County has not yet realized the urgency of our climate crisis. Enforceable changes in policy regarding density, height, car parking, and round-a-bouts should have been done by now.

Your “Performance Metric” table means almost nothing since your “Supporting Efforts” mean almost nothing.

Strategy T-2 Shift Toward Alternative Modes of Transportation (Page 3-17)

We agree with words written on Page 3-17.

T-2.1 Improve Roadway Segments as Multi-modal

There is an insufficient definition of the “multi-modal enhancements” that are being considered and how much this would reduce VMT. We know of no definition for “bikeway”. Would this be Class 1 (separated from cars), 2 (bike lanes), or 3 (marked routes)? There may be a place for all 3 and you may have data showing that each of these 3 can encourage riding and thereby reduce VMT. However, your lack of specificity suggests that you know little of this topic.

We believe in well-maintained roads. Since we must convert rapidly to a fleet of cars that no longer burns gasoline, the answer to having enough money to perform timely road maintenance is to design and implement an environmentally-sound road-use charge (RUC) pricing and payout system. A road user charge (RUC), has been proven feasible by the work of SB 1077. Currently, the gas tax rate, although improved by SB 1, is still too low to

pay the full cost of road maintenance. Besides this, the gas tax has a poor future. How do you propose to pay for whatever improvements are being considered? We oppose raising general taxes, such as a sales tax, to pay for roads. We should not be making it artificially cheap to drive cars. What is the County's position on this issue? We fully support "complete streets". Please explain how you computed the 2030 and 2050 GHG reductions of 604 and 1292. Why did you not mention "road diet" and round-a-bouts? Cycle tracks are controversial among bicyclists. How did you decide you favor them?

T-2.2 Reduce New Non-residential Development Vehicle Miles (Page 3-20)

There is a claim of a 15% reduction by 2030. This may be based on SANDAG's Regional Transportation Plan's VMT reduction as required by SB 375. If so, the County is doing nothing to claim this reduction. Is this based on SANDAG's Regional Transportation Plan's VMT reduction as required by SB 375? If so, there may be a mismatch because SB 375 is for 2035 but the County is claiming a reduction in 2030. Please explain this mismatch in target year. There is a mention of a Transportation Demand Management (TDM) ordinance. Why has the County not passed a TDM ordinance by now? Where can we read the proposed ordinance? Can we see the calculations of the driving reduction based on the imagined ordinance? We notice that the County is still unaware that "free" parking at work is really not free because it reduces everyone's wages, even those that never drive to work. We have repeatedly explained this issue and it discourages us that the County is still unaware that so-called "free" parking is unfair to those that drive less and that it increases the mode split of single-occupancy vehicle (SOV) driving.

The county's performance metric of a 15% reduction is too low to support light-duty vehicles achieving a reasonable climate-stabilizing target, as will be shown later in this letter. Is that value per-capita? Is it with respect to the SB 375 baseline year of 2005? If it is with respect to 2014, please show how you convert an SB 375 target for year 2035 to a value with a different target year and a different baseline year.

T-2.3 Reduce County Employee Vehicle Miles Travelled (Page 3-22)

In the original Sierra Club letter to San Diego County, regarding its first effort to produce a CAP, we proposed a car-parking-pricing-and-payout system that would increase fairness and reduce the choice of driving to work. That letter, dated March 19, 2012, is Reference 7. Throughout that lawsuit we stressed this mitigation measure as a policy that could be implemented for County employees. We were very specific in our proposal.

This feasible mitigation was ignored by the County in their legally-deficient Climate Action Plan (CAP) which they subsequently rescinded under court order. This is the mitigation measure that was described during oral arguments in Appellate Court, when a Justice asked the Club lawyer to describe a feasible mitigation measure that was ignored by the County.

After hearing the description, the Justice commented, "That sounds like feasible mitigation to me."

Here is a brief description of this feasible mitigation measure. This strategy would be a "game-changer", not only for the County, but for improving our prospects for achieving climate-stabilizing targets, wherever driving is a significant source of GHG emissions and so-called "free parking" at work is common.

Demonstration Project to Eliminate the Harm of Bundled-Benefit Parking at Work

San Diego County (“County”) would develop a Demonstration Project to, in effect, Unbundle the Benefit of Parking (“Demonstration Project”) where County employees work (“Proposed Location”).

BACKGROUND: Currently, County employees do not have the ability to choose between earnings and driving – employees effectively pay for parking out of their salary, whether or not they use the parking. The Demonstration Project will provide the opportunity for the employees to choose between earnings and driving. This is functionally equivalent to the implementation of the California Air Pollution Control Officers Association (CAPCOA) measure of unbundling the cost of parking.

PROJECT: Parking would be charged at a given rate (for example \$0.02/min – roughly \$10.80/day, considering 8 hours of work and 1 hour for lunch). Funds generated from these parking charges would be distributed as earnings to all employees working at the proposed location in proportion to each employee’s time spent at work, at the proposed location. Those who decide not to drive will not be charged for parking but will still receive earnings based on their time spent at work at the location. Implemented correctly, this free-market approach will substantially reduce vehicle miles traveled (VMT) and greenhouse gas (GHG) emissions, by reducing the drive-alone mode.

For employees whose parking charges are greater than their parking-lot earnings, an “add-in” may be included so that no employee loses money, compared to “free parking”. (Some documentation of this method refers to this payment as a “must-drive bonus”.) With such “add-in” payments, there could be an “Opt in” or “Opt out” choice. This would mean that, if the charges and payments associated with this system were included on employee pay checks, those that “Opt out”, would see no changes on their pay check, relative to how their pay check looked during the days of “free parking”. If the charges and payments associated with this system were shown on a separate, mailed statement, those that opt out would receive no such statement.

This project may be helped by receiving a grant to pay the development and installation cost, as well as the “add in” payments, for some specified number of years. The County would need to apply for such a grant.

This feasible and sensible mitigation measure is actually a demonstration project of an overall system that would operate all types of parking, as described in Reference 8. Reference 9 is a more detailed description of this demonstration project.

Based on Table 1 of Reference 8, the driving reduction could be 25%, at places of employment. Table 1 shows driving reductions resulting from introducing a new price differential for parking, for 10 cases. Its average reduction in driving is 25% and its smallest, single-case reduction is 15%. Again, these systems can be set up so that no driver loses money. Grant possibilities include the California Air Resources Board’s *Low Carbon Transportation* program and the Strategic Growth Council’s (SGC’s) *Transformative Climate Community* program.

T-2.4 Shared and Reduced Parking in New Non Residential Development (Page 3-22)

The system we are proposing as a demonstration project (shown in the T-2.3 section, in this letter, just above this section) is a sub-system of an overall system of parking we are currently calling a “Dividend-Account Parking” system. The “Dividend” word denotes that

some people receive parking lot earnings. The “Account” word denotes that the cars parked are associated with an account, of a person responsible to pay the cost of the parking. “Account” also denotes that the cost of parking is being taken into account, instead of being ignored and hidden, as is often the case. It is documented in Reference 8. It is a system where all parking is naturally shared.

Ultimately, based on the system we are proposing, we see no reason to restrict this to either New” or to “Non Residential”, as is suggested in the County’s title of this section. The system we are proposing was peer reviewed in 2010, when it was accepted for presentation at an Air and Waste Management Association (AWMA) Conference, in Calgary, Canada. The presentation received two standing ovations: once upon the conclusion of the presentation and again at the conclusion of the question and answer portion of the presentation. The system is hosted by the National Sierra Club: [.http://sierraclub.typepad.com/files/mike-bullock-parking-paper.pdf](http://sierraclub.typepad.com/files/mike-bullock-parking-paper.pdf). The County received this paper as a reference to the Reference 7 letter, back in 2012. We have never been given any indication that anyone at the County has read the paper. The T-2-4 section, which is about parking, gives no indication that anyone at the County has read the paper. We have certainly received no criticism of the paper from the County. Since there has been no criticism, we wonder why its ideas are being ignored. Is there any County employee working for the County on the CAP and its SEIR that is aware of the Sierra Club’s submittals to the County regarding car-parking? If so, what is their opinion of the proposals? Why has the County ignored the Sierra Club’s car parking proposals for over 5 years? Could you please show us how you compute the 1454 and the 2508 GHG reductions shown? How would you handle the sharing in terms of enforcement?

T-3 Decarbonize On-road and Off-road Vehicle Fleet (Page 3-27)

We support efforts to decarbonize vehicles. This includes the efforts shown in your sections T-3.1, T-3.2, T-3.3, and T-3.4. Beyond what is shown in these subsections, we have asked the SANDAG Board to put electrifying the Coaster train into their “Unconstrained” (unconstrained by money) Regional Transportation Plan, for example. We are joining with other groups to push for purchasing only Battery Electric busses. We have not heard that the County is interested in these efforts.

We appreciate your efforts to make construction less polluting. As far as retiring old model cars that get poor gas mileage, we would like to see the County join us in advocating for a plan of enforceable measures, whereby light-duty vehicles (LDVs) achieve a climate-stabilizing target. This would require actions such as what is described in T-3.3. We would like to see the County become a force for climate stabilization at SANDAG. Could you show us how you computed the GHG reduction of 866, shown on Page 3-32? Is the County supportive of electric transit vehicles and if so, what is your plan to help bring that about?

T-3.4 Reduce the County’s Fleet Emissions (Page 3-34)

We are disappointed that the County’s goal is only 50% of new vehicle purchases. We have a climate crisis. Would you please change that to 100%?

T-4 Invest in Local Projects to Offset Carbon Emissions (Page 3-37)

We accept that many of the projects named are worthwhile. However, the car parking system that we describe above is also a worthy project. Once that system is designed, other employers will want to use it, because it increases fairness while it decreases driving.

It can spread to other types of parking because it supports the sharing of parking. It will need to spread to all types of parking, in one unified system, if we are going to have a chance to achieve climate-stabilizing targets.

Energy (Page 3-40)

We appreciate the target of 90% renewable energy in the County by 2030. This will require the measures you named, which we want to be made enforceable, and more.

San Diego is conducting a study of feasibility of CCE. Carlsbad and other cities to its South are joining together to investigate the feasibility of forming a Community Choice Energy (CCE) District, under California Community Choice Aggregation (CCA) law. In the last three years, the rise of Community Choice Energy in California has been dramatic. The first Community Choice Agency (CCA), [Marin Clean Energy](#), launched in 2010, and was the only one for four years until [Sonoma Clean Power](#) launched in 2014, followed soon after by [Lancaster Choice Energy](#) in 2015. By mid-2015 a critical mass of information-sharing and proof-of-concept had spread throughout California and by late 2016 nearly half the counties in the state and over 300 cities were either operational or at some stage of evaluation of Community Choice. The CAP and SEIR should include, as a recommended mitigation measure, joining a CCE. To do this, the County needs to act to determine the feasibility of this measure and its effectiveness in moving towards your stated goal of 90% clean energy by 2030. This target is certainly a strength of your effort.

In 2014, Lancaster started to require all new residential construction project to include solar power. There is a minimum average solar generating capability of 0.5 to 1.5 kW per unit, depending on lot size and location. Are you willing to meet or exceed that standard?

The Need for a Concerted Effort to Ensure that Light-Duty Vehicles Will Achieve a Realistic Climate-Stabilizing Target

First, You Need a Plan:

The well-known and well-respected Energy Policy Initiative Center reported that 41% of the GHG emitted in San Diego County comes from cars and light-duty trucks, denoted as “LDVs” in this report. This is larger than the sum of the next two largest emitters: electricity, at 25% and natural gas, at 9%. Because LDVs are so important, there needs to be a plan showing a set of enforceable measures ensuring that LDVs will achieve a climate-stabilizing target. The first step is to show how a reasonable climate-stabilizing target is derived. As has been shown in the letter, there are strong indications that state mandates, such as SB 32 are not good enough.

This is not just understood by us. The California Democratic Party (CDP) has come to the same conclusion, as shown in its 2016 Platform. This bullet is from that platform (Reference 4) (<http://www.cadem.org/our-california/platform/2016-platform-energy-and-environment>).

- ***Demand a state plan showing how cars and light-duty trucks can hit climate-stabilizing targets, by defining enforceable measures to achieve the needed fleet efficiency and per-capita driving***

CARB should probably do this but so far, they have issued no such plan, perhaps because they have no such plan. However, CEQA requires that decision makers understand the

environmental consequences of what they may approve. What does the state need to do, which has the primary responsibility for fleet efficiency requirements and how much it will cost to drive on the road and how will this fit with what local and regional government may do, understanding that they do RTPs, zoning, and other transportation-related policies such as complete streets, transit, and parking policies. Therefore, such a plan is required for any project that will have a significant impact on the LDV sector. This means that most EIRs have been approved in violation of CEQA law. This should come as no surprise because there are few systems engineers in the ranks of those that might challenge an EIR. Some things take time.

Reference 5 is an example of a state plan that is being requested by the CDP. It may not be perfect but it is an honest attempt and it may be the only such example on the planet. It is included to show that such a report is not impossible. The County or any other government could accept the plan as their own, if they find no errors. What the County cannot do is to take the position that no such plan is required. The County could modify the Plan if it thinks it could improve upon its methods or its assumptions.

Enforceable and Feasible Mitigation Measures to Achieve Driving Reductions

The following numbered mitigation measures must be implemented unless you can prove that they are either not “technologically feasible” or they are not “cost effective”. When considering how cost effective the measures are, keep in mind that climate destabilization, which is where humanity is currently headed, will result in a devastating collapse of the human population, which is very expensive, in many ways.

1.) Reallocate SANDAG Funds Earmarked for Highway Expansion to Transit and Consider Transit-Design Upgrades

It is well-known that the induced traffic demand resulting from adding highway lanes will cause traffic congestion to remain constant. This is true, even if the new lanes are HOV (High Occupancy Vehicle) lanes; HOT (High Occupancy Toll) lanes; or Managed Lanes, which give priority to moving transit vehicles. Any project (or other change, such as autonomous vehicles that can travel at high speeds with very little distance between vehicles) that temporarily creates space on a freeway will induce enough traffic to fill that space, returning congestion to the level it was before the project (or other change.) Therefore, additional lanes will not reduce congestion one iota. The money spent to add lanes is not just a waste of money. With more lanes and the same level of congestion as before, the result is always more frustrated drivers, more air pollution, and more GHG emissions.

The sales tax measure called “Trans-Net” allocates approximately one-third for highway expansion, one-third for transit, and one-third for road maintenance. It has a provision that allows for a reallocation of funds, if supported by at least two-thirds of SANDAG Board members, including a so-called weighted vote, where governments are given a portion of 100 votes, proportional to their population. This feasible mitigation measure is to reallocate the Trans-Net amount, earmarked for all highway expansions, to transit. It is noted that perceived political risk for decision makers does not constitute infeasibility, for a suggested mitigation measure. SANDAG needs to help educate the public about the futility of adding lanes because of induced traffic demand, as well as our responsibility to have a plan showing how cars and light-duty trucks can achieve climate-stabilizing targets. This will reduce political risk.

This money could be used to fund additional transit systems; improve transit operations; and/or redesign and implement the redesign of an existing transit system. A redesign could be

the electrification and automation, or even a wholesale technology upgrading of the Coaster/AMTRAK and Sprinter rail lines. These systems need to be frequent and operate 24/7.

The money could also be used to implement a fixed-guideway connection between the San Diego Airport and both the Santa Fe Train Station and the Old Town Transit Center. A trade-off study is needed to find out if this should be done with a trolley extension or an automated system, perhaps using the technology that connects the Oakland Airport to the Coliseum BART station.

The County needs to assume this mitigation measure and then do everything it its power to convince the SANDAG Board that it must be done. (AB 805 would help.)

2.) A Comprehensive Road-Use Charge (RUC), Pricing-and-Payout System to Improve the Way We Pay for the Use of Roads

Comprehensive means that, for example, pricing, overall, is sufficient to cover all costs, including road maintenance and externalities such as harm to the environment and health; privacy is defined and achieved; the economic interests of low-income drivers doing necessary driving would be protected; that the incentive to drive fuel-efficient cars would be at least as large as it is under the current fuels-excise tax; and, as good technology becomes available, congestion pricing is used, if needed, to protect critical driving from congestion.

The word “*payout*” means that some of the money collected would go to people that are losing money under the current system.

Currently, user fees (gas taxes and tolls) are not enough to cover road costs. Even though general-fund money is being used to operate and maintain roads, California is not doing maintenance with enough frequency to minimize cost. It is well understood that deferred maintenance will cost more than timely maintenance. Besides this, the improved mileage of the Internal Combustion Engine vehicles (ICEs) and the large number of Zero-Emission Vehicles (ZEVs), both of which are needed to have the fleet efficiency required to achieve climate mandates, mean that gas-tax revenues will drop precipitously over the coming years. In view of these facts, California has passed and is implementing SB 1077, which creates a pilot project road user charge (RUC). The Road User Charge Technical Advisory Committee (RUC TAC) has twice visited San Diego. The first time, they met in the SANDAG Board Room. The second time, they met at the CALTRANS District 4 office. SANDAG Board Members and SANDAG staff were conspicuously absent from these meetings. SANDAG staff did not inform its Board of these meetings. This is unfortunate because a RUC is the future of road funding. Unfortunately, the SANDAG Board Majority seems to think that a new sales tax can be used to expand roads. The recent defeat of Measure A suggests that this is not true.

Both SANDAG and the County need to support California in its efforts to create an effective RUC pricing-and- payout system. As the pilot project finishes, legislation is needed to get the design and implementation moving. SANDAG and the County should lobby for a good system and then, in their EIRs, they should assume a good system. Such a system will play a useful role in reducing per-capita driving.

3.) Improving the Way We Pay for the Use of Car Parking

Bundled-cost parking increases the cost of everything, from rent to food; bundled-benefit parking reduces wages. These unsustainable practices are economically unfair to those that drive less or might like to drive less, if they could receive the fair, market-priced compensation for their effort, considering the high cost of providing parking. Surface parking only provides spaces at a rate of 120 car-spaces per acre of land. Parking garage construction costs are over \$20,000 per space. Underground parking costs from \$60,000 to \$100,000 per space. The fourth bullet of the Transportation Sub-plank of the 2016 California Democratic Party Platform (Reference 4) calls for “*shared, convenient and value-priced parking, operated with a system that provides earnings to those paying higher costs or getting a reduced wage, due to the cost of providing the parking.*”

This feasible mitigation was ignored by the County in their legally-deficient Climate Action Plan (CAP) which they subsequently rescinded under court order. This is the mitigation measure that was described during oral arguments in Appellate Court, when a Justice asked the Club to describe a feasible mitigation measure that was ignored by the County. It is described in this letter in Section **T-2.3 Reduce County Employee Vehicle Miles Travelled (Page 3-22)** on Page 13 of this letter.

4.) Good Bicycle Projects and Bicycle Traffic Skills Education

The best criterion for spending money for bicycle transportation is the estimated reduction in driving per the amount spent. It is hoped that the following strategies will come close to maximizing this important parameter.

a.) Projects to Improve Bicycle Access

All of the smart-growth neighborhoods, central business districts, and other high trip destinations or origins, both existing and planned, should be checked to see if bicycle access could be substantially improved with either a traffic calming project, a “complete streets” project, more shoulder width, or a project to overcome some natural or made-made barrier. One example is to build a Vista Way bicycle bridge over I-5 in Oceanside, to allow those walking or biking to travel between the South Oceanside coastal neighborhood and the regional shopping center, which contains such large stores as *Wal-Mart* and *Stator Brothers* grocery store. Currently, those walking or biking from the Vista Way area West of I-5 must travel much further and travel over a steep hill (Cassidy Street). There are no large grocery stores in the Coastal region of Oceanside, west of I-5. Vista Way was connected for bike riders and pedestrians before the construction of I-5.

b.) League of American Bicyclist Certified Instruction of “Traffic Skills 101”

Most serious injuries to bike riders occur in accidents that do not involve a motor vehicle. Most car-bike accidents are caused by wrong-way riding, riding on sidewalks, and errors in intersections; the clear-cut-hit-from-behind accident is rare.

After attending *Traffic Skills 101*, students that pass a rigorous written test and demonstrate proficiency in riding in traffic and other challenging conditions could be paid for their time and effort.

As an example of what could be done in San Diego County, if the average class size was 3 riders per instructor and each rider passes both tests and earns \$100 and if the instructor, with overhead, costs \$500 dollars, for a total of \$800 for each 3 students, that would mean that \$160M could teach $\$160M/\$800 = 200,000$ classes of 3 students, for a total of 600,000 students. This is approximately 20% of the population of San Diego

County. If a significant percentage of the graduates become every-day, utilitarian riders, this program will be a very cost-effective mitigation measure. It is certainly technologically feasible.

If SANDAG is unwilling to do this program countywide, the County could scale the program described above down to a County-run program. Members of Oceanside's Bicycle-Pedestrian Committee and others in the County are already teaching League-Certified classes, as described above.

5.) Eliminate or Greatly Increase the Maximum Height and Density Limits Close to Transit Stops that Meet Appropriate Service Standards

As sprawl is reduced, more compact, transit-oriented development (TOD) will need to be built. This strategy will incentivize a consideration of what level of transit service will be needed, how it can be achieved, and what levels of maximum height and density are appropriate. Having no limits at all is reasonable if models show that the development can function without harming the existing adjacent neighborhoods, given the level of transit service and other *supporting transportation policies*. One such *supporting transportation policy* would be the use of car-parking systems described in References 8 and 9, which support the full sharing of parking, less driving, and less car ownership. These are reasons that the County Supervisors and Staff need to weigh in on the redesign and rezoning of the area around its downtown San Diego location. This is probably not applicable in other locations under County control because the transit service is either nonexistent or it is insufficient.

6.) Work for Installing a “Dividend-Account” Parking System at Train Stations in the County

We understand it is difficult for the County to influence SANDAG and the North County Transit District (NCTD), which runs the Coaster. We are hopeful that AB 805 will reform the decision-making of the NCTD so that it will become open to progressive change and more responsible regarding the fact of our anthropogenic climate change crisis. We would like to see the County to develop a Plan to help the NCTD adopt the same sort of Dividend-Account Parking system at the Transit Centers as what we hope will be installed at your County offices downtown. In this case, the earnings or dividend are paid to adult train riders in proportion to the time they spend on round trip train rides. These beneficiaries are selected because the car parking is being provided for adult (driving age) train riders making round-trip train rides. The parking would be available to anyone driving a car that is in the Dividend-Account Parking system, meaning that there is an account with a person responsible for paying for the parking of the car being parked. This system would allow the parking to be used by any driver with an account, including non-train riders. Fully-shared parking is generally better than parking that is not shared or is less shared. “Free parking” at train stations maximizes driving to the station. A Dividend-Account parking system would maximize ridership. Currently, a person that could easily walk or bike to the station may drive. However, this is less likely to happen after the installation of a Dividend-Account parking system. The net cost (fare minus parking dividend) to ride will be reduced. This will increase ridership. This system will also ensure that someone that drives to the station can be assured of finding a parking place, because it will not be difficult to set the price of the parking to ensure vacancy, as is described in the paper shown here: <http://sierraclub.typepad.com/files/mike-bullock-parking-paper.pdf> (Reference 8). Note that the paper provides a dynamic pricing system

to guarantee a selected minimum vacancy rate. If a person drives to the station but does not find a parking place, they may become discouraged from riding the train.

Summary of the Six Mitigation Measures Described

Do you agree that Measure 3 above is feasible and if not, why not? Do you agree that Item 4 is feasible? Do you see the value in working for Mitigation Measures 1, 2, 5, and 6?

Need to Include Plots and Explanations of the Plots, in the EIR, to Leave No Doubt About the Cause and Grave Nature of Anthropogenic Climate Change

The SEIR must fully explain the urgency and danger of humanity's anthropogenic climate change crisis, sometimes referred to as simply "climate".

The best way to do this is to include plots and explanations of the plots, that leave no doubt about the validity and grave nature of climate.

Figure 3 shows the rise of the world's atmospheric CO₂ over the last 50 years.

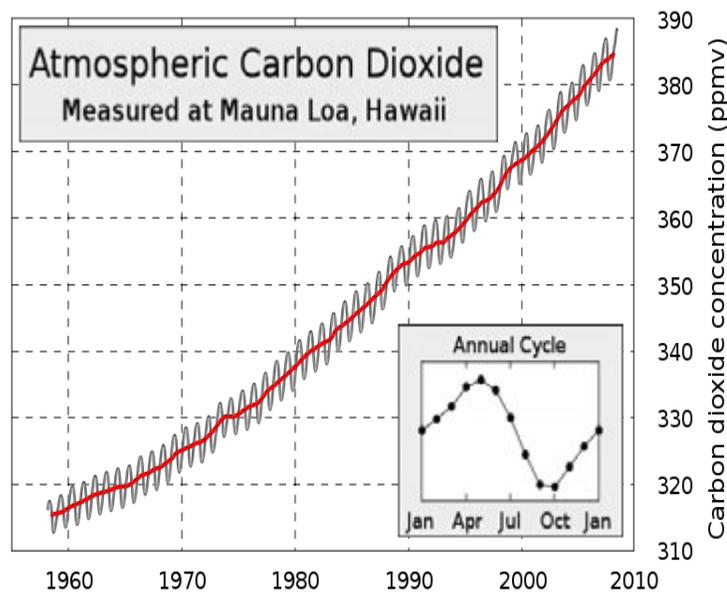

Figure 3 Atmospheric CO₂, Increasing Over Recent Decades

Figure 4 shows both atmospheric temperature (averaged over a year and averaged over all of the earth, derived from an isotope analysis) and atmospheric CO₂, over 800,000 years. (Our species is only around 300,000 years old.) Figure 4 shows that when climate deniers say that climate is always changing and so therefore climate change is normal, they are correct, except for one important consideration. There is nothing normal about the outrageous run up of atmospheric CO₂, to over 400 PPM, in such a short time that it appears to be an instantaneous spike, on Figure 4. There is no doubt that the spike is the result of our combustion of fossil fuels. The spike is clearly anthropogenic climate change.

Temperature and CO₂ Records

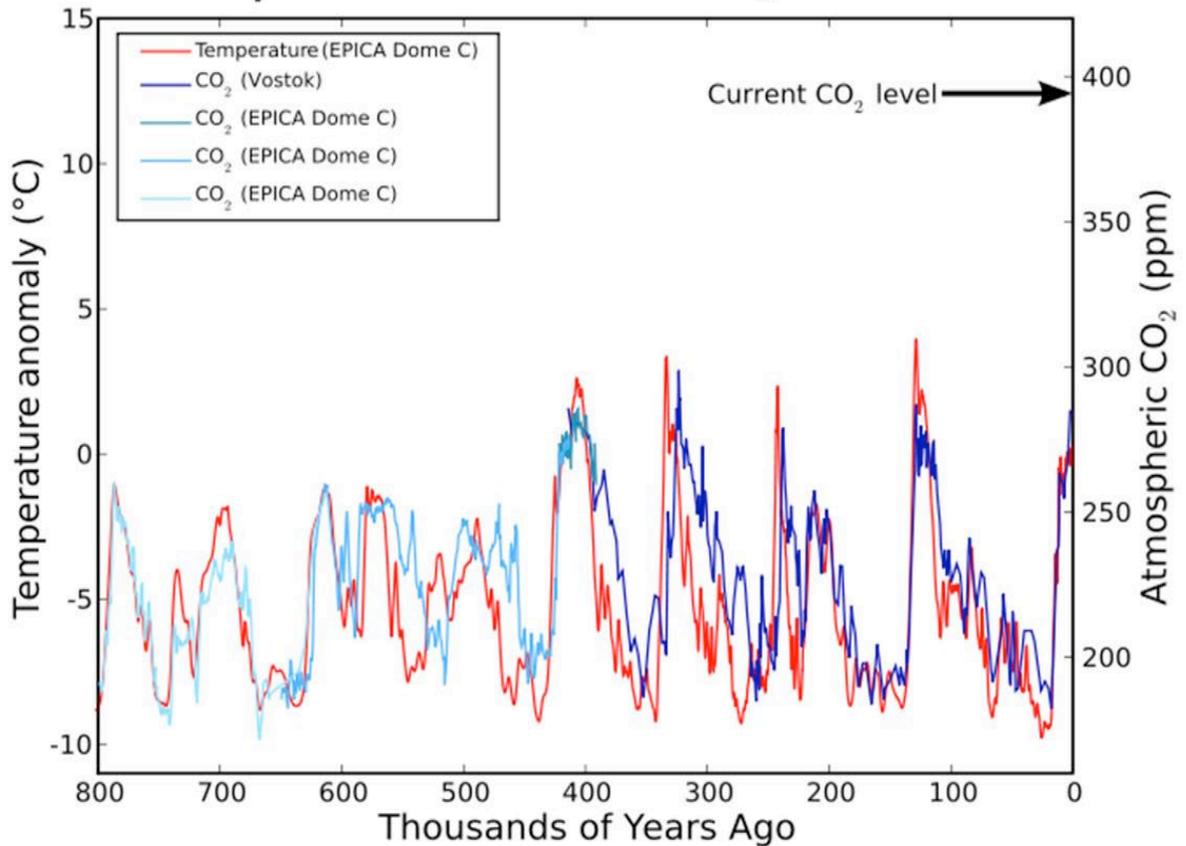

Figure 4 Atmospheric CO₂ and Mean Temperature, from 800,000 Years Ago, with Current CO₂ PPM Shown

Figure 5 covers all of the time of the development of our civilization. By focusing on just 1000 years, the spike's shape, in red, is revealed. Everything was normal until about 150 years ago, which is the start of our industrial revolution, when we started to burn fossil fuels. The ominous increase in temperature (in blue) is also shown. By doing extensive calculations we know how much CO₂ we have produced from the combustion of fossil fuels. Then, by directly measuring the atmospheric CO₂ and the acidity of the oceans, we know where all of that CO₂ currently resides. We also know that atmospheric CO₂ traps heat. There is no doubt that we have an Anthropogenic Global Warming (AGW) catastrophe in the making. Achieving climate-stabilizing targets is our only hope.

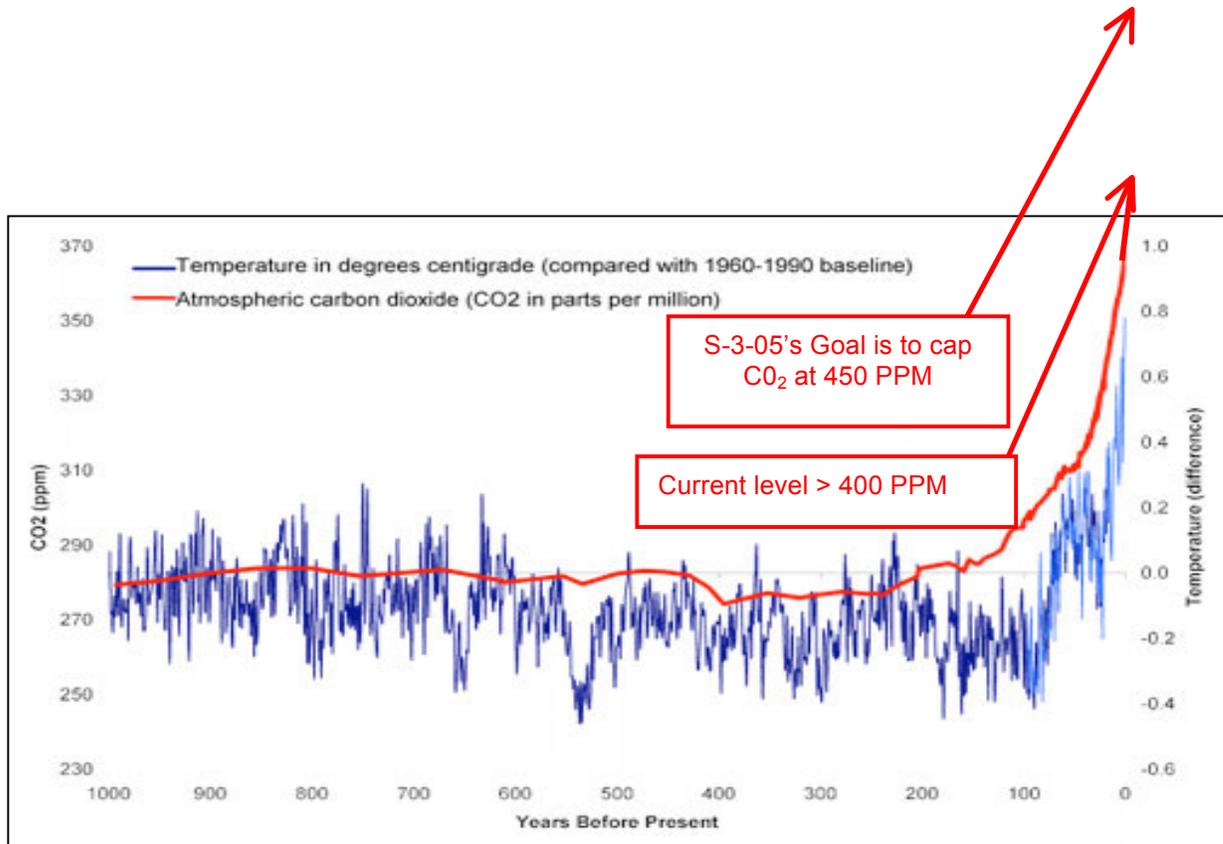

Figure 5 Atmospheric CO2 and Mean Temperature Over the Last 1,000 Years

Conclusion

We offer these words from Reference 10, which is the Superior Court Ruling, against the County (emphasis added):

There is no time for "building strategies" or "living documents;" as the PEIR quite rightly found, enforceable mitigation measures are necessary now.

We need to keep in mind the following:

- climate change has the potential to end most life forms on the planet and
- our own species could be headed towards a “devastating collapse” of our population, to quote the June 2008 issue of *Scientific American*

We would like to meet with County representatives to discuss our concerns and our proposed mitigation measures. Thank you for doing this critical and challenging work.

Respectfully submitted,

COURT OF APPEAL, FOURTH APPELLATE DISTRICT

DIVISION ONE

STATE OF CALIFORNIA

SIERRA CLUB,

Plaintiff and Respondent,

v.

COUNTY OF SAN DIEGO,

Defendant and Respondent.

D064243

(Super. Ct. No. 37-2012-00101054-  
CU-TT-CTL)

APPEAL from a judgment of the Superior Court of San Diego County, Timothy Taylor, Judge. Affirmed.

Thomas E. Montgomery, County Counsel, and C. Ellen Pilsecker, Chief Deputy County Counsel, for Defendant and Appellant.

Law Office of Malinda R. Dickenson, Malinda R. Dickenson; Chatten-Brown & Carstens, Douglas P. Carstens and Josh Chatten-Brown for Plaintiff and Respondent.

This action arises out of the County of San Diego's (County's) 2011 general plan update, wherein the County issued a program environmental impact report (PEIR), and adopted various related mitigation measures. In this action the Sierra Club sought, in a

petition for writ of mandate, to enforce one mitigation measure adopted by the County: the Climate Change Mitigation Measure CC-1.2 (Mitigation Measure CC-1.2). With Mitigation Measure CC-1.2, the County committed to preparing a climate change action plan with "more detailed greenhouse gas [GHG] emissions reduction [GHG] targets and deadlines" and "comprehensive and enforceable GHG emissions reductions measures that will achieve" specified quantities of GHG reductions by the year 2020.

However, the Sierra Club alleged that instead of preparing a climate change action plan that included comprehensive and enforceable GHG emission reduction measures that would achieve GHG reductions by 2020, the County prepared a climate action plan (CAP) as a plan-level document that expressly "does not ensure reductions." The County also developed associated guidelines for determining significance (Thresholds).

According to the Sierra Club, review of the CAP and Thresholds project under the California Environmental Quality Act (CEQA) (Pub. Resources Code, § 21000 et seq.) was performed after the fact, using an addendum to the general plan update PEIR, without public review, without addressing the concept of tiering, without addressing the County's failure to comply with the express language of Mitigation Measure CC-1.2, and without a meaningful analysis of the environmental impacts of the CAP and Thresholds project.

The court granted the petition, concluding that the County's CAP did not comply with the requirements of Mitigation Measure CC-1.2 and thus violated CEQA. The court found that the CAP did not contain enforceable GHG reduction measures that would achieve the specified emissions reductions.

The County appeals, asserting (1) the statute of limitations bars the claim that the mitigation measures are not enforceable; (2) the CAP met the requirements of Mitigation Measure CC-1.2; and (3) that the trial court erred in finding that a supplemental EIR was required. We affirm.

## FACTUAL AND PROCEDURAL BACKGROUND

### A. *Executive Order S-3-05*

In 2005 then-California Governor Arnold Schwarzenegger issued Executive Order No. S-3-05,<sup>1</sup> which acknowledged California's vulnerability to the effects of climate change and established targets for reducing GHG emissions in California over time. Specifically, Executive Order No. S-3-05 set statewide targets for three points in time: 2010, 2020, and 2050. The target for 2010 (2010 Target) was to reduce emissions to the levels they were at in the year 2000. The target for 2020 is to reduce emissions to the levels they were at in 1990 (2020 Target). The target for 2050 is that emissions be 80 percent below the levels they were at in 1990 (2050 Target).

Executive Order No. S-3-05 was based on then-available climate science and represented California's share of worldwide GHG reductions necessary to stabilize climate. As the Attorney General explained, "Executive Order [No.] S-3-05 is an official policy of the State of California, established by gubernatorial order in 2005, and designed to meet the environmental objective that is relevant under CEQA (climate stabilization)."

---

<sup>1</sup> On March 24, 2014, the County requested that we take judicial notice of Executive Order No. S-3-05. We grant that request.

*B. The Legislature Addresses the Need for GHG Emission Reductions*

In response to Executive Order No. S-3-05, the California Legislature enacted the California Global Warming Solutions Action of 2006, Assembly Bill No. 32. (Health & Saf. Code, § 38500 et seq.) Consistent with Executive Order No. S-3-05, Assembly Bill No. 32 required the California State Air Resources Board (CARB) to determine 1990 levels of GHG emissions and then to establish "a statewide greenhouse gas emissions limit that is equivalent to that level, to be achieved by 2020." (Health & Saf. Code, § 38550.) Assembly Bill No. 32 also stated that GHG reductions must continue after 2020, requiring that the statewide greenhouse gas emissions limit established by CARB "remain in effect unless otherwise amended or repealed" (Health & Saf. Code, § 38551, subd. (a)) and further that "[i]t is the intent of the Legislature that the statewide greenhouse gas emissions limit continue in existence and be used to maintain and continue reductions in emissions of greenhouse gases beyond 2020." (Health & Saf. Code, § 38551, subd. (b).) Assembly Bill No. 32 also required that CARB "prepare and approve a scoping plan [for] achieving the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions by 2020." (Health & Saf. Code, § 38561, subd. (a).)

In December 2008 CARB approved the scoping plan. The scoping plan "identifies California's cities and counties as 'essential partners' within the overall statewide effort, and recommends that local governments set a GHG reduction target of 15% below 2005-2008 levels by 2020." Thus, it was acknowledged that CARB would accept this target as a substitute for the 1990 level referenced in Assembly Bill No. 32 and Executive Order No. S-3-05.

### *C. The County's General Plan Update PEIR*

The County acknowledged in the general plan update PEIR that it needed to "reduce GHG emissions to 1990 levels by 2020" and that changes were required both in the community and in the County's operations, buildings, vehicle fleet, and with respect to its employee commutes, water, and waste.

A GHG emissions inventory was prepared as a special appendix (Appendix K). Appendix K set forth projected emissions reductions and assumptions then-available, and promised that the "Greenhouse Gas Reduction/Climate Action Plan, which will be prepared as an implementation strategy, will further detail the County's GHG emissions and how those reductions will occur."

There was extensive public comment on the general plan update, including from the California Attorney General:

"[W]e encourage the County to (1) commit in the General Plan to adopt by a date certain a CAP with defined attributes (targets, enforceable measures to meet those targets, monitoring and reporting, and mechanisms to revise the CAP as necessary) that will be integrated into the General Plan; (2) incorporate into the General Plan interim policies to ensure that any projects considered before completion of the CAP will not undermine the objectives of the CAP; and (3) for all GHG impacts the County has designated as significant, adopt feasible mitigation measures that can be identified today and that do not require further analysis." (Fn. omitted.)

### *D. Mitigation Measures*

The County thereafter promised to take a series of additional actions. These promises took the form of a group of climate change-related mitigation measures:

Mitigation Measures CC-1.1 through CC-1.19 (the Mitigation Measures). The Mitigation

Measures included requirements to update, review, and implement County programs; implement a strategic energy plan; revise the zoning ordinance; coordinate with other entities; educate the public; reduce vehicle miles traveled and encourage alternative modes of transportation; and, based thereon, to revise the County guidelines for determining significance.

The County made the following finding with regard to Mitigation Measure CC-1.2:

"[Mitigation Measure] CC-1.2 requires the preparation of a County Climate Change Action Plan within six months from the adoption date of the General Plan Update. The Climate Change Action Plan will include a baseline inventory of greenhouse gas emissions from all sources and *more detailed greenhouse gas emissions reduction targets and deadlines*. The County Climate Change Action Plan *will achieve comprehensive and enforceable GHG emissions reduction of 17% (totaling 23,572 MTC02E) from County operations from 2006 by 2020 and 9% reduction (totaling 479,717 MTC02E) in community emissions from 2006 by 2020*. Implementation of this Climate Change Action Plan will contribute to meeting the [Assembly Bill No.] 32 goals, in addition to the State regulatory requirements noted above." (Italics added.)

Mitigation Measure CC-1.2 formed the basis for Mitigation Measure CC-1.8, which required "revision of the County Guidelines for Determining Significance based on the Climate Change Action Plan."

Mitigation Measure CC-1.8, in turn, formed the basis for Mitigation Measure CC-1.7, which required that the County guidelines for determining significance anticipated by Mitigation Measure CC-1.8 incorporate CARB's recommendation for a threshold for determining significance of impacts on climate change. Should the recommendation "not be released in a timely manner," the County would "prepare its own threshold."

As required by CEQA (Pub. Res. Code, § 21081.6), the County incorporated a mitigation monitoring and reporting program (MMRP) into the general plan update PEIR.

Included in the MMRP was a promise to achieve GHG reductions by 2020 through comprehensive and enforceable GHG emission reduction measures. In addition to committing to the 2020 Target, the County also committed to compliance with the Executive Order No. S-3-05 trajectory. The County found "significant impacts associated with substantial climate-related risks" such as those "on water supply, wildfires, energy needs, and impacts to public health" would occur as a result of its general plan update. However, as a result of its commitment to adopt a CAP and Thresholds, and other mitigation measures, the County was able to make a finding that the climate change impacts anticipated by the general plan update PEIR would be avoided or substantially lessened.

*E. The CAP and Thresholds Project*

According to the County, the CAP was prepared for the following purposes:

1. To mitigate the impacts of climate change by achieving meaningful greenhouse gas (GHG) reductions within the County, consistent with Assembly Bill No. 32, the governor's Executive Order S-3-05, and CEQA guidelines (Cal. Code Regs., tit. 14, § 15000 et seq. [CEQA Guidelines]).

2. To allow lead agencies to adopt a plan or program that addresses the cumulative impacts of a project.

3. To provide a mechanism that subsequent projects may use as a means to address GHG impacts under CEQA.

4. To comply with the 2011 adopted County General Plan Environmental Impact Report (EIR) Mitigation Measure CC-1.2, Preparation of a Climate Action Plan.

Although compliance with Mitigation Measure CC-1.2 was one purpose of the CAP, two of the four purposes relate to preparation of the CAP as a plan-level document so that environmental review could be avoided on future projects that were determined to be below specified "thresholds." (CEQA Guidelines, § 15183.5.) However, the CAP did not mitigate climate change impacts consistent with Assembly Bill No. 32 and Executive Order No. S-3-05, did not satisfy the plan-level requirements of CEQA Guideline 15183.5, and it did not meet the requirements of Mitigation Measure CC-1.2

Instead, the CAP expressly acknowledged the possibility that "communitywide inventories will indicate that the community is not achieving its reduction targets" and admitted that the CAP "does not ensure reductions." Further, the CAP did not include a meaningful analysis of "measures that extend beyond the year 2020." Rather, the County documented that instead of continuing to reduce GHG emissions after 2020, GHG emissions allowed as a result of the general plan update were anticipated to *increase* after 2020.

The CAP and Thresholds were presented to the planning commission and the board of supervisors as "the project." The Thresholds, like the CAP, purport to expressly facilitate post-2020 development that would have significant adverse climate change impacts, without any consideration of post-2020 climate science as required by Assembly Bill No. 32 and Executive Order No. S-3-05.

#### *F. The Comment Period*

The Sierra Club submitted extensive comments to the County. In particular, the Sierra Club commented on the need to take action consistent with climate science and achieve the Assembly Bill No. 32 and Executive Order No. S-3-05 GHG emissions reductions targets. The Sierra Club also provided specific examples of feasible GHG Reduction measures that would actually reduce GHG emissions and could be adopted without delay. The Sierra Club submitted additional comments and testified at the planning commission hearing, attempted to appeal the planning commission's decision, and testified at the board of supervisors hearing.

#### *G. Proceedings Before the Planning Commission*

The final agenda for the April 27, 2012 regular meeting of the County Planning Commission Regulation Meeting made no reference to the associated Thresholds, which were also presented to the planning commission. Despite acknowledging the significant climate change effects as well as the requirements of Assembly Bill No. 32 and Executive Order No. S-3-05, staff took the position that no additional environmental review was required. The planning commission voted to adopt staff's recommendation with one addition relating to installation of electric vehicle recharging stations.

#### *H. Proceedings Before the Board of Supervisors*

The Project was placed on the agenda for the June 20, 2012 board of supervisors meeting as "County of San Diego Climate Action Plan (District: All)." The staff report and supporting documents presented to the board of supervisors included (1) the CAP, (2) the Thresholds, (3) the environmental documentation, and (4) public documentation.

The environmental documentation included a memorandum referencing "CEQA Guidelines Section 15164 Addendum to the County of San Diego General Plan Update [PEIR] (SCH 2002111067)" (Addendum) which was dated the same day as the hearing, June 20, 2012. The addendum defined the project as "the CAP and Significance Guidelines." The addendum included attachments entitled "Environmental Review Update Checklist Form" (environmental checklist) and "Environmental Review Update Checklist for County of San Diego Climate Action Plan." The environmental checklist included a determination by staff that the "new information included in the CAP and Significance Guidelines represent minor technical additions to the previously certified EIR."

At the board of supervisors hearing, staff acknowledged that "[s]tate and local measures in the climate plan are insufficient to achieve our target in 2035" and explained that the CAP measures were not required, but rather that staff "believe[d]" that "education and incentives" might produce a result.

The County also documented that GHG emissions were anticipated to *increase*, not decrease, after 2020. Staff explained that the County would not comply with Executive Order No. S-3-05 because "the State's plan right now goes out to 2020." Staff further explained to the Board of Supervisors that the Thresholds would result in a less than significant finding for greenhouse gas emissions for future development projects.

Ultimately, the board of supervisors took the following actions:

1. Adopted environmental findings including in attachment C.

2. Adopted the plan titled "County of San Diego Climate Action Plan (Attachment A)."

The only findings made by the County were the following:

1. The environmental impact report (EIR) dated August 3, 2011 on file with the Department of Planning and Land Use (DPLU) as Environmental Review Number SCH 2002111067 was completed in compliance CEQA and the State and County CEQA Guidelines and that the Board of Supervisors has reviewed and considered the information contained therein and the Addendum thereto dated June 20, 2012 on file with DPLU and attached thereto; and
2. There were no changes in the project or in the circumstances under which the project was undertaken that involved significant new environmental impacts which were not considered in the previously certified EIR dated August 3, 2011, that there was no substantial increase in the severity of previously identified significant effects, and that no information of substantial importance had become available since the EIR was certified as explained in the environmental checklist dated June 20, 2012 and attached thereto.

*I. The Sierra Club Files Suit*

The Sierra Club filed a petition for writ of mandate, challenging the June 20, 2012 approval of the CAP and Thresholds project, including the associated environmental review. The Sierra Club alleged that the CAP did not meet the requirements of Mitigation Measure CC-1.2, the Thresholds were not adopted pursuant to the requirements of CEQA Guideline section 15064.7, and that an EIR should have been prepared.

*J. The Trial Court's Decision*

The trial court determined that the CAP did not comply with the requirements for a CAP as set forth in Mitigation Measure CC-1.2, and thus violated CEQA. The trial court found that the CAP neither contained enforceable GHG reduction measures that

will achieve the specified emissions reductions, nor detailed deadlines for GHG emission reductions.

The trial court further found that the approval process violated CEQA, noting: "There is no showing that the County properly considered whether the CAP is within the scope of the PEIR" and that "environmental review is necessary to ascertain whether the CAP met the necessary GHG emission reductions when considering the CAP is merely hortatory and contains no enforcement mechanism for reducing GHG emissions."

Further, the trial court determined that whether or not the Thresholds were adopted was a subsidiary issue that did not need to be reached in light of the trial court's decision on the CAP (which formed the basis for the Thresholds) and the process by which it was approved.

## DISCUSSION

### I. STANDARD OF REVIEW

The Sierra Club and the County agree as to the applicable standards of review.

In reviewing the County's actions under CEQA, we must determine whether there was "a prejudicial abuse of discretion." (Pub. Resources Code, § 21168.5.) "Abuse of discretion is established if the agency has not proceeded in a manner required by law, or if the determination or decision is not supported by substantial evidence." (*Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 477, 486.)

"[A] reviewing court must adjust its scrutiny to the nature of the alleged defect." (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 435 (*Vineyard*)). Challenges to an agency's failure to proceed in the

manner required by CEQA are subject to a significantly different standard of review than challenges that an agency's decision is not supported by substantial evidence. (*Ibid.*)

Where the challenge is that the agency did not proceed in the manner required by law, a court must "determine de novo whether the agency has employed the correct procedures, 'scrupulously enforc[ing] all legislatively mandated CEQA requirements.'" (*Ibid.*)

Furthermore, when a prior environmental impact report has been prepared and certified for a program or plan, the question for a court reviewing an agency's decision not to use a tiered EIR for a later project "is one of law, i.e., 'the sufficiency of the evidence to support a fair argument.'" (*Sierra Club v. County of Sonoma* (1992) 6 Cal.App.4th 1307, 1318.) "[I]f there is substantial evidence in the record that the later project may arguably have a significant adverse effect on the environment which was not examined in the prior program EIR, doubts must be resolved in favor of environmental review and the agency must prepare a new tiered EIR, notwithstanding the existence of contrary evidence." (*Id.* at p. 1319, fn. omitted.) The court "must set aside the decision if the administrative record contains substantial evidence that a proposed project might have a significant environmental impact; in such a case, the agency has not proceeded as required by law." (*Id.* at 1317.)

## II. OVERVIEW OF CEQA

"The fundamental goals of environmental review under CEQA are information, participation, mitigation, and accountability." (*Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 443-444 (*Lincoln Place II*).) As the California Supreme Court has explained: "If CEQA is scrupulously followed, the public will know

the basis on which its responsible officials either approve or reject environmentally significant action, and the public, being duly informed, can respond accordingly to action with which it disagrees. [Citations.] The EIR process protects not only the environment but also informed self-government." (*Laurel Heights Improvement Assn. v. Regents of the University of California* (1988) 47 Cal.3d 376, 392 (*Laurel Heights*).

CEQA requires a public agency to prepare an environmental impact report (EIR) before approving a project that may have significant environmental effects. (Pub. Resources Code, § 21100.) The EIR is "'the heart of CEQA' . . . an 'environmental alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return.'" (*Laurel Heights, supra*, 47 Cal.3d at p. 392.)

CEQA authorizes the preparation of various kinds of environmental impact reports depending upon the situation, such as the subsequent EIR, a supplemental EIR, and a tiered EIR. (Pub. Resources Code, §§ 21166, 21068.5, 21093, 21094.) Whereas the subsequent EIR and supplemental EIR are used to analyze modifications to a particular project, a tiered EIR is used to analyze the impacts of a later project that is consistent with an EIR prepared for a general plan, policy, or program. (CEQA Guidelines, § 15385; compare Pub. Resources Code, § 21166 & CEQA Guidelines §§ 15162, 15163 & 15164 [referencing "the project"] with Pub. Resources Code, § 21093 [stating that later projects may use tiering].)

CEQA requires that "environmental impact reports shall be tiered whenever feasible." (Pub. Resources Code, § 21093, subd. (b).) Tiering means "the coverage of

general matters in broader EIRs (such as on general plans or policy statements) with subsequent narrower EIRs . . . incorporating by reference the general discussions and concentrating solely on the issues specific to the EIR subsequently prepared." (CEQA Guidelines, § 15385; Pub. Resources Code, § 21068.5.) In the context of program and plan-level EIR's, the use of tiered EIR's is mandatory for a later project that meets the requirements of Public Resources Code section 21094, subdivision (b). (Pub. Resources Code, § 21094, subd. (a).)

Another requirement of CEQA is that public agencies "should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects." (Pub. Resources Code, § 21002.) "A 'mitigation measure' is a suggestion or change that would reduce or minimize significant adverse impacts on the environment caused by the project as proposed." (*Lincoln Place II, supra*, 155 Cal.App.4th at p. 445.)

If the agency finds that mitigation measures have been incorporated into the project to mitigate or avoid a project's significant effects, a "public agency shall adopt a reporting or monitoring program for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment. The reporting or monitoring program shall be designed to ensure compliance during project implementation." (Pub. Resources Code, § 21081.6, subd. (a)(1).)

If a mitigation measure later becomes "impracticable or unworkable," the "governing body must state a legitimate reason for deleting an earlier adopted mitigation

measure, and must support that statement of reason with substantial evidence." (*Lincoln Place Tenants Association v. City of Los Angeles* (2005) 130 Cal.App.4th 1491, 1509 (*Lincoln Place I*.)

### III. ANALYSIS

#### A. Statute of Limitations Defense

The County asserts that the Sierra Club's claim that the mitigation measures it adopted are not enforceable is barred by the statute of limitations because the Sierra Club should have challenged the County's approval of the general plan update EIR, not the CAP. We reject this contention.

The petition was filed 30 days after the County's June 20, 2012 approval of the CAP. In addition, the lawsuit was filed 29 days after the County filed a notice of determination (NOD). The Sierra Club's July 20, 2012 petition was timely filed 29 days after. Thus, the County triggered the 30-day statute of limitations set forth in Public Resources Code section 21167, subdivisions (b) and (e).

The Sierra Club is not challenging the validity of the general plan update PEIR or the enforceability of the mitigation measures provided in that document. Rather, the Sierra Club is challenging the project before the Board of Supervisors on June 20, 2012, and seeks to enforce a key mitigation measure set forth in the EIR and MMRP - Mitigation Measure CC-1.2.

Further, the Court of Appeal in *Lincoln Place II, supra*, 155 Cal.App.4th 425 rejected a similar argument to that made by the County. In that case, a tenants' association sought to compel the City of Los Angeles to enforce mitigation measures

contained in a vesting tentative tract map issued by the city. The city argued that the 180-day statute of limitations contained in Public Resources Code section 21167 for challenges to approval of projects without determining whether they have a significant effect on the environment barred the plaintiffs' action. In rejecting that action, the Court of Appeal held "[t]he statute's plain language demonstrates it has no application to this case seeking to *enforce mitigating conditions*." (*Lincoln Place II*, at p. 453, fn. 23, italics added.)

Moreover, the cases cited by the County in support of its position are inapposite. The County cites *River Valley Preservation Project v. Metropolitan Transit Development Bd.* (1995) 37 Cal.App.4th 154 and *Friends of Davis v. City of Davis* (2000) 83 Cal.App.4th 1004 for the proposition that because the time period within which to challenge the general plan update EIR has expired, the EIR is conclusively presumed to have complied with CEQA. Here, however, the Sierra Club is not challenging the general plan update EIR, but the CAP and Thresholds project, and is seeking to enforce Mitigation Measure CC-1.2.

The County's reliance upon *Environmental Council of Sacramento v. City of Sacramento* (2006) 142 Cal.App.4th 1018 and *Mount Shasta Bioregional Ecology Center v. County of Siskiyou* (2012) 210 Cal.App.4th 184 is also unavailing. The petitioners in those actions were challenging the adequacy of the mitigation measures themselves. Here, the Sierra Club does not attack the adequacy of the mitigation measure in the general plan update PEIR. To the contrary, the Sierra Club's lawsuit is in *support* of the County's past findings and promises to achieve GHG Reductions.

*B. Failure To Proceed in a Manner Required by Law*

As detailed, *ante*, implementation of Mitigation Measure CC-1.2 was only one of the purported purposes of the CAP and Thresholds project. The CAP and Thresholds project also purports to be a plan-level document for use in review of later projects.

As we shall explain, *post*, with respect to the CAP as mitigation for a plan-level document, the County failed to proceed in the manner required by CEQA by proceeding with the CAP and Thresholds project in spite of the express language of Mitigation Measure CC-1.2 that the CAP "include . . . more detailed greenhouse gas emissions reduction targets and deadlines" and that the CAP "will achieve comprehensive and enforceable GHG emissions reduction" by 2020. With respect to the CAP as a plan-level document itself, the County failed to proceed in the manner required by law by failing to incorporate mitigation measures into the CAP as required by Public Resources Code section 21081.6.

*1. The County failed to adopt a CAP that complied with the requirements of Mitigation Measure CC-1.2*

"Mitigating conditions are not mere expressions of hope." (*Lincoln Place I, supra*, 130 Cal.App.4th at p. 1508.) Once incorporated, mitigation measures cannot be defeated by ignoring them or by "attempting to render them meaningless by moving ahead with the project in spite of them." (*Lincoln Place II, supra*, 155 Cal.App.4th at p. 450.) This is true even where subsequent approvals are ministerial. (*Katzeff v. California Department of Forestry & Fire Protection* (2010) 181 Cal.App.4th 601, 614 [public agency "may not authorize destruction or cancellation of the mitigation—whether or not

the approval is ministerial—without reviewing the continuing need for the mitigation, stating a reason for its actions, and supporting it with substantial evidence"].) If a mitigation measure later becomes "impractical or unworkable," the "governing body must state a legitimate reason for deleting an earlier adopted mitigation measure, and must support that statement of reason with substantial evidence." (*Lincoln Place I, supra*, 130 Cal.App.4th at p. 1509.)

a. *The CAP does not include enforceable GHG emissions required by Mitigation Measure CC-1.2*

When it adopted the general plan PEIR, the County promised to achieve specified GHG reductions by 2020. However, when it approved the CAP and Thresholds project, the County stated that the CAP does not ensure the required GHG emissions reductions. Rather, the County described the strategies as recommendations.

Until this litigation was initiated, the County described the CAP as the most critical component of the County's climate change mitigation efforts. The CAP was intended to "provide[] the specific details associated with [the General Plan] strategies and measures for greenhouse gas (GHG) emissions reduction *that were not available* during the program-level analysis of the General Plan." (Italics added.)

The County agreed to the mitigating requirement of a CAP containing "comprehensive and enforceable GHG emissions reduction measures that will achieve" the specified GHG Reductions by 2020. This is because, as the County acknowledges, Executive Order No. S-3-05 requires consistent emissions reductions each year from

2010 through 2020 and then a greater quantity of emissions reductions each year from 2020 through 2050.

The County asserts that "[f]ive of the reduction measures incorporated into the CAP are also embodied in state or federal law" and that "CEQA permits reliance on existing regulatory standards as mitigation when it is reasonable to believe compliance will occur."

However, the County acknowledges that these measures will not, alone, achieve the specified GHG emissions reductions by 2020. In fact, the record shows that without local measures the requirements of Assembly Bill No. 32 will not be met.

Further, the record demonstrates that many of the mitigation measures set forth in the MMRP are not likely to achieve GHG emissions reductions by 2020 as promised by Mitigation Measure CC-1.2 because they are not currently funded. The record show that the County has not funded essential programs like replacing its own vehicle fleet, implementing water conservation programs, preparing town center plans, and reducing water demand. The County cannot rely on unfunded programs to support the required GHG emissions reductions by 2020, as Mitigation Measure CC-1.2 requires.

Transportation is a major concern, which the County concedes is the largest source of community GHG emissions. The Sierra Club presented evidence below that driving reductions needed to achieve Assembly Bill No. 32 and Executive Order No. S-3-05 targets are not met. The County did not dispute this evidence. The record shows that transit-related measures are either unfunded, that the County is not making meaningful

implementation efforts, and in some instances that the County is acting contrary to mitigation measures incorporated into the general plan update PEIR.

For example, two of the four transportation measures, T1 (increase transit use) and T2 (increase walking & biking), rely on at least one unfunded program. In addition, measures T1 and T2, as well as T3 (increase ridesharing), also rely on "coordination" with SANDAG and/or other entities.

In response to Sierra Club's comments relating to the effectiveness of these measures as a result of current SANDAG (San Diego Association of Governments) priorities, the County did not request funds based on the fact that it does not control how SANDAG spends its money. As the County stated, "The County does not control regional plans or allocation of regional transportation funding." This position was rejected by the Supreme Court in *City of Marina v. Board of Trustees of the California State University* (2006) 39 Cal.4th 341, 367 [holding respondent could not disclaim responsibility for making payments without first asking for funds].

The CAP's transportation section also does not include an analysis of the County's own operations, and the record appears to include contradictions even over programs over which the County has exclusive control, such as replacement of its own vehicle fleet with alternatively fueled vehicles. Although the County suggests it will implement "1 % greater efficiency per year", the County has not formally bound itself to do so. Indeed, there is no mention of potential funding sources with respect to reductions related to County operations.

b. *The CAP contains no detailed deadlines for reducing GHG emissions*

As the trial court found, the CAP contained no detailed deadlines. The County argues on appeal that the 2020 goal and the timeframes set forth in the MMRP are sufficient to meet the requirement of "more detailed . . . deadlines." However, Mitigation Measure CC-1.2 expressly required that the CAP provide more detailed deadlines. If the County did not intend for the CAP to do anything further with respect to deadlines than already set forth, the County would not have used the word "more." Indeed, in addition to not providing the promised deadlines, the CAP acknowledges that it will not be effective unless it is updated.

c. *The evidence cited by the County*

The County asserts that CAP measures will be effective because "[p]articipation rates were discussed and modified," and the "feasibility of attaining reduction targets was assessed." However, the County does not cite any evidence in the record to support its belief that people will participate in the various programs to the extent necessary to achieve the reductions asserted, or even assert that feasible measures will actually be implemented.

Rather, the County cites to entire appendices and chapters of the CAP. However, information contained in appendices are "not a substitute for "a good faith reasoned analysis."" (*Vineyard, supra*, 40 Cal.4th at p. 442.) "The audience to whom an EIR must communicate is not the reviewing court but the public and the government officials deciding on the project." (*Id.* at p. 443.)

The County also asserts that the CAP "demonstrates a [GHG emissions] reduction of 19%." However, the CAP expressly states that it does not ensure reductions. Instead, the County's evidence relates to quantification of the respective measures. Quantifying GHG reduction measures is not synonymous with implementing them. Whether a measure is effective requires more than quantification, but an assessment of the likelihood of implementation. There is no evidence in the record that the above-referenced mitigation measures will make any contribution to achieving GHG emissions reductions by 2020.

*2. The County's failure to make findings regarding the environmental impact of the CAP and Thresholds project*

Instead of analyzing and making findings regarding the environmental effects of the CAP and Thresholds project, the County made an erroneous assumption that the CAP and Thresholds project was the same project as the general plan update. (*Sierra Club, supra*, 6 Cal.App.4th at p. 1320 ["section 21166 and its companion section of the [CEQA] Guidelines appear to control only when the question is whether more than one EIR must be prepared for what is essentially the same project"].) As a result, the County failed to render a "written determination of environmental impact" before approving the CAP and Thresholds project. (*No Oil, Inc. v. City of Los Angeles* (1974) 13 Cal.3d 68, 81; Pub. Resources Code, § 21151.) This constitutes a failure to proceed in the manner required by law. (*No Oil, supra*, 13 Cal.3d at p. 81.)

By inaccurately assuming the CAP and Thresholds project was the same project as the general plan update, the County failed to analyze the environmental impacts of the

CAP and Thresholds project itself. (*Natural Resources Defense Council, Inc. v. City of Los Angeles* (2002) 103 Cal.App.4th 268, 283 [holding CEQA violated where "no evidence that the [County] formally addressed whether or not the [] project fell within the concept of a 'tiered' EIR"].) As a result, the County never made the required findings that the effects of the CAP and Thresholds project were examined, mitigated, or avoided. (Pub. Resources Code, § 21094, subd. (a).)

The facts of the present case, as the trial court found, are similar to *Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156 (*CSNC*). In *CSNC*, the county prepared a general plan and PEIR. (*Id.* at p. 1162.) In the PEIR, one of the mitigation measures was the preparation of a management plan, including a fee program, to mitigate the general plan's impacts on oak woodland habitat. (*Id.* at p. 1163.) The initial study concluded that the project was merely an implementation of the county's general plan. (*Id.* at p. 1176.)

The Court of Appeal rejected this argument, holding that a tiered EIR was required to examine the management plan since the PEIR did not include sufficient details, rejecting the argument that the management plan was merely an implementation of the general plan. (*CSNC, supra*, 202 Cal.App.4th at pp. 1176, 1184-1185.)

The County attempts to distinguish *CSNC* by asserting the general plan update PEIR analyzed the same environmental issue addressed in the CAP. However, the record reveals that the necessary details were not available to the County at the time the general plan update PEIR was certified. Indeed, no component of the project, the CAP or the Thresholds, had even been created at the time of the general plan update.

As the Court of Appeal in *CSNC* explained:

"That the preceding 2004 program EIR contemplated adverse environmental impacts resulting from development under the 2004 General Plan does not remove the need for a tiered EIR for the oak woodland management plan. . . . Here, the specific project—the oak woodland management plan (including Option B fee program)—required a tiered EIR to examine its specific mitigation measures and fee rate." (*CSNC, supra*, 202 Cal.App.4th at p. 1184.)

The general plan update anticipated implementation of mitigation measures—CC-1.2, CC-1.7, and CC-1.8—as mitigating conditions to mitigate the adverse climate change environmental impacts of the general plan update. Those measures were analyzed in the PEIR. However, the PEIR never considered the use of the CAP and the Thresholds as a plan-level program. Thus, the environmental impacts of its use needed to be considered in an EIR. (*NRDC, supra*, 103 Cal.App.4th at p. 281 [project did not arise until after PEIR and thus was not contemplated therein].)

The County contends that the Board of Supervisors made an "implied finding" that the CAP complied with Mitigation Measure CC-1.2 and that finding is "entitled to great deference." However, "such an 'implicit finding' does not satisfy CEQA's requirement of express findings." (*Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1037.) "[T]he board of supervisors must make findings . . . to permit a reviewing court to bridge the analytic gap between the evidence and the ultimate decision." (*People v. County of Kern* (1976) 62 Cal.App.3d 761, 777; see *Citizens for Quality Growth v. City of Mt. Shasta* (1988) 198 Cal.App.3d 433, 442 ["passing references to the mitigation measures are insufficient to constitute a finding, as nothing in City's resolutions binds it to follow these measures"].)

Moreover, even if "implied findings" were permissible, there can be no "interpretation" of Mitigation Measure CC-1.2 contrary to its express terms. (*Southern Cal. Edison Co. v Public Utilities Com.* (2000) 85 Cal.App.4th 1086, 1105 ["an agency's interpretation of a regulation or statute does not control if an alternative reading is compelled by the plain language of the provision"]; see *Santa Clarita Organization for Planning the Environment v. City of Santa Clarita* (2011) 197 Cal.App.4th 1042, 1062 [agency's "view of the meaning and scope of its own ordinance" does not enjoy deference when it is "clearly erroneous or unauthorized"].)

3. *The County failed to proceed in the manner required by law by failing to incorporate mitigation measures directly into the CAP*

As discussed, *ante*, one of the major differences between the climate change action plan anticipated by Mitigation Measure CC-1.2 in the general plan update PEIR and the CAP and Thresholds project as prepared, is that the general plan update PEIR did not analyze the CAP as a plan-level document that itself would facilitate further development. As a plan-level document, the CAP is required by CEQA to incorporate mitigation measures directly into the CAP:

*"A public agency shall provide the measures to mitigate or avoid significant effects on the environment are fully enforceable through permit conditions, agreements, or other measures. Conditions of project approval may be set forth in referenced documents which address required mitigation measures or, in the case of the adoption of a plan, policy, regulation, or other public project, by incorporating the mitigation measures into the plan, policy, regulation, or project design." (Pub. Resources Code, § 21081.6, subd. (b), italics added.)*

As authority for the assertion that it did not need to incorporate enforceable mitigation measures into the CAP directly, the County cites *Twain Harte Homeowners Assn. v. County of Tuolumne* (1982) 138 Cal.App.3d 664, 689-690. However, *Twain Harte* was decided before enactment of Public Resources Code section 21081.6, subdivision (b), which, as discussed, *ante*, requires "in the case of the adoption of a plan" that mitigation measures be fully enforceable "by incorporating the mitigation measures into the plan . . . ."

"The purpose of CEQA is not to generate paper, but to compel government at all levels to make decisions with environmental consequences in mind." (*Bozung v. Local Agency Formation Com.* (1975) 13 Cal.3d 263, 283.) By failing to consider environmental impacts of the CAP and Thresholds project, the County effectively abdicated its responsibility to meaningfully consider public comments and incorporate mitigating conditions. In addition to the example discussed, *ante*, related to transportation impacts, the Sierra Club also provided examples of mitigation implemented by other regions to mitigate the effects of climate change in the energy sector. The County neither implemented nor responded to these examples which have already been implemented elsewhere.

#### 4. *The trial court's finding that the County must prepare an EIR*

As set forth in *Lincoln Place I*, a supplemental EIR must be prepared when a public agency determines a previously adopted mitigation measure is infeasible. (*Lincoln Place I, supra*, 130 Cal.App.4th at pp. 1508-1509.) In addition, CEQA guidelines,

section 15183.5, subdivision (b)(1)(F) provides that a plan for the reduction of GHG emissions should "[b]e adopted in a public process following environmental review."

The County's failure to comply with Mitigation Measure CC-1.2 and Assembly Bill No. 32 and Executive Order No. S-3-05 supports the conclusion that the CAP and Thresholds project will have significant, adverse environmental impacts that have not been previously considered, mitigated, or avoided.

a. *Substantial evidence supports the court's finding preparation of an EIR was required*

The County asserts that the substantial evidence standard of review applies to the question of whether a supplemental EIR was required, under which deference is given to an agency's determination. (*Latinos Unidos de Napa v. City of Napa* (2013) 221 Cal.App.4th 192, 200-202.) The Sierra Club, on the other hand asserts that the "fair argument" test applies, under which "deference to the agency's determination is not appropriate and its decision not to require an EIR can be upheld only when there is no credible evidence to the contrary." (*Sierra Club, supra*, 6 Cal.App.4th at p. 1318.) We conclude that under either standard, the trial court did not err in finding a supplemental EIR was required.

The fair argument versus substantial evidence test is of no moment because, here, there is no substantial evidence in the record supporting the County's erroneous conclusion that "activities associated with the CAP and Significance Guidelines are within the scope of the General Plan Program EIR."

The County does not dispute that "to avoid serious climate change effects, atmospheric GHG concentrations need to be stabilized as quickly as possible." In fact, the County warns that expected local adverse effects of climate change include "higher temperatures, [¶] a greater number of extremely hot days, [¶] changes in the pattern and amount of precipitation, [¶] decreased water supplies accompanied by increased demand, [¶] increased wildfire risk, [¶] changes in ecosystems, and [¶] decline or loss of plant and animal species." However, the CAP and Thresholds project was approved without the appropriate environmental analysis to avoid or mitigate these consequences. As the trial court found, "environmental review is necessary to ascertain whether the CAP met the necessary GHG emission reductions when considering the CAP is merely hortatory and contains no enforcement mechanism for reducing GHG emissions."

Moreover, as the County acknowledges, the details of the CAP "were not available during program-level analysis of the General Plan." For example, the general plan update PEIR did not provide a "baseline GHG emissions inventory; detailed GHG-reduction targets and deadlines; comprehensive and enforceable GHG emissions-reduction measures; and implementation, monitoring, and reporting of progress toward the targets defined in the CAP." In 2011 the County found that implementation of mitigation measures, including CC-1.2, CC-1.7, and CC-1.8, were part of the mitigation imposed to mitigate the climate change impacts of the general plan update. It cannot be said that failing to comply with Mitigation Measure CC-1.2, Assembly Bill No. 32, and Executive Order No. S-3-05 does not change the environmental conclusions in the general plan update PEIR.

Further, the general plan update PEIR did not contemplate that preparation of the CAP and Thresholds project was at the "plan-level." As a plan-level document, the CAP and Thresholds project was required to undergo environmental review as a matter of law. (CEQA Guidelines, § 15183.5, subd. (b)(1)(F).) The general plan update PEIR also did not contemplate that as a result of the CAP, "[m]ore projects will fall below the bright line threshold, and will not have to conduct detailed analysis", much less study the environmental impact of such. County staff, the planning commission, and the board of supervisors were all aware that approving the CAP and Thresholds project would allow more projects to avoid a climate change analysis, including projects with post-2020 climate change impacts without post-2020 environmental review.

Furthermore, in 2011, the County found that climate change impacts were mitigated not only by implementation of mitigation measures, but also by "compliance with applicable regulations" including Assembly Bill No. 32 and Executive Order No. S-3-05.

By contrast, the CAP and Thresholds project now acknowledges it does not comply with Executive Order No. S-3-05. Instead of maintaining a constant rate of GHG emissions reductions after 2020, as required by Executive Order No. S-3-05, the County admits that GHG emissions will instead increase after 2020. Thus, the County's own documents demonstrate that the CAP and Thresholds project will not meet the requirements of Assembly Bill No. 32 and Executive Order No. S-3-05 and thus will have significant impacts that had not previously been addressed in the general plan update PEIR.

The explanation given to the board of supervisors for failing to address the post-2020 impacts facilitated by the CAP and Thresholds project was that "the State's plan doesn't go out that far, and it would be speculative for us to do that."

However, contrary to the County's argument that it would be "speculative" to consider the environmental impacts of the CAP, the County has acknowledged that other agencies have, in fact, been able to do so. It is an abuse of discretion to reject alternatives or mitigation measures that would reduce adverse impacts without supporting substantial evidence. (CEQA Guidelines, §§ 15043, 15093, subd. (b).) The County's assumption that considering post-2020 impacts is "speculative" is not supported by substantial evidence. (Pub. Resources Code, § 21082.2, subd. (c) ["Argument, speculation, unsubstantiated opinion or narrative, evidence which is clearly inaccurate or erroneous . . . is not substantial evidence. Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts."].)

The Sierra Club provided feasible mitigation measures. The County rejected these mitigation measures without substantial evidence for doing so.

In sum, the CAP does not fulfill the County's commitment under CEQA and Mitigation Measure CC-1.2, to provide detailed deadlines and enforceable measures to ensure GHGF emissions will be reduced.

DISPOSITION

The judgment is affirmed. The Sierra Club shall recover its costs on appeal.

# First Update to the **Climate Change Scoping Plan**

## ***Building on the Framework***

From:

[http://www.arb.ca.gov/cc/scopingplan/2013\\_update/first\\_update\\_climate\\_change\\_scoping\\_plan.pdf](http://www.arb.ca.gov/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf)

### **B. Achieving Climate Stabilization**

Scientific research indicates that an increase in the global average temperature of 2°C (3.6°F) above pre-industrial levels, which is only 1.1°C (2.0°F) above present levels, poses severe risks to natural systems and human health and well-being. Considering knowledge from the paleo-climate record with changes currently observed in the Greenland and Antarctic ice sheets, we can expect substantial sea level rise, 0.4 to 0.8 meters, with upper end uncertainties approaching one meter above present day during the 21st Century and continued substantial increase after 2100 even with stringent mitigation of emissions to achieve 2°C stabilization. Increased climate extremes, already apparent at present day climate warming (~0.9°C), will no doubt be more severe. **To have a good chance (not a guarantee) of avoiding temperatures above those levels, studies focused on a goal of stabilizing the concentration of heat-trapping gases in the atmosphere at or below the 450 parts per million (ppm) CO<sub>2</sub>-equivalent (CO<sub>2</sub>e, a metric that combines the climate impact of all well-mixed GHGs, such as methane and nitrous oxide, in terms of CO<sub>2</sub>).**

The CO<sub>2</sub>e target is a somewhat approximate threshold, and the exact level of CO<sub>2</sub>e is not precisely known because the sensitivity of the climate system to GHGs has uncertainty. Different models show slightly different outcomes within this range. **An example of a pre-IPCC assessment study (Meinshausen et al. 2009)<sup>15</sup> which has synthesized many studies on climate sensitivities, concluded that we would need to stabilize at about 400 ppm CO<sub>2</sub>e (Bullock note: We have already exceeded 400 PPM!!!!!!!) in order to likely avoid exceeding the 2°C threshold (even at that stabilization target, there is still about a 20 percent chance of exceeding the temperature target).** Further, a recent paper by an international team of scientists (Hansen et al. 2013)<sup>16</sup> asserts that the **widely accepted target of limiting human-made global climate warming to 2°C above preindustrial levels is likely too high and may subject future generations and nature to irreparable harm. Recognizing this fact, the international community agreed in meetings in Cancun in 2012 to review, by 2015, progress to the 2°C target and consider whether it should be strengthened to a 1.5°C threshold.**

What is important to recognize in these studies of warming thresholds is the critical importance of non-CO<sub>2</sub> gases, particularly the short-lived climate pollutants. For example, to avoid 2°C warming at a 66 percent confidence level, total carbon emissions (as CO<sub>2</sub>e) must be kept to 1000 GtC. Considering that we have already emitted about 500 GtC, which leaves 500 GtC to be divided up among nations. If the non-CO<sub>2</sub> gases are included then

the total CO<sub>2</sub>e emissions are at 790 GtC, leaving only 210 GtC to be emitted. Thus, there is a compelling case to reduce the short-lived climate pollutants.

In early May 2013, the Mauna Loa monitoring station, which has been shown to provide excellent measurements of CO<sub>2</sub> throughout the global atmosphere, recorded atmospheric CO<sub>2</sub> of 400 ppm,<sup>17</sup> substantially higher than the 316 ppm recorded when the station made its first measurements in 1958. The monitoring station offers the longest-running record of atmospheric CO<sub>2</sub> measured directly from the air. This recent reading will take a few years to become the international average; however, reaching 400 ppm at Mauna Loa is significant and has surpassed a worrisome milestone.

Although stabilizing atmospheric GHG concentration below 450 ppm CO<sub>2</sub>e is important, it does not mean that once that level is reached, temperatures will immediately level off. Because of time lags inherent in the Earth's climate, the initial warming that occurs in response to a given increase in the concentration of CO<sub>2</sub> ("transient climate change") reflects only about half the eventual total warming ("equilibrium climate change").

Observational data reveal that, in recent decades, some climate extremes are already increasing in response to relative modest warming; these extremes would likely increase considerably with warming of 2°C or more. While the findings suggest that even at relatively low levels of global warming the world will have to face significant sea level rise, the studies also demonstrate that the potential impacts are substantially greater if we allow warming to reach a level as high as 2°C. If they occur, changes such as these would not rapidly reverse, as even if the atmospheric CO<sub>2</sub> amount declines, it would take many centuries for the deep ocean to cool.

To prevent exceeding 450 ppm CO<sub>2</sub>e, developed countries must substantially reduce their emissions in the near term. The 2008 World Energy Outlook suggests that Organization for Economic Co-operation and Development (OECD) countries must reduce emissions by about 40 percent below 2006 levels by 2030.<sup>18</sup> The Union of Concerned Scientists has suggested a 2030 emissions target for the United States of 56 percent below 2005 levels (44 percent below 1990 levels).<sup>19</sup> A governmental study from the Netherlands finds that Europe would have to reduce emissions by 47 percent below 1990 levels and the United States would have to reduce emissions by 37 percent below 1990 levels by 2030.<sup>20</sup> The International Energy Agency comes to a similar conclusion, finding that the United States would have to reduce emissions by about 38 percent below 1990 levels by 2030.<sup>21</sup> Note that percent reductions by 2030 depend on the assumed overall trajectory of emissions, including the amount after 2030.

Because of the cumulative effects of GHG emissions and resultant changes to the earth's energy balance and the inertia in the climate system, delaying efforts to reduce emissions will likely mean that global average temperature will increase by more than 2°C, increasing the costs associated with combatting climate change. Reducing the global concentration to 450 ppm CO<sub>2</sub>e after delaying mitigation actions for ten more years is estimated to cost an additional \$3.5 trillion, compared to levels of investment needed now if low-carbon strategies were to be adopted immediately.<sup>22</sup>

**Re: Comments on Survey of CEQA Documents on Greenhouse Gas Emissions  
Draft Work Plan and Development of GHG Threshold of Significance for  
Residential and Commercial Projects**

This letter provides comments from the Center for Biological Diversity (“the Center”) on the “Survey of CEQA Documents on Greenhouse Gas Emissions Draft Work Plan” as well as SCAQMD’s continuing efforts to develop a greenhouse gas (GHG) threshold of significance for residential and commercial projects.

SCAQMD’s survey of the GHG emissions from residential, commercial, and mixed-use projects should yield valuable data on the range of emissions resulting from these types of Projects in the South Coast air basin. Under the Work Plan, SCAQMD will use this data “to determine the level of GHG emissions for residential and commercial projects that constitute the 90th percentile ... or other percentile desired.” (Work Plan at 1.) According to SCAQMD, a threshold based on the 90% capture of sector emissions is consistent with the long-term emission reduction objectives set by Executive Order S-3-05, which calls for emission reductions to 80% below 1990 levels by 2050, or 90% below current levels. (SCAQMD Interim GHG Significance Threshold Staff Proposal (revised), at 3-2.) Compliance with Executive Order S-3-05 targets is presumed to be sufficient “to contribute to worldwide efforts to cap GHG concentrations at 450 ppm, thus, stabilizing the climate.” (*Id.*)

While the Center appreciates SCAQMD’s recognition that a GHG threshold must be based on long-term climate stabilization objectives, the best available scientific data now indicates that the threats posed by even small increases in temperature are far greater than previously thought. Stabilization of greenhouse gas emissions at 450 ppm as contemplated under Executive Order S-3-05 is insufficient to minimize the risk of catastrophic outcomes. Therefore, the capture of 90% of emissions from the residential and commercial sectors, which is based on compliance with Executive Order S-3-05, is

not a sufficiently stringent capture rate to sufficiently contribute to preventing dangerous climate change.

Importantly, while the emission reduction targets embodied in AB 32 and Executive Order S-3-05 can inform a significance determination, it is only to the extent that these targets accurately reflect scientific data on needed emissions reductions. Under CEQA, regulatory standards can serve as proxies for significance where they accurately reflect the level at which an impact can be said to be less than significant. *See, e.g., Protect the Historic Amador Waterways v. Amador Water Agency*, 116 Cal. App. 4th 1099, 1109 (2004).

To ensure that an adopted threshold of significant is an accurate reflection of scientific and factual data, this letter sets for the best available science on climate change. As set forth below, the best available science most strongly support a threshold of zero. The further a threshold is from zero, the more tenuous the evidence to support a determination that the threshold is effective at meeting the environmental objective of avoiding dangerous climate change. Framed in the context of SCAQMD’s methodology, the further a threshold is from a 100% capture rate, the more tenuous the evidence to support a determination that the threshold is effective. Accordingly, in the event SCAQMD is unwilling to set a zero threshold, SCAQMD should consider increasing the capture rate beyond 90% and also require projects with emissions less than this threshold to adopt measures to reduce their GHG emissions before reaching a determination that project impacts are less-than-significant. A non-zero quantitative threshold – assuming it is sufficiently stringent – coupled with performance standards that projects under this threshold must adopt recognizes that all projects must be part of the solution to global warming and would seem to be more equitable and defensible than a bright-line non-zero threshold alone.<sup>1</sup>

Finally, with regard to the Work Plan itself, it would be helpful to include data on emissions from categorically exempt projects. In the debate over an appropriate threshold of significance for GHGs, arguments have been forwarded that a low threshold would eliminate the application of categorical exemptions. Whether or not this is the case, actual data on the emissions typically resulting from projects invoking a categorical exemption would better inform this discussion.

### **1. A GHG Threshold That Purports to Be Consistent with Executive Order S-3-05 Emission Reduction Targets Is Insufficient to Prevent Dangerous Climate Change**

CEQA calls for the identification of “any critical thresholds for the health and safety of the people of the state.” Pub. Res. Code § 21000(d). With regard to GHGs, this

---

<sup>1</sup> Were the District to adopt a non-zero threshold, a quantitative threshold that does not require projects under this threshold to take any action to reduce GHGs may also create an improper *de minimis* exception. *See, e.g., Communities for Better Env’t v. California Resources Agency*, 103 Cal. App. 4th 98, 121 (2002) (“Focusing on the *de minimis* effect in absolute terms isolates the effect individually, and this runs counter to the combined approach that CEQA cumulative impact law requires.”).

critical threshold is avoiding dangerous anthropogenic interference (DAI) with the climate system. Article 2 of the United Nations Framework Convention on Climate Change (UNFCCC) calls for “stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference (DAI) with the climate system.”<sup>2</sup> With the United States and over 180 other countries as signatories, the UNFCCC’s objective of avoiding DAI with the climate is widely viewed as the international regulatory standard for protecting the global climate. The environmental objective of avoiding DAI is recognized in ARB’s Draft GHG Threshold Guidance. (ARB Preliminary Draft Staff Proposal, Recommended Approaches for Setting Interim Significance Thresholds for Greenhouse Gases under the CEQA (“ARB Draft GHG Threshold”), Oct. 24, 2008 at 3.) In its Policy Objective for the Interim GHG Threshold for Industrial Projects, SCAQMD seems to set a roughly analogous objective of “reducing GHG emissions to stabilize climate change.” (SCAQMD Interim GHG Significance Threshold Staff Proposal (revised), at 3-2.)

The policy objectives of both ARB and SCAQMD’s threshold proposals both state that reaching the emission reduction targets set forth by Executive Order S-3-05, whereby emissions are reduced to 80% below 1990 levels by 2050, would contribute to avoiding dangerous climate change because these reductions are consistent with a pathway to the stabilization of atmospheric concentrations of GHG emissions at 450 ppm. (ARB Draft GHG Threshold at 3; SCAQMD Interim Threshold Proposal at 3-2.) Stabilization of GHGs at 450 ppm provides a 50/50 chance of limiting mean temperature rise to 2°C above pre-industrial levels.<sup>3</sup>

A pathway toward stabilization of GHGs at 450 ppm presents two serious concerns. First, the best available scientific evidence now indicates that a warming of 2°C is not “safe” and would not prevent dangerous interference with the climate system. Second, because the consequences of overshooting a 2°C threshold could include the displacement of millions due to sea level rise, irreversible loss of entire ecosystems, and the triggering of multiple climactic “tipping points” wherein climate change begins to feed on itself and spin rapidly out of control, the risk tolerance for overshooting a 2°C temperature rise should be extremely low. Yet a stabilization target of 450 ppm seems content to, at best, flip a coin in the hopes that future generations are not left with few choices beyond mere survival. While the emission reduction targets set forth under Executive Order S-3-05 is a significant improvement from business-as-usual, because these targets are insufficient to adequately minimize the risk of DAI, compliance with Executive Order S-3-05 is not a sufficiently stringent objective from which to develop a threshold of significance.

<sup>2</sup> United Nations Framework Convention on Climate Change, art. 2, May 9, 1992, *available at* [http://unfccc.int/essential\\_background/convention/background/items/1349.php](http://unfccc.int/essential_background/convention/background/items/1349.php).

<sup>3</sup> Union of Concerned Scientists, *How to Avoid Dangerous Climate Change: A Target for U.S. Emissions* 3 (Sept. 2007); Malte Meinshausen, *What Does a 2°C Target Mean for Greenhouse Gas Concentrations? A Brief Analysis Based on Multi-Gas Emission Pathways and Several Climate Sensitivity Uncertainty Estimates* in AVOIDING DANGEROUS CLIMATE CHANGE 268 (Cambridge Univ. Press 2006).

Projected risks and damages from global warming are more serious than believed even a few years ago. In 2001, the Intergovernmental Panel on Climate Change (IPCC) used five Reasons For Concern (RFCs) in its Third Assessment Report (TAR) to illustrate the temperature range at which impacts may be considered dangerous.<sup>4</sup> Relationships between the impacts reflected in each RFC and increases in global mean temperature were portrayed in a “burning embers” diagram, which reflected the severity of risk from rising temperature through gradations in color from white (no or little risk) to yellow (moderately significant risk) to red (substantial or severe risk).<sup>5</sup> Depending on the RFC, substantial impacts or risks (transition from yellow to red) occurred with a temperature rise from 1°C to 4°C from current levels.<sup>6</sup>

Since the release of the TAR, scientific understanding of the vulnerability of the climate to temperature rise has evolved considerably.<sup>7</sup> Based on new findings in the growing scientific literature since the TAR was released, the burning embers diagram was revised in 2008 to reflect the dangerous risks posed by smaller increases in temperature than originally identified in the TAR.<sup>8</sup> In the updated burning embers diagram, substantial impacts or risks now occur at or near current temperature levels for a number of RFCs.<sup>9</sup> As reflected in the updated RFCs, a 2°C temperature increase from pre-industrial levels (or 1.4°C increase from 1990 levels) is well past the point where severe and irreversible impacts will occur.<sup>10</sup>

It is now estimated that a mean global temperature increase of 1.5°C above pre-industrial levels has the potential to trigger irreversible melting of the Greenland ice sheet, a process that would result in an eventual 7m sea level rise over and above that caused by thermal expansion of the oceans, and potentially causing an additional sea level rise of 0.75m, as soon as 2100.<sup>11</sup> Specific consequences of a 2°C temperature rise from pre-industrial levels include the loss of 97% of the world’s coral reefs and the transformation of 16% of global ecosystems.<sup>12</sup> At a 2°C temperature rise, approximately one to three

<sup>11</sup> Rachel Warren, *Impacts of Global Climate Change at Different Annual Mean Global Temperature Increases* in AVOIDING DANGEROUS CLIMATE CHANGE 95 (Cambridge Univ. Press, 2006). Unlike the IPCC’s RFC, Warren assessed impacts from temperature rise from pre-industrial levels, not 1990 levels.

<sup>12</sup> *Id.* Indeed, given increased confidence that 1°C to 2°C increase poses significant risks to many unique and threatened systems, including many biodiversity hotspots, the updated burning embers diagram indicates substantial impacts and/or moderate risks from warming that has already occurred. Smith, *supra* note 5, at 5.

billion people would experience an increase in water stress, sea level rise and cyclones would displace millions from the world's coastlines and agricultural yields would fall in the developed world.<sup>13</sup> In the Arctic, ecosystem disruption is predicted upon expectations of a complete loss of summer sea ice, with only 42% of the tundra remaining stable. This would destroy the Inuit hunting culture, cause the extinction of the polar bear and result in large losses in global bird populations. Moreover, because Arctic ice functions to reflect heat back into the atmosphere, its loss would allow more sunlight to heat the Arctic Ocean and further accelerate the buildup of heat and the melting of the Greenland ice sheet. As the devastating and irreversible impacts resulting from a 2°C mean global temperature rise are far in excess of any reasonable definition of DAI, limiting mean temperature rise to 2°C above pre-industrial levels is not a sufficient environmental objective for the purposes of developing a GHG significance threshold.

Specific impacts to California are also more dire than previously estimated. For example, in its most recent report, the Climate Action Team determined that the latest scientific findings indicate that “prior estimates [of sea-level rise] likely have been too low.”<sup>14</sup> Based on two recent models, “[b]y 2050, sea-level rise could range from 30-45 cm (11 to 18 inches) higher than in 2000, and by 2100, sea-level rise could be 60 to 140 cm (23 to 55 inches) higher than in 2000. As sea level rises, there will be an increased rate of extreme high sea-level events, which can occur when high tides coincide with winter storms and there are associated high wind wave and beach run-up conditions.”<sup>15</sup> Moreover, the rise in sea-level may be much higher than even these models predict because they do not account for the ice-melt contributions from the Greenland and Antarctic ice sheets and assume medium to medium high emissions scenarios.<sup>16</sup>

Not only are the climate impacts expected from a 2°C temperature increase far in excess of what should be considered “safe”, but policies which propose greenhouse gas stabilization levels of 450 ppm CO<sub>2</sub>eq present substantial risks of overshooting this target, thus exacerbating the problem. Equating a particular atmospheric concentration of greenhouse gases with a specific temperature increase involves a significant degree of uncertainty. This is because climate sensitivity – the extent to which temperatures will rise as a result of increasing concentrations of heat-trapping gases – depends on Earth's response to certain physical processes that are not fully understood.<sup>17</sup> Thus, due to uncertainty in climate sensitivity, scientists estimate that the mean probability of exceeding 2°C where stabilizing greenhouse gases at a CO<sub>2</sub>eq level of 450 ppm is 54% with a 30% probability that global average temperature would rise more than 3°C.<sup>18</sup> At

<sup>18</sup> Malte Meinshausen, *What Does a 2°C Target Mean for Greenhouse Gas Concentrations? A Brief Analysis Based on Multi-Gas Emission Pathways and Several Climate Sensitivity Uncertainty Estimates* in AVOIDING DANGEROUS CLIMATE CHANGE (Cambridge Univ. Press) (2006) at 268-69. Meinshausen operates under assumptions that do not roughly equate CO<sub>2</sub> eq with CO<sub>2</sub> concentrations. In *What Does a*

400 ppm CO<sub>2</sub>eq, the mean probability of exceeding 2°C is 28%.<sup>19</sup> If greenhouse gas emissions were stabilized at 350 ppm CO<sub>2</sub>eq, the mean probability of exceeding 2°C would be reduced to 7%.<sup>20</sup>

Properly accounting for climate sensitivity in climate policy is critical because, as dire as the projected impacts resulting from a 2°C mean temperature increase, increases above 2°C would result in impacts of apocalyptic proportions. If a 2-3°C increase in mean global temperature occurred, feedbacks in the climate system would cause a shift in the terrestrial carbon cycle. Currently, land-based carbon acts as a sink for CO<sub>2</sub>, buffering the effects of anthropogenic climate change. If CO<sub>2</sub> concentrations continue to rise, this sink will become a source, owing to increased soil respiration, further exacerbating climate change. The most dramatic impacts will be a widespread loss of forests and grassland, including the Amazon rainforest, which would undergo a transition to savannah, triggering wide spread implications for local population, global biodiversity, and the global carbon cycle.<sup>21</sup> At a global increase in temperature of 3°C above pre-industrial levels, many additional impacts in human and natural systems would occur in ways exponentially more devastating than those predicted for a 2°C temperature increase. Few ecosystems can adapt to such a large temperature rise: 22% would be transformed losing 7% to 74% of their extent.<sup>22</sup> An additional 25 to 40 million people would be displaced from coasts due to sea level rise, an additional 1200 to 3000 million would suffer an increase in water stress and 65 countries would lose 16% of their agricultural GDP.<sup>23</sup>

Based on the severe impacts already observed as well as future impacts and risks posed by additional warming to which we are committed due to inertia in the climate system, climatologists are increasingly concluded that current climate conditions already constitute DAI and that greenhouse gas emissions ultimately must be drawn down to net negative levels through the rapid phase-out of coal and improved forest and agricultural management.<sup>24</sup> Atmospheric concentrations of CO<sub>2</sub> have risen from a pre-industrial

concentration of 280 ppm to 383 ppm in 2007.<sup>25</sup> Annual mean global temperature has increased by 0.76°C relative to pre-industrial times and is increasing at a rate of 0.17°C/decade.<sup>26</sup> Impacts from this anthropogenic interference with the climate has already resulted in tens of thousands of climate-related deaths, species extinction, ocean acidification and loss of coral reefs, and the significant retreat of glaciers and sea ice. In addition to the impacts already observed, additional warming “in the pipeline” due to inertia in the climate system and their feedback loops will result in further increases in temperature posing significant risks of severe and irreversible impacts.<sup>27</sup> The climate is locked into anywhere from 0.3 to 0.7°C additional warming relative to late 20th century levels due to the eventual impacts of past historical emissions.<sup>28</sup> On account of additional warming to which we are committed, Ramanathan and Feng found that there is a “high probability that the DAI threshold is already in our rearview mirror.”<sup>29</sup> Similarly, on the basis of paleoclimate evidence and ongoing climate change, James Hansen and other leading climate scientists concluded the present CO<sub>2</sub> levels of 385 ppm are “already in the dangerous zone” and that “[i]f humanity wishes to preserve a planet similar to that on which civilization developed and to which life on Earth is adapted, paleoclimate evidence and ongoing climate change suggest that CO<sub>2</sub> will need to be reduced from its current 385 ppm to at most 350 ppm, but likely less than that.”<sup>30</sup> In looking at dangerous climate change through the lens of risk tolerance, Harvey concluded that, at a 10% risk tolerance, atmospheric CO<sub>2</sub> concentrations close to present levels “violates the UNFCCC” for a range of assumptions of climate sensitivity.<sup>31</sup> Accordingly, as the climate change to which we are committed is already dangerous, there is little scientific basis to conclude that any new source of emissions is innocuous.

## 2. Conclusion

The Center appreciates SCAQMD’s continued work to develop a threshold of significance for GHGs. The Center urges SCAQMD to apply the data derived from the Work Plan in a manner that is consistent with the scientific and factual data on the emission reductions necessary to avoid DAI. *See* Guidelines § 15064(h). Given the

severe and irreversible impacts resulting from a 2°C mean global temperature rise and the significant risk that this temperature would increase beyond 2°C at GHG levels of 450 ppm, a stabilization objective of 450 ppm CO<sub>2</sub>eq is far in excess of what can be considered safe. Accordingly, setting a threshold based on consistency with a 450 ppm stabilization target is inconsistent with CEQA’s purpose to “identify any critical thresholds for the healthy and safety of people of the state.” Pub. Res. Code § 21000(d). Because the 90% capture rate is based on the outdated presumption that compliance with Executive Order S-3-05 targets is sufficient to avoid dangerous climate change, SCAQMD should adopt a threshold for residential and commercial projects that captures a higher percentage of emissions and requires projects with emissions below this threshold to comply with performance standards.<sup>32</sup>

<sup>32</sup> The 90% capture rate used for SCAQMD’s industrial threshold purportedly reflected the practical concern that minimal mitigation was available for the types of projects (such as boilers) that fell under this threshold. These concerns do not apply to residential and commercial structures, where any number of mitigation measures are available for all sizes of projects to reduce GHG emissions.

# Climate-Stabilizing, California Light-Duty Vehicle Requirements, Versus Air Resource Board Goals

Paper 881

**Mike R. Bullock**

Retired Satellite Systems Engineer, 1800 Bayberry Drive, Oceanside, CA 92054

## ABSTRACT

An Introduction is provided, including the importance of light-duty vehicles (LDVs: cars and light duty trucks) and a definition of the top-level LDV requirements to limit their carbon dioxide (“CO<sub>2</sub>”) emissions.

Anthropogenic climate change fundamentals are presented, including its cause, its potential for harm, California mandates, and a greenhouse gas (GHG) reduction road map to avoid disaster.

A 2030 climate-stabilizing GHG reduction target value is calculated, using statements by climate experts. The formula for GHG emissions, as a function of per-capita driving, population, fleet CO<sub>2</sub> emissions per mile, and the applicable low-carbon fuel standard (LCFS) is given. The ratio of the 2015 value of car-emission-per-mile to the 2005 value of car-emission-per-mile is obtained.

Internal Combustion Engine (ICE) mileage values from 2000 to 2030 are identified, as either mandates or new requirements. A table is presented that estimates 2015 LDV fleet mileage.

Zero Emission Vehicle (ZEV) parameters are given. A table is shown that uses 2030 ZEV and ICE (ICE LDVs) requirements, named the “Heroic Measures” case, to compute the LDV fleet-equivalent mileage. That equivalent fleet mileage is used, with population and the required emission reduction, to compute a required per-capita driving reduction, with respect to 2005. Measures to achieve this per-capita driving reduction are described, with reductions allocated to each measure. The energy used per year for the Heroic Measures case is estimated

The “Heroic Measures” set of fractions of ZEV’s purchased, as a function of year, is compared to the California Air Resources Board (CARB) goals.

## INTRODUCTION

Within the context of working the anthropogenic-climate-change problem and from a systems engineering perspective, the top-level requirement is to reduce greenhouse gas (GHG) emissions enough to support stabilizing our climate at a livable level. This top-level requirement must flow down to the subsystem of LDVs, especially due to the magnitude of their emissions. (As an example, LDVs emit 41% of the GHG in San Diego County<sup>1</sup>.)

More specifically, LDV requirements will be identified that, taken together, will result in GHG emission reductions sufficient to “support climate stabilization”. “Support climate stabilization” means that the LDV emission level will be equal to a climate-stabilizing target. Such a target is expressed as an emission level in some target year. The target is based on climate science.

From a systems engineering perspective, at the top level, the needed LDV requirements are

- LDV fleet efficiency, meaning the greenhouse gas (GHG) emissions per mile driven, applicable to the entire fleet, on the road in the year of interest and
- an upper bound on per-capita driving, given the derived fleet efficiency and the predicted population growth.

The fleet efficiency requirement will be developed as a function of lower-level requirements, such as Corporate Average Fuel Efficiency (CAFÉ) requirements, requirements on how fast Battery Electric Vehicles (BEVs) must be added into the fleet each year, and requirements to get low-efficiency vehicles off the roads. The second top-level requirement, the upper bound on per-capita driving, will spawn transportation-system requirements designed to result in less driving, such as better mass transit. This paper will derive a formulae to compute the required per-capita driving levels, based on fleet efficiency, predicted population growth, and the latest, science-based, climate-stabilizing GHG emission target.

In this work, three categories of LDV emission-reduction strategies will be considered: cleaner cars, cleaner fuels, and less driving.

## **BACKGROUND: OUR ANTHROPOGENIC CLIMATE CHANGE PROBLEM**

### **Purpose of This Section**

Before going to work to solve a systems-engineering problem, it is important to understand the nature of the problem. How complex is the problem? How much is at stake if the problem is not solved? Is it reasonable to take a chance and only solve the problem with a reasonably high probability or is there too much at stake to gamble? This section is an attempt to answer these questions.

### **Basic Cause**

Anthropogenic climate change is driven by these two processes<sup>2</sup>: First, our combustion of fossil fuels is adding “great quantities” of CO<sub>2</sub> into our atmosphere. Second, that additional atmospheric CO<sub>2</sub> is trapping additional heat.

### **California’s First Three Climate Mandates**

California’s Governor’s Executive Order S-3-05<sup>3</sup> is similar to the Kyoto Agreement and is based on the greenhouse gas (GHG) reductions that were recommended by climate scientists for industrialized nations back in 2005. In 2005, many climate scientists believed that the reduction-targets of S-3-05 would be sufficient to support stabilizing Earth’s climate at a livable level, with a reasonably high level of certainty. More specifically, this executive order aims for an average, over-the-year, atmospheric temperature rise of “only” 2 degree Celsius, above the preindustrial temperature. It attempts to do this by limiting our earth’s level of atmospheric CO<sub>2</sub>\_e to 450 PPM by 2050 and then reducing emissions further, so that atmospheric levels would come down to more tolerable levels in subsequent years. The S-3-05 emission targets are 2000 emission levels by 2010, 1990 levels by 2020, and 80% below 1990 levels by 2050.

It was thought that if the world achieved S-3-05, there might be a 50% chance that the maximum temperature rise will be less than 2 degrees Celsius, thus leaving a 50% chance that it would be larger than 2 degrees Celsius. A 2 degree increase would put over a billion people on the planet into a condition described as “water stress” and it would mean a loss of 97% of the earth’s coral reefs.

There would also be a 30% chance that the temperature increase would be greater than 3 degrees Celsius. A temperature change of 3 degree Celsius is described in Reference 3 as being “exponentially worse” than a 2 degree Celsius increase.

The second California climate mandate is AB 32, the *Global Warming Solutions Act of 2006*. It includes provisions for a cap and trade program, to ensure meeting S-3-05’s 2020 target of the 1990 level of emissions. It continues after 2020. AB 32 requires CARB to always implement measures that achieve the maximum *technologically feasible and cost-effective* (words taken from AB 32) greenhouse-gas-emission reductions.

In 2015 Governor Brown signed Executive Order B-30-15. This Executive Order established a mandate to achieve an emission level of 40% below 2020 emissions by 2030, as can be seen by a Google search. If Executive Order S-3-05 is interpreted as a straight line between its 2020 target and its 2050 target, then the B-30-15 target of 2030 is the same as S-3-05’s implied target of 2035, because 2035 is halfway between 2020 and 2050 and 40% down is halfway to 80% down.

California is on track to achieve its S-3-05 second (2020) target. However, the world emission levels have, for most years, been increasing, contrary to the S-3-05 trajectory. In part because the world has been consistently failing to follow S-3-05’s 2010-to-2020 trajectory, if California is still interested in leading the way to stabilizing the climate at a livable level, it must do far better than S-3-05, going forward, as will be shown.

## **Failing to Achieve these Climate Mandates**

What could happen if we fail to achieve S-3-05, AB 32, and B-30-15 or if we achieve them but they turn out to be too little too late and other states and countries follow our example?

It has been written<sup>4</sup> that, “A recent string of reports from impeccable mainstream institutions—the International Energy Agency, the World Bank, the accounting firm of PricewaterhouseCoopers—have warned that the Earth is on a trajectory to warm by at least 4 Degrees Celsius and that this would be incompatible with continued human survival.”

It has also been written<sup>5</sup> that, “Lags in the replacement of fossil-fuel use by clean energy use have put the world on a pace for 6 degree Celsius by the end of this century. Such a large temperature rise occurred 250 million years ago and extinguished 90 percent of the life on Earth. The current rise is of the same magnitude but is occurring faster.”

## **Pictures That Are Worth a Thousand Words**

Figure 1 shows (1) atmospheric CO<sub>2</sub> (in blue) and (2) averaged-over-a-year-then-averaged-over-the-surface-of-the-earth world atmospheric temperature (in red). This temperature is with respect to a recent preindustrial value. The data starts 800,000 years ago. It shows that the current value of atmospheric CO<sub>2</sub>, which is now over 400 PPM, far exceeds the values of the last 800,000 years. It

also shows that we should expect the corresponding temperature to eventually be about 12 or 13 degrees above preindustrial temperatures. This would bring about a human disaster<sup>3,4,5</sup>.

Figure 2 shows the average yearly temperature with respect to the 1960-to-1990 baseline temperature (in blue). It also shows atmospheric levels of CO<sub>2</sub> (in red). The S-3-05 goal of 450 PPM is literally “off the chart”, in Figure 2. Figure 2 shows that, as expected, temperatures are starting to rise along with the increasing levels of CO<sub>2</sub>. The large variations in temperature are primarily due to the random nature of the amount of solar energy being received by the earth.

## **FURTHER BACKGROUND: CALIFORNIA’S SB 375 AND AN IMPORTANT DATA SET**

As shown in the Introduction, LDVs emit significant amounts of CO<sub>2</sub>. The question arises: will driving need to be reduced or can cleaner cars and cleaner fuels arrive in time to avoid such behavioral change? Steve Winkelman, of the Center for Clean Air Policy (CCAP), worked on this problem.

### **SB 375, the *Sustainable Communities and Climate Protection Act of 2008***

Under SB 375, the California Air Resources Board (CARB) has given each Metropolitan Planning Organization (MPO) in California driving-reduction targets, for the years 2020 and 2035. “Driving” means yearly, per capita, vehicle miles travelled (VMT), by LDVs, with respect to 2005. The CARB-provided values are shown at this Wikipedia link, [http://en.wikipedia.org/wiki/SB\\_375](http://en.wikipedia.org/wiki/SB_375). It is important to note that although this link and many other sources show the targets to be “GHG” and not “VMT”, SB 375 clearly states that the reductions are to be the result of the MPO’s Regional Transportation Plan (RTP), or, more specifically, the Sustainable Communities Strategy (SCS) portion of the RTP. Nothing in the SCS will improve average mileage. That will be done by the state and federal government by their Corporate Average Fleet Efficiency (CAFÉ) standards. The SCS can only reduce GHG by reducing VMT. The only way an SCS can reduce GHG by 12%, for example, is to reduce VMT by 12%.

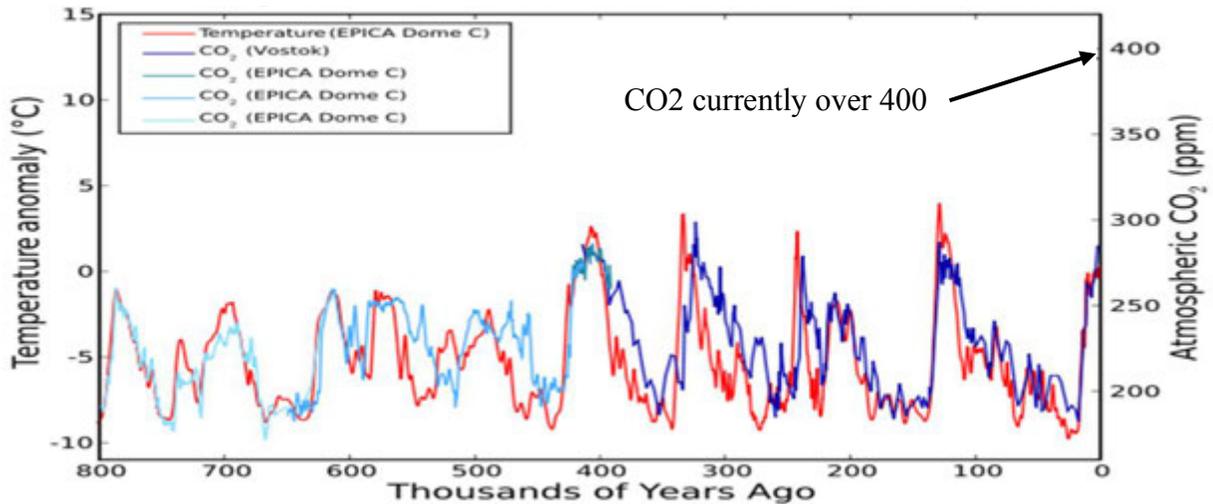

Under SB 375, every Regional Transportation Plan (RTP) must include a section called a Sustainable Communities Strategy (SCS). The SCS must include driving reduction predictions corresponding to the CARB targets. Each SCS must include only *feasible* transportation, land use, and transportation-related policy data. If the SCS driving-reduction predictions fail to meet the CARB-provided targets, the MPO must prepare an Alternative Planning Strategy (APS). An APS uses *infeasible* transportation, land use, and transportation-related policy assumptions. The total reductions, resulting from both the SCS and the APS, must at least meet the CARB-provided targets.

### **Critical Data: Useful Factors from Steve Winkelman’s Data**

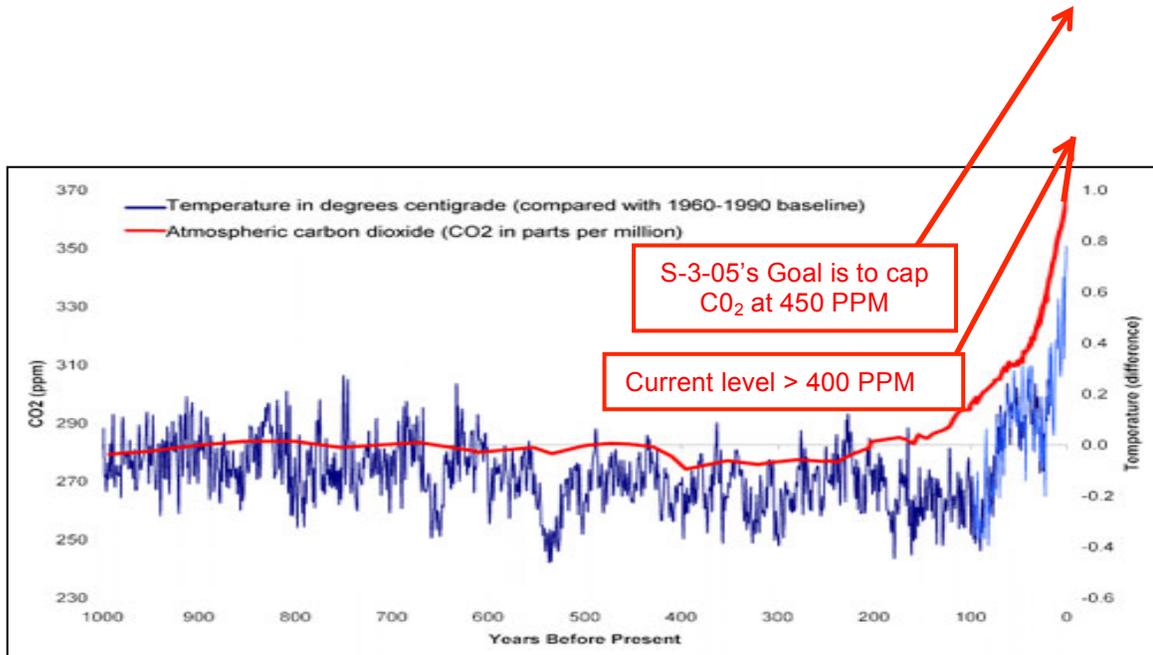

Figure 3<sup>6</sup> shows 6 variables as a percent of its 2005 value. The year 2005 is the baseline year of SB 375. The red line is the Caltrans prediction of VMT. The purple line is California’s current mandate for a Low Carbon Fuel Standard (LCFS). As shown, by 2020, fuel in California must emit 10% less per gallon than in 2005. The turquoise line is the 1990 GHG emission in California. As shown, it is 12% below the 2005 level. This is important because S-3-05 specifies that in 2020, state GHG emission levels must be at the

1990 level. The green line is the CO<sub>2</sub> emitted per mile, as specified by AB 1493, also known as “Pavley 1 and 2” named after Senator Fran Pavley. The values shown do not account for the LCFS. The yellow (or gold) line is the S-3-05 mandate, referenced to 2005 emission levels. The blue line is the product of the red, the purple, and the green line and is the percentage of GHG emissions compared to 2005. Since VMT is not being adequately controlled, the blue line is not achieving the S-3-05 line. Figure 3 shows that driving must be reduced. For this reason, Steve Winkelman can be thought of as the true father of SB 375.

**Figure 1. Atmospheric CO<sub>2</sub> and Mean Temperature from 800,000 Years Ago**

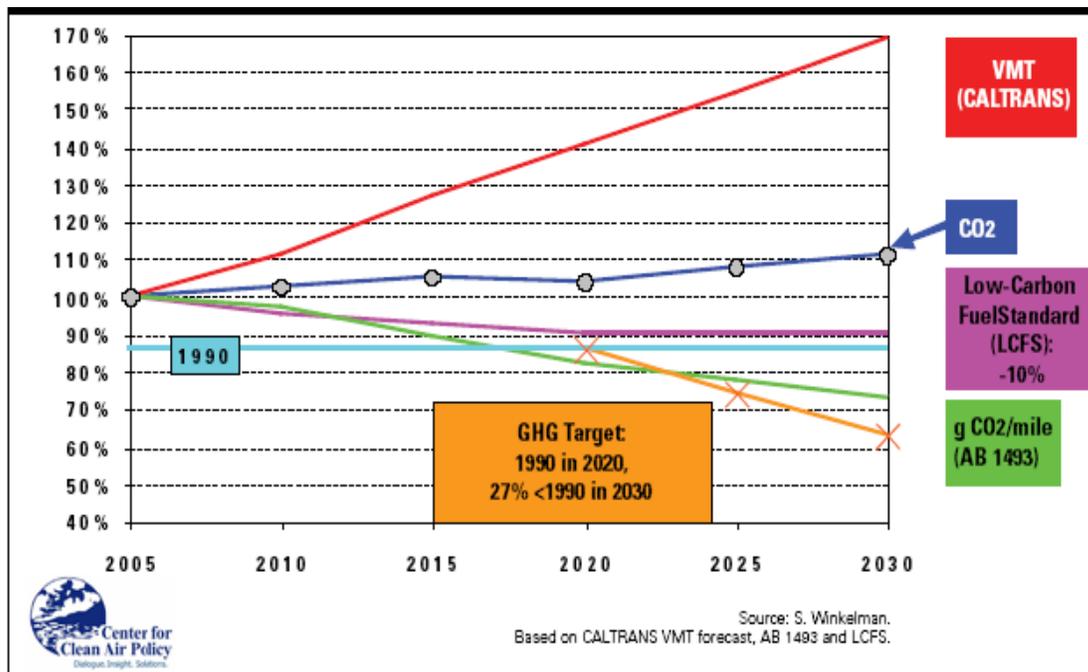

**Figure 2. Atmospheric CO<sub>2</sub> and Mean Temperature, Over the Last 1,000 Years**

This table provides inspiration for a road map to climate success for LDVs. Climate stabilization targets must be identified and achieved by a set of requirements to define fleet efficiency and per-capita driving.

**Figure 3** The S-3-05 Trajectory (the Gold Line) AND the CO<sub>2</sub> Emitted from Personal Driving (the Blue Line), where that CO<sub>2</sub> is a Function (the Product) of the California-Fleet-Average CO<sub>2</sub> per Mile (the Green Line), The Predicted Driving (VMT, the Red Line), and the Low-Carbon Fuel Standard (the Purple Line)

## THE DEVELOPMENT OF CALIFORNIA'S TOP-LEVEL LDV REQUIREMENTS TO SUPPORT CLIMATE STABILIZATION

It is also clear that cleaner cars will be needed and can probably be achieved. As will be seen, much cleaner cars will be needed if driving reductions are going to remain within what many people would consider achievable. Mileage and equivalent mileage will need to be specified. A significant fleet-fraction of Zero-Emission Vehicles (ZEVs, either Battery-Electric LDVs or Hydrogen Fuel Cell LDVs) will be needed. Since mileage and equivalent mileage is more heuristic than emissions per mile, they will be used instead of CO<sub>2</sub> per mile driven.

Since the SB-375 work used 2005 as the reference year, it will remain the reference year here.

### GHG Target to Support Climate Stabilization

The primary problem with S-3-05 is that California's resolve and actions have been largely ignored by other states, our federal government, and many countries. Therefore, rather than achieving 2000 levels by 2010 and being on a track to achieve 1990 levels by 2020, world emission have been increasing. Reference 7 states on Page 14 that the required rate of reduction, if commenced in 2020,

would be 15%. That rate means that the factor of 0.85 must be achieved, year after year. If this were done for 10 years, the factor would be  $(0.85)^{10} = 0.2$ . We don't know where world emissions will be in 2020. However, it is fairly safe to assume that California will be emitting at its 1990 level in 2020, in accordance with S-3-05. This situation shows that the correct target for California is to achieve emissions that are reduced to 80% below California's 1990 value by 2030. Note that if the reductions start sooner, the rate of reduction of emissions can be less than 15% and the 2030 target could be relaxed somewhat. However, it is doubtful that the world will get the reduction rate anywhere near the needed 15% by 2020. Therefore, the target, of 80% below 1990 levels by 2030 is considered to be correct for California. Reference 7 also calls into question the advisability of aiming for a 2 degree Celsius increase, given the possibilities of positive feedbacks that would increase warming. This concern for positive feedbacks is another reason that this paper will work towards identifying LDV requirement sets that will support achieving 80% below 1990 values by 2030.

### Notes on Methods

The base year is 2005. An intermediate year of 2015 is used. The car efficiency factor of 2015 with respect to 2005 is taken directly from Figure 3. The car efficiency factor of 2030 with respect to 2015 is derived herein, resulting in a set of car-efficiency requirements. It is assumed that cars last 15 years.

### Primary Variable Used

Table 1 defines the primary variables that are used.

**Table 1 Variable Definitions**

| <b>Variable Definitions</b> |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| $e_k$                       | LDV Emitted CO <sub>2</sub> , in Year “ $k$ ”                                                                                         |
| $L_k$                       | Low Carbon Fuel Standard (LCFS) Factor that reduces the Per-Gallon CO <sub>2</sub> emissions, in Year “ $k$ ”                         |
| $C_k$                       | LDV CO <sub>2</sub> emitted per mile driven, average, in Year “ $k$ ”, not accounting for the Low Carbon Fuel Standard (LCFS) Factor  |
| $c_k$                       | LDV CO <sub>2</sub> emitted per mile driven, average, in Year “ $k$ ”, accounting for the Low Carbon Fuel Standard (LCFS) Factor      |
| $p_k$                       | Population, in Year “ $k$ ”                                                                                                           |
| $d_k$                       | Per-capita LDV driving, in Year “ $k$ ”                                                                                               |
| $D_k$                       | LDV Driving, in Year “ $k$ ”                                                                                                          |
| $M_k$                       | LDV Mileage, miles per gallon, in Year “ $k$ ”                                                                                        |
| $m_k$                       | LDV Equivalent Mileage, miles per gallon, in Year “ $k$ ” accounting for Low Carbon Fuel Standard (LCFS) Factor, so this is $M_k/L_k$ |
| N                           | Number of pounds of CO <sub>2</sub> per gallon of fuel but not accounting for the Low Carbon Fuel Standard (LCFS) Factor              |

## Fundamental Equations

The emissions are equal to the CO2 per mile multiplied by the per-capita driving multiplied by the population, since per-capita driving multiplied by the population is total driving. This is true for any year.

$$\text{Future Year } k: \quad e_k = c_k * d_k * p_k \quad (\text{Eq. 1})$$

$$\text{Base Year } i: \quad e_i = c_i * d_i * p_i \quad (\text{Eq. 2})$$

Dividing both sides of Equation 1 by equal values results in an equality. The terms on the right side of the equation can be associated as shown here:

$$\frac{e_k}{e_i} = \frac{c_k}{c_i} * \frac{d_k}{d_i} * \frac{p_k}{p_i} \quad (\text{Eq. 3})$$

Since carbon dioxide emitted per gallon is just a constant (about 20 pounds per gallon), the constant cancels out of the ratio of emissions per mile, leaving the following relationship.

$$\text{To work with mileage:} \quad \frac{m_i}{m_k} = \frac{c_k}{c_i} \quad (\text{Eq. 4})$$

Putting Equation 4 into Equation 3 results in the following equation:

$$\frac{e_k}{e_i} = \frac{m_i}{m_k} * \frac{d_k}{d_i} * \frac{p_k}{p_i} \quad (\text{Eq. 5})$$

Showing the base year of 2005, the future year of 2030, introducing the intermediate year of 2015 and the year of 1990 (since emissions in 2030 are with respect to the 1990 value) results in Equation 6.

$$\frac{e_{2030}}{e_{1990}} * \frac{e_{1990}}{e_{2005}} = \frac{c_{2030}}{c_{2015}} * \frac{c_{2015}}{c_{2005}} * \frac{d_{2030}}{d_{2005}} * \frac{p_{2030}}{p_{2005}} \quad (\text{Eq. 6})$$

The ratio on the far left is the climate-stabilizing target, which is the factor of the 2030 emission to the 1990 emission. It is shown to be 0.20 or 80% less. The next ratio is the emission of 1990 compared to 2005. It is the turquoise line of Figure 3, which is 0.87. The first ratio on the right side of the equation is the fleet emission per mile in 2030 compared to the value in 2015. This ratio will be derived in this report and it will result in a set of car efficiency requirements. Moving to the right, the next ratio is the car efficiency in 2015 compared to 2005. It can be obtained by multiplying the purple line 2015 value times the green line 2015 value, which is 0.90 \* 0.93. The next term is the independent variable. It is the driving reduction required, compared to the 2005 level of driving. The final term on the far right is the ratio of the population in 2030 to the population in 2005. Reference 8 shows that California's population in 2005 was 35,985,582. Reference 9 shows that California's population in 2030 is predicted to be 44,279,354. Therefore,

$$\frac{p_{2030}}{p_{2005}} = 44279354 \div 35985582 = 1.2305 \quad (\text{Eq. 7})$$

Putting in the known values results in Equation 8:

$$0.20 * 0.87 = \frac{c_{2030}}{c_{2015}} * 0.90 * 0.93 * \frac{d_{2030}}{d_{2005}} * 1.2305 \quad (\text{Eq. 8})$$

Combining the values, solving for the independent variable (the per-capita driving ratio), and changing from emission-per-mile to equivalent-miles-per-gallon results in the following:

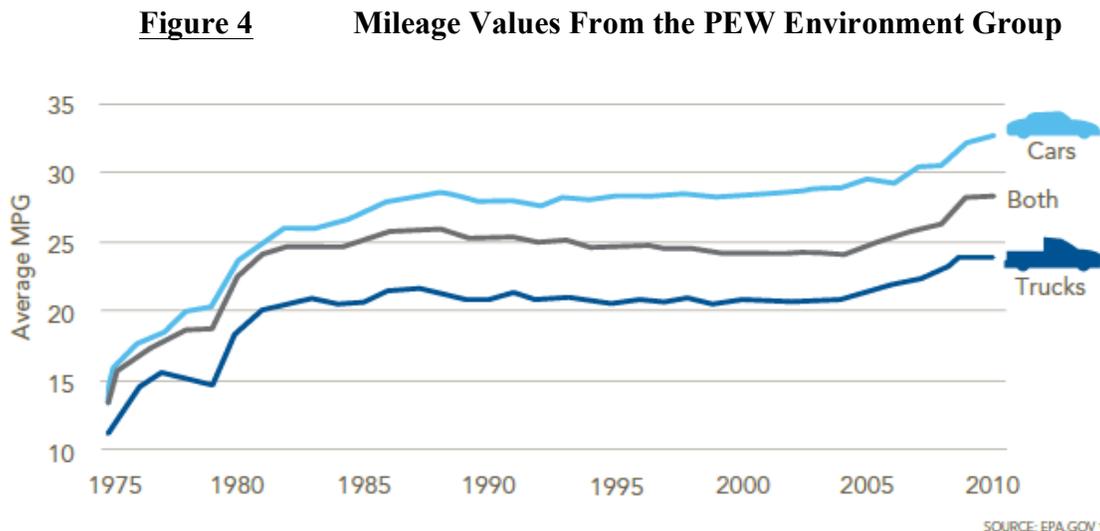

$$\frac{d_{2030}}{d_{2005}} = 0.1689 * \frac{m_{2030}}{m_{2015}} \quad (\text{Eq. 9})$$

With the coefficient being so small, it is doubtful that we can get the equivalent mileage in 2030 to be high enough to keep the driving ratio from falling below one. The mileage of the 2005 fleet will be based on the best data we can get and by assuming cars last 15 years. The equivalent mileage in 2030 will need to be as high as possible to keep the driving-reduction factor from going too far below 1, because it is difficult to reduce driving too much. The equivalent mileage will be dependent on the fleet-efficiency requirements in the near future and going out to 2030. Those requirements are among the primary results of this report.

### Internal Combustion Engine (ICE) Mileage, from Year 2000 to Year 2030

The years from 2000 to 2011 are taken from a plot produced by the PEW Environment Group, [http://www.pewenvironment.org/uploadedFiles/PEG/Publications/Fact\\_Sheet/History%20of%20Fuel%20Economy%20Clean%20Energy%20Factsheet.pdf](http://www.pewenvironment.org/uploadedFiles/PEG/Publications/Fact_Sheet/History%20of%20Fuel%20Economy%20Clean%20Energy%20Factsheet.pdf)

The plot is shown here as Figure 4. The “Both” values are used.

The values from 2012 to 2025 are taken from the US Energy Information Agency (EIA) as shown on their website, [http://www.c2es.org/federal/executive/vehicle-standards#ldv\\_2012\\_to\\_2025](http://www.c2es.org/federal/executive/vehicle-standards#ldv_2012_to_2025). They are the LDV Corporate Average Fleet Efficiency (CAFÉ) values enacted into law in the first term of President Obama. From 2025 to 2030, it is assumed that the yearly ICE improvement in CAFÉ will be 2.5 MPG.

### Mileage of California’s LDV Fleet in 2015

Table 2 uses these values of the Internal Combustion Engine (ICE) LDV mileage to compute the mileage of the LDV fleet in 2015. It assumes that the fraction of ZEVs being used over these years is small enough to be ignored. The 100 miles driven, nominally, by each set of cars, is an arbitrary value and inconsequential in the final calculation, because it will divide out. It is never-the-less used, so that it is possible to compare the gallons of fuel used for the different years. The “f” factor could be used to account for a set of cars being driven less. It was decided to not use this option by setting all of the values to 1. The Low Carbon Fuel Standard (LCFS) values are taken from Figure 3. The gallons of fuel are computed as shown in Equation 10, using the definition for  $L_k$  that is shown in Table 1.

**Table 2 Calculation of the Fleet MPG for 2015**

| LDV Set                              | Years Old | Model Year | CAFE MPG | LCFS Factor $L_{Year}$ | Factor Driven f | Gallons Used Per f*100 Miles |
|--------------------------------------|-----------|------------|----------|------------------------|-----------------|------------------------------|
| 1                                    | 14-15     | 2001       | 24.0     | 1.0                    | 1.0             | 4.17                         |
| 2                                    | 13-14     | 2002       | 24.0     | 1.0                    | 1.0             | 4.17                         |
| 3                                    | 12-13     | 2003       | 24.0     | 1.0                    | 1.0             | 4.17                         |
| 4                                    | 11-12     | 2004       | 24.0     | 1.0                    | 1.0             | 4.17                         |
| 5                                    | 10-11     | 2005       | 25.0     | 1.0                    | 1.0             | 4.00                         |
| 6                                    | 9-10      | 2006       | 25.7     | .9933                  | 1.0             | 3.87                         |
| 7                                    | 8-9       | 2007       | 26.3     | .9867                  | 1.0             | 3.75                         |
| 8                                    | 7-8       | 2008       | 27.0     | .9800                  | 1.0             | 3.63                         |
| 9                                    | 6-7       | 2009       | 28.0     | .9733                  | 1.0             | 3.48                         |
| 10                                   | 5-6       | 2010       | 28.0     | .9667                  | 1.0             | 3.45                         |
| 11                                   | 4-5       | 2011       | 29.1     | .9600                  | 1.0             | 3.30                         |
| 12                                   | 3-4       | 2012       | 29.8     | .9533                  | 1.0             | 3.20                         |
| 13                                   | 2-3       | 2013       | 30.6     | .9467                  | 1.0             | 3.09                         |
| 14                                   | 1-2       | 2014       | 31.4     | .9400                  | 1.0             | 2.99                         |
| 15                                   | 0-1       | 2015       | 32.6     | .9333                  | 1.0             | 2.86                         |
| <b>Sum of Gallons:</b>               |           |            |          |                        |                 | <b>54.29</b>                 |
| <b>Miles = 100*Sum(f's):</b>         |           |            |          |                        |                 | <b>1500</b>                  |
| <b>MPG = Miles/(Sum of Gallons):</b> |           |            |          |                        |                 | <b>27.63</b>                 |

$$Gallons\ Used\ per\ f * 100\ miles = \frac{f \times 100}{(CAFE\ MPG) / L_k} \quad (Eq. 10)$$

**How ICE Mileage Values Will Be Used with ZEV Equivalent Mileage Values**

As will be seen, after 2015, the net (computed using both ICEs and ZEVs) mileage values for each year are assumed to greatly improve by having a significant fraction of ZEVs. The ICE CAFÉ standards are used in this report as just the ICE contribution to fleet MPG. The ICE MPG values are inadequate by themselves and will therefore need to become less important because ZEVs will need to quickly take over the highways.

Federal requirements will need to change dramatically. Currently, federally-mandated corporate average fuel efficiency (CAFÉ) standards have been implemented, from 2000 to 2025. These standards require that each corporation produce and sell their fleet of cars and light-duty trucks in the needed proportions, so that the combined mileage of the cars they sell, at least meet the specified mileage.

The car companies want to maximize their profits while achieving the required CAFÉ standard. In California, the car companies will already be required to sell a specified number of electric vehicles, which have a particularly-high, equivalent-value of miles-per-gallon. If the laws are not changed, this will allow these companies to sell more low-mileage, high profit cars and light-duty trucks, and still achieve the federal CAFÉ standard.

It will be better to apply the CAFÉ standards to only the ICEs and then require that the fleet of LDVs sold achieve some mandated fraction of ZEVs. The ZEVs will get better and better equivalent mileage, as our electrical grid is powered by more renewable sources of energy. Therefore, their equivalent mileage is not fixed, but will improve over the years. Requirements developed here are for 2030. Therefore a high percentage of all the electricity generated in the state, including both the “in front of the meter” (known as the “Renewable Portfolio Standard” or “RPS”) portion and the “behind the meter” portion is assumed to come from sources that do not emit CO2. More specifically, the value of 80% is assumed. This therefore becomes a fleet-efficiency requirement.

### ZEV Equivalent Mileage Values

To calculate the mileage of the 2030 fleet of LDVs, it is necessary to derive a formula to compute the equivalent mileage of ZEVs, as a function of the percent of electricity generated without emitting CO2, the equivalent ZEV mileage if the electricity is from 100% fossil fuel, and the equivalent ZEV mileage if the electricity is from 100% non-CO2 sources. The variables defined in Table 3 are used.

The derivation of the equation for equivalent ZEV mileage is based on the notion that the ZEV can be imagined to travel “r” fraction of the time on electricity generated from renewables and “(1-r)” fraction of the time on fossil fuel. If the vehicle travels “D” miles, then, using the definitions shown in Table 3, the following equation can be written.

$$G = \frac{r \times D}{m_{zr}} + \frac{(1-r) \times D}{m_{zf}} \quad (\text{Eq. 11})$$

$$m_z = D/G = D / \left( \frac{r \times D}{m_{zr}} + \frac{(1-r) \times D}{m_{zf}} \right) \quad (\text{Eq. 12})$$

Dividing the numerator and the denominator by D and multiplying them both by the product of the two equivalent mileage values results in Equations 13.

$$m_z = m_{zr} \times m_{zf} / (r \times m_{zf} + (1 - r) \times m_{zr}) \quad (\text{Eq. 13})$$

Again, using the definitions in Table 3 results in the following.

$$m_z = \text{Num}/(\text{Den}) \quad (\text{Eq. 14})$$

**Table 3 Variables Used in the Calculation of ZEV Equivalent Mileage**

| <b>Variable</b> | <b>Definition</b>                                                      |
|-----------------|------------------------------------------------------------------------|
| $m_z$           | <b>ZEV Equivalent mileage</b>                                          |
| $m_{zr}$        | <b>ZEV Equivalent mileage if the electricity is from renewables</b>    |
| $m_{zf}$        | <b>ZEV Equivalent mileage if the electricity is from fossil fuels</b>  |
| $r$             | <b>fraction of electricity generated from sources not emitting CO2</b> |
| $G$             | <b>Gallons of equivalent fuel used</b>                                 |
| $D$             | <b>Arbitrary distance travelled</b>                                    |
| $Num$           | $m_{zr} \times m_{zf}$                                                 |
| $Den$           | $r \times m_{zf} + (1 - r) \times m_{zr}$                              |

Table 4 shows an assignment of assumed values and the result of a calculation, using Equations 13, 14, and the definitions in Table 3, to produce a ZEV equivalent mileage.

**Table 4 Variable Assignment and the Resulting ZEV Mileage**

| $m_{zr}$    | $m_{zf}$  | $r$        | $1-r$      | Num              | Den            | $m_z$         |
|-------------|-----------|------------|------------|------------------|----------------|---------------|
| <b>5000</b> | <b>70</b> | <b>0.8</b> | <b>0.2</b> | <b>350000.00</b> | <b>1056.00</b> | <b>331.44</b> |

### **Computing an LDV Fleet Mileage Assuming Heroic Measures (HM)**

Table 5 shows the additional definitions that will be used in this calculation. Table 6 computes the 2030 LDV mileage, assuming “Heroic Measures” to reduce the miles driven in poor-mileage ICE’s, in building and selling a significant fraction of ZEVs, and in getting the Low Carbon Fuel Standards to continue to improve beyond the Figure 3 minimum of 0.90.

**Table 5 Additional Variables Used in the Calculation of 2030 LDV Mileage**

| <b>Variable</b> | <b>Definition</b>                                      |
|-----------------|--------------------------------------------------------|
| $D_i$           | <b>Distance travelled by ICE vehicles</b>              |
| $D_z$           | <b>Distance travelled by ZEVs</b>                      |
| $G_i$           | <b>Gallons of Equivalent fuel used by ICE vehicles</b> |
| $G_z$           | <b>Gallons of Equivalent fuel used by ZEVs</b>         |

As shown by the values for “f”, government policies must be adopted, in 2030, to reduce the miles driven by the ICE’s, from model years 2016 to 2023. The 2016 model ICE’s are driven only 30% as much as the nominal amount. The 2017 year ICE’s can be driving 10% more. This rate of change continues up to 2023, when the ICE’s are doing less damage, due to the large fraction of ZEVs on the road.

**Table 6 Calculation of 2030 LDV Mileage Assuming Heroic Measures**

| Year                                                             | ICE Parameters and Calculations |       |         |     |       |        | ZEVs |       |       | Yearly Totals |               |          |
|------------------------------------------------------------------|---------------------------------|-------|---------|-----|-------|--------|------|-------|-------|---------------|---------------|----------|

| 2029                                                             | 58.7                            | .8000 | 73.38   | 1.0 | 5.0   | .0681  | .99  | 99    | .299  | 100.0         | .3123         | 320.18   |
| 2030                                                             | 61.2                            | .8000 | 76.50   | 1.0 | 5.0   | .0654  | .99  | 99    | .299  | 100.0         | .3118         | 320.75   |
| Sum of Miles and then Gallons of Equivalent Fuel:                |                                 |       |         |     |       |        |      |       |       | 1259.00       | 11.34         |          |
| Equivalent MPG of LDV Fleet in 2030:                             |                                 |       |         |     |       |        |      |       |       | <b>111.03</b> |               |          |
| Sum of ZEV Miles = 865. Fraction of Miles Driven by ZEVs = 68.7% |                                 |       |         |     |       |        |      |       |       |               |               |          |

As shown, the ZEV fraction of the fleet assumes the value of 12%, just 2 years from now (shown in the green field.) It then proceeds upward, to 18% in 2019; 24% in 2020; 34% in 2021; and so on, until it reaches 99% by 2028.

Achieving these fractions of ZEVs might be compared to what was done during World War II, when automobile production lines were rapidly converted to produce tanks. This reduced the new cars that could be purchased. Besides this, rationing gasoline made it difficult to drive at times and, due to shortages of leather, which was being used to produce boots for soldiers, some citizens found it hard to even buy shoes. These rapid and inconvenient changes were tolerated, because most people agreed that the war needed to be won. The heroic measures assumed here may not be possible unless citizens and the political leaders they elect understand the dire consequences of climate destabilization and therefore accept, and even demand, the measures that are needed to support climate stabilization.

The equivalent miles per gallon of the LDV fleet in 2030, specifically 111.03 miles per gallon, will be considered as a potential 2030 LDV requirement.

## Computing the Heroic-Measures (HM) Case Per-Capita and Net Driving Factor Requirements, Based on the Result Shown in Table 6

Plugging the

- equivalent MPG of the LDV fleet in Year 2030, taken from the bottom of Table 6, which is 111.03 MPG ( $m_{2030}$ ), and
- the MPG of the LDV fleet in Year 2015, taken from the bottom of Table 2, which is 27.63 MPG ( $m_{2015}$ ),

into Equation 9, gives the following result:

$$\frac{d_{2030}}{d_{2005}} = \mathbf{0.1687} * \frac{m_{2030}}{m_{2015}} = \mathbf{0.1687} * \frac{111.03}{27.63} = \mathbf{0.68} \quad (\text{Eq. 14})$$

This means that the per-capita driving in 2030 will need to be about 32% less than in year 2005. The net driving can be computed by multiplying the per-capita driving, 0.68, by the population factor of 1.2305, computed in Equation 7, resulting in 0.84 (since  $0.68 \times 1.2305 = 0.84$ .) This means that, even with the 23% increase in California's population, the net driving will have to drop by 16%. If this LDV requirement set is selected, all of California's transportation money can be used to improve transit, improve active transportation (mainly walking and biking), and maintain, but not expand, roads. The good news is that there can be little or no congestion because highway capacity now is larger than it was in 2005. Policies will be needed to achieve the required reduction in driving.

### Case 2: Computing LDV Requirements that Support Climate Stabilization but Still Allow 2005 Per-Capita Driving

The first step is to use Equation 9 and the value of the mileage in 2015 to compute the needed LDV equivalent fleet mileage for 2030 if the left side of the equation is equal to 1.0.

$$m_{2030} = \mathbf{1.0} \times m_{2015} / \mathbf{0.1689} = \mathbf{27.63} / \mathbf{0.1689} = \mathbf{163.59} \text{ MPG} \quad (\text{Eq. 15})$$

Table 7 is constructed, with the fraction of ZEVs selected to achieve the needed equivalent fleet mileage of about 163.59 MPG. Since its ZEV fractions are larger and sooner than in the "Heroic Measures" table, Table 7 is showing what has been called the "Extra-Heroic Measures" (EHM) case. The ICE "f" values are unchanged; as are the LCFS values. The EHM ZEV differences from the HM case are the highlighted "z" values.

This means that with the 23% increase in California's population, computed in Equation 7, the net driving would also increase by 23%. If this LDV requirement set were to be implemented, a lot of California's transportation money would be needed to expand the highway system, leaving less to improve transit, improve active transportation (mainly walking and biking), and maintain roads.

**Table 7 Calculation of 2030 LDV Mileage Assuming Extra-Heroic Measures**

| Year                                              | ICE Parameters and Calculations |       |         |     |       |       | ZEVs |       |       | Yearly Totals |               |          |
|---------------------------------------------------|---------------------------------|-------|---------|-----|-------|-------|------|-------|-------|---------------|---------------|----------|
|                                                   | CAFÉ MPG                        | LCFS  | Eq. MPG | f   | $D_i$ | $G_i$ | z    | $D_z$ | $G_z$ | Total Miles   | Total Gallons | 2030 MPG |
| 2016                                              | 34.3                            | .9267 | 37.01   | .3  | 30.0  | .8105 | .04  | 0     | .012  | 32.8          | .7901         | 41.51    |

**Comparing the ZEV Fraction Values of the “Heroic-Measures” (HM) Case to the “Extra-Heroic Measures” (EHM) Case**

Table 8 shows the direct comparison of the ZEV fractions that are ZEV requirements for the HM Case and the EHM Case. The largest differences are highlighted. The EHM case does not appear to be achievable.

**Table 8 HM Case and the EHM Case Which Supports 2005 Per-Capita Driving**

| Cases | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 | 2028 | 2029 | 2030 |
|-------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| HM    | .04  | .07  | .12  | .18  | .24  | .34  | .48  | .62  | .76  | .90  | .95  | .98  | .99  | .99  | .99  |
| EHM   | .04  | .10  | .25  | .40  | .65  | .90  | .95  | .95  | .98  | .98  | .99  | .99  | .99  | .99  | .99  |

## **ACHIEVING THE REQUIRED DRIVING REDUCTION OF THE HEROIC-MEASURES (HM) CASE**

As shown in Equation 14, in 2030, the per-capita driving will need to at least 32% below the 2005 value. As shown in this link, [http://en.wikipedia.org/wiki/SB\\_375](http://en.wikipedia.org/wiki/SB_375), California's Metropolitan Planning Organizations (MPOs) are adopting Region Transportation Plans (RTPs) that will achieve reductions in year 2020 and 2035. As also shown there, the targets, for year 2035, range from 0% for Shasta to 16% for Sacramento Area Council of Governments. Since this is for 2030 instead of 2035, and to be reasonably conservative, it is assumed here that the state will achieve a 10% reduction in per-capita driving, in 2030, compared to 2005. This leaves 22% to be achieved by new programs.

The title of each of the following subsections contains the estimated per-capita driving reduction each strategy will achieve, by 2030.

### **Reallocate Funds Earmarked for Highway Expansion to Transit and Consider Transit-Design Upgrades (3%)**

San Diego County has a sales tax measure called "TransNet", which allocates one-third for highway expansion, one-third for transit, and one-third for road maintenance. It has a provision that allows for a reallocation of funds, if supported by at least two-thirds of SANDAG Board members, including a so-called weighted vote, where governments are given a portion of 100 votes, proportional to their population. It is hereby proposed to reallocate the TransNet amount, earmarked for highway expansion, to transit and to do similar reallocations throughout California.

This money could be used to fund additional transit systems; improve transit operations; and/or the redesign and implementation of the redesign of existing transit systems. The redesign could include electrification and automation or even upgrading to a different technology.

### **A Comprehensive Road-Use Fee Pricing and Payout System to Unbundle the Cost of Operating Roads (7.5%)**

*Comprehensive* means that pricing would be set to cover all costs (including road maintenance and externalities such as harm to the environment and health); that privacy and the interests of low-income drivers doing necessary driving would be protected; that the incentive to drive fuel-efficient cars would be at least as large as it is under the current fuels excise tax; and, as good technology becomes available, that congestion pricing is used to protect critical driving from congestion.

The words *payout* and *unbundle* mean that some of the money collected would go to people that are losing money under the current system.

User fees (gas taxes and tolls) are not enough to cover road costs<sup>10</sup> and California is not properly maintaining its roads. Reference 10 shows that in California user fees amount to only 24.1% of what is spent on roads. Besides this, the improved mileage of the ICEs and the large number of ZEVs needed mean that gas tax revenues will drop precipitously.

This system could be used to help reduce the ICE LDV miles driven in 2016 to 2022, as shown in the "f" column of Tables 6 and 7. This system could probably be implemented in less than 5 years.

## **Unbundling the Cost of Car Parking (7.5%)**

Unbundling the cost of car parking<sup>11</sup> throughout California is conservatively estimated to decrease driving by 7.5%, based on Table 1 of Reference 11. That table shows driving reductions resulting from introducing a price for parking, for 10 cases. Its average reduction in driving is 25% and its smallest reduction is 15%.

## **Good Bicycle Projects and Bicycle Traffic Skills Education (3%)**

The best criterion for spending money for bicycle transportation is the estimated reduction in driving per the amount spent. The following strategies may come close to maximizing this parameter.

### ***Projects to Improve Bicycle Access***

All of the smart-growth neighborhoods, central business districts, and other high trip destinations or origins, both existing and planned, should be checked to see if bicycle access could be substantially improved with either a traffic calming project, a “complete streets” project, more shoulder width, or a project to overcome some natural or made-made obstacle.

### ***League of American Bicyclist Certified Instruction of “Traffic Skills 101”***

Most serious injuries to bike riders occur in accidents that do not involve a motor vehicle<sup>12</sup>. Most car-bike accidents are caused by wrong-way riding and errors in intersections; the clear-cut-hit-from-behind accident is rare<sup>12</sup>.

After attending *Traffic Skills 101*, students that pass a rigorous written test and demonstrate proficiency in riding in traffic and other challenging conditions could be paid for their time and effort.

As an example of what could be done in San Diego County, if the average class size was 3 riders per instructor and each rider passes both tests and earns \$100 and if the instructor, with overhead, costs \$500 dollars, for a total of \$800 for each 3 students, that would mean that \$160M could teach  $\$160M/\$800 = 200,000$  classes of 3 students, for a total of 600,000 students. The population of San Diego County is around 3 million.

## **Eliminate or Greatly Increase the Maximum Height and Density Limits Close to Transit Stops that Meet Appropriate Service Standards (2%)**

As sprawl is reduced, more compact, transit-oriented development (TOD) will need to be built. This strategy will incentivize a consideration of what level of transit service will be needed, how it can be achieved, and what levels of maximum height and density are appropriate. Having no limits at all is reasonable if models show that the development can function without harming the existing adjacent neighborhoods, given the level of transit service and other supporting transportation policies (such as car parking that unbundles the cost and supports the full sharing of parking<sup>11</sup>) that can be assumed.

## **Net Driving Reduction from All Identified Strategies**

By 2030, the sum of these strategies should be realized. They total 23%, resulting in a 1% margin over the needed 22% (which is added to the existing 10% to get the needed 32%.)

## ADDITIONAL ELECTRICITY REQUIRED

The URL [http://www.energy.ca.gov/2013\\_energypolicy/documents/2013-06-26\\_workshop/presentations/09\\_VMT-Bob\\_RAS\\_21Jun2013.pdf](http://www.energy.ca.gov/2013_energypolicy/documents/2013-06-26_workshop/presentations/09_VMT-Bob_RAS_21Jun2013.pdf) shows that Californians drove about 325 Billion miles per year, from 2002 to 2011. This value can be multiplied by the 0.84 factor reduction of driving, computed right after the calculation shown in Equation 14, and the fraction of miles driven by ZEVs, shown at the bottom of Table 6, of 0.687 (from 68.7%), to give the 2030 miles driven by ZEVs = 325 Billion x 0.84 x 0.687 = 188 Billion miles per year.

Using the Tesla information here [http://en.wikipedia.org/wiki/Tesla\\_Roadster](http://en.wikipedia.org/wiki/Tesla_Roadster), it is assumed that 21.7 kW-h is used per 100 miles, or 0.217 kW-h per mile. The total energy used per year is therefore 188 Billion miles x 0.217 kW-h = 40,699 GW-h.

<http://www.cpuc.ca.gov/cfaqs/howhighiscaliforniaselectricitydemandandwheredoesthepowercomefrom.htm>, shows that California is using about 265,000 GW-h per year. Therefore the electricity needed to power California's HM ZEV LDF fleet in 2030 is 100% x 40,648/265,000 = 15.34% of the amount of electricity California is currently using. Table 4 shows that 80% (r = 0.80, with "r" defined in Table 3) of electricity must be generated without producing CO<sub>2</sub>. This estimated 15.34% increase in demand should help the California Public Utilities Commission (CPUC) and the California Energy Commission (CEC) with their planning.

## COMPARISON WITH CALIFORNIA AIR RESOURCES BOARD (CARB) PLANNING

The following quote<sup>13</sup> allows us to compare the CARB plan for LDVs with what would be required to stabilize the climate at a livable level, in the form of the Heroic Measures case:

*Regulations on the books in California, set in 2012, require that 2.7 percent of new cars sold in the state this year be, in the regulatory jargon, ZEVs. These are defined as battery-only or fuel-cell cars, and plug-in hybrids. The quota rises every year starting in 2018 and reaches 22 percent in 2025. Nichols wants 100 percent of the new vehicles sold to be zero- or almost-zero-emissions by 2030*

Table 9 shows the values implied by this statement and compares them to the HM values. Table 10, which is similar to Tables 6 and 7, computes the overall mileage of the 2030 fleet, using the CARB values.

### Computing the Heroic-Measures (HM) Case Per-Capita and Net Driving Factor Requirements, Based on the Result Shown in Table 10

Plugging the

- equivalent MPG of the LDV fleet in Year 2030, taken from the bottom of Table 10, which is 74.25 MPG, and
- the MPG of the LDV fleet in Year 2015, taken from the bottom of Table 2, which is 27.63 MPG,

into Equation 8, gives the following result:

$$\frac{d_{2030}}{d_{2005}} = 0.1687 * \frac{m_{2030}}{m_{2015}} = 0.1687 * \frac{74.25}{27.63} = 0.45 \quad (\text{Eq. 16})$$

**Table 9 Zero Emission Vehicle (ZEV) % of Fleet, for Two Cases**

| Year | CARB  | Heroic Measures | Year | CARB   | Heroic Measures |
|------|-------|-----------------|------|--------|-----------------|
| 2016 | 2.7%  | 4.0%            | 2024 | 19.6%  | 76.0%           |
| 2017 | 2.7%  | 7.0%            | 2025 | 22.0%  | 90.0%           |
| 2018 | 5.1%  | 12.0%           | 2026 | 37.6%  | 95.0%           |
| 2019 | 7.5%  | 18.0%           | 2027 | 53.2%  | 98.0%           |
| 2020 | 9.9%  | 24.0%           | 2028 | 68.8%  | 99.0%           |
| 2021 | 12.4% | 34.0%           | 2029 | 84.4%  | 99.0%           |
| 2022 | 14.8% | 48.0%           | 2030 | 100.0% | 99.0%           |
| 2023 | 17.2% | 62.0%           |      |        |                 |

This means that the per-capita driving will need to be about 55% less in 2030 than in year 2005. The net driving can be computed by multiplying the per-capita driving, 0.45, by the population factor of 1.2305, computed in Equation 7, resulting in 0.55. This means that, even with the 23% increase in California’s population, the net driving will have to drop by 45%. If CARB wants the LDV sector to achieve a reasonable climate-stabilizing target, it will need to require ZEV adoption profile closer to the Heroic Measures Case. The adoption profile they have now will required a reduction in driving that will probably be very difficult to achieve.

## CONCLUSION

A requirement set named “Heroic Measures” (HM) is quantified. Table 8 shows that the HM LDV efficiency requirements are much easier to achieve than those needed to allow per-capita driving to remain close to its 2005 level, which has been quantified as the “Extra Heroic Measures Case”. Strategies to achieve the required HM driving reductions are also allocated and described. They are perhaps about as difficult as achieving the HM LDV fleet efficiency. It is computed that the 2030 fleet of LDV HM ZEVs would require an amount of electricity which is equal to about 15% of what California is using today. The current CARB plan for ZEV adoption is shown to require a very large reduction in driving if LDVs are to achieve a climate-stabilizing target.

**Table 10 Calculation of 2030 LDV Mileage Assuming the CARB Values**

| Year                                              | ICE Parameters and Calculations |       |         |     |       |        | ZEVs |       |       | Yearly Totals |               |          |

# Modern Roundabouts

Reduce congestion and improve safety on main roads

## What is a “Modern Roundabout?”

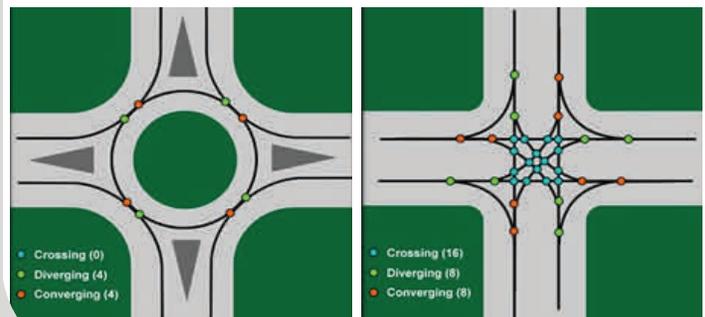

A modern roundabout is a circular intersection in which vehicles travel counterclockwise around a center island. Unlike large traffic circles or rotaries of the past, modern roundabouts are easy to navigate, environmentally friendly, attractive, and safe. Raised “splitter islands” induce arriving drivers to slow down prior to entering the intersection, and provide a refuge island for crossing pedestrians. Entering vehicles yield to traffic already in the roundabout.

Photo: SANDAG

## Why are roundabouts so much safer?

Roundabouts reduce both speed and the number of “conflict points,” from 32 to 8 (see figure).<sup>4</sup> Crashes in roundabouts are also less severe; converting intersections from signals to roundabouts reduces injury crashes by 80% and all crashes by 50%.<sup>4</sup> Severe injuries are rare; a study of 23 conversions found a 76% decrease in injury crashes and an 89% reduction in fatalities.<sup>5</sup> Bicyclists and pedestrians of different skills levels are safely accommodated in roundabouts, although visually impaired pedestrians may require special treatments.<sup>6</sup>

## How do roundabouts improve traffic flow?

Unlike signals, roundabouts keep traffic moving. Since the capacity of a street is greatly influenced by its intersections, reducing the number of stops increases road capacity, which improves traffic flow. As a result, fewer lanes are required, which has multiple safety, capacity, and cost benefits. On La Jolla Blvd. in San Diego (photos), five roundabouts allowed the City to shrink the street and widen the sidewalks, providing outdoor dining and meeting places, with less traffic noise.

## How do roundabouts improve air quality?

By reducing vehicle idling, roundabouts significantly decrease fuel consumption and emissions.

- On La Jolla Blvd. each roundabout is estimated to annually save 20,000 gallons of gasoline,<sup>1</sup> avoiding 9.9 lbs. of particulate pollution.<sup>2</sup>
- One roundabout can eliminate 189 metric tons of CO<sub>2</sub>e emissions annually, equivalent to 37 cars.<sup>1,3</sup>
- Installing 320 roundabouts in San Diego could reduce CO<sub>2</sub>e emissions by 60,480 metric tons annually — equal to the annual emissions of 10,900 cars.<sup>1,2</sup>

## How much do roundabouts cost?

As of 2014, the installation cost of a roundabout was around \$1 million, while traffic signals typically cost \$600,000. However, long-term costs for roundabouts are lower since little maintenance and no electricity are required. Costs of traffic crashes are also greatly reduced.

## Do drivers prefer roundabouts?

Until recently, roundabouts were unfamiliar to Americans. But drivers favor roundabouts once they become familiar with them. A 2002 study of roundabout conversions in three communities found that only 36% of drivers supported roundabouts before they were constructed, but 70% favored them one year after construction.<sup>8</sup>

# Traffic Circles

Reduce harmful emissions while improving neighborhoods

## What is a traffic circle?

Traffic circles (or “mini-roundabouts”) are circular intersection islands similar to modern roundabouts, usually installed in **2-lane streets**. Unlike with roundabouts, the approach islands (“splitter islands”) are painted rather than raised.<sup>1</sup>

Large vehicles such as buses and fire trucks can comfortably navigate traffic circles, improving safety and reducing noise on residential streets.

## How much do traffic circles improve safety?

The Institute of Transportation Engineers found traffic circles reduce intersection collisions 70%.<sup>5</sup> Similarly, the City of Seattle studied 130 sites and found a 73% decrease.<sup>6</sup> These results stem from the sideways routing (“horizontal deflection”) of the travel path, which eliminates dangerous crash types such as head-on, left turn, and right angle crashes,<sup>7</sup> and discourages speeding. In Portland, traffic circles virtually eliminated speeds over 35 mph, where before, 15% or more of traffic exceeded 35 mph.<sup>8</sup> Traffic circles are unexpected, so proper signage and markings are important.

Old and new traffic circles, in Del Mar and North Park, respectively.

## What are the main advantages of traffic circles?

Traffic circles are a relatively low-cost intervention to reduce traffic speeds and intersection crashes.<sup>2</sup> Although the geometry of the center island reduces speeds, it need not reduce the access of large trucks and emergency vehicles (above photo). To handle especially long trucks and busses, the center island typically includes a mountable “apron” less than four inches high that rear wheels can pass over.<sup>3</sup> However, the island must be large enough to prevent vehicles from making left turns in front of it. In addition to increasing safety, traffic circles provide a space for vegetation, public art, or a neighborhood identity sign.<sup>2</sup> However, it is important to consider how ongoing watering or maintenance costs will be funded.

**Cost:** On average \$10,000 — \$25,000, excluding costs of landscaping.<sup>4</sup>

## How do traffic circles reduce auto emissions?

One gallon of gasoline burned by an average San Diego vehicle produces 17.5 lb CO<sub>2</sub>, 45.4g CO, 11.3g NO<sub>x</sub>, and 4.5g VOC.<sup>9</sup> Like roundabouts, traffic circles used in place of stop signs or signals reduce these emissions two ways:

- (1) Reducing starts and stops: In one study, small roundabouts were found to reduce CO by 29%, NO<sub>x</sub> by 21% and greenhouse gases by 28%.<sup>10</sup> The town of Carmel, Indiana, has converted over half its intersections to roundabouts or traffic circles, with an estimated average savings of 24,000 gallons of fuel (and accompanying emissions) per intersection per year.<sup>11</sup>
- (2) Calming neighborhood traffic: Data show residents walk<sup>12</sup> or bike more — replacing some vehicle trips — when cars drive slower in their neighborhood.

San Diego, CA 92123-1666

Re: Comments Regarding the Draft Climate Action Plan and Related Documents

Dear Ms. Lowe:

The San Diego & Imperial Counties Chapter of the Sierra Club (the “Sierra Club” or the “Chapter”) respectfully requests that the Draft County of San Diego Climate Action Plan (“Draft CAP”), the Draft Guidelines for Determining Significance: Climate Change (“Draft Significance Thresholds”), and the Draft Report Format and Content Requirements: Greenhouse Gas Analyses and Reporting (“Draft GHG Report Requirements”) be returned to staff for revisions and subsequent recirculation before presentation to the Board of Supervisors for consideration at a public hearing.

In failing to require greenhouse gas (“GHG”) reductions past 2020 projections, the County Draft CAP, Draft Significance Thresholds, and Draft GHG Report Requirements, if adopted, will themselves contribute to the ultimate human catastrophe: climate destabilization.

Additionally, the County has failed to keep its own promises to the people – promises made just last year in the 2011 County of San Diego General Plan Update Environmental Impact Report (“General Plan EIR”).

As set forth below, the Draft CAP does not meet its stated goals of (1) complying with General Plan EIR Mitigation Measure CC-1.2 or Assembly Bill 32 (“AB 32”); or (2) mitigating the impacts of climate change consistent with the reduction requirements contained in Executive Order S-3-05 (“the Executive Order”).<sup>1</sup>

To make matters worse, and instead of contributing to the solution, the Draft Significance Thresholds and the Draft Report Requirements serve to further exacerbate the devastating impacts of climate change by purporting to limit California Environmental Quality Act (“CEQA”) review – and therefore consideration of mitigation measures and alternatives - based on thresholds that do nothing to avoid dangerous anthropogenic interference (“DAI”) within the climate system.

---

<sup>1</sup> In addition, the Draft CAP does not mitigate the impacts of climate change consistent with the California Environmental Quality Act (“CEQA”) Guidelines, allow lead agencies to adopt a plan or program that addresses the cumulative impacts of a project, or provide a mechanism that subsequent projects may use as a means of addressing GHG impacts under CEQA.

For this reason, adoption of the Draft Significance Thresholds and the Draft Report Requirements themselves would have adverse environmental impacts that have not been analyzed by the County as required by CEQA.

I. **THE DRAFT CAP DOES NOT COMPLY WITH THE REQUIREMENTS OF MITIGATION MEASURE CC-1.2 OR AB 32.**

The General Plan EIR identified significant impacts related to GHG emissions and was adopted based on findings that the mitigation measures identified and described therein would be implemented. Specifically, in certifying the General Plan EIR, the Board of Supervisors made findings that Mitigation Measure CC-1.2 would mitigate potentially significant climate change impacts to a level below significance:

**CC-1.2 requires the preparation of a County Climate Change Action Plan within six months from the adoption date of the General Plan Update. The Climate Change Action Plan will include a baseline inventory of greenhouse gas emissions from all sources and more detailed greenhouse gas emissions reduction targets and deadlines. The County Climate Change Action Plan will achieve comprehensive and enforceable GHG emissions reduction of 17% (totaling 23,572 MTCO<sub>2</sub>E) from County operations from 2006 by 2020 and 9% reduction (totaling 479,717 MTCO<sub>2</sub>E) in community emissions from 2006 by 2020. Implementation of the Climate Action Plan will contribute to meeting the AB 32 goals, in addition to the state regulatory requirements...**

General Plan EIR, Finding A-37, Attachment H-1, p. 71-72. Mitigation Measure CC-1.2 states as follows, and requires the County to:

**Prepare a County Climate Change Action Plan with an update baseline inventory of greenhouse gas emissions from all sources, more detailed greenhouse gas emissions reduction targets and deadlines; and a comprehensive and enforceable GHG emissions reduction measures that will achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020. Once prepared, implementation of the plan will be monitored and progress reported on a regular basis.**

General Plan EIR, p. 7-80.

The Draft CAP is not the County Climate Change Action Plan contemplated by Mitigation Measure CC-1.2. As set forth below, the Draft CAP: (A) does not provide an updated baseline inventory; (B) does not provide detailed reduction targets and deadlines; (C) does not contain “comprehensive and enforceable GHG emissions reduction measures”; (D) does not “achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emission between 2006 and 2020”; and (E) precludes meaningful monitoring and reporting.

**A. THE DRAFT CAP DOES NOT PROVIDE AN UPDATED BASELINE INVENTORY.**

Mitigation Measure CC-1.2 required that County “Prepare a County Climate Change Action plan with an update baseline inventory of greenhouse gas emissions from all sources...” but the Draft CAP does not provide such an updated inventory. Instead, the Draft Cap appears to use 2005 and 2006 baselines that were already in existence at the time Mitigation Measure CC-1.2 was adopted.

**B. THE DRAFT CAP DOES NOT PROVIDE MORE DETAILED REDUCTION TARGETS AND DEADLINES.**

Mitigation Measure CC-1.2 required that the County “Prepare a County Climate Change Action plan with...more detailed greenhouse gas emissions reduction targets and deadlines...” but the Draft CAP in fact provides *less* detailed targets and deadlines than provided in AB 32 and the Executive Order.

The Draft CAP appears to ignore certain requirements of AB 32 as interpreted by the County’s own data. For example, the County’s position is that, “To achieve AB 32’s 2020 target, community-wide emissions would have to be reduced by 479,717 MT CO<sub>2</sub>e from 2006 levels. **A 9% reduction from 2006 levels is necessary to achieve 1990 levels...**” General Plan EIR, CEQA Findings Regarding Significant Effects, Attachment A, p.2. The Draft CAP does not distinguish between community emissions reductions and County emissions reductions and omits any reference to the 9% community reductions set forth in Mitigation Measure CC-1.2.

Instead, the entirety of the established targets and deadlines appears to be “15% below 2005 levels by 2020.” Draft CAP, p. 20. The Draft CAP in fact recognizes that to be on track to meet the goals of the Executive Order emissions reductions would have to be 49% below 2005 levels by 2035; and that the Draft CAP does not meet that goal. Draft CAP, p. 49.

As if an excuse, the Draft CAP states that only “current technology and existing state and federal regulations” are considered. Draft CAP, p. 49. Notwithstanding that there is no excuse for contributing to climate destabilization, the Draft CAP makes inaccurate assumptions and statements with respect to currently available solutions. For example, in assuming it cannot meet the Executive Order requirements, the Draft CAP must be presuming it will not meet the regulatory goals already established by the California Public Utilities Commission. If the County were to meet the already established California Energy Efficiency Strategic Plan goals for 2020, GHG emissions from stationary electricity usage would drop 50% by 2020 compared to a 2008 baseline year. See Attachment 1. The GHG reduction would exceed 80% by 2030 if the same pace of zero net energy building retrofits is assumed in the 2020-2030 timeframe. See Attachment 2. Currently available transportation related GHG reduction solutions are presented in the Appendix. See also Attachments 5-7.

**C. THE DRAFT CAP DOES NOT PROVIDE COMPREHENSIVE AND ENFORCEABLE GHG EMISSIONS REDUCTION MEASURES.**

It was no mistake that Mitigation Measure CC-1.2 used language like “comprehensive,” “enforceable,” and “will achieve.” Proposed mitigation measures are required by law to be “fully enforceable.” Cal. Pub. Res. Code § 21081.6(b); Guidelines § 15126.4(a)(2). Mitigation measures must be definite and defined so that their effectiveness is ascertainable. See, e.g., *San Franciscans for Reasonable Growth v. City & County of San Francisco*, 151 Cal.App.3d 61, 79 (1984).

Instead of “achieving” the reductions set forth in Mitigation Measure CC-1.2 and required by law, the Draft CAP concedes that it “does not ensure reductions...” Draft CAP, p. 69. In addition, the Draft CAP uses language such as “addressing,” “informing and inspiring meaningful GHG reductions,” and “Allow lead agencies to adopt a plan or program that addresses the cumulative impacts of a project.” These vague statements should be replaced with mandatory requirements that actually produce results.

The CAP provides seventeen GHG reduction measures that the drafters conclude will allow the County to achieve the goal of reducing emissions to 15% below 2005 levels by 2020. Draft CAP, p. 22. However, the measures do not explain the strategies that will be implemented, they do not provide cost breakdowns, they do not describe any incentives, they do not set forth specific mechanisms for monitoring each measure, and they do not explain the role of each implementation partner listed.

For example, measure E1, Energy-Efficient New Development, states that the County will “use incentives to encourage builders to exceed current energy efficiency standards by 15%.” Draft CAP, p. 29. What incentives? It then states there are also educational programs that “will create the educated and experienced workforce that is needed to take advantage of the County’s Green Building Incentive program.” *Ibid.* Where is the description of the County’s Green Building Incentive program? Who will participate in the educational program? How will the program be implemented or monitored? E1 also neglects to explain the likelihood of securing funding from the listed “Potential Funding Sources” and how instrumental are each to the success of the measure. *Ibid.* In addition, the measure does not indicate the roles of each implementation partner. *Ibid.* Without this important information, how could the County accurately determine the GHG reductions anticipated from this measure or the participation rate? All these things must be considered in order to provide full information and demonstrate enforceability to achieve acceptable mitigation under CEQA.

The Draft CAP concedes that some of the strategies provided in will not yield quantifiable emissions reductions. Draft CAP, p. 22. The strategies that will not yield quantifiable emissions reductions are not, and must be, identified. There is no information about the percentage of reductions that do not yield quantifiable emissions reductions, and there is therefore no way to analyze their effect on the requirements of Mitigation Measure CC-1.2.

In summary, the Draft CAP does not provide comprehensive and enforceable mechanisms that will actually reduce GHG emissions. With inadequate reduction measures it is far from clear whether or not the Draft CAP will achieve the County GHG emissions reduction target of 15% below 2005 levels by 2020. Further, with an ambiguous reduction target, it is not possible to determine that such a target will be sufficient even to comply with AB 32.

**D. THE DRAFT CAP DOES NOT PROVIDE COMPREHENSIVE REDUCTION MEASURES THAT WILL ACHIEVE A 17% REDUCTION IN EMISSIONS FROM COUNTY OPERATIONS AND A 9% REDUCTION IN COMMUNITY EMISSIONS.**

Mitigation measure CC-1.2 requires the CAP to achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020. As set forth above, the Draft CAP does not actually achieve *any* emission reductions. In addition, the CAP only gives one emissions reduction target - 15% below 2005 levels by 2020.

Nowhere in the Draft CAP is there a reference to reducing “9% community emissions between 2006 and 2020.” Moreover, the terms “County” and “community” are used in the General Plan EIR, “municipal” and “community” are used in Attachment A to General Plan EIR Attachment H-1 (“Attachment A”), and just “County” is used in the Draft CAP. See e.g. Attachment A, p. 3. The inventory update in Attachment A says the *community* baseline year is changed to 2005, however, the 2005 baseline year used in the Draft CAP is for the *County*. No explanation is provided for the absence of the “9% reduction between 2006 and 2020” requirement of Mitigation Measure CC-1.2 in the Draft CAP.

#### **E. THE CAP MONITORING PROGRAM PRECLUDES EFFECTIVE IMPELEMENTATION.**

The Draft CAP also fails to provide for effective implementation. Mitigation Measure CC-1.2 requires that, “Once prepared, implementation of the plan will be monitored and progress reported on a regular basis.” The inadequate Draft CAP itself concedes that, “it is imperative to monitor progress toward the goals set in CAP and to revisit and update the CAP periodically.” Draft CAP, p. 69. However, the proposed monitoring tool that can “track progress between inventories and examine effectiveness of specific measures” and is contemplated to be “revisited periodically to reflect any changes in emissions projections or reduction potential,” neglects to define “periodically.” *Ibid*. In addition, the monitoring section of the CAP does not explain how the County will “coordinate monitoring efforts at the community and local government levels,” which seems to be the key to the success of the program. *Ibid*. Without full participation and information from those implementing the Draft CAP, as well as those affected by the Draft CAP measures, the monitoring system will not receive the necessary and relevant information to make an assessment about the progress of implemented measures.

#### **II. THE DRAFT CAP DOES NOT COMPLY WITH THE EXECUTIVE ORDER**

The Governor’s Executive Order S-3-05 states:

**[T]he following greenhouse gas emission reduction targets are hereby established for California: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce GHG emissions to 1990 levels; by 2050, reduce GHG emissions to 80 percent below 1990 levels**

The CAP acknowledges the targets established in the Executive Order and the developed emissions forecasts for 2035 necessary to reach 2050 GHG emissions reductions. Draft CAP, p. 20. The Draft CAP explains that reductions “would need to reach 49% below 2005 levels by 2035, based on emissions forecasts for 2035 and 2050 under BAU conditions, to meet the 2050 goal.” *Ibid*. However, after expressing dedication to meeting legislative goals and the need to look beyond 2020 deadlines, and determining reduction targets for 2035 and 2050, the CAP stops short. Draft CAP, p. 49, 52. The Draft CAP utilized the same measures developed for 2020 scenario for the 2035 scenario, with the only change being an increase in rates of participation. Draft CAP, p. 49. This planning only yields a potential reduction of 13.7% below 2005 levels by 2035 and “does not achieve the 49% reduction target.” *Ibid*.

The scientific community recognizes that DAI within the climate system will not be avoided by 2020 reductions alone. See Attachments 3, 4. As set forth above, the Draft CAP inaccurately states that “current technology and existing state and federal regulations” are considered. Draft CAP, p. 49. Regulatory goals already established by the California Public Utilities Commission provide current solutions and guidance to achieve 2035 and 2050

reductions. See Attachments 1, 2. Similarly, currently available transportation related GHG reduction solutions are presented in the Appendix, in which specific comments are provided and inadequacies explained. See also Attachments 5-7.

**III. THE DRAFT SIGNIFICANCE THRESHOLDS AND THE DRAFT REPORT REQUIREMENTS, AS DRAFTED, WILL CONTRIBUTE TO CLIMATE DESTABILIZATION AND ARE SUBJECT TO CEQA.**

Instead of trying to avoid DAI within the climate system, the Draft Significance Thresholds and Draft Report Requirements serve to further exacerbate the devastating impacts of climate change.

The CEQA Guidelines explained that lead agencies may adopt thresholds of significance for use in environmental review but that the thresholds must be supported by substantial evidence:

- (a) Each public agency is encouraged to develop and publish thresholds of significance that the agency uses in the determination of the significance of environmental effects. A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant.
- (b) Thresholds of significance to be adopted for general use as part of the lead agency's environmental review process must be adopted by ordinance, resolution, rule, or regulation, and developed through a public review process and be supported by substantial evidence.
- (c) When adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.

CEQA Guidelines § 15064.7. Here, there is no substantial evidence that supports adoption of the Draft Significance Thresholds and Draft Report Requirements which do not even purport to provide for emissions reductions past 2020 targets. The scientific of climate change reveals that 2020 targets are insufficient to avoid DAI within the climate system. Adoption of the Draft Significance Thresholds and/or the Draft Report Requirements will therefore themselves adversely impact the environment. An EIR would be required before either or both could be adopted.

CEQA Guideline section 15064.4, entitled, Determining the Significance of Impacts from Greenhouse Gas Emissions, provides additional guidance for determining GHG impact significance:

- (a) The determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in section 15064. A lead agency should make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion

to determine, in the context of a particular project, whether to:

(1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use. The lead agency has discretion to select the model or methodology it considers most appropriate provided it supports its decision with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use; and/or

(2) Rely on a qualitative analysis or performance based standards.

(b) A lead agency should consider the following factors, among others, when assessing the significance of impacts from greenhouse gas emissions on the environment:

(1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;

(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.

(3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project.

Again, as set forth above, there has been no effort based on existing scientific and factual data to calculate the GHG emissions that would result from adoption of the Draft Significance Thresholds or the Draft Report Requirements. To the contrary, existing scientific and factual data reveals that thresholds that do not meet 2035 requirements are insufficient. See Attachment 3, Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group Meeting #15, p. 2. As set forth and referenced in the attached letter from the Center for Biological Diversity, not even compliance with the Executive Order will avoid dangerous anthropogenic interference with the climate system. See Attachment 4. Failing to address emissions reductions past 2020 necessarily renders the Draft Significance Thresholds and Draft Report Requirements insufficient.

I have attached an appendix and seven (7) documents, which are incorporated by reference as part of our comments on the County's proposed plan. This letter, its appendix and the incorporated documents must be included in any review of your plan. We request written responses to each and every comment made in this submission. Please notice our organization at the above address of any further processing of this plan or meetings on this plan.

Thank you for your fine staff work and including us in this process.

Respectfully submitted,

*/s/ John Stump*

**The San Diego Chapter of the Sierra Club is San Diego's oldest and largest grassroots environmental organization, founded in 1948. Encompassing San Diego and Imperial Counties, the San Diego Chapter seeks to preserve the special nature of the San Diego and Imperial Valley area through education, activism, and advocacy. The Chapter has over 14,000 members. The National Sierra Club has over 700,000 members in 65 Chapters in all 50 states, and Puerto Rico.**

## **APPENDIX**

### **Summary**

Improvements to Chapters 1 and 2 are given. Chapter 2 suggestions include computing the driving reductions needed to achieve the S-3-05's trajectory by 2035. Feasible mitigation measures would eliminate congestion, improve air quality, increase social equity, and empowering people to make meaningful decisions both about methods of transit and how to spend their hard earned dollars.

### **Qualifications**

Understanding the relationship between global warming and transportation requires mathematics. The Chapter Transportation Chair, Mike Bullock, a contributor to this letter and drafter of this Appendix, has a BSEE degree and a Masters of Science, Engineering (MSE) degree. He worked for 36 years at Lockheed Martin, in Sunnyvale. For the last 20 years there, he worked as a satellite-systems engineer. One of his responsibilities was to develop equations and methods to measure and then compensate out, through satellite database upload, the misalignments of the key antennas on the MILSTAR communication satellite.

### **Specific Comments on the Draft CAP**

#### **1.1 Comments on the Draft CAP's Purpose**

The Attorney General Office's (AG's) excellent letter found at [http://ag.ca.gov/cms\\_attachments/press/pdfs/n2056\\_santa\\_clarita\\_letter.pdf](http://ag.ca.gov/cms_attachments/press/pdfs/n2056_santa_clarita_letter.pdf) compels a high standard of specificity. This CAP must identify the needed GHG reductions and show how those needed reductions will be achieved.

The words, "informing and inspiring meaningful GHG reductions" should be replaced with "achieving meaningful GHG reductions."

The first sentence on the top of the right column should include the *regional* level. SANDAG's RTP2050 is a \$214B dollar plan, with direct impacts on GHG emissions. SANDAG's work should not be ignored.

Table 1.1 should be labeled so the reader understands the year of the reductions. If the year is 2020, a similar table is needed for 2035.

#### **1.3 Comments on the Greenhouse Effect**

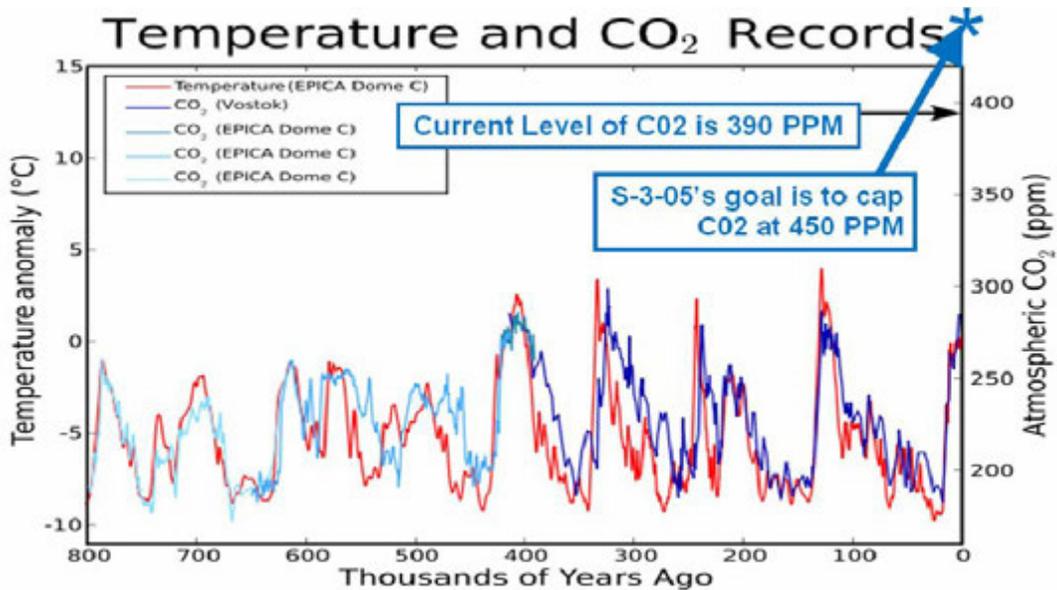

This section fails to inform the reader of the urgency and extreme danger posed by our climate crisis. The June 2008 issue of *Scientific American* (*The Ethics of Climate Change*, by Professor John Broome) reports that the levels of GHG expected in 20 years will result in a 5% chance of a 14.4 degree Fahrenheit increase in the earth's temperature and this would be an "utter catastrophe" and create the possibility of a "devastating collapse of the human population, perhaps even to extinction".

The plot shown on Page 6 fails to show the historic temperature profile. For that information, it is necessary to also show Figure 1 and 2. They are well known. Note that the 450 PPM value is shown. That would be the peak level of atmospheric CO<sub>2</sub>, if the world achieves the S-3-05 trajectory. That peak value would occur in year 2050 and then the atmospheric level of CO<sub>2</sub> would gradually be brought down to less-dangerous levels.

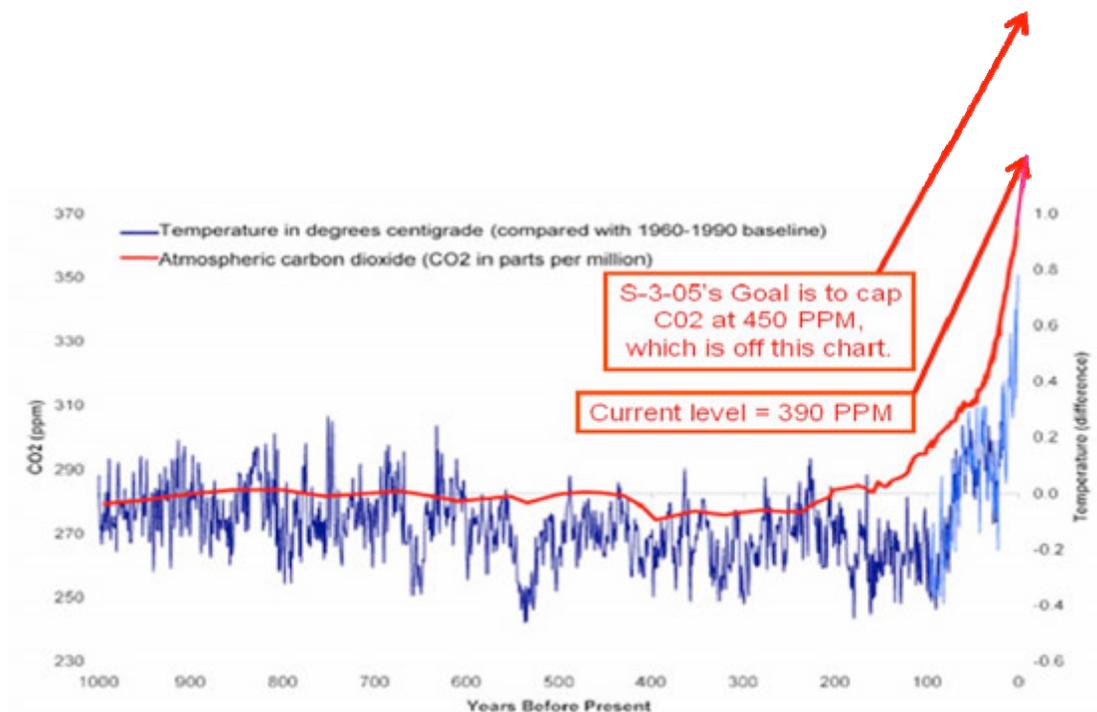

Figure 1 shows that the CO<sub>2</sub> levels shown on your Page-6 plot, which are 400 PPM up to 1000 PPM, correspond to temperatures of well over 10 degrees Centigrade. Such temperatures would risk a catastrophic collapse of the human population, to include the eventual extinction of our species. There are no adaptation strategies that could deal with such an event.

Figure 2 clearly shows that, although the temperature rise is somewhat masked by solar activity, underneath that relatively high frequency temperature variation, the temperature rise, which is due to the trapped heat caused by the higher-than-normal CO<sub>2</sub>, is already taking place. The trapped heat's effect on our atmosphere will be delayed as it melts ice and warms the ocean. We must at least achieve the S-3-05 trajectory.

**Figure 1 Atmospheric CO<sub>2</sub> and Mean Temperature, 800,000 Years Ago, with 450 PPM CO<sub>2</sub> Shown**

**Figure 2 Atmospheric CO2 and Mean Temperature, Over the Last 1,000 Years**

Attachment 3, also available at <http://www.aqmd.gov/ceqa/handbook/GHG/2009/april22mtg/CBDcomments.pdf>, has descriptions of the likelihoods of various S-3-05 outcomes, first in terms of temperature rise. Even if we achieve S-3-05, there is a 50% chance that the temperature rise will exceed 2 Degrees Centigrade. A 2 degree Centigrade rise in temperature would have very serious negative consequences, as described. There is a 30% chance that the temperature change would exceed 3 Degrees Centigrade, which is described as “exponentially worse” than the 2-Degrees-Centigrade outcome. And so on. Going above 500 PPM is unthinkable and yet that seems to be exactly what we are doing.

On Page 6 the Draft CAP, failing to meet S-3-05 is described by saying that “climate change will threaten our economic well-being, public health, and environment”. The dangerous and currently out-of-control predicament in fact threatens human extinction. A bullet on Page 7 states that local effects could include “the decline or loss of species”, but does not reveal that our own species is at risk. This sort of over sight continues throughout Pages 8 and 9.

On Page 9 it says, “The extent to which these changes produce negative impacts will depend on actions taken today to ensure resilience in the face of climate change and, where necessary, adaptation to its impacts”. This ignores our responsibility to limit our GHG emissions and the fact that without sufficient and timely limitations, adaptation will not be possible.

#### **1.4 Comments on the “Local Effects of Climate Change” and “Potential Climate Change Health Effects” Sections**

These sections do not describe the severity of our climate crisis.

#### **1.5 Comments on the “Relationship to Other State and County Documents”**

It is crucial that the Draft CAP require strategies that will reduce emissions to levels at least as low as the S-3-05 trajectory.

Table 1.2 is valuable but must be improved in at least the following ways.

The description of S-3-05 needs to contain the following additional sentence: “These targets must be considered as points that define straight-line trajectories. It should also be understood that world-wide emission levels must at least stay beneath these straight lines. The net emissions, over the years, must be limited. The net emission is proportional to the area under these straight lines. Any year that emissions are above the lines creates a surplus that then requires years beneath the lines. The world is currently emitting at levels well above the line between the first two points.

The SB 375 description is incorrect because what the Metropolitan Planning Organization (MPOs) must achieve is GHG reductions that do not include reductions from state programs of cleaner cars and cleaner fuels. This means that the reductions can only be achieved by driving reductions, or, in other words, reducing vehicle miles travelled (VMTs). Therefore, it would be more accurate to simply change the “GHG emissions” words to “VMTs”, to say “VMTs from passenger vehicles must be reduced . . .”

#### **1.6 Comments on the “Scope and Content of the CAP”**

The bullet “Community Measures and Actions” should identify Table 3.2, since it provides the estimated GHG emissions. For example, T2, shown on Page 41, gives the results as a “50% increase in bicycle and pedestrian facilities”; T3 gives “50% of employers using TDM. It is not until Table 3.2 that the reader learns of the GHG reductions. Besides this, the estimated GHG reductions (only from VMT reductions, for cars and light-duty trucks) need to be for years 2035 and 2050, not just 2020 as stated in that bullet.

#### **2.1 Comments on the Draft CAP’s Chapter 2**

#### **2.2 Comments on the “Business-as-Usual Projections”**

Regarding the transportation sector; cleaner cars, cleaner fuels, and other state-transportation programs are out of the County’s direct control but the County can play an important role by seeking improved legislation and rule making. The County’s primary role, in terms of transportation, however, is to reduce VMT. Table 2.3’s BAU should therefore assume the state’s transportation programs will perform as currently estimated but assume VMT will be “BAU”, meaning as currently projected with no county or regional programs to reduce driving.

#### **2.3 Comments on the “GHG Emissions-Reduction Targets”**

We appreciate your recognition of the critical need to meet S-3-05. Given the dire predictions as set forth in Attachment 3 and reference materials therein <http://www.aqmd.gov/ceqa/handbook/GHG/2009/april22mtg/CBDcomments.pdf>, compliance with S-3-05 should be stated as the *minimum* to be accomplished.

The computation of the critical value of 49% below the 2005 value by 2035 should be set forth. This value means that the 2035 emissions need to be  $(.51) \times (2005 \text{ emissions})$ . In Attachment 5, letter from Sierra Club to SANDAG, April 20, 2011, *California Air Resources Board (CARB)*

*Greenhouse Gas (GHG) Reduction Targets, Issued to SANDAG, in Accordance with SB 375, for the Year 2035*) the computation was .525, instead of .51.

Driving reductions needed to achieve 2020 or 2035 reductions are not met. This calculation can only be done by assuming some achieved improvement from cleaner cars and cleaner fuels. The work shown here will repeat the process shown in Attachment 5.

**Overview of Relationships and Derivation of Key Formula**

The S-3-05 net reduction in GHG emissions, from cars and light-duty trucks, expressed as a fraction of 2005 emissions, is obtained by multiplying four factors together. The definitions of Table 1 apply.

**Table 1** Factor Definitions, with Respect to Year 2005

| <b>Factor Definitions</b>                                                                                                                         |                                                                          |
|---------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| <i>All are for for the year of interest, with respect to year 2005 values.<br/>Except for Population, all are for cars and light-duty trucks.</i> |                                                                          |
| <b>f</b>                                                                                                                                          | <b>net factor of the emissions of Greenhouse Gas</b>                     |
| <b>f_Pavley</b>                                                                                                                                   | <b>factor of the average statewide mileage</b>                           |
| <b>f_Fuel</b>                                                                                                                                     | <b>factor of the reduction of GHG due to fuels that burn less carbon</b> |
| <b>f_Population</b>                                                                                                                               | <b>factor of the population in the region of interest</b>                |
| <b>f_PerCapitaVMT</b>                                                                                                                             | <b>factor of per capita driving</b>                                      |

The following equations apply.

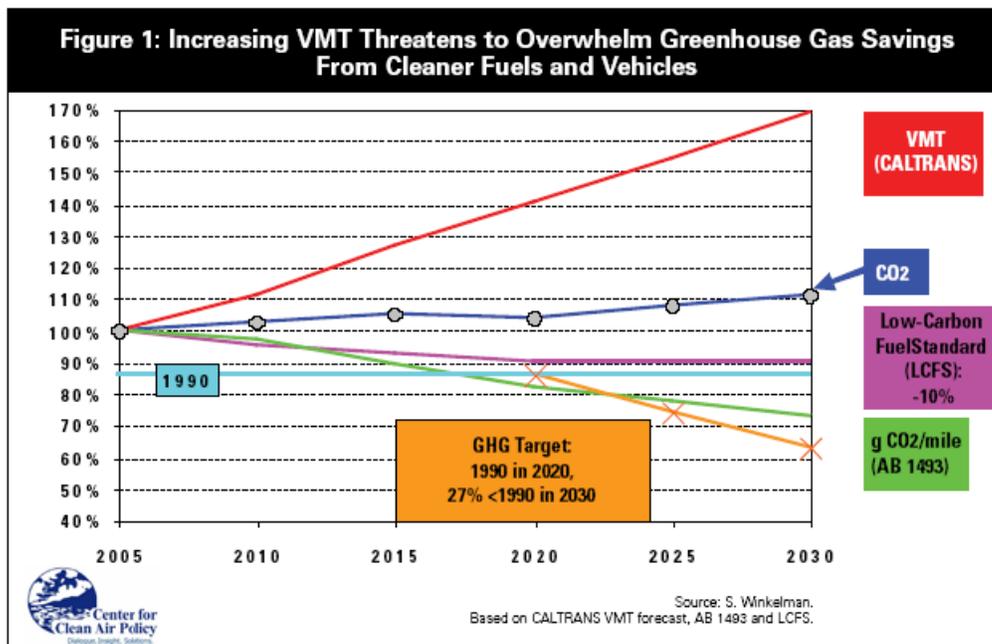

**Eq. 1**  $f = f\_Pavley \times f\_Fuel \times f\_Population \times f\_PerCapitaVMT$

Eq. 2 is derived from Eq. 1.

**Eq. 2**  $f\_PerCapitaVMT = f / (f\_Pavley \times f\_Fuel \times f\_Population)$

Figure 3 is from <http://www.nrdc.org/globalWarming/sb375/files/sb375.pdf>, a widely-respected report on SB 375. Note that all of its values are in the units of factors (same as fraction) of their values in year 2005. Figure 3 will supply all of the needed values, except for the factor of population. (Neither the red line nor the blue line are used.) Its gold line is the S-3-05 trajectory. (CARB ignored this line when it issued the MPO driving-reduction values for year 2035.)

**Figure 3** GHG Reductions from Pavley (AB 1493, in Green); the Low Carbon Fuel Standard (in Purple); the Predicted Driving (VMT, in Red); the Net Result of GHG (CO2, in Blue); and & the S-3-05 Trajectory (in Gold)

**Getting the Net Factor of the Emissions of Greenhouse Gas in 2035, with Respect to 2005 Values**

To get the net factor of the emissions of GHG, for year 2035, with respect to year 2005, it is necessary to extrapolate the Governor’s Executive Order target values (the gold line of Figure 1), out to year 2035. The gold line shows that this factor is 0.87 in 2020 and is 0.64 in 2030. Therefore, in year 2035, the factor will be

$$0.64 + [(.64 - .87) / (2030-2020)] * (2035-2030) = 0.525$$

However, as stated above, the value of .51 will be used, to correspond to your “.49 down” value.

**Getting the Factor of the Average Statewide Mileage in 2035, with Respect to the 2005 Value**

To get the Pavley reduction factor, for Year 2035, it is necessary to extrapolate the average statewide mileage factor data, which is Figure 1’s green line, out to Year 2035. It is 0.82 in 2020 and it is 0.73 in 2030. Therefore, in year 2035 the statewide mileage factor data will be

$$0.73 + [(.73 - .82) / (2030-2020)] * (2035-2030) = 0.685$$

Pavley 1 ends in Year 2017. It is widely assumed that it will be replaced by what is often called “Pavley 2”. The extrapolation computed here is based on the assumption made by the author of Figure 1, as shown in the slope of the green line from year 2020 to 2030. Based on the authoritative credentials of the authors of Figure 1, this is the best assumption that can be made. Assuming that the California fleet will continually get

more efficient, in terms of CO<sub>2</sub> per mile driven, relies on an assumption that a significant fraction of our car owners will be able to purchase newer-model cars.

### **Getting the Factor of the Reduction of GHG Due to Fuels that Burn Less Carbon**

Looking at the purple line of Figure 1, it is clear that this factor will be 0.9 in 2035.

### **Getting the Factor of the Increase in Population**

The factor for population in San Diego County is computed using the populations estimated in CARB's <http://arb.ca.gov/cc/sb375/mpo.co2.reduction.calc.pdf>, namely 3,034,388 people in 2005 and 3,984,753 people in 2035. So the factor, from 2005 to 2035 is  $3,984,753/3,034,388 = 1.313$ . Note that this number will be different for the unincorporated area. If the unincorporated value is larger, the per-capita factor will be smaller and so the needed per-capita reduction in driving will be larger. If the unincorporated value is smaller, the per-capita factor will be larger and so the needed per-capita reduction in driving will be smaller. The net driving change compared to 2005 will be unchanged, regardless of what population growth is assumed.

### **Computing the Required Driving Reduction, for 2035**

The 4 values computed above are used in Eq. 2 to compute the required factor.

$$\text{Eq. 3 } f_{\text{PerCapitaVMT}} = .51 / ( .685 \times 0.9 \times 1.313 )$$

Therefore,  $f_{\text{PerCapitaVMT}} = .630$ . **This corresponds to a 37.0% reduction in per-capita driving, in year 2035, compared to year 2005.**

It is also important to compute the net driving factor and the net driving reduction. The net driving factor is the per-capita driving reduction factor (.630) multiplied by the population factor (1.313).

$$\text{Eq. 4 } f_{\text{netDriving}} = .630 \times 1.313 = .827.$$

**This means that even with more efficient cars, cleaner fuels, and a larger population; the net driving in San Diego County will have to be 17.3% less than in year 2005.**

Therefore, there is absolutely no reason to add highway capacity. The only rational course of action is to shift all the currently-allocated-highway-expansion money to transit expansion.

Please add these important calculations and conclusions to your GHG Emissions-Reduction Targets section.

## **3.0 Comments on the Draft CAP's Chapter 3 Land Use and Transportation Community Measures and Actions, for Year 2035**

Given the large role that the driving of cars and light-duty trucks plays in emitting GHG, the CAP must achieve the year 2035 driving reductions shown at the end of this letter's Section 2.0. This is a per-capita driving reduction of 37.0% and a net driving reduction of 17.3%. Both of these values are with respect to year 2005. Given the large change needed, LU1, T1, T2, and T3 will be insufficient. At least two more transportation "Measures and Actions" will be required.

### **3.1 Comments on LU 1**

This section should be improved. "Near existing and planned transit corridors" should say "Within walking distance of existing and funded transit stops on transit lines with service at or above levels shown to significantly reduce driving reductions and car ownership for those living

within walking distance of its stops.” The “25% of new development” shown in Table 3.2 should be at least 75%. As soon as possible, California needs to implement an equitable and environmentally-sound road use fee pricing system that will unbundle the costs of building roads, of maintaining roads, and of the external economic losses road use imposes on society in general, such as environmental and health costs. This will cause the market to support so-called “smart growth”, mixed-use development over urban sprawl. The County needs to seek legislation to help make this happen.

“Smart” should be defined as “VMT-reducing”. This will allow strategies that are proposed or required at such developments to be evaluated for value. Unbundling the cost of parking should also be developed and required, as described in Reference 3 (Reference 3 was presented by our Transportation Chair in Calgary, Canada, at the Sustainable Land Use and Transportation Session of the Air and Waste Management Association's 103rd Conference and Exposition, in the summer of 2010. It is therefore published and peer reviewed.) This will give consumers, residents and employees more control over their money. It will also reduce driving, as shown in Reference 3's Table 1.

Zoning within the qualifying areas should eliminate density and height limitations, as well as minimum parking requirements. Investors will respect the market limitations as there will be poor demand for developments that don't work for those that buy, rent or lease in such developments. Besides this, when projects are proposed, good modeling will determine functionality. Meeting the relaxed zoning does not have to mean automatic approval. The political process will litigate the tension between neighborhood concerns and the need to reduce driving. The off-street parking ordinance should require that the parking costs are unbundled, using either the method of parking operating as its own profit center or using the methods describe in Reference 3.

### **3.2 Comments on T 1, “Increase Transit Use”**

Many of the comments of Section 3.1 apply. Given that the CAP must achieve the year 2035 driving reductions shown at the end of this letter's Section 2.0; in particular, a net driving reduction of 17.3%, compared to year 2005; the TransNet tax money allocated to highway expansion needs to be reallocated to transit. Although this is a SANDAG Board decision, it should be pointed out by our County Board at every opportunity. However, it is still doubtful that great transit service can be expanded out to cover all of the unincorporated areas, and the unbundling proposals are important.

### **3.3 Comments on T 2, “Increase Walking and Biking”**

Most of this section is valuable. However, its reliance on the regional plans, including the Regional Bicycle Plan, should be reduced and the need to improve those plans should be stated. The primary problem with these plans stems from the reluctance of the SANDAG Board to require that expenditures be ranked on their estimated ability to decrease driving. The ranking should be based on driving reduction per dollar spent. This point has been made many times by our Transportation Chair and it has been ignored by the SANDAG's Board and Executive Director.

### **Education and Projects to Support Bicycle Transportation**

As stated, the criteria for spending money for bicycle transportation should be to maximize the resulting estimated reductions in driving. The following strategies will probably do this.

## Projects

Each of SANDAG's smart growth place types, both existing and planned, shown on SANDAG's well-documented Smart-Growth Concept Map, should be checked to see if bicycle access could be substantially improved with either a traffic calming project, a "complete streets" project, more shoulder width, or a project to overcome some natural or made-made obstacle. These projects should be prioritized using a cost/benefit ratio metric.

It is hereby assumed that 80% of the money available for the Regional Bicycle Plan (over a billion dollars) should be used to fund the projects. They should be selected for implementation, from top of the list (lowest cost/benefit ratio) down, until the money is used up. An example of one of these projects, for the proposed town center near the corner of I-5 and SR-78, is to devise a method to restore the shortest-distance route from Vista Way to Vista Way, which is currently broken by Interstate 5. This would connect a large South Oceanside coastal neighborhood with a regional shopping center, which includes a large grocery store, avoiding a circuitous and hilly current route.

Building recreational bike paths is generally not a cost-effective expenditure. It sends a message that bikes do not belong on the road.

## Education

The remaining 20% of the money should be used to do the following.

1.) Teach interested adults about bicycle accident statistics (most serious injuries occur to cyclists in accidents that do not involve a motor vehicle), car-bike accident statistics (most are caused by wrong-way riding and errors in intersections; clear cut hit-from-behind is rare), and how to ride in all conditions, to minimize problems.

2.) Teach riding-in-traffic skills and how to ride in other challenging conditions, by having the class members and instructor go out and ride in real conditions, until proficiency is achieved.

Students that pass a rigorous written test and demonstrate proficiency in traffic and other challenging conditions are paid for their time and effort.

These classes should be based on the curriculum developed by the League of American Bicyclists and taught by instructors certified by the League.

Assuming a class size of 3 riders per instructor and that each rider passes both tests and earns \$100 and that the instructor, with overhead, costs \$500 dollars, for a total of \$800 for each 3 students, means that \$200M (computed as 20% of \$1B) could educate  $\$200M/\$800 = 250,000$  classes of 3 students, for a total of 750,000 students, out to year 2050. This is about 20% of the population of San Diego County.

### **3.4 Comments on T3, "Increase Ridesharing"**

By taking the position that transportation demand management must only be programs that reduce driving, the CAP is helping to foster the widespread belief that driving levels are the result of free economic choice, and that this free choice must be made less likely by offering some new incentive to not drive or causing drivers to suffer some sort of punitive measure when they insist on driving. That approach to TDM is conventional but it is also misleading.

To engender objectivity, please generalize the concept and go beyond the conventional. More specifically, please state that TDM is the adoption of policies that affect the amount of driving. These 3 classifications of TDM are suggested in Reference 3:

- "Positive", which reduces driving, such as charging for parking at a higher rate than what is justified by its cost,
- "Zero", which is neutral in its effect on driving, such as charging for parking at the rate which is justified by its cost, and
- "Negative", which increases driving, such as charging for parking at a lower rate than what could be justified by its cost.

It should then be pointed out that so called "free parking" is a widespread form of a (significantly) negative TDM. The only way to make this TDM more negative would be to pay people for parking their car.

This treatment will increase objectivity towards the idea of "TDM". After all, who really wants their demand for anything to be "managed". However, many current policies manage demand for driving by encouraging driving. If we could just get all the "levers" adjusted to "Zero TDM", all of our congestion and driving-related climate destabilization problems would be greatly reduced. Besides this, there is a basic fairness issue. Having at least "Zero TDM" should be the law of the land. This is true, even without the challenge and mandate of climate stabilization. One of the best TDM measures would be to unbundle the cost of parking in all locations, as explained in Reference 3. After these systems are installed, it would be possible to adjust the charge above the zero TDM level. It is important to note that the earnings go back to those for whom the parking is built. This makes the positive TDM more popular since everyone likes getting monthly earnings.

### **3.5 Comments on T4, "Alternative Fuel Vehicles"**

This is a state program. The county should urge CARB to take actions to increase the GHG reductions it can achieve. It is also correct to work for enough charging stations. However, the estimate derived from Figure 3's green line is all that can be assumed at this time. If at some later time CARB believes that it can do better than Figure 3's green line, then at that time, perhaps the calculation shown in Section 2.2 can be updated. However, there is nothing wrong with achieving more GHG reductions than what is required by the S-3-05 trajectories. Most of the driving reductions will come from increased equity, in any case.

### **3.6 Comments on an Additional "Community Measure and Action"**

In Section 2.2 it was shown that the per-capita driving needs to be at least reduced by 37.0% by 2035. Reforming transportation to increase economic equity should not wait. For these reasons, LU-1, T-1, T-2, and T-3 are insufficient. This measure is needed as soon as it can be developed and instituted.

### **Unbundling the Cost of Car Parking**

For the vast majority of destinations in California, the cost of car parking is hidden within other costs. This has serious consequences. For example, at most places of employment, parking costs reduce the wages that can be paid to all the employees, even those that never use the parking. Similarly, at most apartment complexes, bundled parking costs increase the rent and this is true, even for families that do not own a car. Bundled parking costs routinely increase the costs of goods, such as groceries, for all customers. Again, this is even true for those that do not drive. Since governments require businesses to provide minimum levels of parking, they are involved in this economic discrimination towards those that drive less.

Driving less is, to some degree, a lifestyle choice. Since government has no valid reason to encourage driving, the lifestyle choice of less driving deserves constitutional, or at least legal,

protection from any practices that discriminate against it, economically. So far, the County has not taken an active role in educating its citizens on how parking policy affects economic fairness or how parking policies that are more fair could reduce driving.

On June 22<sup>nd</sup> 2010, our Transportation Chair presented a paper on how parking could be operated to unbundle parking costs in a way that supports the sharing of parking. This was at the 101<sup>st</sup> Conference and Exhibit of the Air and Waste Management Association, in Calgary, Canada. The session, *Sustainable Land Use and Transportation*, included the paper, *A Plan to Efficiently and Conveniently Unbundle Car Parking Costs*. The paper was extremely well received. It was published as a proceeding of the Conference. See Attachment 6.

The following points, taken from Attachment 6, apply.

- Vehicle miles traveled (VMT) are a major cause of global warming and pollution.
- California's Metropolitan Planning Organizations (MPOs) need to adopt strategies that reduce vehicle miles traveled (VMT), in order to at least meet the S-3-05 trajectory, for years 2020 and 2035.
- The appropriate pricing of parking is one of the least costly tools documented to reduce VMT.
- New technologies, such as sensors feeding computer-generated billing, offer the potential to efficiently bill drivers for parking and alert law enforcement of trespassers.
- Reformed parking policies can increase fairness, so that, for example, people who use transit or walk do not have to pay higher prices or suffer reduced wages, due to parking.
- Methods to unbundle parking cost are inefficient, unless they support the spontaneous sharing of parking spaces. Shared parking, with unbundled cost, would ultimately allow the county to require significantly less parking.
- Typical current systems of timed parking and metered parking are far from ideal. Such parking has no automated record keeping, so it is difficult to know where there is too much or too little parking.
- Good policies will eventually let cities and the county to turn parking minimums into parking maximums.

Less land and resources devoted to parking will support mixed use and make "smart growth" more economically viable. It should therefore be a key ingredient supporting the CAP's LU-1.

Here is a copy of the abstract of Attachment 6.

The *Introduction* shows documented driving reductions due to the pricing of parking. It notes that although the benefits of priced and shared parking are known, such parking has not been widely implemented, due to various concerns. It states that a solution, called "*Intelligent Parking*," will overcome some of these concerns, because it is easy to use and naturally transparent. It asserts that this description will support a "Request for Proposal" (RFP) process. Eight background information items are provided, including how priced parking would help California achieve greenhouse gas reduction targets. A story demonstrates some of the key features of *Intelligent Parking*. Arguments for less parking, shared parking, and priced parking are made. Barriers to progress are identified. The fair pricing of parking is described. New ways to characterize transportation demand management are presented. Seven goals of

*Intelligent Parking* are listed. Eleven definitions and concepts, that together define *Intelligent Parking*, are described. This includes a method to compute a baseline price of parking and how to adjust that price instantaneously to keep the vacancy above 15% (“Congestion Pricing”). An implementation strategy is described.

This abstract aroused enough interest among those responsible for A&WMA’s *Sustainable Land Use and Parking* session that they requested that a manuscript, which was ultimately selected to become part of the written Conference Proceedings and for presentation.

The County could also play a pivotal role by helping to find a demonstration project, probably at a school or an office. Attachment 7 sets forth specific solutions. Attachment 6 describes an implementation strategy in its Implementation Section, on Page 16. The County has the authority, in its off-street parking ordinances, to require cooperation with an agency implementing unbundling and this would be the correct action, after a sufficient number of successful demonstrations have been achieved. “Successful” would need to mean that nearly all stakeholders would be pleased with the program.

If fully implemented, this strategy, by itself, would probably decrease driving throughout California by between 15% and 25%. This is shown in Table 1 of Attachment 6.

Below is an email indicating that the basic features of enforcement, charging, distributing earnings, and sending out monthly statements would not be difficult.

**Email Showing that the Basic Required Technology Could Be Easily Developed**

**Subject:** RE: RFID\_ParkingNewCalsbadHS

Dear Carlsbad School Board,

I wanted to send a quick note discussing the technical feasibility of tracking cars into a lot without impacting students or requiring the need for gates. Mike Bullock and I have discussed this project; it can be accomplished straightforwardly by utilizing Radio Frequency Identification and/or Video Cameras integrated with automated license recognition systems. The cars would need to register with the system at the start, but it would be fairly painless for the users after the initial installation. The back end database system can also be implemented both straightforwardly and at a reasonable price.

This is not necessarily a recommendation of the proposal for unbundled parking. Rather it is strictly an unbiased view of the technical feasibility of the proposal to easily and unobtrusively track cars, both registered and unregistered, into a fixed lot.

Best regards,

David R. Carta, PhD  
CEO Telaeris Inc.

### **3.7 Comments on an Additional State-Wide “Community Measure and Action”, Unbundling the Costs of Driving and a Summary of Results of All Additions**

This measure would require a state and/or federal government action. Therefore, like advocating for cleaner cars, the role of the County would be to understand the value and then advocate for this measure, at the state and federal level.

#### **Unbundling**

“Unbundling”, in the heading above, denotes that the money collected should be paid out to those that are losing money under the current system. This means, for example, that the money collected to account for increased health-care costs, caused by the air pollution the public must breathe, would go to reduce the cost of health care, not to build or even maintain roads.

#### **3.7.1 A Comprehensive Road-Use-Fee Pricing System**

**Abstract** This section contains a listing of road pricing principles. It provides an example of a road-use fee structure that supports the listed principles. Useful background information is provided. Arguments in favor of the presented example are presented.

**Initial Note** For many reasons, including the climate crisis, a comprehensive road-use fee pricing system is needed. It would be optimal for the state to implement the type of system described in this section. However, the state has a long history of irresponsibility in pricing road use. It is hoped that global warming will change this. Certainly, all the MPO’s in the state should be urging our state government to wake up and take action. If these efforts fail, the MPO’s will have to proceed as best they can to implement as much of these road-use pricing system components as possible.

#### **Road-Use Fee Principles**

1. The first principle is that of “full-cost pricing”. Driving has enjoyed a favored status in this state and in this country, resulting in sprawl, health-damaging pollution, global warming emissions, and congestion. We should advocate for the elimination of that favoritism in California, primarily by adopting this first principle.
2. Secondly, the current economic rewards for good mileage vehicles must not be eroded. Due to global warming, motorists need to “go electric” as soon as possible.
3. In addition, road-wear factors (primarily weight), the noise generated, and the pollution generated by each individual vehicle must be taken into account. This will increase fairness and support a shift to lighter, cleaner, and quieter vehicles.
4. The time and place of travel must be incorporated to reduce congestion.
5. Any road-use fee structure must do no economic harm to low-income drivers.
6. As road-use fee technologies evolve, privacy must be protected at each step.

#### **An Example of a Conforming Road-Use Fee Structure**

##### **Condition 1**

100% of the funding for all of the expenses of public roads, *excluding* those costs associated with future expansion (covered in Condition 3), comes from a road-use fee (that may include a fuel excise tax), that ultimately (as affordable technology can support) would contain the following **Features**:

**1. VMT Fee** A base, per-mile (VMT) component fee paid by all motorized vehicles for road construction and maintenance. It would vary by model so that the incentive to drive efficient vehicles is at least as large as for our current fuel excise tax. This means that a Prius would be much cheaper, per mile, than a Hummer.

**2. Carbon Fee** An additional per-mile carbon component part is computed using an effective fee per gallon that is equal or larger than the fuel tax that this per-mile carbon fee might replace, to correlate with the amount of CO<sub>2</sub> emitted. This could either be charged at the pump, as it is now done, or could be added to the VMT fee by using a price per mile computed by dividing the effective price per gallon by the charged vehicle's (year and model) average mileage, in the units of mile per gallon.

**3. Road Wear Fee** An additional per-mile component part that is proportional to the vehicle's (year and model) average weight, or other road-wear variable of the vehicle being charged.

**4. Air Pollution Fee** An additional per-mile component part proportional to the charged vehicle's (year and model) average pollution level, to be used to compensate people, schools, businesses, governments, and corporations harmed by pollution, with this rate set for full compensation.

**5. Noise Pollution Fee** An additional per-mile component part proportional to the average noise pollution level of the charged vehicle, to compensate people, schools, businesses, governments, and corporations harmed by noise pollution, with the rate set for full compensation.

**6. Congestion Fee** An additional per-mile component part or, alternatively a multiplier, to account for either time and place, or instantaneous traffic flow rate, to reduce or eliminate congestion, with the proceeds of this fee (collection minus collection cost) used for either the expansion or the operation of transit systems that would tend to reduce this congestion.

**7. Low Income Relief** A fractional multiplier that would reduce the total per-mile cost for drivers with a sufficiently low income and a sufficiently high need to drive, but only available for a period of calendar time sufficient for the driver to change their circumstance creating the need to drive, unless this is impossible. Section V's Section 7 has more detail.

**8. Privacy** Privacy protections so that where and when people drive, the vehicle they drive, and any Feature 7 advantage, is fully protected, unless a warrant is issued by a judge in response to substantiated allegations of a serious, felony crime.

## **Condition 2**

The per-mile charges of Condition 1 must be large enough to fund yearly payments to the municipalities having large, limited access roads (AKA "freeways") within their boundaries (thereby keeping land off of their property-tax rolls), with these yearly payments equal to the average yearly property tax per acre of the adjacent land, multiplied by the total acreage covered by the road's right of way, including frontage roads.

## **Condition 3**

No expansion of the system of public roads should be done unless market research and traffic modeling show that the net revenue of the proposed road or additional lanes will fund all the expenses identified in Conditions 1 and 2.

## **Condition 4**

No expansion of the system of public roads should be done unless it is shown that the expansion will not negatively impact the state's AB32 and S-3-05 goals and responsibilities.

### **Condition 5**

The sales tax on gasoline and diesel fuel should remain. Its revenue can be used as is the revenue from any other sales tax that is collected on consumer items.

### **Background Material**

This section provides information about the current level of the fuel tax, the difficulty of raising the fuel tax, the use of the fuel *sales* tax, lane performance during times of high demand, demand under the condition of "full cost pricing", political "push back" to full cost pricing, other opinions that a pure fuel tax is becoming obsolete, and finally, information indicating that a road-use fee could be raised by a simple majority in the state legislature.

#### **1. Current Level of Fuel Excise Tax**

A full accounting of the fuel excise tax and what it currently pays for is not our responsibility. A significant segment of the population probably believes that current fuel tax rates are high enough. However, a San Diego County newspaper, the North County Times (NCT), in a February 9, 2009 article, reported that the Chair of the California Transportation Commission (CTC) recently wrote that the fuel tax currently contributes nothing to road construction **and only provides half of the money needed annually for repairs:**

<http://www.nctimes.com/articles/2009/02/09/news/columnists/downey/z8591536f3e7332da882575510076fa1e.txt>

Increasing the state gas and diesel taxes, unchanged at 18-cents per gallon since 1994—when the final one-cent increase mandated by Proposition 111 (June, 1990 that doubled the nine-cent excise fuel tax over a 5-year period) was added, is long overdue.

#### **2. The Difficulty of Raising the Fuel Tax**

To raise the fuel tax would require a 2/3<sup>rd</sup> majority vote of the legislature. In addition, according to a CNN report, <http://www.cnn.com/2009/POLITICS/02/20/driving.tax/>

"Officials including [Secretary of Transportation] LaHood have opposed raising the national gas tax, particularly in the current recession, and have said a new system is needed."

#### **3. Use of the Fuel Sales Tax**

California has a sales tax on all consumer items sold in the state, except food and medicine. The revenues from sales taxes are generally placed in our state's general fund. However, an exception to the general rule has been made for the sales tax on gasoline and diesel. By the conditions of a successful ballot measure, the sales tax on fuel must be used to support roads, which supplements the excise tax on fuel (also known as the "gas tax"), allowing the excise tax to be lower than necessary.

#### **4. Lane Performance During Times of High Demand**

From the DOT's Freeway Management and Operations Handbook:

[http://ops.fhwa.dot.gov/freewaymgmt/publications/frwy\\_mgmt\\_handbook/fmoh\\_complete\\_all.pdf](http://ops.fhwa.dot.gov/freewaymgmt/publications/frwy_mgmt_handbook/fmoh_complete_all.pdf), Page 1-18, comes the following:

As flow increases from zero, density also increases, since more vehicles are on the roadway. When this happens, speed declines because of the interaction of vehicles.

This decline is negligible at low and medium densities and flow rates. As the density further increases, these generalized curves suggest that speed decreases significantly just before capacity is achieved, with capacity being defined as the product of density and speed resulting in the maximum flow rate. This condition is shown as optimum speed  $S_o$  (often called critical speed), optimum density  $D_o$  (sometimes referred to as critical density), and maximum flow  $V_m$ . (7). In general, this maximum flow (i.e. capacity) occurs at a speed between 35 and 50 mph.

Efficient freeway operation depends on the balance between capacity and demand. In the simplest terms, highway congestion results when traffic demand approaches or exceeds the available capacity of the highway system. As vehicle demand approaches highway capacity, traffic flow begins to deteriorate. Flow is interrupted by spots of turbulence and shock waves, which disrupt efficiency. Then, traffic flow begins to break down rapidly, followed by further deterioration of operational efficiency.

Therefore, when demand is allowed to significantly exceed capacity, the flow rate drops well below optimum. In fact, speed can drop to nearly zero. With no intervention, freeway lanes can be counted on to fail, just when they are needed the most.

### **5. Demand, Under the Condition of “Full-Cost” Pricing**

The price-setting stipulations of “An Example of a Conforming Road-Use Fee Structure”, Features 1 through 6 of Condition 1, in conjunction with Condition 2, could be described as “full cost pricing”. It is not our responsibility to do an analysis to calculate what the average price per mile would need to be or to then determine how much driving would be reduced in reaction to this price. It could be that driving would decrease so much that congestion would disappear and the new problem would be to figure out what to do with the excess land buried under unneeded highway lanes and how to meet the large new demand for transit.

### **6. Political Pushback to the Notion of Full-Cost Pricing**

There are many, well-funded “think tanks” and political figures and institutions that argue against raising the cost of driving. So far they have been largely successful in keeping the taxes on driving low.

### **7. Other Opinions That a Pure Fuel Tax Is Becoming Obsolete**

There are many indications that more decision makers are adopting the view that the fuel tax either needs to be replaced or supplemented. We have undertaken no comprehensive search and evaluation to quantify this. However the following examples are presented, with the first three being taken from the same NCT article identified in Section-1 of this Section.

First the Chair of the CTC pointed out that, “People are driving more-fuel-efficient cars and ones that run on alternative fuels and buying less gas. As a result, they are paying less in gas taxes”. The author of the NCT article states that the CTC Chair and others are calling for “phasing out the gas tax,” in favor of a VMT fee.

Second, Will Kempton, director of the California Department of Transportation, told local officials in Valley Center recently “we need to make a transition to a new way of collecting transportation funds.” Kempton also said the state should consider following the lead of Oregon, which is exploring a tax based on the number of miles a person drives.

Third, Jim Earp, a California Transportation Commission member from Roseville, added, “Either that or we're going to have to jack up the gas tax considerably.”

Fourth, the Christian Science Monitor editorial, February 27, 2009, "A road map to better US roads," says, "Congress should heed a panel that suggests replacing a tax on gas with one on miles driven."

<http://www.csmonitor.com/2009/0227/p08s01-comv.html> It goes on to say, "In Europe, the Netherlands will transition to a VMT by 2014 and Denmark by 2016. Changing behavior is the key to 21st century transport that must unclog crowded highways and reduce dependence on fossil fuels. Taxing miles alerts drivers to the real cost of using roads and can better motivate them to drive less. A VMT (fee) is the more reliable and efficient way to pay for transport. Its time has come."

Finally, according to a CNN report, <http://www.cnn.com/2009/POLITICS/02/20/driving.tax/>, Speaking to The Associated Press, Transportation Secretary LaHood, an Illinois Republican, said, "We should look at the vehicular miles program where people are actually clocked on the number of miles that they traveled."

### **8. Raising a Road-Use Fee Could Be Done By a Simple Majority**

The Sacramento Bee printed an article by Dan Walters, on January 20<sup>th</sup>, 2009, describing a proposal to help close California's budget gap.

<http://www.nctimes.com/articles/2009/01/20/opinion/walters/zd5e9d64561b6efd78825753e006c951a.tx>.

The key elements from the article are as follows.

- 1.) Senate President Pro Tem Darrell Steinberg, the scheme's father, insists that it's legal, basing that assertion on a 5-year-old opinion from the Legislature's legal office.
- 2.) The plan would eliminate excise and sales taxes on gasoline and raise other taxes to help close the budget deficit, then "backfill" the gasoline taxes with a new "fee" that would actually increase the bite on motorists by 50 percent, from 26 cents a gallon to 39 cents. **A "fee" can be imposed by a simple majority vote as long as it relates to actual services rendered by government.**

Note that this fee approach is relatively far from meeting all of the stipulations of this letter. However, it would represent significant progress.

### **Arguments in Favor of Road Use Fees**

This Section provides an analogy demonstrating why roads should be operated for the equal benefit of all. It presents some of the consequences of the current level of our state fuel tax. It argues that a road-use fee should include a vehicle miles traveled (VMT) component and that furthermore, a component should relate to congestion pricing (i.e. needs to account for *specific* time and place of travel). A road-use fee should account for environmental impacts, should protect low-income families, and contain privacy protections. It explains why revenue from a road use fee should be used to pay an effective property tax to municipalities. It argues that this resolution offers methods that would help to alleviate the state's budget problems. It states that it is easier to discuss setting a road use fee than it is to discuss increasing an excise tax on fuel. Finally, it briefly discusses some of the emerging technologies and the relationship between technology and this resolution.

#### **1. Full-Cost Pricing**

Roads should be priced so that they are no longer an economic burden on those that choose to drive less than average. Yet, it is hard to be objective about roads. Here's an analogy.

Assume that California owned a large number of 2-bedroom apartments that it allowed families to live in if they paid a tax of \$500 a month, even though the market rental value of the apartments was \$1000 a month. Clearly, the people living in the apartments are the winners and all the other citizens of California are the losers, because if the state set the price to the market value, it would have additional money that it could either use for the benefit of all citizens or it could return the money to everyone as a tax rebate. Some might note that since there are a large number of these apartments, almost everyone that wants one could get one, so those that don't live in these 2-bedroom apartments are losing out because of their own poor choice. However, since not every citizen wants to live in these apartments, the State's practice is indefensible. The correct thing for the state to do would be to allow low-income citizens to remain in the rental units at the subsidized price of \$500 a month, stop calling the price-per-month a "tax" and instead call the price-per-month a "user fee", and set the price for the families that are not low income to the market value of \$1000 per month. In this case, the low-income families remain winners. Even though all the others are losers, they are losing much less than before. This assumes that the state takes the additional earnings and uses it in a way that benefits all citizens. Buying more 2-bedroom apartments would not qualify. This analogy's original operation is similar to what California does by underpricing road use fees, as described below.

## **2. Consequences of the Current Level of Fuel Tax**

### **a. Economic Inequity**

Because our state fuel tax is too low, funds derived from taxes (and fees) that are not related to the choice of driving a car must be used to support our system of public roads. Examples are our sales tax, our income tax, our property tax, and the development fees that increase many of our costs. In effect what is happening is that money is systematically *being taken* from those that drive less and *being given* to support those that drive more.

This violates a fundamental principle of our free market system. People should pay for what they use and, conversely, people should not be forced to pay for what they do not use. It is true that we often willingly violate this principle, for some higher purpose. Education, mass transit, and Section 8 housing are good examples. However, there is no valid reason to increase driving by making it artificially cheap to drive, or for that matter, to park a car. The facts about global warming suggest quite the opposite.

### **b. Global Warming Threat and the California Example of Road-Use Pricing**

From <http://www.sandiego.edu/EPIC/ghginventory/GHG-On-Road1.pdf.pdf>, we learn that in San Diego County, emissions from on-road vehicles are about 46% of regional GHG emissions. Many world leaders know that many of our citizens have taken all of the time and cost variables into account and then built their life around their automobiles. How can we expect the world to do its part to reduce GHG emissions, if they see us unwilling to reform the way we price the use of roads, so as to conform to the basic free-market principles that we claim to hold dear?

### **c. Other Pollution**

Besides GHG emissions it is well known that on-road transportation contributes significantly (around 50% by some accounts) to our air and noise pollution. Cars cause air and water pollution directly and indirectly. This occurs when they are manufactured, when their fuel is transported and refined (refineries are, by far, the biggest cause of ground-water contamination in California), and when they are driven.

#### **d. Urban Sprawl**

The dominance of the automobile is the primary reason for our sprawling, urban land-use patterns. For example, it is well known that a simple 4-lane freeway, with frontage roads, can consume 26 acres per mile. An acre of land can only park 117 cars. Sprawl has taken valuable farm land, wet lands, and wild-life habitat. It makes it more difficult to walk or to bicycle. It also makes it more difficult to provide or to use transit.

#### **e. Summary Statement**

GHG emissions, urban sprawl and air, water, and noise pollution are made worse by making driving seem artificially inexpensive to the public. Note that for every penny earned by raising the price per mile to drive to its correct value, a penny could be cut from other taxes and fees that are unrelated to driving. Secretary of Transportation Ray LaHood's statement ("we can't raise the gas tax in a recession") shows that he misses this important point. This point has been made by the Sierra Club, as shown in <http://www.sierraclub.org/policy/conservation/trans.aspx>, where it says, of subsidies to driving, "These subsidies should be publicly scrutinized and eliminated by appropriate fuel and carbon taxes, parking and road user charges, . . ."

### **3. The Use of the Gasoline Sales Tax**

As stated in Section III. 3, currently the *sales* tax on fuel must be used for the same purposes as the *excise* tax on fuel. This is contrary to the normal rule for sales taxes, whereby sales taxes are used for general-fund purposes, unrelated to the item sold. For example, the sales taxes from running shoes are not removed from the general fund to be used to build running facilities. Likewise, the sales tax on alcoholic beverages is not separated out to be used to subsidize the building of more drinking establishments. If we are going to end our unfortunate favoritism towards roads, we need to end the practice of using the sales tax from gasoline as if it were an additional fuel excise tax. This practice would be ended if the implied recommendations of this report were enacted. The sales tax on gasoline should continue, but the tax on the sale of gasoline should go to the general fund, as does the tax on the sale of other consumer items.

### **4. Reasons to Adopt a VMT Based, Road-Use Fee**

From a Global Warming perspective, there is a hierarchy of favored transportation modes.

Mode 0: Telecommuting (no need to leave the house)

Mode 1: Walking

Mode 2: Cycling (skate boarding and any other device-aided, non-motorized transportation mode)

Mode 3: Transit

Mode 4: Electric cars or cars that get great mileage

Mode 5: Other cars

In terms of reducing pressure to expand road capacity, Modes 0, 1 and 2 are many times more desirable than even Mode 4, which is many times better than Mode 5. The point here is that as much as we want to see more electric cars and more cars that get exceptional mileage, we should not lose sight of the fact that unless all road users pay their fair share, those people using Modes 0, 1 and 2 are not being fully rewarded for not using road capacity, and this is

poor environmental policy, based on the desirability factors suggested. All cars are large, manufactured devices with a finite life. They promote sprawl. People that routinely use Modes 0, 1 and 2 have often set up their lives so that they could drive less. Those life-style choices need to be fully rewarded. The statements of Sections 2a and 2d of this Section apply.

## **5. Reasons to Adopt Road-Use Pricing Methods Tied to *Specific* VMT**

### **a. Need to Support Section II's Feature 6**

The current fuel tax is simple and, in theory it could be raised to cover the costs of driving, for those vehicles that use fuel. Alternatively, it is easy to imagine odometers that transmit their values at scheduled times to a billing computer. With vehicle-recognition schemes, implemented at the pump or within the billing computer containing odometer data, it would be possible to expand these simple methods to support Features 1 through 5, Feature 7, and Feature 8. However, these simple methods would not support congestion pricing, Feature 6, which is sufficiently important that it must be identified and supported.

### **b. Value Feature 6: Congestion Pricing**

Various names have been proposed for Feature 6, including "congestion pricing" or "convenience pricing". Regardless of the name, it is a powerful way to reduce our society's propensity for expanding highways. Proponents of freeway expansion frequently mention the fact that highway "gridlock" harms our public safety because it can significantly delay emergency vehicles. Individuals in society see this in personal terms. We can all imagine a need to get home to attend to a child, or to get to an emergency room. The consequences of congestion can go well beyond being just a frustrating inconvenience. Sometimes people feel that they would pay almost anything to be able to drive at higher speeds. How many people have missed a plane, or a train, or a critical business meeting, "stuck in traffic"? Besides this, lanes also often support transit. Transit success requires dependable and reasonably fast bus travel. In addition, stop and go traffic wastes fuel, increases GHG, and increases unhealthy emissions.

"Convenience Lanes" could provide an option for drivers when they feel it is worth the extra money to drive beyond congestion speeds. This pricing also provides a means to keep one or more lanes operating close to their theoretical capacity, instead of at the greatly reduced flow rate that comes when demand is large. The pricing can adjust automatically so as to keep demand below capacity, on one or more lanes. This means that congestion in parallel lanes will clear sooner than if all lanes were allowed to stay severely congested.

"Convenience Lanes" also offer the hope of significant revenue generation, if enough people are willing to, in effect, bid up the price. (This will probably happen if the price of driving is kept low enough in regular lanes that there are still times and places where congestion is significant.) Feature 6 would require that proceeds (collection minus collection costs) be used for transit systems that would tend to reduce the congestion. The lanes and roads that are parallel to the "convenience priced" lanes can be counted on to fail to carry their capacity when serious congestion strikes. Fortunately, there is no comparable effect for transit. Although it is conceivable that transit demand could exceed transit carrying capacity, when this happens, the transit can be counted on to continue to carry its full capacity.

### **c. Feature 6 and Road Price Variability**

Some roads are relatively expensive to build; others are relatively inexpensive. There is no reason we have to settle for charging the same per-mile price for all roads. Similarly, driving at different times should be priced differently. It is well understood that freeways are sized and

expanded to facilitate peak driving times. Since it is more costly to provide the added capacity needed at peak times, it is reasonable to charge peak-time drivers more. Charging more at the times that demand is high will tend to smooth out traffic demand over various times of the day.

#### **d. Feature 6 and Pollution**

Feature 6 can reduce congestion. This is important because stop-and-go traffic emits more pollution and GHG emissions than lanes operating at “optimum speed” as identified above.

#### **e. Feature 6 Supported by the CTC**

These powerful arguments have evidently been recognized by the CTC. In their *Addendum to the 2007 Regional Transportation Plan Guidelines, Addressing Climate Change and Greenhouse Gas Emissions During the RTP Process*, adopted on May 29, 2008, they provide strong support to lane pricing.

[http://www.catc.ca.gov/programs/rtp/Adopted\\_Addendum\\_2007\\_RTP\\_Guidelines.pdf](http://www.catc.ca.gov/programs/rtp/Adopted_Addendum_2007_RTP_Guidelines.pdf),

In the CTC’s Pricing Strategies Section (Page 3), the CTC instructs Metropolitan Planning Organizations to “model adding pricing **to existing lanes**, not just as a means for additional expansion. **Variable/congestion pricing should be considered.**”

Variable/congestion pricing cannot be done without Section II’s Feature 6 of its Condition 1.

#### **f. Arguments to Support Road-Pricing Guideline**

There is widespread confusion regarding who owns existing lanes and what promises were made. Converting existing, “free” lanes to be lanes that are priced can be justified by explaining that fuel taxes have always been road-use fees and that any stated or implied promise that paying fuel tax entitled drivers, for all time forward, to drive free on the roads that the fuel taxes may have been used to fund was specious. Specifically, the claim that drivers “already paid” for roads through the payment of fuel taxes is incorrect because (i) many drivers have just started driving; (ii) many drivers that paid fuel tax for many years have died; and (iii) paying a fee to use a public road is no different than paying rent to use property and paying rent does not lead to quasi ownership. These same arguments can be used against statements supporting the idea that drivers can forever drive free over a bridge because the tolls have paid off the loan for the bridge.

### **6. Reasons for Features 2 – 5**

These features charge vehicles for their environmental impacts.

### **7. Reasons for Feature 7**

The ability of low-income families to be able to drive to work and other essential family errands must be protected. However, given our challenge of global warming, this needs to be “constructive charity”. The features shown in Section II suggest that a billing computer will probably be involved. If so, that computer’s database can, perhaps at the individual’s discretion, be supported with information such as current housing details, current salary, job location, occupation and job skills to include a full resume, childcare, location of family and friends, hobbies, or recreational pursuits, and other items that could be related to the individual’s current need to drive. When the software determines that the person qualifies for a reduced multiplier of the full cost of driving (a subsidy), it could then also run various programs to offer, in creative, tailored, form letters, suggestions for changing circumstances to reduce driving. This could involve a search for jobs, a search for suitable housing, a search for daycare, and a search for better locations to pursue hobbies or recreational pursuits. The

availability of transit would be considered in the software and would be offered. Job training could be suggested or offered at a discount. If circumstances support it, the person could also be asked if they would be interested in a class on riding a bicycle in traffic. Taking such a class could earn the person a financial award, perhaps to include a new or used bicycle. The software would put a high priority on helping the person achieve a lifestyle that requires less driving. As a last resort the software would take into account the congestion level of various routes and offer a driving route that requires a reduced subsidy. If no billing computer is involved, the person receiving the subsidy might be required to send in data to support the running of these programs to reduce driving and the subsidy to driving.

### **8. Reasons for Feature 8**

Privacy must be protected, unless confidential disclosure to law enforcement agencies is ordered by a judge based on reasonable cause. We currently rely on laws and judges to protect our privacy regarding what we say on the telephone, our emails, our internet activities, and the information we provide on our tax forms. This information could be both politically revealing and highly embarrassing, to the point where it could seriously degrade our personal and professional lives. In terms of protecting our democracy, it is especially important that our political activities be protected. Where we drive and park a car is also somewhat sensitive in this regard. However, in most cases it is less sensitive than our emails and what we say on the phone. Cell phone companies already have information about our travel. Many locations, such as Dallas, have “toll-tags” that record every time someone goes through a toll plaza and charges them accordingly. The conclusion is that the argument that many people will never accept a computer, with built in privacy protections, from having information about where we drive is overblown and not supported by the facts.

### **9. Reasons for Condition 2**

Railroads pay property tax on the land under their tracks. Utility companies pay property taxes on the land under their transmission lines. There is no reason that large highways should not pay a property tax for the land they take off the tax rolls in each community. The favored status of roads should be eliminated.

### **10. California’s Budget Problem**

California currently has a large budget gap. Children may lose their health care and education cuts will probably be severe. State parks may close. Most state funding for transit may be cut. This strategy might help to reduce some of these cuts.

### **11. Raising the Fuel Tax vs. Pricing a Road-Use Fee**

There are advantages in reframing the question from should we raise the fuel tax to: Should we replace the fuel tax with a road-use fee and, if so, how should we set the price of the road-use fee? Section III. 2 showed that a 2/3rds vote is needed in the state legislature to raise a tax; while, as shown in Section III. 8, only a simple majority is needed to set and then raise a user fee. Besides this, there are a lot of common misunderstandings about our fuel taxes. Many think they are a mechanism whereby drivers somehow buy new roads. This confusion was discussed in detail in this Section’s Subsection 5f. If we can move the discussion to one of how to properly set the price of road use, we will have already made large gains in framing the question to the advantage of environmentalists and everyone that recognizes that it is time to stop favoring driving.

### **12. Technology**

It is not our responsibility to pick the technologies that will ultimately be used in the implementation of the road-use pricing described. Email and phone conversations with employees of “Skymeter”, <http://www.grushhour.blogspot.com/>, indicate that they were ready to respond to a Request For Proposal (RFP) to implement VMT pricing in the Netherlands, to include every road in the country. Their proposal would have been that each car will have a GPS unit, about as large as an eye-glasses case, sitting on the dash. It will contain a database of roads and a variable set of pricing coefficients. The GPS software will determine the car’s location with sufficient accuracy so as to support software computing a running tabulation of charges, as the car is driven. They state that the final challenge was to design the software so that the unit would function when the car was being driven in the presence of GPS reflections, such as in city “canyons” which is to say around multiple large buildings. They have solved this problem with additional algorithms and have demonstrated this in the most severe conditions they could find. However, they don’t want to have to distinguish between lanes, suggesting that congestion pricing on large multi-lane roads, where pricing varies between parallel lanes, may require a Radio Frequency Identification (RFID) overlay pricing scheme, such as is currently used for “toll tags.”

There are probably several, perhaps even many, ways to accomplish road-use pricing that has the features described in this Section.

### **3.7.2 Conclusions**

The best strategies to reduce VMT are shown here, with the estimated driving reductions for each one shown in square brackets:

- Comprehensive (equitable and environmentally sound) road use fee pricing system, as could be installed by *Skymeter*; [15%]
- Unbundling the cost of car parking; [15%] (This estimate is based on Table 1 of Reference 3.)
- Good bicycle projects and bicycle education; [5%,] (This estimate should be checked by the League of American Bicyclists.)
- Stopping all freeway expansions and reconfiguring TRANSNET to be 67% for transit and 33% for road maintenance [10%]

These strategies could be implemented by 2020, not 2035, and would decrease per capita driving by a sum of at least 45% (15+15+5+10). The strategies to do this are primarily those that increase fairness for all, especially families that drive less than average.

## ABSTRACT

The *Introduction* shows documented driving reductions due to the pricing of parking. It notes that although the benefits of priced and shared parking are known, such parking has not been widely implemented, due to various concerns. It states that a solution, called “*Intelligent Parking*,” will overcome some of these concerns, because it is easy to use and naturally transparent. It asserts that this description will support a “Request for Proposal” (RFP) process. Eight background information items are provided, including how priced parking would help California achieve greenhouse gas reduction targets. A story demonstrates some of the key features of *Intelligent Parking*. Arguments for less parking, shared parking, and priced parking are made. Barriers to progress are identified. The fair pricing of parking is described. New ways to characterize transportation demand management are presented. Seven goals of *Intelligent Parking* are listed. Eleven definitions and concepts, that together define *Intelligent Parking*, are described. This includes a method to compute a baseline price of parking and how to adjust that price instantaneously to keep the vacancy above 15% (“Congestion Pricing”). An implementation strategy is described.

## INTRODUCTION:

It has been well established that appropriately priced parking will significantly reduce driving<sup>1</sup>. Most case studies presented in Table 1 are evaluations of the most general type of “car-parking cash-out”: *a program that pays employees extra money each time they get to work without driving*. They show that a price differential between using parking and not using parking will significantly reduce driving, even when transit is described as poor. Since driving *must* be reduced<sup>2</sup>, the pricing of parking is desirable.

Shared parking is also recognized as desirable because it can sometimes result in less parking being needed.

Although the advantages of pricing and sharing parking have been recognized for many years, these practices are still rare. This paper identifies some of the reasons for this lack of progress. The pricing and sharing method of this paper has a natural transparency and ease of use that would reduce many of the concerns. This paper also suggests that those governments that have the necessary resources can take the lead role in developing and implementing the described systems. These governments will recover their investments, over time.

This paper describes how parking facilities could be tied together and operated in an optimum system, named *Intelligent Parking*. The description of *Intelligent Parking* is sufficient to support a “Request for Proposal” process, leading to full implementation.

There are two distinct parts to *Intelligent Parking*. The first is how to set the price. The second is how to distribute the earnings. Briefly, the earnings go to the individuals in the group for whom the parking is built.

**Table 1      Eleven Cases of Pricing Impact on Parking Demand**

| <b>Location</b>                                              | <b>Number of Workers<br/>@ Number of Firms</b> | <b>1995 \$'s<br/>Per Mo.</b> | <b>Parking Use<br/>Decrease</b> |
|--------------------------------------------------------------|------------------------------------------------|------------------------------|---------------------------------|

| <b><i>Group B: Areas with fair public transportation</i></b> |                                                |                              |                                 |
| Los Angeles Civic Center                                     | 10,000+ @ "Several"                            | \$125                        | 36%                             |
| Mid-Wilshire Blvd, Los Angeles                               | 1 "Mid-Size" Firm                              | \$89                         | 38%                             |
| Washington DC Suburbs                                        | 5,500 @ 3                                      | \$68                         | 26%                             |
| Downtown Los Angeles                                         | 5,000 @ 118                                    | \$126                        | 25%                             |
| <b>Average for Group</b>                                     |                                                | <b>\$102</b>                 | <b>31%</b>                      |
| <b><i>Group C: Areas with good public transportation</i></b> |                                                |                              |                                 |
| U. of Washington, Seattle, WA                                | 50,000 employees, students                     | \$18                         | 24%                             |
| Downtown Ottawa, Canada                                      | 3,500 government staff                         | \$72                         | 18%                             |
| Bellevue, WA                                                 | 430 @ 1                                        | \$54                         | 39%*                            |
| <b>Average for Group, except Bellevue, WA Case*</b>          |                                                | <b>\$45</b>                  | <b>21%</b>                      |
| <b>Overall Average, Excluding Bellevue, WA Case*</b>         |                                                |                              | <b>25%</b>                      |

\* Bellevue, WA case was not used in the averages because its walk/bike facilities also improved and those improvements could have caused part of the decrease in driving.

## **PERTINENT BACKGROUND INFORMATION**

- Vehicle miles traveled (VMT) are a major cause of global warming and pollution<sup>2,3</sup>.
- California's Metropolitan Planning Organizations (MPOs) will need to adopt strategies that reduce vehicle miles traveled (VMT), in order to meet SB375 GHG reduction targets, to be issued by the California Air Resources Board in late 2010, for years 2020 and 2035<sup>2</sup>.
- The appropriate pricing of parking is one of the least costly documented tools to reduce VMT.
- New technologies, such as sensors feeding computer-generated billing, offer the potential to efficiently bill drivers for parking and alert law enforcement of trespassers.
- Reformed parking policies can increase fairness, so that, for example, people who use transit or walk do not have to pay higher prices or suffer reduced wages, due to parking.

- Methods to unbundle parking cost are inefficient unless they support the spontaneous sharing of parking spaces. Shared parking with unbundled cost would ultimately allow cities to require significantly less parking.
- Typical systems of timed parking and metered parking are far from ideal. Parking has no automated record keeping, so it is difficult to know where there is too much or too little.
- Good policies will eventually let cities turn parking minimums into parking maximums.

## **A GLIMPSE INTO A POSSIBLE FUTURE**

Jason is driving to work for the first time in several years. He has decided to save money by carrying home a new 3-D, big-screen computer, which he plans to purchase at a store near his office after work. He wanted to avoid paying delivery charges.

Things have been changing around his office development since they unbundled the cost of parking at the near-by train station. Many people who caught the early trains and lived close to the station stopped driving and parking in the best parking spaces; demand for housing close to the station went up; and wealthy riders, who insisted on driving, did so, confident that they could always find parking as close to the platform as their schedules required, due to congestion pricing. Who would have guessed how much those people were willing to pay? It was shocking. Parking-lot earnings, paid to round-trip train riders, meant that the net cost to ride the train went significantly down. Ridership and neighborhood vitality both went significantly up. All Jason knew was that the price to park at his office had been going up yearly because of increased land values. His parking-lot earnings from his office had been increasing almost every month, due to the ripple effect of train riders parking off-site at cheaper parking. Some of them were using his office parking.

As he pulls out of his driveway, he tells his GPS navigation unit his work hours (it already knew his office location), the location of the store where he plans to buy the computer, and his estimated arrival and departure times at the store. He tells the GPS unit he wants to park once, park no more than 1 block from the store, walk no more than 1 mile total, and pay no more than an average of \$2 per hour to park. He is not surprised to hear the GPS tell him that his request is impossible. He tells the GPS he will pay an average of \$3 per hour and learns that the GPS has located parking.

It guides him into a church parking lot. He hopes the church will use his money wisely. The GPS tells him the location of a bus stop he could use to get to work and the bus's next arrival time at the stop. With automatic passenger identification and billing, the bus has become easy to use, except that it is often crowded. Jason gets out of the car and walks to work, with no action required regarding the parking.

Three weeks later, when Jason gets his monthly statement for his charges and income for automotive road use, transit use, parking charges, and parking earnings, he finds that the day's parking did indeed cost about \$30 for the 10 total hours that he parked. He notes that the parking-lot earnings for his office parking averaged about \$10 per day that month. He then notices the parking lot earnings from the store, where he spent about \$1000 dollars. He sees that the parking-lot earnings percent for the store that month was 1.7%, giving him about \$17. So for the day, Jason only spent a net of about \$3 on parking. Then he realized that he should have had the computer delivered after all. If he would have bicycled that day, as he usually did, he would have still gotten the \$27 earnings from the two parking facilities and he would have paid nothing

for parking. So the choice to drive cost him \$30. He remembers that the delivery would have only been \$25 dollars. Oh well. He enjoyed his before-work and after-work walks.

## **THE CASE FOR LESS PARKING**

Less parking will support more compact development.<sup>1</sup> This makes walking and biking more enjoyable and less time consuming. There would certainly be less “dead space”, which is how parking lots feel to people, whether they arrive by car or not, after they become pedestrians.

Since parking can be expensive, less parking can reduce overhead costs significantly, such as leasing expense and parking-lot maintenance cost. Less overhead means more profit and less expense for everyone. A need for less parking can create redevelopment opportunities at existing developments and reduce project cost at new developments.

At new developments, car-parking costs could prevent a project from getting built.<sup>2</sup>

## **THE CASE FOR SHARED PARKING**

Shared parking for mixed uses means that less parking is needed. For example, shared parking could be used mostly by employees during the day and mostly by residents at night.

Fully shared parking means that very little parking would be off limits to anyone. In a central business district with shared parking, drivers would be more likely to park one time per visit, even when going to several locations. Pedestrian activity adds vitality to any area.

## **THE CASE FOR APPROPRIATELY-PRICED PARKING**

### **To Reduce Driving Relative to Zero Pricing**

#### *Traditional Charging or Paying Cash-out Payments*

As shown in the Introduction, this relationship (pricing parking reduces driving) is not new.<sup>3</sup>

Using results like Table 1, at least one study<sup>4</sup> has used an assumption of widespread pricing to show how driving reductions could help meet greenhouse gas (GHG) target reductions. Dr. Silva Send of EPIC <http://www.sandiego.edu/epic/ghgpolicy/> assumes that all work locations with 100 employees or more in San Diego County will implement cash-out, to result in 12% less driving to work. Currently, almost all employees in San Diego County “park for free”, unless they happen to work in a downtown core area.

---

<sup>1</sup> This is especially true of surface parking, which only accommodates 120 cars per acre.

<sup>2</sup> On September 23, 2008, a panel of developers reviewed the Oceanside, Ca. “Coast Highway Vision” [http://www.ci.oceanside.ca.us/pdf/chv\\_finalvisionstrategicplan.pdf](http://www.ci.oceanside.ca.us/pdf/chv_finalvisionstrategicplan.pdf). Parts of this plan were described as smart growth.

At the review, developer Tom Wiegel said, “Parking is the number 1 reason to do nothing,” where “do nothing” meant “build no project.” The other developers at the meeting agreed.

<sup>3</sup> For many years the Victoria Transport Policy Institute (VTPI) has been recognized as a source of reliable information on “Transportation Demand Management”, or TDM.

From [http://www.vtpi.org/tdm/tdm72.htm#\\_Price\\_Parking](http://www.vtpi.org/tdm/tdm72.htm#_Price_Parking):

Even a relatively small parking fee can cause significant travel impacts and provide significant TDM benefits. “TDM Benefits” refers to the many public and private benefits of having fewer people choosing to drive.

### ***Current, Best-Practice “Unbundling”***

The “best-practice” use of the phrase, “unbundled parking cost”, is to describe the case where either the cost of parking, for the case of a condominium, or the rent for parking, for the case of an apartment, is separated from either the purchase price and common fees or the rent of the dwelling unit.

This gives the resident families the choice of selecting the number of parking spaces they would like to rent or buy, including the choice of zero. This would tend to reduce the average number of cars owned per dwelling unit and, in this way, would also tend to reduce driving. Its major drawback is that this method does not encourage sharing.

### **To Increase Fairness and Protect the US Economy**

It is stated above that almost all employees in San Diego County “park for free”. Of course there is really no such thing as “parking for free”. So-called “free parking” always reduces wages or increases costs. At a work site, it reduces everyone’s wage, even those employees that never drive. At an apartment complex, so-called “free parking” increases the rent. Therefore, “free parking” at work or at apartments violates the fundamental rule of the free market, which is that people should pay for what they use and not be forced to pay for what they do not use. Parking should at least be priced to achieve fairness to non-drivers.

The US economy would also benefit. Reductions in driving would lead to reductions in oil imports, which would reduce the US trade deficit.<sup>4</sup>

### **BARRIERS TO PROGRESS**

Given all this, it might seem that the widespread pricing of parking should have happened by now. However there are barriers. In 2007, a majority of the City Council of Cupertino, Ca. indicated that they wanted their City Manger to negotiate reduced parking requirements with any company that would agree to pay sufficient cash-out payments. To this date, no company, including Apple Inc., has expressed an interest. Most companies probably perceive cash-out as expensive. Even if they realize they could get a reduced parking requirement in exchange for paying sufficient cash-out amounts and even if the economics worked in support of this action (quite possible where land is expensive), they want to stay focused on their core business, instead of getting involved in new approaches to parking, real estate, and redevelopment.

On the other hand, simply charging for parking and then giving all the employees a pay raise is probably going to run into opposition from the employees, who will feel that they would be losing a useful benefit.

In addition, neighbors fear the intrusion of parked cars on their streets. Permit parking, which could offer protection, is not always embraced. City Council members know that a sizable fraction of voting citizens believe that there can actually never be too much “free parking”,

---

<sup>4</sup> From [http://en.wikipedia.org/wiki/Balance\\_of\\_trade#Warren\\_Buffett\\_on\\_trade\\_deficits](http://en.wikipedia.org/wiki/Balance_of_trade#Warren_Buffett_on_trade_deficits), Warren Buffet wrote in 2006,

“The U.S. trade deficit is a bigger threat to the domestic economy than either the federal budget deficit or consumer debt and could lead to political turmoil. Right now, the rest of the world owns \$3 trillion more of us than we own of them.”

Professor Shoup's famous book<sup>5</sup> notwithstanding. Some Council members probably feel that way themselves.

It doesn't help that current methods of charging for downtown parking are often very inefficient.<sup>5</sup> For example, downtown Oceanside, California has parking meters that will only accept coins. Besides this, all their on-street, downtown parking is timed, with maximums from 10 minutes to 4 hours. These time limits are enforced by a city employee, who applies chalk from a tire to the street and then records the time. However, by watching the time and moving their car soon enough, drivers can avoid getting a ticket. Of course, they could instead drive to the mall and not have to worry about having coins or elapsed time since parking. It is not surprising that downtown merchants often object to charging for parking.

In summary, those that resist charging for parking, *based on their perceptions*, include

- Companies, *who fear the complexity and expense of paying cash-out payments*;
- Employees, *who fear of losing a current benefit*;
- City leaders, *who fear the political repercussions*;
- Downtown patrons, *who dislike the inconvenience and worry*;
- Downtown business owners, *who fear that it will drive away customers*.

## **THE COST, VALUE, AND FAIR PRICE OF PARKING**

### **Estimated and Actual Capital Cost**

#### ***Surface Parking***

One acre of surface parking will accommodate 120 cars. Land zoned for mixed use is sometimes expensive. At \$1.2 million per acre, the land for a single parking space costs \$10,000.

Construction cost should be added to this to get the actual, as-built cost of each parking space. Estimated cost can be determined by using appraised land value and construction estimates. For new developments, after the parking is constructed, it is important to note the actual, as-built cost.

#### ***Parking-Garage Parking***

One acre of parking-garage will accommodate considerably more than 120 cars. The construction cost of the garage and the value of its land can be added together to get the total cost. Dividing that total cost by the number of parking spaces yields the total, as-built cost of each parking space. Adding levels to a parking garage may seem like a way to cut the cost of each parking space, for the case of expensive land. However, there is a limit to the usefulness of this strategy because the taller the parking garage, the more massive the supporting structural members must be on the lower levels, which increases total cost. Parking-garage parking spaces are often said to cost between \$20,000 and \$40,000. The actual costs should be noted.

#### ***Underground Parking***

In order to compute an estimate for the cost of a parking space that is under a building, it is necessary to get an estimate of the building cost with and without the underground parking. The difference, divided by the number of parking spaces, yields the cost of each parking space. The

---

<sup>5</sup> According to Bern Grush, Chief Scientist of Skymeter Corporation <http://www.skymetercorp.com/cms/index.php>, often two-thirds of the money collected from parking meters is used for collection and enforcement costs.

cost or value of land plays no role in the cost of this parking. However, it does not follow that this parking is cheap. Underground parking spaces are often said to cost between \$60,000 and \$90,000 dollars each. Although there will be an “as built” cost of the building with the parking, there will never be an “as built” cost of the building without the parking. However, after the construction is done, the estimate for the cost of the underground parking should be reconsidered and re-estimated if that is needed. The final, best-estimate cost should be noted.

## **Value**

Initially, value and cost are the same. For surface parking and parking-garage parking, the value would initially be the same as the as-built cost. For underground parking, the value would initially be the same as the best-estimate cost. However, over time, the value must be updated. Both construction costs and land-value costs will change. The value assigned to a parking place should always be based on the current conditions.

## **Fair Pricing**

Parking space “values”, as described above, must first be converted to a yearly price by using a reasonable conversion factor. This conversion factor could be based on either the “cost of money” or the “earnings potential of money”. It is expected that this conversion factor would be 2% to 5% during times of low interest rates and slow growth; but could be over 10% during times of high-interest and high growth. For example, if the surface parking value is \$12,000 and it is agreed upon to use 5% as the conversion factor, then each parking spot should generate \$600 per year, just to cover capital costs. The amount needed for operations, collection, maintenance, depreciation, and any special applicable tax is then added to the amount that covers capital cost. This sum is the amount that needs to be generated in a year, by the parking space.

The yearly amount of money to cover capital cost needs to be re-calculated every year or so, since both the value and the conversion factor will, in general, change each year. The cost of operations, collection, maintenance, depreciation, and any special applicable tax will also need to be reconsidered.

Once the amount generated per year is known, the base price, per unit year, can be computed by dividing it (the amount generated per year) by the estimated fraction of time that the space will be occupied, over a year. For example, if a parking space needs to generate \$900 per year but it will only be occupied 50% of the time, the time rate charge is \$1800 per year. This charge rate per year can then be converted to an hourly or even a per-minute rate. The estimated fraction of time that the parking is occupied over a year will need to be reconsidered at least yearly.

## **NEW DEFINITIONS TO PROMOTE AN OBJECTIVE VIEW OF PRICING**

- The “fair price” means the price that accounts for all costs.
- The “baseline amount of driving” means the driving that results from the application of the fair price.
- “Zero transportation demand management” (“zero TDM”) is the amount of demand management that results when the fair price is used. It will result in the baseline amount of driving.
- “Negative TDM” refers to the case where the price is set below the fair price. This will cause driving to exceed the baseline amount. Since TDM is commonly thought to be an action that reduces driving, it follows that negative TDM would have the opposite effect.
- “Positive TDM” refers to the case where the price is set above the fair price. This would cause the amount of driving to fall below the baseline amount.

Clearly, so-called “free parking” is an extreme case of negative TDM. The only way to further encourage driving would be to have a system that pays a driver for the time their car is parked.

## **THE GOALS OF *INTELLIGENT PARKING***

- There is only one agency operating all parking. (“All parking” does not include driveways and garages in single-family homes.) *Intelligent Parking* is designed and installed by regional or state government, using low-bid contractors, with design and start-up costs covered by the overhead portion of collection fees.
- Nearly all parking is shared. Almost always, anyone can park anywhere. Those who want exclusive rights to parking will pay “24/7” (all day, every day).
- Parking is operated so that the potential users of parking will escape the expense of parking by choosing to not use the parking. This characteristic is named “unbundled” because the cost of parking is effectively unbundled from other costs.
- Parking is priced and marketed to eliminate the need to drive around looking for parking.
- Parking at any desired price is made as easy as possible to find and use.
- Records of the use of each parking space are kept, to facilitate decisions to either add or subtract parking spaces.
- The special needs of disabled drivers, the privacy of all drivers, and, if desired, the economic interests of low-income drivers are protected.

## **DEFINITIONS & CONCEPTS OF *INTELLIGENT PARKING***

### **Parking Beneficiary Groups**

There are at least 7 types of beneficiary groups. Note that in all cases, members of beneficiary groups must be old enough to drive.

- 1.) People who have already paid for the capital cost of parking. An example of this type of beneficiary group would be the owners of condominiums, where parking has been built and the cost is included in the price of the condominium. Note that although they have technically already paid for the parking, if they borrowed money to pay for some portion of the price, the cost is built into their monthly payment. This illustrates why the value of parking and the cost of borrowing money (rate of return on money) are key input variables to use to compute the appropriate base, hourly charge for parking.
- 2.) People who are incurring on-going costs of parking. An example of this type of beneficiary group is a set of office workers, where the cost of “their” parking is contained in either the building lease or the cost of the building. Either way, the parking costs are reducing the wages that can be paid to these employees.<sup>6</sup>
- 3.) People who are purchasing or renting something where the cost of the parking is included in the price. Examples of this beneficiary group are people that rent hotel rooms, rent an apartment, buy items, or dine in establishments that have parking.

---

<sup>6</sup> Such parking is often said to be “for the benefit of the employees”. Defining this beneficiary group will tend to make this statement true, as opposed to the common situation where the employees benefit only in proportion to their use of the parking.

- 4.) People who own off-street parking as a business. They could be the individual investors or could be a government or government-formed entity.
- 5.) People who are said to benefit from parking, even though the money for the parking has been supplied by a source that may have very little relationship to those that are said to benefit. An example of this group would be train riders that make round trips from a station which has parking that is said to be “for riders”. Students at a school with parking would be another example.
- 6.) People who are considered by many to be the logical beneficiaries of on-street parking. Owners of single-family homes are the beneficiaries of the parking that is along the boundaries of their property. The same status is given to residents of multi-family housing.
- 7.) Governments. Since they build and maintain the streets, they should get a significant benefit from on-street parking.

## **Unbundled Cost and Spontaneous Sharing**

“Unbundled cost” means those who use the parking can see exactly what it costs and those who don’t use the parking will either avoid its cost entirely or will get earnings to make up for the hidden parking cost they had to pay. This conforms to the usual rule of the free market where a person only pays for what they choose to use. Unbundled cost is fair.

“Spontaneous sharing” means that anyone can park anywhere at any time and for any length of time. Proper pricing makes this feasible.

### ***How to Unbundle***

The method of unbundling can be simply stated, using the concept of “beneficiary group” as discussed above. First, the fair price for the parking is charged. The resulting earnings<sup>7</sup> amount is given to the members of the beneficiary group in a manner that is fair to each member. Methods are described below.

### ***Why this Supports Sharing***

Members of a beneficiary group benefit financially when “their” parking is used. They will appreciate users increasing their earnings. They are also not obligated to park in “their” parking. If there is less-expensive parking within a reasonable distance, they might park there, to save money. This is fine, because all parking is included in the *Intelligent Parking* system.

### ***Computing the Earnings for Individuals***

*Intelligent Parking* must be rigorous in paying out earnings<sup>7</sup>. For a mixed use, the total number of parking spaces must first be allocated to the various beneficiary groups. For example in an office/housing complex, 63.5% of the parking might have been sold with the office. If so, the housing portion must be paying for the other 36.5%. For this case, it would follow that the first step is to allocate 63.5% of the earnings to the workers and 36.5% to the residents.

---

<sup>7</sup> The earnings amount is the revenue collected minus the collection cost and any other costs that will have to be paid due to the implementation of *Intelligent Parking*. The costs associated with the parking, paid *before* the implementation of *Intelligent Parking*, should *not* be subtracted from the revenue because they will continue to be paid as they were before the implementation of *Intelligent Parking*. Therefore, these costs will continue to reduce wages and increase the prices of goods and services.

How the monthly earnings are divided up among the members of the beneficiary group depends on the beneficiary group type. For each member, the group's total monthly earnings amount is always multiplied by a quantity and divided by the sum (the sum is the denominator) of that quantity, for all members.

For example, for each employee, the multiplier is the number of hours that the employee worked over the month while the denominator is the total number of hours worked by all employees over the month. At a school, for each student, the numerator is the total time spent at the school, over the month, while the denominator is the sum of the same quantity, for all the students.

For a train station with parking being supplied for passengers that ride on round trips of one day or less, the numerator is the passenger's monthly hours spent on such round trips, over the month; while the denominator is the total number of hours spent by all passengers on such round trips, over the month. Radio Frequency Identification (RFID) units on passengers could support an automated calculation of monthly charges for fares, as well as monthly hours on round trips.

At a shopping center, the numerator is the sum of the money spent by the shopper, over the month, while the denominator is the total amount of money spent by all shoppers over the month.

At a condominium, the numerator is the number of parking places that were paid for (directly or indirectly) by the resident family and the denominator is the total number of parking places at the condominium project; similarly, for apartment complexes.

### ***Where Earnings Are Low***

The goal is that if someone doesn't park, they don't pay, either directly or indirectly, because the earnings that they get will balance out their losses (like reduced wages, for example). However, charging for parking that few want to use will not sufficiently compensate the people that have been forced, or are being forced, to pay for such parking. The only remedy in this case is to redevelop the parking or lease the parking in some other way, for storage, for example. The earnings from the new use should go to those that are in the beneficiary group that was associated with the low-performing parking.

### ***Why This Method of Unbundling Will Feel Familiar to Leaders***

Developers will still be required to provide parking and will still pass this cost on, as has been discussed. There will be no need to force an owner of an exiting office with parking to break his single business into two separate businesses (office and parking).

Parking beneficiaries are identified that conform to traditional ideas about who should benefit from parking.<sup>8</sup>

### ***Unbundling the Cost of On-Street Parking***

The revenue from on-street parking in front of businesses will be split evenly between the city and the business's parking beneficiaries. All of the earnings from on-street parking in front of apartments or single-family homes will be given to the resident families.<sup>9</sup>

---

<sup>8</sup> Showing exactly where parking earnings go will reduce the political difficulties of adopting pay parking in a democracy where the high cost of parking is often hidden and rarely discussed.

<sup>9</sup> Although governments own the streets, often, back in history, developers paid for them and this cost became embedded in property values. Admittedly, how to allocate on-street parking earnings is somewhat arbitrary. With

### ***Special Considerations for Condominiums***

Unbundling for a condominium owner means that, although their allocated amount of parking has added to their initial cost, their allocated amount of parking also earns money for them. Unbundling for a condominium could also mean that an owner can choose to have control over a single or several parking places. Such parking spaces could be equipped with a red light and a green light. If the red light is lit, this will mean that the space is not available for parking, except for the person who is controlling the spot. If the green light is lit, it will mean that the space is available to anyone. A space that is being reserved with a red light is charged at the full price to the condominium owner that has control over the space. The owner that controls these spaces can change the state of the parking space (available or not available) by either a phone call, on line, or at any pay station system that might be in use for the system. After condominium owners experience the cost of reserving a space for themselves, they might give up on the idea of having their own, personal, unshared parking space; especially since *Intelligent Parking* will give most owners and their guests all the flexibility they need in terms of parking their cars.

Some people think that condominium parking should be gated, for security reasons. However, parking within parking garages needs to be patrolled at the same frequency level as on-street parking, which is enough to ensure that crime around either type of parking is very rare. Cameras can help make parking garages that are open to the public safe from criminal activity.

### ***Special Considerations for Renters***

Unbundling for renters means that, although their allocated amount of parking increases their rent, their allocated amount of parking also earns money for them. Therefore, their traditional rent (includes parking) is effectively reduced by the money earned by those parking spaces allocated to them. Renters will be motivated to either not own a car or to park in a cheaper location. Parking in a cheaper location is not a problem because all parking is part of the *Intelligent Parking* system. Renters will welcome anyone to park in “their” parking, because it will increase their earnings.

### ***Special Considerations for Employers***

At first, companies may want the option of offering “free parking” to their employees so as to be able to compete with traditional job sites. This means giving employees that drive every single day an “add-in” amount of pay so that the sum of the add-in and their parking-lot earnings equals their charge, for any given monthly statement. The operator of the parking, which sends out statements, can pay out the “add in” amount, in accordance with the company’s instruction. The company will then be billed for these amounts. There could be no requirement for the company to provide any such “add-in” amount to the employees that don’t drive every day. This would allow the company to treat its every-day drivers better than other employees and so this would be a negative TDM. However, this economic discrimination would be substantially less than the current, status-quo, economic discrimination, where drivers get “free” parking and non-drivers get nothing.

## **Clusters of Parking**

Clusters are a contiguous set of parking spaces that are nearly equal in desirability and thus can be assigned the same price. They should probably consist of from 20 to 40 spaces. For off-street

---

congestion pricing and efficient methods, governments may earn significantly more than they are under current practices.

parking, they could be on either side of the access lane to the parking spaces, so that an observer could see the 20 to 40 cars, and get a feel for the vacancy rate. At a train station, clusters will normally be organized so that their parking spaces are approximately an equal distance from the boarding area. On-street clusters would normally conform to our current understanding of what a block is, which is to say from one cross street to the next cross street. The width of the street and the length of the block should be taken into account in defining on-street clusters of parking and in deciding if the parking on either side of the street should or should not be in the same cluster of parking spaces.

## **Examples of Good and Bad Technology**

### ***Parking Meters or Pay Stations***

Parking meters are a relic of an earlier period, before computers. Pay stations do not add enough usefulness to merit their inclusion in *Intelligent Parking*, except as a bridge technology. Once good systems are set up, pay stations should cost additional money to use because of their expense. It would be best to devise an implementation strategy that will minimize their use when the system is first put into effect and will take them out of service as soon as possible.

### ***Radio Frequency Identification Backed Up by Video-Based “Car Present” and License Recognition***

Government will eventually enter into an RFID (Radio Frequency Identification) age. Organizers of large athletic events already have. Organizers that put on large open-water swims, foot races, and bike rides have routinely used RFID for many years.<sup>10</sup> An RFID vendor in San Diego<sup>11</sup> states that passive RFID units cost less than \$5, are reliable, are durable, and they could be used to identify cars as well as people. He also sees no problem in implementing most of the features of *Intelligent Parking*.<sup>12</sup>

### ***Automatic Data Collection and Sending Out Statements***

Note that the “back end database” of Dr. Carta’s written statement<sup>12</sup> refers to the ability to send statements of earnings and billing to students.<sup>13</sup>

---

<sup>10</sup> For example, over 20,000 people ran the 2008 Bay-to-Breakers foot race in San Francisco. Each runner had a “chip” in their shoe lace. Each runner’s start time and finish time were recorded and all results were available as soon as the last runner crossed the finish line.

<sup>11</sup>David R. Carta, PhD, CEO Telaeris Inc., 858-449-3454

<sup>12</sup> Concerning a Final Environmental Impact Report-approved and funded new high school in Carlsbad, California, where the School Board has signed a *Settlement Agreement* to consider “*unbundled parking*”, “*cash-out*”, and “*pricing*”, Dr. Carta wrote, in a January 13<sup>th</sup>, 2010 written statement to the Board,

I wanted to send a quick note discussing the technical feasibility of tracking cars into a lot without impacting students or requiring the need for gates. Mike Bullock and I have discussed this project; it can be accomplished straightforwardly by utilizing Radio Frequency Identification and/or Video Cameras integrated with automated license recognition systems. The cars would need to register with the system at the start, but it would be fairly painless for the users after the initial installation. The back end database system can also be implemented both straightforwardly and at a reasonable price.

This is not necessarily a recommendation of the proposal for unbundled parking. Rather it is strictly an unbiased view of the technical feasibility of the proposal to easily and unobtrusively track cars, both registered and unregistered, into a fixed lot.

<sup>13</sup> In an earlier email on this subject, Dr. Carta wrote,

## ***Putting it Together***

Certainly, government, and in particular transit agencies and parking agencies, could use RFID-based technology. For example, when a person with an RFID unit which is tied to a billable address or a credit card with an open account gets on a bus or a train, they should not have to pay at that time, visit a pay station, or “swipe a card” that has a positive balance. Utility customers that pay their bills are not required to pre-pay. The same courtesy should be extended to transit riders, people that drive on roads, people that get parking-lot earnings, and people that park cars. There should be one monthly bill or statement, for all four activities.

## ***Global Positioning Systems GPS***

An alternative model is to have GPS systems in cars that would detect the car’s parking location, that location’s current charge rate, and would perform all of the charging functions in the car. The only information the parking-lot-enforcement system would need is whether or not a car being parked is owned by a bill-paying owner. The car owner’s responsibility would be to pay the bills indicated by the box in the car. The box would need to process a signal that a bill had been paid. It would also need to process pricing signals.

## ***Not Picking Winners***

The purpose of this report is to describe what an ideal system would do, *not* how it is done. How a proposed system works is left to the systems, software, and hardware engineers that work together to submit a proposal based on this description of what an ideal system does.

## **Privacy**

Privacy means that no one can see where someone has parked, without a search warrant. Also, the level of the detail of information that appears on a bill is selected by the customer.<sup>14</sup>

## **Ease of Use for Drivers**

For credit-worthy drivers that have followed the rules of the system, pay parking will not require any actions other than parking. Paying for all parking fees over a month is then done in response to a monthly billing statement. Parking will feel to the consumer like a service provided by a municipality, such as water, energy, or garbage. One important difference is that users belonging to a “beneficiary group” will get an earnings amount in their monthly statement. Those that earn more than what they are charged will receive a check for the difference. This ease of use will make all parking less stressful.

## **Base Price**

### ***Off-Street***

---

This is not too tough - we probably would integrate with a service that already sends physical mail from an electronic submission instead of re-inventing this wheel.

<sup>14</sup> License plates that have no RFID tags fail to use the best technology to accomplish the primary purpose of license plates, which is to identify and help intercept cars used in a crime. Identifying cars is a legitimate government goal. Protecting privacy is also a legitimate goal. Both goals can be realized with good laws, good enforcement, and good systems engineering.

Off-street parking is priced so that even if demand does not threaten to fill the parking beyond 85%, the money generated will at least equate to an agreed-upon return on the parking value and pay all yearly costs. Equation 1 shows the calculation of the hourly rate.

$$r_{BaselineHourly} = \frac{(r_{Investment} \times v_{Parking}) + c_{YOPD}}{(n_{HoursPerYear} \times f_{TO})} \quad (\text{Eq. 1})$$

where:

|                      |   |                                                                             |
|----------------------|---|-----------------------------------------------------------------------------|
| $r_{BaselineHourly}$ | = | the computed baseline hourly rate to park                                   |
| $r_{Investment}$     | = | yearly return on investment, such as .06                                    |
| $v_{Parking}$        | = | value of a parking space, such as (parking garage) \$40,000                 |
| $c_{YOPD}$           | = | yearly operations <sup>15</sup> plus depreciation, per space, such as \$100 |
| $n_{HoursPerYear}$   | = | number of hours per year, 24 x 365 = 8760 Hours per Year                    |
| $f_{TO}$             | = | fraction of time occupied, such as 0.55.                                    |

For the example values given, the base hourly rate of parking, to cover the cost of the investment, operations<sup>15</sup>, and depreciation is \$0.519 per hour. This could be rounded up to \$0.52 per hour. This price could also be increased to result in positive TDM, to reduce driving more than the fair-price, zero-TDM amount.

### ***On-Street***

If on-street parking is located within walking distance (one-quarter mile) of off-street parking, its base price is set equal to the closest off-street parking's base price. Otherwise, it is set to some agreed-upon value, like fifty cents per hour. However, on-street parking has a special meaning for downtown merchants and for neighborhoods, two powerful political forces in any city. Merchants that have few cars parking on their street, even though it is permitted, are probably failing in their businesses. They would like free parking to help draw visitors to their store front. Neighborhoods that are not impacted by parking would probably prefer no pricing. For these reasons, for any on-street parking cluster, no price is charged until the cluster occupancy reaches 50%. (Time of day is irrelevant.)

### **Congestion Pricing**

The time-rate price of parking is dynamically set on each cluster of parking, to prevent the occupancy rate from exceeding 85% (to reduce the need to drive around looking for parking). An 85% occupancy rate (15% vacancy) results in just over one vacant parking space per city block<sup>5</sup>. If the vacancy rate is above 30%, the price is left at the baseline hourly rate. If vacancies fall below 30%, the price can be calculated in a stair-step method, such as shown in Table 2.

Equation 2 is an alternative method.

In either case, the total charge is time parked, multiplied by the time-averaged, time-rate price. The base multiplier would be adjusted to be just large enough to keep the vacancy rate from falling below a desired level, such as 15%, so it is always easy to find parking.

---

<sup>15</sup> This includes money for policing, cleaning, maintenance, any applicable parking tax, and all collection costs. Collection costs will need to include an amount to recover the development and installation costs of *Intelligent Parking*.

**Table 2 Hourly Rates for 2 Base Multipliers and a Baseline Hourly Rate of \$0.52**

| Vacancy Rate | Base Multiplier = 2 |       |             | Base Multiplier = 2.5 |          |             |
|--------------|---------------------|-------|-------------|-----------------------|----------|-------------|
|              | Multiplication      |       | Hourly Rate | Multiplication        |          | Hourly Rate |
|              | Formula             | Value |             | Formula               | Value    |             |
| Above 30%    | $r_0$               | 1     | \$0.52      | $r_{50}$              | 1        | \$0.52      |
| 25% to 30%   | $r_1$               | 2     | \$1.04      | $r_{51}$              | 2.5      | \$1.30      |
| 20% to 25%   | $r_2$               | 4     | \$2.08      | $r_{52}$              | 6.25     | \$3.25      |
| 15% to 20%   | $r_3$               | 8     | \$4.16      | $r_{53}$              | 15.625   | \$8.13      |
| 10% to 15%   | $r_4$               | 16    | \$8.32      | $r_{54}$              | 39.0625  | \$20.31     |
| 5% to 10%    | $r_5$               | 32    | \$16.64     | $r_{55}$              | 97.6563  | \$50.78     |
| Below 5%     | $r_6$               | 64    | \$33.28     | $r_{56}$              | 244.1406 | \$126.95    |

$$r_{HourlyRate} = r_{BaselineHourly} \times (B^{(30-V)/5}), \text{ for } V < 30; r_{BaselineHourly}, \text{ otherwise (Eq. 2)}$$

where:

$r_{HourlyRate}$  = the congestion-priced hourly rate to park

$r_{BaselineHourly}$  = the baseline hourly rate to park, such as \$0.52 per hour (taken from from Eq. 1).

$B$  = the base of the multiplier being computed, such as 2.50

$V$  = the vacancy rate percent, such as 17.5, for 7 vacancies in a cluster of 40 spaces,  $100*(7/40) = 17.5$

For the example values given, the hourly rate of parking would be \$9.88 per hour.

### Pricing Predictions and Notifications

Drivers will develop strategies for their routine trips. The computer system that keeps records of parking use will also provide help for users. The *Intelligent Parking* website will direct a user to an appropriate cluster of parking if the user provides the destination location or locations, the time and date, and the hourly rate they wish to pay. If the walk is going to be long, the website could suggest using transit to get from the cheaply-priced parking to the destination. In such cases, the website may also suggest using transit for the entire trip.

Another user option is to specify the time, location, and the distance the user is willing to walk. In this case, the computer would give the cheapest cluster of parking available at the specified walk distance. The price prediction would be provided.

All price predictions would also have a probability of correctness associated with them. If a user can show that a computer has predicted a much lower price than what actually occurred, with a sufficiently high probability, it would be reasonable to charge the user the predicted price rather than the actual price.

Websites could routinely inform viewers when occupancy rates are expected to be unusually high, due to a special event (for example, a sporting event). The parking system website will always give current and predicted hourly rates for all locations. The hourly rates of parking will

also be available at a phone number and possibly at pay stations. The base-price hourly rate, for any parking cluster, would be stable and could therefore be shown on signs. Parking garage entrances could have large video screens showing both predicted and existing price. Users will also learn to look at parking and judge whether congestion pricing applies, or could apply, while their car is parked. It would not be long before these capabilities are added into GPS navigation systems.

## **Prepaid RFID**

To be inclusive, pay stations or convenience stores will offer a pre-paid RFID that can be set on the dashboard of a car. This will support drivers with poor credit or drivers who have not obtained the necessary equipment to support the normal, trouble-free methods. This will also work for drivers that do not trust the system to protect their privacy for a certain trip (by removing or disabling the permanent RFID) or for all trips. No billing would occur.

## **Enforcement**

The system would notify the appropriate law enforcement agency if an unauthorized car was parked. Authorized cars would need either a pre-paid RFID or equipment indicating that their owners had *Intelligent Parking* accounts and were sufficiently paid up on their bills.

## **IMPLEMENTATION**

This description of *Intelligent Parking* will help to implement efficient parking systems. Parking at train stations, schools, and government buildings could introduce many of these concepts. This description of *Intelligent Parking* is sufficient to support a “Request for Proposal” process, which could lead to full implementation. Widespread installation should be done by a government agency, to minimize actions required on the part of the private sector. Laws would simply require the cooperation of all private-sector and government entities.

## **SUMMARY**

A parking plan, *Intelligent Parking* has been described.

1. Technology will make it easy to use for most drivers.
2. Its parking is almost always shared, to support mixed uses.
3. It unbundles cost by charging and having earnings go to the parking beneficiaries.
4. Traditional groups, such as single-family home owners, employees, tenants, train riders, and students benefit from parking. The benefit is equal for drivers and non-drivers.
5. Baseline prices are computed primarily from the value of the parking and an agreed-upon rate of return. On-street parking is free until it is half full, at which time its base price often matches that of the closest off-street parking.
6. For all parking, price is dynamically increased to guarantee availability. Earnings are therefore only limited by what people are willing to pay.
7. Technology helps drivers find parking and decide if they want to drive or use transit.
8. Prepaid RFIDs provide service to those who have poor credit or don't want to be billed.
9. Disabled and perhaps low-income drivers will have accounts that allow them to park at reduced prices and perhaps avoid congestion pricing. Specially designated spots might also be required for disabled drivers.

10. The system will provide reports showing where additional parking would be a good investment and where it would be wise to convert existing parking to some other use.
11. Privacy will be protected. Law enforcement officials would need a search warrant to see where someone's car has been parked. The level of detail on billing would be selected by the car's owner.
12. Implementations could begin in carefully selected locations and expand.

Global warming, air pollution, trade deficits, and fairness are some of the significant reasons that governments have a responsibility to implement *Intelligent Parking*.

# Equitable and Environmentally-Sound Car-Parking Policy at a Work Site

By Mike Bullock [mike\\_bullock@earthlink.net](mailto:mike_bullock@earthlink.net)

Aug. 30, 2015

## Introduction

This paper describes a parking policy that distributes the benefit of parking to all employees, regardless of how often they choose to drive. It does this by

- Charging a fair price for the parking, per unit of time parked, and by
- Giving the total earnings (*total parking-lot earnings*) to the employees, such that each employee's share of the *total parking-lot earnings* is proportion to the time they spend at the work site served by the parking.

The following, additional, optional action would guarantee that no driver loses money under the policy:

- Adding a *must-drive bonus* to each driver's share of the *parking-lot earnings*, if it happened that their share of the *parking-lot earnings* is less than their parking-lot charge. This means that the employee's *must-drive bonus* would be equal to their *parking-lot charge* minus their share of the *parking-lot earnings*.

If an employer decided to pay a *must-drive bonus* to its employees, it would be possible to allow employees to effectively "opt out" of the program so they would not need to be mailed the car-parking statements. The system would feel like "free parking" to them.

Reference 1 describes a more comprehensive policy that will efficiently and conveniently unbundle the cost (or the benefit) of parking in all circumstances. It is available at the following URL: <http://sierraclub.typepad.com/files/mike-bullock-parking-paper.pdf>.

The system described herein is less complex because it does not include congestion pricing, price predictions, or policies that are unique to on-street parking. These features can be eliminated, because it is assumed that there will be an adequate supply of parking, so no congestion pricing is needed; that the price can be relatively stable, so no price predictions are needed; and finally, that employees can be successfully required to park only in their employee parking, so there is no need for new, on-street parking policies, designed to protect adjoining neighborhoods from the intrusion of additional parked cars. If the adjoining neighborhoods had permit parking with a 2-hour limit for cars with no permit, very few employees would ever park in those neighborhoods, in any case.

## **Rationale**

This system of “unbundled parking cost” will allow all stakeholders to see the actual value of the parking. It will reduce single-occupancy driving to work. Less driving will reduce traffic congestion, air pollution and greenhouse gas (GHG) emissions.

Parking is expensive to provide. Therefore, if no parking had been provided, the saved money could have been invested to increase employee salaries. The method described in this paper allows employees to gain some of that lost salary back, by driving less.

Providing free or underpriced parking only benefits employees that would drive every day, even if they had a method to recover some of their lost salary.

## **Methods**

The parking is operated on the behalf of the employees, as if it were their own business. Those that drive to work are therefore their own customers.

*Charge* for parking is proportional to time parked and is charged to the employee associated with the car. (A charge rate that is acceptable to all must be established.) For example, if sixty cents per hour is selected, the charging software could round off the parking duration time to the nearest minute and apply a one-cent-per-minute charge. The data-collection method could be implemented with RFID’s on cars being detected at parking-lot entrances and exits. Unauthorized cars coming into the employee parking facility would be identified with license-plate detection and, if a car belonging to a felon is driven into the parking lot, a warning notice could be sent to authorities, if this is desired by the company leaders.

*Earnings* (net revenue, minus the cost of collection and distribution) are given to the employees; in proportion to the time they spend at the work site. This could be based on an employee’s schedule or, for more accuracy, could be based on “time-at-the-work-site” data, collected using personal radio frequency identification units (RFIDs) and detectors that are tied to a central, implementing computer. The variables used to compute the amount of money to be paid to an employee are shown in Table 1. The corresponding formula is shown in Figure 1.

*Parking statements* are automatically sent out monthly, showing the individual’s charges and earnings. If desired, the statements could include a *must-drive bonus*, so that no driver losses money under the system. The *must drive bonus* would probably need to come from funds available for employee compensation.

## Implementation

Since this is a new system, it would be prudent for the company leaders to have the vendor take the full responsibility for operating the system, for the first 10 years. This arrangement would ensure that the vendor would debug the system and continue to look for operational efficiencies, over the 10 year period. A sliding scale of vendor-compensation could be specified in the contract, as follows: The vendor could operate the system for 10% of the revenue, for the first 5 years; 5% of the revenue, for the next 3 years; and 2% of the revenue, for the final 2 years. For example, if it is assumed that, on average, 600 cars are parked for 8 hours, for 200 days per year, at a rate of 50 cents per hour, then the yearly revenue would be \$480,000 per year. The vendor would therefore collect \$240,000 over the first 5 years, \$72,000 over the next 3 years, and \$28,800 over the last two years. Figure 2 shows contact information and excerpts of received emails, from a San Diego vendor. This vendor has stated that the design and installation of a fully-automated system would be easy to perform.

**Table 1 Variables Used to Compute an Employee's Monthly Earnings**

| <b>Definitions to Compute an Employee's Monthly Earnings</b> |                                                    |
|--------------------------------------------------------------|----------------------------------------------------|
| $T_{Employee}$                                               | The Employee's Monthly Time at the Work Site       |
| $T_{AllEmployees}$                                           | Total Monthly Time at the Work Site, All Employees |
| $E_{AllEmployees}$                                           | Total Monthly Earnings from the Employee Parking   |

**Figure 1 Formula Used to Compute an Employee's Monthly Earnings**

$$E_{Employee} = T_{Employee} * ( E_{AllEmployees} / T_{AllEmployees} )$$

## Introducing a New Price Differential, for Driving, Compared to Not Driving

Table 2 shows that introducing a price differential into the choice of how often to drive will decrease the amount of driving.

## Other Benefits

Depending on the work site's location and the size of its access roads, there could be a substantial decrease in local congestion, improving the health of all employees and those living near the congestion. This parking policy will show neighbors that the company is working to be a good citizen. This program will encourage active transportation, meaning

modes that provide exercise for the employees. It will also teach the employees the value of parking. It is recommended that the method of determining the selected rate of charge be shared with both the employees and the community at large. This program can be thought of as a demonstration project of a new approach to parking.

|                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>David R. Carta, Ph.D., CEO</b><br/><b>TELAERIS Inc.</b><br/><b>Innovative Solutions and Rapid Development</b><br/><b>9123 Chesapeake Dr., San Diego, CA 92123</b><br/><b>+1.858.627.9708 : Office</b><br/><b>+1.858.627.9702 : Fax</b><br/><b>+1.858.449.3454 : Mobile</b><br/>e-<br/><b>mail: <a href="mailto:David.Carta@Telaeris.com">David.Carta@Telaeris.com</a></b><br/><b>skype: davidcarta</b></p> | <p>I reviewed your Intelligent Parking proposal and presentation in their entirety. The identification of vehicles which you suggest for student parking using commercially available RFID technologies is a fairly straightforward process. There are numerous, inexpensive passive (no battery required) RFID tags which have been specifically designed for use on cars and trucks. These tags are installed directly on license plates or windshields, can be read from up to 30 meters away, and can be read as cars drive up to 60 mph. Additionally, automatic license recognition systems, used in conjunction with RFID, can provide a high level of enforcement making it difficult to cheat the system, similar to the Fast Track system which allows tolls to be automatically collected.</p> |
| <p>This is not too tough - we probably would integrate with a service that already sends physical mail from a electronic submission instead of re-inventing this wheel.</p>                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### **Green House Gas Impacts**

S-3-05 is a California Governor's Executive Order to drop the state's Year 2020 levels of greenhouse gas (GHG) emissions to the state's level of 1990 emissions and to drop the state's Year 2050 level of GHG emissions to 80% *below* the state's 1990 levels. If the world were to achieve similar reductions, the earth's level of atmospheric CO2 would be capped at 450 parts per million (PPM). Figures 3, 4, and 5 show how large 450 PPM is, compared to values over the last 800 thousand years. Reference 2 shows that the goal of S-3-05 is to limit atmospheric CO2 to 450 PPM and it also shows that even if this cap is achieved, the risk of a human catastrophe caused by global warming is significant. Reference 3's Figure 1 shows that a significant reduction in driving is critically needed.

### **Conclusion**

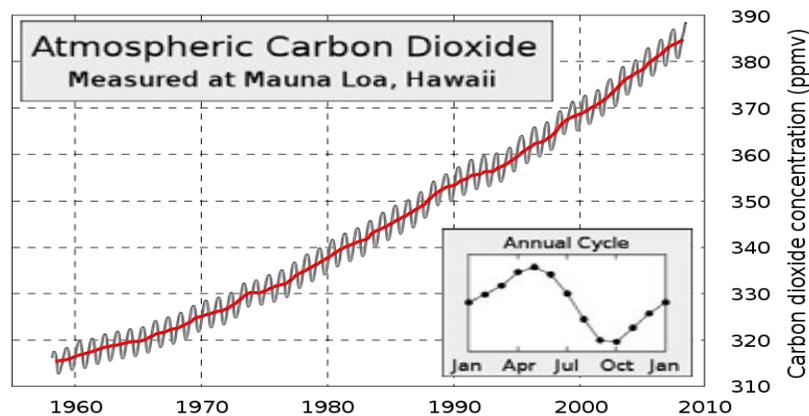

Adopting this program would benefit the employer, the employees, and the community, in many ways. They will all gain an added understanding of economics, technology, and the power of the free-market principle that sometimes it is better to have people pay for what they use and not force people to lose money for something they don't use. All the members

of the work-place community could take pride in being part of this pioneering effort to reduce driving and greenhouse gas emissions. It would be a demonstration of the fundamental features of Reference 1. It would set an example for other employers.

CASE TITLE: **SIERRA CLUB vs. County of San Diego [E-FILE]**

CASE CATEGORY: Civil - Unlimited CASE TYPE: Toxic Tort/Environmental

---

**APPEARANCES**

---

The Court, having taken the above-entitled matter under submission on 04/19/2013 and having fully considered the arguments of all parties, both written and oral, as well as the evidence presented, now rules as follows:

1. Overview and Procedural Posture.

In this CEQA case, this court for the second time in the last 6 months is required to address the controversial topic of global climate change. The court last addressed this subject in *Cleveland Nat'l. Forest Foundation v. SANDAG*, Case No. 2011-00101593; that case is now on appeal (D063288). As noted in its December 2012 ruling, this court recognizes it is but a way station in the life of most CEQA cases, and it seems this one will likely fit this pattern.

Because the trial courts are not final, it is important that they be prompt, and the court has done its best in that regard. The petition was filed on July 20, 2012. The case was assigned to Judge Hayes, but the Sierra Club challenged her, and the case was reassigned to Dept. 72. ROA 9, 11. The petition was promptly served. ROA 10.

The parties were first before the court on November 6, 2012, when they sought a hearing date and supplied the court with a stipulated briefing schedule. The court granted the requests. ROA 15, 16. The County filed its answer on January 9, 2013 (ROA 19), and the briefing began in February, 2013. ROA 21-25. The 4300+ page Certified Administrative Record (AR) is contained on a compact disk which was lodged on April 4 (the CD lodged with the opening brief, ROA 22, was either blank or incompatible with the court's aging desktop computers). The court has reviewed the briefing and the record.

Sierra Club contends that the County's June 20, 2012 "Climate Action Plan" (CAP), which is AR 002-126, is insufficient and violates CEQA in several respects: it does not comply with mitigation measures spelled out in the County's 2011 Program EIR (PEIR), adopted in connection with the 2011

General Plan Update (GPU)(AR 0441 ff); it fails to satisfy the requirements for adopting thresholds of significance for greenhouse gas emissions (GHG); and it should have been set forth in a stand-alone environmental document rather than in an addendum to the PEIR. The County denies these claims, and asserts the CEQA challenge is time-barred, the CAP complies with all legal requirements, the use of an addendum was appropriate, and that all relief is barred by the Sierra Club's failure to notify the AG as required by Pub. Res. Code section 21167.7. Although briefed by Sierra Club, neither standing nor exhaustion are challenged by the County.

Following publication of a tentative ruling on April 16, the case was argued on the afternoon of April 19 by Cory Briggs, Esq. on behalf of Sierra Club, and Ellen Pilsecker, Deputy County Counsel, on behalf of the County. The arguments were focused and thoughtful. Following the arguments, the court took the matter under submission. The court's ruling follows.

## 2. Overview of the CEQA Process.

### A. The Court's Role in CEQA Cases.

In *Mira Mar Mobile Community v. City of Oceanside*, 119 Cal.App.4th 477, 486 (2004) (*Mira Mar Mobile Community*), the court explained that "[i]n a mandate proceeding to review an agency's decision for compliance with CEQA, [courts] review the administrative record de novo [citation], focusing on the adequacy and completeness of the EIR and whether it reflects a good faith effort at full disclosure. [Citation.] [The court's] role is to determine whether the challenged EIR is sufficient as an information document, not whether its ultimate conclusions are correct. [Citation.]" An EIR is presumed adequate. Pub. Res. Code § 21167.3, subd. (a).

Courts review an agency's action under CEQA for a prejudicial abuse of discretion. Pub. Res. Code § 21168.5. "Abuse of discretion is established if the agency has not proceeded in a manner required by law or if the determination or decision is not supported by substantial evidence." *Id.*; see *Mira Mar Mobile Community*, supra, 119 Cal.App.4th at 486; *County of San Diego v. Grossmont-Cuyamaca Community College Dist. ("Grossmont")*, 141 Cal. App. 4th 86, 96 (2006)(same).

In defining the term "substantial evidence," the CEQA Guidelines state: "'Substantial evidence' ... means enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached. Whether a fair argument can be made ... is to be determined by examining the whole record before the lead agency. Argument, speculation, unsubstantiated opinion[,] narrative [or] evidence which is clearly erroneous or inaccurate ... does not constitute substantial evidence." CEQA Guidelines, § 15384(a). "In applying the substantial evidence standard, [courts] resolve all reasonable doubts in favor of the administrative finding and decision. [Citation.]" *Mira Mar Mobile Community*, supra, 119 Cal.App.4th at 486; *Grossmont*, supra, 141 Cal. App. 4th at 96.

Although the lead agency's factual determinations are subject to the foregoing deferential rules of review, questions of interpretation or application of the requirements of CEQA are matters of law. While judges may not substitute their judgment for that of the decision makers, they must ensure strict compliance with the procedures and mandates of the statute. *Grossmont*, supra, 141 Cal. App. 4th at 96.

### B. The Three Steps of CEQA.

CEQA establishes "a three-tiered process to ensure that public agencies inform their decisions with

environmental considerations." *Banker's Hill, et al v. City of San Diego*, 139 Cal. App. 4th 249, 257 (2006)("Banker's Hill"); see also CEQA Guidelines, § 15002(k)(describing three-step process).

#### First Step in the CEQA Process.

The first step "is jurisdictional, requiring that an agency conduct a preliminary review in order to determine whether CEQA applies to a proposed activity." *Banker's Hill, supra*, 139 Cal. App. 4th at 257; see also Guidelines, § 15060. The Guidelines give the agency 30 days to conduct this preliminary review. (Guidelines, § 15060.) The agency must first determine if the activity in question amounts to a "project." *Muzzy Ranch Co. v. Solano County Airport Land Use Com.* (2007) 41 Cal.4th 372, 380. "A CEQA ...project falls into one of three categories of activity which may cause either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment (§ 21065)." *Sunset Sky Ranch Pilots Assn. v. County of Sacramento* (2009) 47 Cal.4th 902, 907.

As part of the preliminary review, the public agency must also determine the application of any statutory exemptions or categorical exemptions that would exempt the proposed project from further review under CEQA. See Guidelines, § 15282 (listing statutory exemptions); Guidelines, §§ 15300–15333 (listing 33 classes of categorical exemptions). The categorical exemptions are contained in the Guidelines and are formulated by the Secretary under authority conferred by CEQA section 21084(a). If, as a result of preliminary review, "the agency finds the project is exempt from CEQA under any of the stated exemptions, no further environmental review is necessary. The agency may prepare and file a notice of exemption, citing the relevant section of the Guidelines and including a brief 'statement of reasons to support the finding.' " *Banker's Hill, supra*, 139 Cal.App.4th at 258, citing Guidelines, §§ 15061(d), 15062(a)(3).

#### Second Step in the CEQA Process.

If the project does not fall within an exemption, the agency proceeds to the second step of the process and conducts an initial study to determine if the project may have a significant effect on the environment. (Guidelines, § 15063.) If, based on the initial study, the public agency determines that "there is substantial evidence, in light of the whole record ... that the project may have a significant effect on the environment, an environmental impact report [(EIR)] shall be prepared." [CEQA, § 21080(d).] On the other hand, if the initial study demonstrates that the project "would not have a significant effect on the environment," either because "[t]here is no substantial evidence, in light of whole record" to that effect or the revisions to the project would avoid such an effect, the agency makes a "negative declaration," briefly describing the basis for its conclusion. (CEQA, § 21080(c)(1); see Guidelines, § 15063(b)(2); *Banker's Hill, supra*, 139 Cal.App.4th at 259.)

The Guidelines and case law further define the standard that an agency uses to determine whether to issue a negative declaration. "[I]f a lead agency is presented with a fair argument that a project may have a significant effect on the environment, the lead agency shall prepare an EIR even though it may also be presented with other substantial evidence that the project will not have a significant effect." (Guidelines, § 15064(f)(1), italics added.) This formulation of the standard for determining whether to issue a negative declaration is often referred to as the "fair argument" standard. See *Laurel Heights Improvement Assn. v. Regents of University of California*, 6 Cal.4th 1112, 1134–1135 (1993). Under the fair argument standard, a project "may" have a significant effect whenever there is a "reasonable possibility" that a significant effect will occur. *No Oil v. City of Los Angeles*, 13 Cal.3d 68, 83-84 (1974). Substantial evidence, for purposes of the fair argument standard, includes "fact, a reasonable assumption predicated upon fact, or expert opinion supported by fact." § 21080, subd. (e)(1).

Substantial evidence is not argument, speculation, unsubstantiated opinion or narrative, evidence that is clearly inaccurate or erroneous, or evidence of social or economic impacts unrelated to physical impacts on the environment. § 21080, subd. (e)(2).

If the initial study reveals no substantial evidence that the project may have a significant environmental effect, the agency may adopt a negative declaration. Pub. Res. Code § 21080, subd. (c)(2); Guidelines, § 15070, subd. (b); Grand Terrace, supra, 160 Cal.App.4th at 1331; Save the Plastic Bag Coalition v. City of Manhattan Beach, 52 Cal. 4th 155, 175 (2011)(holding common sense is part of the substantial evidence analysis). "Alternatively, if there is no substantial evidence of any net significant environmental effect in light of revisions in the project that would mitigate any potentially significant effects, the agency may adopt [an MND]. [Citation.] [An MND] is one in which '(1) the proposed conditions "avoid the effects or mitigate the effects to a point where clearly no significant effect on the environment would occur, and (2) there is no substantial evidence in light of the whole record before the public agency that the project, as revised, may have a significant effect on the environment." (§ 21064.5 . . .)' [Citations.]" Grand Terrace, supra, at 1331-1332. The MND allows the project to go forward subject to the mitigating measures. Pub. Res. Code §§ 21064.5, 21080, subd. (c); see Grand Terrace, supra, 160 Cal. App. 4th at 1331.

### Third Step in the CEQA Process.

If no negative declaration is issued, the preparation of an EIR is the third and final step in the CEQA process. Banker's Hill, supra, 139 Cal. App. 4th at 259; Guidelines, §§ 15063(b)(1), 15080; CEQA, §§ 21100, 21151.

### C. The Environmental Impact Report.

Central to CEQA is the EIR, which has as its purpose informing the public and government officials of the environmental consequences of decisions before they are made. [Citation.] "An EIR must be prepared on any 'project' a local agency intends to approve or carry out which 'may have a significant effect on the environment.' Pub. Res. Code §§ 21100, 21151; Guidelines, § 15002, subd. (f)(1). The term 'project' is broadly defined and includes any activities which have a potential for resulting in a physical change in the environment, directly or ultimately. Pub Res. Code § 21065; Guidelines, §§ 15002, subd. (d), 15378, subd. (a); [Citation].) The definition encompasses a wide spectrum, ranging from the adoption of a general plan, which is by its nature tentative and subject to change, to activities with a more immediate impact, such as the issuance of a conditional use permit for a site-specific development proposal." CREED v. City of San Diego, 134 Cal. App. 4th 598, 604 (2005).

"To accommodate this diversity, the Guidelines describe several types of EIR's, which may be tailored to different situations. The most common is the project EIR, which examines the environmental impacts of a specific development project. (Guidelines, § 15161.) A quite different type is the program EIR, which 'may be prepared on a series of actions that can be characterized as one large project and are related either: (1) Geographically, (2) As logical parts in the chain of contemplated actions, (3) In connection with issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program, or (4) As individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects which can be mitigated in similar ways.'" Guidelines, § 15168, subd. (a); CREED, supra, 134 Cal. App. 4th at 605. As the court held in CREED, a program EIR may serve as the EIR for a subsequently proposed project only to the extent it contemplates and adequately analyzes the potential environmental impacts of the project. CREED, supra, 134 Cal. App. 4th at 615.

As noted in part 1 above, the EIR at issue in this case is of the latter variety, a PEIR.

Under CEQA, an EIR is presumed adequate (Pub. Resources Code, § 21167.3), and the plaintiff in a CEQA action has the burden of proving otherwise. (Preserve Wild Santee v. City of Santee, 210 Cal. App. 4th 260, 275 (2012), internal quotation marks omitted, quoting Concerned Citizens of South Central L.A. v. Los Angeles Unified School Dist. (1994) 24 Cal.App.4th 826, 836.) Courts review an agency's determinations and decisions for abuse of discretion. An agency abuses its discretion when it fails to proceed in a manner required by law or there is not substantial evidence to support its determination or decision. [§§ 21168, 21168.5; Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova (2007) 40 Cal.4th 412, 426-427 (2007) ("Vineyard")]. "Judicial review of these two types of error differs significantly: While [courts] determine de novo whether the agency has employed the correct procedures, 'scrupulously enforc[ing] all legislatively mandated CEQA requirements' [citation], [courts] accord greater deference to the agency's substantive factual conclusions." (Vineyard, supra, 40 Cal. 4th at 435.)

Consequently, in reviewing an EIR for CEQA compliance, courts adjust "scrutiny to the nature of the alleged defect, depending on whether the claim is predominantly one of improper procedure or a dispute over the facts." (Vineyard, supra, 40 Cal.4th at 435.) For example, where a petitioner claims an agency failed to include required information in its environmental analysis, the court's task is to determine whether the agency failed to proceed in the manner prescribed by CEQA. Conversely, where a petitioner challenges an agency's conclusion that a project's adverse environmental effects are adequately mitigated, courts review the agency's conclusion for substantial evidence. (Vineyard, supra, 40 Cal. 4th at 435.)

#### D. Further Requirements of CEQA.

In addition to the foregoing public process/decision maker information steps, the Legislature in enacting CEQA also intended to "provide certain substantive measures for protection of the environment. [Citations.] In particular, one court noted [Public Resources Code] section 21002 requires public agencies 'to deny approval of a project with significant adverse effects when feasible alternatives or feasible mitigation measures can substantially lessen such effects.' [Citation.] (Quail Botanical Gardens Foundation, Inc. v. City of Encinitas (1994) 29 Cal.App.4th 1597, 1601-1602, citing No Oil, Inc. v. City of Los Angeles (1974) 13 Cal.3d 68, 75 and Laurel Heights Improvement Assn. v. Regents of University of California (1993) 6 Cal.4th 1112, 1123 . . . ). The Legislature declared its intention in enacting CEQA "that all public agencies responsible for regulating activities affecting the environment give prime consideration to preventing environmental damage when carrying out their duties. [Citations.] CEQA is to be interpreted 'to afford the fullest possible protection to the environment within the reasonable scope of the statutory language.' " (Mountain Lion Foundation v. Fish & Game Com. (1997) 16 Cal.4th 105, 112.)

### 3. RFJN.

Sierra Club, with its reply briefing, filed a Request for Judicial Notice to which was attached a copy of the AG's letter acknowledging receipt of a copy of the petition in July of 2012 (shortly after it was filed). The court grants the request for judicial notice under Evid. Code section 452(c) and (g). This conclusively eliminates the County's third affirmative defense and the argument under Pub. Res. Code section 21167.7 contained on pp. 14-15 of the County's brief. In fact, this argument was meritless from the outset, as Sierra Club filed a proof of service on the AG last July (ROA 8). In other words, the County's

argument that "the case file contains no indication that [the AG notification requirement] was met" was demonstrably untrue when the County's answer was filed and when its brief was filed. County Counsel forthrightly acknowledged this at the April 19 hearing.

#### 4. Discussion and Ruling.

Former Governor Schwarzenegger issued, in 2005, Executive Order S-03-05, which for the first time set a state goal of reducing greenhouse gas emissions. This Executive Order gave rise to the Global Warming Solutions Act of 2006 (AB 32), which is codified at H&S Code section 38500 et seq. Section 38550 provides:

"By January 1, 2008, the [Air Resources Board] shall, after one or more public workshops, with public notice, and an opportunity for all interested parties to comment, determine what the statewide greenhouse gas emissions level was in 1990, and approve in a public hearing, a statewide greenhouse gas emissions limit that is equivalent to that level, to be achieved by 2020. In order to ensure the most accurate determination feasible, the state board shall evaluate the best available scientific, technological, and economic information on greenhouse gas emissions to determine the 1990 level of greenhouse gas emissions."

In the 2011 PEIR for the GPU, the County concluded that the GHG and climate-change impacts from the County's own operations and from community sources were "potentially significant" both in relation to compliance with AB 32 and with regard to the updated general plan itself. AR 488 (end of first paragraph under "Summary"), 493 (end of "Summary" paragraph). Consequently, the County had to adopt a series of mitigation measures to render these impacts insignificant. AR 494-500. Among those mitigation measures was CC-1.2, which is the focus of Sierra Club's attack:

"Prepare a County Climate Change Action Plan with an update[d] baseline inventory of greenhouse gas emissions from all sources, more detailed greenhouse gas emissions reduction targets and deadlines; and a comprehensive and enforceable GHG emissions reduction measures that will achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020. Once prepared, implementation of the plan will be monitored and progress reported on a regular basis." [AR 496]

The County undertook to prepare the CAP, in accordance with Mitigation Measure CC-1.2, within six months [AR 313-314]. The County did not do so; the CAP was not approved until nearly a year after the PEIR was certified.

The central questions in this case are whether the CAP was properly approved, and whether it meets the requirements of Mitigation Measure CC-1.2. Thus, the court rejects the County's first affirmative defense which is addressed on pp. 5-7 of the County's brief. These arguments are premised on the notion that because the GPU and PEIR were adopted in the summer of 2011, an action filed in July of 2012 cannot pass muster under the 180 day limitations period of Pub. Res. Code section 21167. But the court agrees with Sierra Club that the gravamen of its petition is not an attack on the PEIR, but rather an effort to enforce the PEIR's requirement of enforceable mitigation measures. The case law relied on by the County all arose in settings in which the mitigation measures themselves were challenged as inadequate, or the cases are otherwise inapplicable. This case was filed 30 days after the June 20, 2012 approval by the County of the CAP, and it is not time-barred.

Regarding the first central question identified above: the court finds the CAP should have been the subject of a supplemental EIR instead of an addendum to the PEIR that concluded the CAP is within the scope of the PEIR. (AR 16:1372, second sentence of last paragraph.) Thus, the CAP was not properly approved and violates CEQA.

There is no explanation and no substantial evidence to justify why the CAP was not subject to a supplemental EIR with public notice and opportunity for comment. There is no showing that the County properly considered whether the CAP is within the scope of the PEIR; a supplemental EIR would require the Board of Supervisors to confront this issue. Further, environmental review is necessary to ascertain whether the CAP met the necessary GHG emission reductions when considering the CAP is merely hortatory and contains no enforcement mechanism for reducing GHG emissions.

In this regard, the case has some similarities to *Center for Sierra Nevada Conservation v. County of El Dorado* (2012) 202 Cal.App.4th 1156 (County of El Dorado). That case, like this one, involved a program EIR for a general plan. *Id.* at 1175. One of the mitigation measures called for implementation of a mitigation fee program. The county later did an initial study for the fee program, and stopped short of a more complete environmental review. The court of appeal held a tiered EIR was required to examine the specific mitigation measures and fee rate, rejecting the argument that the fee program was merely implementation of the general plan. Here, the CAP "provides the specific details associated with the ... General Plan ... strategies and measures for greenhouse gas (GHG) emissions and reductions that were not available during program-level analysis of the General Plan" (AR 16:1357), and as such, the CAP should have been the subject of a supplemental EIR [as opposed to an IS followed by addendum to the PEIR]. Thus, the CAP was not properly approved and violated CEQA.

Turning to the second central question identified above: the court finds that even if the CAP was properly approved, it does not comport with the requirements of Mitigation Measure CC-1.2; thus, the CAP violates CEQA. In this regard, there is no substantial evidence in the AR that the CAP satisfies Mitigation Measure CC-1.2; in fact, the evidence in the AR discloses the reverse is true.

For instance, the AR shows the CAP fails to meet Mitigation Measure CC-1.2 GHG emission reduction goals and targets. The CAP admits "The CAP itself does not itself ensure reductions ..." [AR 2:74]; the CAP regards its goals and strategies as mere recommendations [AR 2:27 - "The goals and strategies recommended in the CAP ..."]; and the CAP describes itself as a "living document," a "working document," and "a platform for the County to build strategies to meet its emission-reduction targets" [AR 2:15, 73.] As the court noted in its December 2012 decision, the County's adoption of the CAP occurs "in a setting in which hundreds of thousands of people in [the County] live in low-lying areas near the coast, and are thus susceptible to rising sea levels associated with global climate change." There is no time for "building strategies" or "living documents;" as the PEIR quite rightly found, enforceable mitigation measures are necessary now.

The AR shows the CAP contains no detailed deadlines for GHG emission reductions. This is borne out by the consultant who prepared the CAP for the County pointing out early on "[t]he Draft CAP neglects to describe how the County will monitor the effectiveness of the plan and its component measures over time" [AR 83:1947, last paragraph]; the County's admission "the CAP did not set such dates" [County's opposition memorandum, page 11:21-22]; and the word "deadline" appears but once in the CAP, in describing Mitigation Measure CC-1.2 [AR 2:76.]

Further, the AR shows the CAP contains no enforcement mechanism for reducing GHG emissions. The

CAP's goals and strategies are mere recommendations [AR 2:27 - "The goals and strategies recommended in the CAP..."]; there is no indication in the CAP how the measures described for community activities (Chapter 3) and the County's operations (Chapter 4) can or will be enforced [AR 2:26-57, 59-63]; the County contends five of the CAP's twenty-seven GHG reduction measures are required under state law and thus enforceable but fails to address the other twenty-two reduction measures [County's opposition memorandum, page 9:1-8; and Exhibit A to County's opposition memorandum]; and no evidence is related in the AR that supports the "belief" of the County staffer that GHG emissions reductions can be achieved through only education and incentives [AR 20:1581 and AR 23:1629 -"It is important to note that, as currently written, none of these measures are mandates. We believe that the emission reduction can be achieved through education and incentives."]

At the April 19 argument, County Counsel suggested that some of the absent benchmarks can be found in the Minutes of the Board reflecting its approval of the CAP. Having reviewed the minutes, the court agrees with Sierra Club that the minutes do not set forth enforceable standards or create any mandatory duty that could later be enforced if not carried out.

As such, the CAP, even if it was properly approved, does not comport with the requirements of Mitigation Measure CC-1.2, and thus violates CEQA.

In view of the foregoing, the court finds it unnecessary to address the subsidiary dispute over whether the guidelines for determining thresholds of significance for GHG were adopted or not. Compare *Natter v. Palm Desert Rent Review Comm'n.*, 190 Cal. App. 3d 994, 1001 (1987); *Young v. Three for One Oil Royalties*, 1 Cal. 2d 639, 647-648 (1934).

Let a writ of mandate issue forthwith, directing respondent the County of San Diego to set aside its June 20, 2012 approval of the CAP. Counsel for petitioners is directed to forthwith submit same to the court for signature.

IT IS SO ORDERED.

---

Re: Newland Sierra (Log No. PDS2015-ER-15-08-001; SCH No. 2015021036, Project Numbers: PDS2015-GPA-15-001, PDS2015-SP-15-001, PDS2015-REZ-15-001, PDS2015-TM-5597, PDSXXXX-HLP-XXX) – General Plan Inconsistency of GHG Mitigation

Dear Ms. Smith:

As you know, we represent Golden Door Properties, LLC (“Golden Door”), a world-class resort and agricultural operation in rural Twin Oaks Valley. The Golden Door is an industry leader in sustainability efforts, and has restored farming and beekeeping on its property, including the replanting of many new trees on the property—sharing its bounty at a community Farm Stand and through retail operations. As a local land owner, farmer, and employer, Golden Door honors its responsibility to our community by extending its support to local and regional organizations and well beyond. The Golden Door is committed to environmental stewardship and sustainability, and is proud that California is a leader in efforts to reduce greenhouse gas (“GHG”) emissions to combat the threat of global climate change.

We are writing to share our concern that the proposed Newland Sierra Project, as described in its Draft Environmental Impact Report (“DEIR”), would be inconsistent with existing and newly adopted County General Plan provisions requiring reduction of GHG emissions within unincorporated areas of San Diego County. The Board of Supervisors in its recent actions on February 14<sup>th</sup> has confirmed this inconsistency with the County’s General Plan. (Our comments address only the Newland Sierra Project. Our comments also do not relate to what the County may approve or not approve for new development projects if the County were

to amend its General Plan policies to allow for the use of international or other “out of jurisdiction” offsets and remove the requirement for “local” reductions.<sup>1</sup>)

We request that the County staff suspend further processing of the Newland Sierra Project due to its clear conflict with the County’s General Plan Conservation and Open Space Element. Projects which flatly conflict with the County’s General Plan should not be processed by staff nor should they be presented to the Planning Commission or Board of Supervisors.

If County staff believes that the Newland Sierra Project is consistent with the County General Plan Conservation and Open Space Element, we request that the County staff prepare and release to the public the County staff’s consistency analysis on this issue. No such consistency analysis has yet been provided to the public on this important issue.

## I. BACKGROUND

As you are aware, we have been writing to the County about climate change, the Climate Action Plan (“CAP”), and the Newland Sierra Project since January 2015. The Golden Door has provided extensive comments about GHG issues for the CAP and the Newland Sierra Project and participated in the County’s recent proceedings to approve a CAP. One of the issues consistently raised by the Golden Door over the past several years is that the County’s General Plan requires GHG emissions reductions to occur within the County for the Newland Sierra Project. The 2011 General Plan included Goal COS-20, requiring “local” emissions reductions: “Reduction of local GHG emissions contributing to climate change that meet or exceed requirements of the *Global Warming Solutions Act of 2006*.”

### A. The Golden Door Has Previously Notified the County of this Issue

The Golden Door raised this issue on multiple occasions. In the Golden Door’s August 14, 2017 letter on the Newland Sierra Project’s DEIR, we specifically noted that Newland’s offset program contradicted General Plan Goal COS-20: “The Project contravenes the General Plan EIR’s mitigation measures CC-1.2 and CC-1.8 and General Plan Goal COS-20 because its offsets may come from outside the County.” (Letter from C. Garrett [Latham & Watkins LLP for Golden Door] to A. Smith [County Planning and Development Services], at 38.)<sup>2</sup> We also raised this issue in our September 25, 2017 DSEIR letter on the CAP: “The CAP, therefore, was intended to mitigate impacts from GHG emissions *within San Diego County*. In addition, Goal COS-20 of the General Plan prioritizes ‘[r]eduction of *local* GHG emissions contributing to climate change that meet or exceed requirements of the *Global Warming Solutions Act of 2006*.’ (Emphasis added.)” (See Attachment A at 3 [emphasis in original letter].)

---

<sup>1</sup> While CEQA Guidelines Section 15126.4(c)(3) acknowledges that offsite measures, including carbon offsets, may be appropriate to mitigate a project’s GHG emissions, the General Plan imposes additional requirements that such offset reductions must occur locally.

<sup>2</sup> Golden Door’s letter is on file with the County as part of this project’s record.

**B. A Plain Reading of Goal COS-20 Requires Emissions Reductions to Occur Within the County**

Based on the plain language of Goal COS-20, the General Plan requires GHG emissions “reductions” to remain local. It does not allow for purchase of carbon offset credits from outside the County. While purchase of off-site mitigation credits from outside of the County may comply with the California Environmental Quality Act (“CEQA”) if certain criteria are met, the General Plan’s requirements are distinct from requirements under CEQA. Further, these emissions “reductions” are distinct in concept from CEQA’s requirement for “mitigation.” The County’s Conservation and Open Space Element refers to both “reductions” and “mitigation” depending on the context in which they are used. This distinction supports a plain reading that Goal COS-20 requires GHG emissions reductions to occur within the County despite any other permissible methods under CEQA.

**C. Other Provisions of the Conservation and Open Space Element Support the Plain Reading**

In addition, other provisions of the Conservation and Open Space Element support the plain reading of Goal COS-20. The General Plan’s Conservation and Open Space Element’s Guiding Principles discuss GHG emissions and emissions reduction efforts in conjunction with local air pollutants.

Energy production, transportation, and consumption are key contributors to greenhouse gases affecting climate change, poor local air quality, and a variety of other sustainability challenges. The Conservation and Open Space Element *encourages and supports land use development patterns and transportation choices that reduce pollutants and greenhouse gases*. In addition, the Element encourages renewable energy production, along with efficient energy use in buildings and infrastructure and minimizes the impacts of projects that can generate air pollutants.

(County General Plan at 5-3 [emphasis added].) In addition, the “Context” section of the Conservation and Open Space Element relating to Air Quality, Climate Change, and Energy discusses policies to reduce GHG emissions and local air pollutants:

There is a strong correlation between land use planning, transportation system planning, and the emission of air quality pollutants, greenhouse gases (GHG) that contribute to global climate change (GCC) and criteria pollutants that degrade air quality within a region. The primary opportunities to reduce air quality pollutants and GHG emissions are in the urbanized areas of the County where there are land use patterns that can best support the increased use of transit and pedestrian activities since most GHGs and air pollutants result from mobile source emissions. The unincorporated County can also be a part of the solution by producing development patterns that contribute to reducing the dependence on the automobile and by promoting development with lower energy demands.

*The development of sustainable communities contributes to both the reduction in overall air pollutants as well as solving the larger challenges associated with GCC.* A holistic approach to achieving sustainable communities requires the integration of a regionwide multi-modal transportation system with a significant reduction in the reliance on single-occupant motor vehicles, along with buildings that consume less through design and efficient building materials.

(*Id.* at 5-31 [emphasis added].) The Conservation and Open Space Element makes no mention of GHG reduction activities occurring outside of the unincorporated County.

#### **D. Additional General Plan Provisions Support the Plain Reading**

The General Plan's Guiding Principles further support the requirement for local GHG emissions reduction by illustrating the importance of local actions to reduce GHG emissions. Guiding Principle 7 reads as follows:

**Maintain environmentally sustainable communities and reduce greenhouse gas emissions that contribute to climate change.**

...

The County of San Diego can move towards sustainability and a reduction of GHG emissions by managing land development and building construction, conserving habitats and natural resources, providing efficient transportation and mobility systems, and developing its infrastructure and public services. As described for Guiding Principle 2, land should be developed more compactly, resulting in reduced automobile use and increased use of public transit, walking, and bicycling. This will result in less consumption of gasoline, generation of less air pollution and GHG emissions, the preservation of greater amounts of habitat and agricultural lands, and the improvement of the lifestyles and health of community residents. Locating residences closer to retail stores and jobs also increases the economic viability of those commercial entities. Providing new recreational facilities and access to the County's abundant open spaces can improve public health. Similarly, choices for alternative transportation modes including bus and transit systems, pedestrian routes, and bicycle paths should be expanded, as described in Guiding Principle 6. This will result in similar benefits to public health by increasing outdoor activities.

(*Id.* at 2-13 [emphasis in original].)

In addition, Goal LU-5 provides direction on the reduction of "local" GHG emissions through land use planning: "**Climate Change and Land Use.** A land use plan and associated development techniques and patterns that reduce emissions of local greenhouse gases in accordance with state initiatives, while promoting public health." (*Id.* at 3-27 [emphasis in original].)

The General Plan’s guiding principles, goals, and policies support the plain reading of Goal COS-20, requiring GHG emissions reductions to occur locally.

## II. THE COUNTY’S AMENDMENTS TO GENERAL PLAN GOAL COS-20 AND POLICY COS-20.1 ON FEBRUARY 14, 2018, CONFIRM THAT GHG EMISSIONS REDUCTIONS MUST BE OBTAINED WITHIN THE COUNTY

On February 14, 2018, the County approved the CAP. Over the Golden Door’s objection—and similar objections of many other members of the public—the County approved a new program as part of the CAP that would allow General Plan Amendment projects to rely almost exclusively on carbon offset credit purchases from anywhere in the world. This program is inconsistent with General Plan policies requiring GHG reductions to occur within the unincorporated County.

At this same time in February, the County had the ability to amend the General Plan to allow for these non-“local” offset credit purchases. In fact, the Golden Door sent a letter to the County prior to approval of the CAP offering alternative language for the amendments to General Plan Goal COS-20 and Policy COS-20.1 that set forth the type of language that would be required for any General Plan Amendment projects to allow for international offset credits to satisfy the County’s criteria for GHG emissions reductions.<sup>3</sup> (This February 13 letter from the Golden Door is attached hereto as Attachment B.)

The County, however, rejected the Golden Door’s alternative language. Instead, the County doubled down on the pre-existing General Plan policy to require “local” emissions “reductions”. In conjunction with its approval of the CAP, the County amended Goal COS-20 and Policy COS-20.1 to clarify that the “local” reductions required by the General Plan must occur within the “unincorporated County.” The amended version of Goal COS-20 in strikethrough and underline form reads as follows:

Reduction of ~~local~~ community-wide (i.e., unincorporated County) and County Operations GHG greenhouse gas emissions contributing to climate change that meet or exceed requirements of the Global Warming Solutions Act of 2006, as amended by Senate Bill 32 (as amended, Pavley, California Global Warming Solutions Act of 2006; emissions limit).

Because the County removed the word “local” from Goal COS-20 and replaced it with “community-wide (i.e., unincorporated County) and County Operations,” the County confirmed

---

<sup>3</sup> If the County staff had accepted our proposed language, and proposed other conforming changes to the other related Conservation and Open Space Element and other General Plan policies, this would have addressed the issue of San Diego County General Plan consistency for the use of international offsets. As we have noted in other correspondence, CARB has approved of other land use projects which have utilized emissions from outside the local County or jurisdiction.

the Golden Door's repeated position that the County General plan contains a specific policy requiring that "local" reductions are meant to be within the unincorporated County.

Moreover, the County amended Policy COS-20.1 – which requires preparation of the CAP – to add a similar requirement that emissions reductions occur within the unincorporated County. The amended version of Policy COS-20.1 in strikethrough and underline form reads as follows:

Prepare, maintain, and implement a ~~climate change action plan with a baseline inventory of GHG emissions from all sources; GHG emissions reduction targets and deadlines, and enforceable GHG emissions reduction measures.~~ Climate Action Plan for the reduction of community-wide (i.e., unincorporated County) and County Operations greenhouse gas emissions consistent with the California Environmental Quality Act (CEQA) Guidelines section 15183.5.

These amendments to General Plan Goal COS-20 and Policy COS-20.1 remove any ambiguity (if it existed before) about the geographic scope of the word "local" and clarify that the County's GHG emissions reductions are to occur within the unincorporated County. This action confirms the concerns previously raised by the Golden Door and creates an impasse of inconsistency for any attempt to rely on out-of-County offset credits for GHG emissions reductions.

It is difficult to understand all of the precise motivations of County staff, the Planning Commission and the Board of Supervisors in adopting this newly amended Conservation and Open Space General Plan language. We are certain, however, that a key motivating factor for this amendment to the General Plan language was the desire to reassure the public and California state officials that the County's General Plan goals and policies would in fact require a reduction in local emission within the unincorporated area of the County, rather than result in increases in those emissions.

As noted in multiple provisions of the County's General Plan, keeping GHG emissions reductions within the unincorporated would result in important co-benefits for County residents. These could include improved air quality and public health as well as decreased traffic congestion and economic stimulus. The California Air Resources Board ("CARB") has recognized the importance of these local co-benefits in its 2017 Scoping Plan. CARB's 2017 Scoping Plan emphasizes the importance of offset programs relying on local projects for emissions offsets:

To the degree a project relies on GHG mitigation measures, ***CARB recommends that lead agencies prioritize on-site design features that reduce emissions, especially from VMT, and direct investments in GHG reductions within the project's region that contribute potential air quality, health, and economic co-benefits locally.*** For example, on-site design features to be considered at the planning stage include land use and community design options that reduce VMT, promote transit oriented development, promote street

design policies that prioritize transit, biking, and walking, and increase low carbon mobility choices, including improved access to viable and affordable public transportation, and active transportation opportunities. Regionally, additional GHG reductions can be achieved through direct investment in local building retrofit programs that can pay for cool roofs, solar panels, solar water heaters, smart meters, energy efficient lighting, energy efficient appliances, energy efficient windows, insulation, and water conservation measures for homes within the geographic area of the project.

(CARB, 2017 Climate Change Scoping Plan at p. 102 [emphasis added]; attached hereto as Attachment C.) Keeping the reductions local would also help ensure enforcement and could stimulate growth by investing in the local green economy.

### **III. THE GENERAL PLAN'S REQUIREMENT THE GHG REDUCTIONS MUST BE OBTAINED WITHIN THE UNINCORPORATED COUNTY APPLIES TO THE NEWLAND SIERRA PROJECT**

County staff has made clear that the Climate Action Plan does not apply to General Plan Amendment projects, such as the Newland Sierra Project. The following exchange between County staff and Supervisor Diane Jacob occurred at the February 14, 2018 meeting at which the Board of Supervisors approved the CAP:

County Staff Member: *That checklist is not used by General Plan Amendments. General Plan Amendments do not tier from the cap or are not afforded any streamlining benefits from the cap.* General Plan Amendments are not in the baseline inventory or the projections for the cap. They're simply analyzed as cumulative impacts and the county has feasible mitigation and we must apply feasible mitigation when there are cumulative impacts.

Supervisor Diane Jacob: Okay. I hear what you're saying. Explain to me: Number one on the checklist is "The proposed project, consistent with the existing General Plan, regional category land use designations and zoning designations." That's pretty clear. And then, also, "If yes, proceed to step two, which is 'Cap Measures Consistency of the Checklist.'" But then it does say, "If no, proceed to question two below." And then question two below, "Does the project include a land use element under a zoning designation amendment that would result in an equivalent or less GHG-intensive project when compared to the existing designations?" That doesn't seem to be consistent, to me, with what you just said.

County Staff Member: Supervisor Jacob, that piece of the checklist – So, what the checklist is meant to capture is general plan, consistent projects that are consistent with the density or intensity in the General Plan. *We recognize General Plan*

*Amendments in process excluded*, that there may be certain scenarios where a GPA comes into, for example, become consistent with or requires a rezone to be consistent with land use or vice-versa, that would afford those projects that aren't increasing any density or intensity an ability to use the checklist as well, because they would stay below that density that was approved in the 2011 General Plan.

(County Board of Supervisors Meeting Transcript at 114:15-116:5 (Feb. 14, 2018) [attached hereto as Attachment D].)

Although the CAP's checklist may not apply to the General Plan Amendment projects as described by County staff in their discussion with Supervisor Jacob,<sup>4</sup> and such projects may not be eligible to tier off the CAP, amended General Plan Goal COS-20 and Policy COS-20.1 are part of the General Plan and apply to all projects in the County. Newly amended General Plan Goal COS-20 and Policy COS-20.1 must be applied to the Newland Sierra Project, and the County must make a finding that the project is consistent with those goals and policies prior to any decision on the Project. The Newland Sierra Project must analyze consistency with General Plan Goal COS-20 and Policy COS-20.1 – as amended – even if the staff has indicated that the remainder of the Board's February 14<sup>th</sup> actions on the CAP do not apply to General Plan Amendment projects.

It should be noted that the Newland Sierra Project does not now include any proposed amendment to County General Plan Conservation and Open Space Goal COS-20 and Policy COS-20.1 to create an exception to allow Newland Sierra to increase GHG emissions in unincorporated San Diego County so long as such local GHG emissions increases are offset by promised GHG reductions somewhere else in the United States or internationally. If Newland Sierra now intends to amend its project to include such an applicant proposed amendment to the Conservation and Open Space Element, the County's EIR for the project needs to be revised and recirculated to provide for such a proposed amendment, as well as to allow for public comment and environmental analysis of such an amendment.

#### **IV. THE NEWLAND SIERRA PROJECT'S GHG MITIGATION IS INCONSISTENT WITH GENERAL PLAN GOAL COS-20 AND POLICY COS-20.1 BECAUSE IT ALLOWS FOR OUT-OF-COUNTY OFFSET CREDIT PURCHASES**

The GHG mitigation proposed in the Newland DEIR is inconsistent with Goal COS-20 and Policy COS-20.1, because it relies on the purchase of carbon offset credits from outside the unincorporated County. M-GHG-1 in the Newland DEIR requires Newland to "purchase and retire carbon offsets in a quantity sufficient to offset 100 percent of the project's construction emissions." M-GHG-2 in the Newland DEIR requires Newland to "purchase and retire carbon offsets for the incremental portion of the project within the Site Plan in a quantity sufficient to

---

<sup>4</sup> This is especially pertinent for projects such as the Newland Sierra Project, which increases proposed development intensities and densities above those set forth in the current General Plan (including the intensities and densities included in SANDAG's regional growth and VMT analysis).

offset, for a 30-year period, the operational GHG emissions from that incremental amount of development to net zero.” Both M-GHG-1 and M-GHG-2 provide the following geographic priority scheme for GHG emissions reductions:

- 1) project design features/on-site reduction measures; 2) off-site within the unincorporated areas of the County of San Diego; 3) off-site within the County of San Diego; 4) off-site within the State of California; 5) off-site within the United States; and 6) off-site internationally.

(Newland Sierra DEIR at 2.7-48, 2.7-51.)

The Newland DEIR further indicates that only 18 percent of its operational emissions reductions will occur on-site; therefore, 82 percent will derive from off-site carbon credit purchases.<sup>5</sup> (Newland Sierra DEIR at 2.7-47.) Further, the County has admitted in proceedings on the CAP that no off-site credits are currently available within the unincorporated County. As a result, 82 percent of Newland’s GHG emissions reductions for operational emissions will be obtained through off-site offset purchases outside of the unincorporated County—i.e., from geographic priority levels three through six. Moreover, the Newland Sierra DEIR only requires offset credits to be purchased from local sources to the extent such credits are “financially competitive in the global offset market.” This criteria essentially eliminates any prioritization of local offsets and allows the developer to purchase the least expensive credits available regardless of the potential benefits of local projects. This approach is inconsistent with General Plan Goal COS-20 and Policy COS-20.1.

For the Newland Sierra Project to be consistent with General Plan Goal COS-20 and Policy COS-20.1’s requirement that GHG emissions “reductions” be obtained within the unincorporated County, the County must either revise the DEIR’s mitigation measures or amend its General Plan. The County could revise the geographic priority levels in M-GHG-1 and M-GHG-2 to eliminate levels three through six. (See e.g., Attachment B at “Option Two” of Attachment B, Options.) This approach would clarify that the Project could only obtain off-site reductions within the unincorporated County. Additional analysis would be required to demonstrate that sufficient emissions reductions can be achieved in geographic priority levels one and two.

On the other hand, if the County allows Newland to obtain GHG emissions reductions from all six geographic priority levels, then Newland must revise its project application to include an applicant proposal to amend General Plan Goal COS-20 and Policy COS-20.1. (See e.g., Attachment B at “Option One” of Attachment B, Options.) In addition, the County would be required to amend the other relevant General Plan policies cited in this letter – and any other applicable General Plan policies – to specifically state that GHG emissions reductions may be obtained from international sources. In that event, analysis of the County-wide impacts of such a policy change would be required, as would a full analysis of vertical and horizontal General Plan

---

<sup>5</sup> The Newland DEIR does not quantify on-site GHG emissions reduction for construction emissions.

consistency. In any event, the Newland Sierra Project cannot be approved with Mitigation Measures M-GHG-1 and M-GHG-2 as currently drafted, because they are inconsistent with the plain language of General Plan Goal COS-20 and Policy COS-20.1.

It is important to note that this letter only addresses the consistency of the Newland Sierra Project with the County of San Diego's General Plan policies. This letter does apply to other County proposals or decisions. The Golden Door's position on whether, to what extent, and under what conditions GHG offsets may be used in the absence of a conflict with the County's General Plan has been described in other letters.<sup>6</sup> Our concern noted in this letter is that the County has decided to adopt or reaffirm General Plan provisions which require local GHG emissions reduction and do not allow for local GHG emissions increases, while at the same time the County is continuing to process a contradictory project which provides for the use of international offsets to allow for local GHG emission increases in violation of the General Plan.

Thank you for your time and attention to our comments. Please do not hesitate to contact us should you have any questions or comments.

Best regards,

*Christopher W. Garrett*

Re: San Diego County Draft Climate Action Plan

Dear Ms. Soffel:

We represent the Golden Door Properties LLC (the “Golden Door”), an award-winning spa and resort that opened in 1958. This historic haven is situated on approximately 600 acres on the south side of Deer Springs Road in northern San Diego County (“North County”). It was the highest rated establishment in *Travel and Leisure*’s recent list of world’s best destination spas. Its property encompasses a peaceful array of hiking trails, luxurious spa amenities, tranquil Japanese gardens, and a bamboo forest. Agricultural cultivation on the property includes avocado groves and fresh vegetable gardens as well as citrus and olive trees.

The Golden Door is committed to environmental stewardship and sustainability. It uses sustainable and bio-intensive agriculture practices and has eliminated guests’ use of plastic water bottles. The owners are not seeking to expand the Golden Door, but are seeking to further enhance the Golden Door according to guiding principles, including the extensive sustainable agriculture on the surrounding acres. Reducing greenhouse gas (“GHG”) emissions to combat the threat of global climate change is an important issue for the Golden Door.

As such, we appreciate the opportunity to participate in the Climate Action Plan (“CAP”) process and provide input on the County’s efforts to reduce GHG emissions. The Golden Door is particularly concerned about GHG emissions from the proposed Newland “Sierra” Project (the “Newland Project”), a revised Merriam Mountains project on property located near Deer Springs Road. The Newland Project would implement urban residential density in a rural area of the unincorporated County, far from job and urban centers and from transit infrastructure. This unplanned development would contradict modern planning principles and the County’s General Plan and would result in long single-occupant vehicle trips causing significant GHG emissions in contrast to the County’s stated goal in the CAP. We submit the following comments on the draft CAP and draft Supplemental Environmental Impact Report (“DSEIR”).

## I. THE COUNTY SHOULD HALT PROCESSING PROJECTS UNTIL THE CAP IS COMPLETED

As an initial matter, the County should cease processing and approving projects until the CAP is completed. While the CAP provides avenues for General Plan Amendments not already considered within the CAP and considers pending projects within its cumulative impacts analysis, the CAP is in draft form and is subject to revisions following the public comment process.

In particular, the County should refrain from processing the Newland Project prior to the adoption of the CAP, as doing so may result in impermissible tiering. We are concerned that the Newland Project may be attempting to tier off the CAP prior to its approval. An environmental impact report (“EIR”) may not tier off of an incomplete or future environmental document. (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 440.) Newland’s proposed “net zero” mitigation measures—in its draft EIR published in June—do not meet the requirements of the CAP’s offset mitigation measures as currently drafted. Further, the CAP’s offset measures may be revised to provide stronger environmental protection prior to approval. As such, the Newland Project should not be allowed to tier off of the unapproved CAP, and the County should refrain from processing the Newland Project until the CAP is completed.

The Newland Project purports to be “net zero” but does not provide adequate assurances that its offsets will actually achieve the required emissions reductions. The Golden Door provided more fulsome comments on the Newland Project’s draft EIR and its various deficiencies in its August 14, 2017 comment letter on the Newland Project’s draft EIR.

In particular, the CAP’s offset mitigation measures provides geographic priorities for GHG offset projects, beginning with: “1) project design features/on-site reduction measures; 2) off-site within the unincorporated areas of the County of San Diego; 3) off-site within the County of San Diego; 4) off-site within the State of California; 5) off-site within the United States; and 6) off-site internationally.” (DSEIR at p. 2.7-37.) The Newland draft EIR provides a list of priorities for projects, including a “true up” provision for its operational GHG emissions offset requirement. The Newland EIR’s “true up” provision allows the County’s Planning & Development Services (“PDS”) Director to, after Project approval and without additional public input, decrease the volume of operational emissions that Newland is required to offset. This “true up” provision renders the Newland Project’s offset mitigation measure illusory.

In contrast, the CAP does not contain any such illusory “true up” provision. The Newland Project should not be allowed to bypass more stringent offset requirements in the CAP simply by being approved prior to the adoption of the CAP. Such an approach would be improper here, where the CAP is required mitigation for the County’s General Plan EIR from 2011. (*Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 445 [mitigation measures must be implemented, not “merely adopted and then neglected or disregarded”].) Sprawl projects, such as the Newland Project, that cause significant GHG emissions from long automobile trips in contrast to modern planning principles, should not be allowed to bypass any GHG reduction measures in the CAP simply by seeking approval

subsequent to the time in which the County set the requirement for the CAP but prior to actual approval almost seven years later.

The offset requirements and assurances in the CAP provide more certainty of achieving GHG emissions reductions than in Newland's flawed "net zero" approach. Thus, the County should abstain from processing the Newland Project until the CAP is completed.

## II. GHG REDUCTIONS SHOULD BE PRIORITIZED WITHIN THE COUNTY

The County's General Plan prioritizes GHG emissions reductions within San Diego County. In 2011, following approximately ten years of substantial input from numerous stakeholders and citizen groups, the County approved an update to its General Plan. (San Diego County General Plan at pp. 1-2.) In the EIR for the General Plan, the County concluded that the GHG and climate change impacts from the County's operations and from community sources were "potentially significant"—that without mitigation the County would fail to comply with AB 32, which requires the State to lower its GHG emissions to 1990 levels by 2020. As a result, the General Plan EIR included mitigation measures for GHG and climate change impacts, including the adoption of a CAP. (San Diego County General Plan, Mitigation Measure CC-1.2.) The CAP, therefore, was intended to mitigate impacts from GHG emissions *within San Diego County*. In addition, Goal COS-20 of the General Plan prioritizes "[r]eduction of *local* GHG emissions contributing to climate change that meet or exceed requirements of the Global Warming Solutions Act of 2006." (Emphasis added.)

The CAP provides the following 2020 and 2030 adjusted reduction targets and 2050 goal for emissions *in the County*: two percent below 2014 levels by 2020; 40% below 2014 levels by 2030; and 77 percent below 2014 levels by 2050. (CAP at 2-11.) "[T]o meet the 2030 target and 2050 goal, the County will need to achieve a reduction of 897,237 MTCO<sub>2</sub>e by 2030 and 2,253,066 MTCO<sub>2</sub>e by 2050 beyond legislative-adjusted projections. To close the emissions gap shown in Figure 2.3, this CAP proposes 11 strategies and 29 measures that the County would implement to reduce GHG emissions." (CAP at 2-14.)

The State of California has set an example for all other jurisdictions by making bold commitments to reduce greenhouse gas emissions. The County has explicitly made commitments to reduce emissions in the County consistent with its share of reductions needed for the State to achieve its goals. However, we note that the County has not demonstrated substantial evidence to support the availability of offsets within the County. While the language in the CAP states that the County will fund and implement investment projects, there is no evidence or assurance to suggest that the County is making the investment. Allowing payment for offsets to occur outside of the County is akin to the medieval payment for indulgences. A one-time payment should not absolve emitters for their GHG emissions that occur within the County. The County made a promise to reduce emissions within the County; it should uphold that promise for the benefit of its residents who expect a local reduction in GHGs and copollutants based on the County's plans. There must be some assurance that offset projects will occur within the project site or the County. While we understand each project is unique, the County should incorporate a standard into its offset priorities to promote GHG reductions within the County; otherwise project proponents may be incentivized to devote all or almost all of the

resources to offsets occurring outside of the County. The County should consider at least the following methods for ensuring a certain level of offsets occur within the County in addition to any others that would promote offsets within the County:

- A bright-line percentage requirement for offsets to occur within San Diego County, or if this is deemed infeasible, a proportionate dollar amount or fee paid to facilitate GHG emissions reductions within the County;
- A bonus structure similar to a density bonus approach, that allows greater use of offsets for projects located in infill areas or close to existing transit;
- A more regimented set of findings describing the infeasibility of on-site offsets or offsets within the County that the County must make for a proposed project before it is allowed to use offsets outside of the County;
- A requirement that each project must specifically identify available offsets that the project will use within the County prior to approval; or
- A requirement that each project must meet a defined, impartial criteria, such as LEED Platinum.

### **III. THE CAP MUST PROVIDE ASSURANCES FOR OFFSETS**

Regardless of where offsets occur, the County must provide assurances that the offset projects will achieve their projected reductions. The CAP provides, “[a]fter adoption, the CAP will continue to be maintained by the County Department of Planning & Development Services (PDS). Key staff in PDS, with active participation and assistance from the Sustainability Task Force, will facilitate and oversee implementation, monitoring, and reporting on the progress of each measure.” (CAP at 5-2.) It is unclear if such monitoring extends to the offsets, or how the County staff will be able to monitor offset projects that may occur on the other side of the world. In addition, it is unclear if the County has any mechanism to enforce offsets in other jurisdictions; therefore, it is unclear if the mitigation is actually enforceable. The CAP should provide detailed information on how the County will ensure monitoring and reporting of the mitigation projects funded by offsets, as mere funding by itself does not equate to mitigation. (See *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692.)

Moreover, the CAP should ensure that the County is able to meet its 2050 emissions reduction goals that extend to 2050. (CAP at 1-2.) While the CAP maintains that it “demonstrates how the County will achieve GHG emissions targets for 2020 and 2030, and demonstrate progress to 2050,” (CAP at 1-13) it is unclear how the 2050 target will be met if General Plan Amendments approved in the near future only provide mitigation assurances to 2048 (assuming approval of the CAP in 2018). The Appendix B to the DSEIR provides:

Adherence to the protocols listed in this Appendix, as well as any additional protocols subject to the same standards as the protocols

herein, ensures that the carbon reductions generated by CAP Measure T-4.1 are real, permanent, quantifiable, verifiable, and enforceable. Carbon offset registries require projects to comply with approved protocols using rigorous, standardized review processes. The protocols contain rules and procedures governing the retirement or cancellation of carbon offsets. Protocols and processes ensure that offsets retired from County direct investment projects pursuant to CAP Measure T-4.1 and listed on an offset registry satisfy the environmental integrity criteria established by the offset protocols. Carbon offsets achieved through implementation of Measure T-4.1 must be complete and retired before the County can take reduction credits. A registry will ensure that carbon offsets are retired in perpetuity.

(Appendix B at p. i.)

The County should provide similar assurances for General Plan Amendments approved using offsets. The CAP prioritizes “local projects that would offset carbon emissions within the unincorporated county.” (Strategy T-4, DSEIR at p. 2.7-17.) The County must ensure General Plan Amendments are held to the same standards as the County’s own offset projects. Moreover, the County should consider whether and how to ensure mitigation for General Plan Amendment offset projects is continued beyond the 30-year out year. If there are no assurances that the offset projects will continue beyond their specified expiration date or for the full term of the County’s planning period specified in the proposed CAP then, the County is not accurately calculating what the projects’ overall GHG impacts will be for the full term of the County’s planning period specified in the CAP. If the offset projects are no longer operational after their prescribed term or potential expiration date, then the County should carefully consider whether it is still accurate for the County to assume that the GHG emissions from the offset projects can be counted as part of any project’s overall reduction in GHG emissions during the County’s full planning period specified in the CAP.

As such, the County should consider whether to provide assurances that funding for offset mitigation projects will continue, lest the County experience a significant spike in GHG emissions once the funding for offset projects has concluded and they are no longer operational. (See *Cleveland National Forest v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 514 [an EIR must adequately describe the nature and magnitude of the adverse effect].) In any event, if the County is proposing to allow offset projects which expire or may no longer be enforceable before the end of the County’s planning period used in the CAP, then the potential increases when these offset project may “expire” should be counted in the County’s overall numerical calculations in the CAP including expected GHG increases due to expiring offset agreements. As the Court of Appeal stated in *Sierra Club v. County of San Diego* (2015) 231 Cal.App.4th 1152, 1170: “Quantifying GHG reduction measures is not synonymous with implementing them. Whether a measure is effective requires not just quantification, but also an assessment of the likelihood of implementation.” Likewise, if offsets counted on by the CAP as a GHG reduction measure are likely or possibly going to expire before the end of the CAP’s planning

period in 2050, or shortly thereafter, this should be disclosed to the public, since it is relevant to whether the mitigation measure will be implemented for the full planning period.

#### **IV. GHG INVENTORY AND REDUCTION STRATEGIES**

##### **A. GHG Inventory**

The CAP's business as usual projections include "[g]rowth from General Plan Amendments "GPAs" adopted since adoption of the 2011 General Plan Update are also included in the projections." (CAP at 2-7.) "The GHG emissions inventory for the CAP does not include emissions attributable to proposed GPAs that would increase density/intensity above what is allowed in the General Plan. Even though there were GPAs that were adopted between 2011 (adoption of 2011 General Plan Update) and 2014 (inventory baseline year), none of these GPAs were constructed by 2014 and; therefore, their GHG emissions are not included in the 2014 inventory. The 2014 inventory is based on emissions-generating activities that existed on the ground in 2014." (CAP at 2-14.)

The Draft SEIR's Mitigation Measure GHG-1 applies to all future General Plan Amendments, including those discussed in the cumulative impacts section. The County maintains that with the inclusion of this mitigation measure, all future GPAs will not interfere with the County's reduction targets or 2050 goal. (CAP at 2-14.) The County thus concludes that "General Plan Amendments would, therefore, comply with the threshold of significance, which is consistency with the CAP." (CAP at 2-14.) However, there is not enough information presented in the DSEIR or CAP to ascertain the veracity of this conclusion. A project-by-project breakdown of emissions from each project appears to be missing from the CAP and DSEIR.

##### **B. Transportation Reductions**

The County concludes that it "has limited options under its control for implementing transportation-based strategies," despite acknowledging that on-road transportation is the largest source of GHG emissions in the County. (CAP at 3-3.) The County should ensure future projects are located in infill locations close to existing transit, in addition to exploring additional methods of implementing transportation-based strategies to reduce the County's reliance on single-occupant vehicles. The CAP provides strategies to reduce VMTs, and notes that the General Plan provides "a framework to accommodate future development in an efficient and sustainable manner that is compatible with the character of unincorporated communities and the protection of valuable and sensitive natural resources. In accommodating growth, the County focuses on the provision of diverse housing choices while protecting the established character of existing urban and rural neighborhoods." (CAP at 3-9.)

Further, Strategy T-1 provides, "This strategy focuses on preserving open space and agricultural lands, and focusing density in the county villages. By not developing housing in the more remote areas, the county will avoid GHG emissions from transportation and energy use associated with conveyance of water and solid waste services. Reductions in Vehicle Miles Traveled (VMT) resulting from this strategy will also improve air quality through reduced

vehicle emissions and contribute to public health improvements by creating opportunities for active transportation choices.” (CAP at 3-9.)

The County should ensure such strategies are appropriately implemented in all pending and future projects. In particular, the County should not allow the Newland Project, which would add over 28,000 daily trips in an area located far from existing transit, to move forward before the CAP is approved. This contravenes the CAP’s stated strategies and risks thwarting the CAP’s comprehensive approach. If the County allows the Newland Project to progress prior to adoption of the CAP, the County enables the Newland Project to avoid the CAP’s goal of “preserving open space and agricultural lands” by developing on a parcel currently zoned for a much lower level of density—primarily RL-20—than the project currently proposes.

The CAP should also include requirements that land use decisions support smart growth development near existing infrastructure and transit and placing housing near jobs in order decrease GHG emissions from long automobile trips. One potential tool to support this approach would be to require General Plan Amendment projects to be consistent with the land use patterns used by SANDAG to general its Regional Transportation Plan and Sustainable Communities Strategy, which is intended reduce GHG emissions by linking land use and transportation planning pursuant to SB 375.

### **C. Acquire Open Space Conservation Land**

The CAP provides:

Acquisition of land by the County under the MSCP would reduce GHG emissions through preservation of land which can otherwise be developed. GHG emissions reductions are realized from reductions in transportation, energy use, waste, and water consumption. Preservation of these lands also helps protect watersheds, improve water quality, and preserves vegetation, which provides carbon sequestration benefits. Reductions for this measure are quantified based on the reduced development potential associated with preservation of lands. Future acquisitions beyond those targeted in this measure will reduce GHG emissions in the county, the benefit of which will be reflected in the County’s biennial GHG inventory updates.

(CAP at 3-10.)

Additional details for this measure are required. For instance, how will the County calculate the reductions from this measure, but allow GPAs such as the Newland Project to move forward? Further, will the County count implementation of the North County MSCP as a potential reduction? If so, would this include a developed Newland Project? Doing so may amount to de facto project approval for the Newland Project prior to the completion of the environmental process, as the MSCP is currently in draft form. Further, the NC MSCP has not been approved and is not scheduled to go before the Board of Supervisors for a decision for

several more years. The NC MSCP must also be approved by the State and Federal Wildlife Agencies before taking effect. It is improper for the CAP to take credit for emissions reductions to be achieved by a plan or program that has not been approved. (*Vineyard Area Citizens for Responsible Growth, Inc.*, *supra*, 40 Cal.4th at 440.)

We thank you for your time and attention to our comments. Please do not hesitate to contact us should you have any questions or comments.

**VIA EMAIL AND HAND DELIVERY**

San Diego County Board of Supervisors  
County Board of Supervisors  
1600 Pacific Highway, Room 402  
San Diego, CA 92101  
Attn: Clerk of the Board of Operations

Re: Comments re Climate Action Plan (Agenda Item No. 1)

Dear Supervisors Cox, Jacob, Gaspar, Roberts, and Horn:

We represent Golden Door Properties, LLC (“Golden Door”), a world-class resort and agricultural operation in rural Twin Oaks Valley. The Golden Door is an industry leader in sustainability efforts, and has restored farming and beekeeping on its property—sharing its bounty at a community Farm Stand and through retail operations. As a local land owner, farmer, and employer, Golden Door honors its responsibility to our community by extending its support to local and regional organizations and well beyond.

The Golden Door is committed to environmental stewardship and sustainability, and is proud that California is a leader in efforts to reduce greenhouse gas (“GHG”) emissions to combat the threat of global climate change. This is an important issue for the Golden Door, and we have been in communication with the County about its Climate Action Plan (“CAP”) and potential GHG emissions from the proposed Newland Sierra project since January 2015. We submitted comments on the CAP’s draft supplemental environmental impact report (“DSEIR”) and the draft environmental impact report for the proposed Newland Sierra project. We also submitted comments to the Planning Commission in advance of the hearing on the Final CAP and its final supplemental environmental impact report (“FSEIR”).

The Golden Door supports efforts to reduce GHG emissions in San Diego County and the intent of the County’s CAP. Many of the CAP’s provisions could result in beneficial emissions reductions. The Golden Door, however, is concerned that the version of the CAP recommended by the Planning Commission contains several fatal flaws and is inconsistent with the California Environmental Quality Act (“CEQA”) and the County’s General Plan. These flaws must be corrected before the CAP may be approved.

In particular, the Golden Door is concerned about the CAP’s mitigation measure for cumulative GHG impacts caused by General Plan Amendment projects. This mitigation measure, known as GHG-1, would allow findings of no significant impacts based on the

purchase of GHG offset credits derived from mitigation projects around the world. We are concerned that the language provided in the CAP's FSEIR does not do enough to ensure GHG reductions – and their valuable co-benefits – remain local in accordance with the County's General Plan and guidance from expert State agencies. As you are aware, the CAP is required to mitigate GHG impacts from the County's 2011 General Plan Update. Mitigation measure GHG-1, however, extends the purview of the CAP far beyond this legal requirement and sets forth a program for all future General Plan Amendment projects. Mitigation Measure GHG-1, therefore, constitutes its own separate project requiring review and analysis under CEQA. As detailed below, such analysis has not been performed. We are concerned that failure to perform this environmental review results in a failure to disclose significant environmental impacts to the Supervisors and to the public.

Because the flaws in Mitigation Measure GHG-1 would become set policy that later General Plan Amendment projects could rely on, we must express our concerns now so the Board can fix this problem. Otherwise, General Plan Amendment projects would be able to rely on this flawed approach to GHG mitigation without further review of whether the underlying mitigation program complies with CEQA or causes environmental impacts. Now is the appropriate time to perform the required analysis and revise or remove the CAP's Mitigation Measure GHG-1.

#### **I. MITIGATION MEASURE GHG-1 IS A “PROJECT” AND SHOULD BE REVIEWED AND ANALYZED UNDER CEQA**

Mitigation Measure GHG-1 allows for the purchase of carbon offset credits in order to mitigate the GHG emissions impacts from all subsequently approved General Plan Amendment projects. While this plan was not required to be part of the CAP, it will have its own impacts and should be analyzed as a “project” under CEQA. Previously, the Court of Appeal determined that the invalidated 2011 CAP and its thresholds of significance was a separate project from the 2011 General Plan Update (“2011 GPU”) and constituted a separate project under CEQA. It held that the County failed to proceed in a manner required by law when it considered the CAP, thresholds, and 2011 GPU as the same project. (*Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, 1170–71.) The 2018 CAP falls victim to the same error. The offset program outlined in Mitigation Measure GHG-1 constitutes its own separate and distinct project.

Under CEQA, a “project” has two essential elements. First, it is an activity that may cause a direct (or reasonably foreseeable indirect) physical environmental change. (Pub. Res. Code § 21065; 14 Cal. Code Regs § 15378.) Here, the offset program will undoubtedly cause a direct physical environmental change because it inherently involves the use or creation of mitigation projects all over the world. It would also impact the pattern of unplanned growth in the County, causing a variety of impacts, including traffic, air quality, and GHG impacts. Second, the potential project must be an activity directly undertaken by a public agency, an activity supported in whole or in part by a public agency, or an activity involving the issuance by a public agency of some form of entitlement, permit, or other authorization. (*Id.*; *San Lorenzo Valley Community Advocates for Responsible Educ. v San Lorenzo Valley Unified Sch. Dist.* (2006) 139 Cal.App.4th 1356, 1377.) Here, the County is a public agency undertaking the

proposed activity – an offset program to mitigate any potential GHG impacts from General Plan Amendments approved after the adoption of the CAP.

Mitigation Measure GHG-1 is proposed as a mitigation measure in the CAP’s DSEIR—just as the CAP itself was proposed as a mitigation measure for the 2011 GPU. However, at the Planning Commission hearing on the CAP, County staff repeatedly and incorrectly assured the commissioners that the offset program was not part of the CAP:

The Climate Action Plan that is before the Commission today does not rely on offset credits, carbon credits outside of the county. You are – and I think what is confusing to this discussion is the reference to pending General Plan Amendments. Those are clearly not a subject of this Climate Action Plan. This Climate Action Plan is mitigating the land uses and activities that were programmed in the General Plan. So the relevancy of General Plan amendments to this item, there is none.

(Planning Commission Hearing Transcript at pp. 63:23 to 64:11.)

If, indeed, the General Plan Amendments and the Mitigation Measure GHG-1 are not part of the CAP – why were they included in the discussion and presented as a mitigation measure? If County staff is to be taken seriously, Mitigation Measure GHG-1 should be analyzed as a separate and discrete project from the CAP. However, the County has failed to do so. By including the CAP and the offset program for General Plan Amendments as the same project, the County has failed to analyze the environmental impacts of the offset program. (*Sierra Club, supra*, 231 Cal.App.4th at 1171; see also *Natural Resources Defense Council, Inc. v. City of Los Angeles* (2002) 103 Cal.App.4th 268, 283 [holding that CEQA was violated where there was “no evidence that the [County] formally addressed whether or not the ... project fell within the concept of a ‘tiered’ EIR”].)

Here, the County was not required to create a complete framework for all GHG mitigation for all General Plan Amendment projects in perpetuity. But it did. Mitigation Measure GHG-1 is its own project and may not forego environmental review by bootstrapping onto the CAP’s environmental review and failing to analyze its own impacts.

In addition, the CAP checklist is a separate environmental document that we do not believe has been properly analyzed under CEQA. Similarly, any subsequent General Plan Amendment pursuant to Mitigation Measure GHG-1 has not been adequately analyzed under CEQA and for horizontal and vertical consistency with the General Plan.

## II. MITIGATION MEASURE GHG-1 IS INCONSISTENT WITH STATE AGENCY GUIDANCE AND REGIONAL PLANNING

### A. The State's Expert Agency on GHGs Emphasizes the Need for On-Site Emissions Reductions and Local Mitigation Projects

The CAP's proposed mitigation program for General Plan Amendment projects (GHG-1) relies on the purchase of offset credits. Mitigation Measure GHG-1 provides geographic priorities for these offset projects, beginning with 1) project design features/on-site reduction measures; 2) off-site within the unincorporated areas of the County of San Diego; 3) off-site within the County of San Diego; 4) off-site within the State of California; 5) off-site within the United States; and 6) off-site internationally. (FSEIR at p. 8-52.) The expert State agency for GHG and air quality issues emphasizes the high priority of on-site and local measures for such a GHG mitigation program. The California Air Resource Board's ("CARB") 2017 Scoping Plan Update emphasizes the importance of offset programs relying on local projects for emissions offsets:

To the degree a project relies on GHG mitigation measures, **CARB recommends that lead agencies prioritize on-site design features that reduce emissions, especially from VMT, and direct investments in GHG reductions within the project's region that contribute potential air quality, health, and economic co-benefits locally.** For example, on-site design features to be considered at the planning stage include land use and community design options that reduce VMT, promote transit oriented development, promote street design policies that prioritize transit, biking, and walking, and increase low carbon mobility choices, including improved access to viable and affordable public transportation, and active transportation opportunities. Regionally, additional GHG reductions can be achieved through direct investment in local building retrofit programs that can pay for cool roofs, solar panels, solar water heaters, smart meters, energy efficient lighting, energy efficient appliances, energy efficient windows, insulation, and water conservation measures for homes within the geographic area of the project.

(CARB, 2017 Climate Change Scoping Plan at p. 102 [emphasis added].) It is important that the CAP ensures on-site GHG-reduction features are exhausted before continuing to off-site measures, and similarly that local off-site projects are exhausted before any consideration is given to allowing offsets from projects throughout the State, nation, and world.

The County has attempted to frame Mitigation Measure GHG-1 as consistent with CARB's guidance for location of GHG mitigation. In fact, in response to the Golden Door's comments to the Planning Commission, County staff states that its geographic priorities are consistent with CARB's guidance and with the recently approved Newhall Ranch project in Los Angeles County. (See Response to Comments X29-3.) As discussed in more detail below, this

is simply inaccurate. In particular, the Newhall Ranch project required 53 percent of emissions reductions to be obtained through on-site measures and set specific percentage requirements for emissions reductions to be obtained locally. Newhall Ranch allowed for only 20 percent of emissions reductions to be obtained internationally. The CAP's Mitigation Measure GHG-1 provides no such local requirements and would allow for 100 percent of reductions to be obtained internationally – based on only a *post hoc* determination by County staff that would be made outside of any public process.

Moreover, the Newhall Ranch project obtained a letter from CARB specifically approving of its GHG mitigation approach. The County, however, has provided no similar evidence that CARB approves of Mitigation Measure GHG-1. The County's attempt to frame its approach to GHG mitigation for General Plan Amendment projects as consistent with CARB's guidance rings hollow.

## **B. State Guidance and Regional Planning Emphasize VMT Reduction**

In October 2017, CARB proposed updates to regional passenger GHG emissions reduction targets for California's metropolitan planning organizations ("MPOs"). In December 2018, CARB approved an updated Climate Change Scoping Plan Update to address the use of GHG offset credits. Both documents emphasize the need to reduce VMT in order to meet statewide climate change goals.

### **1. CARB 2017 Scoping Plan Update**

CARB's 2017 Scoping Plan Update emphasizes the importance of reducing VMT as an integral component of GHG emissions reductions efforts:

To the degree a project relies on GHG mitigation measures, ***CARB recommends that lead agencies prioritize on-site design features that reduce emissions, especially from VMT, and direct investments in GHG reductions within the project's region that contribute potential air quality, health, and economic co-benefits locally.*** For example, on-site design features to be considered at the planning stage include land use and community design options that reduce VMT, promote transit oriented development, promote street design policies that prioritize transit, biking, and walking, and increase low carbon mobility choices, including improved access to viable and affordable public transportation, and active transportation opportunities. Regionally, additional GHG reductions can be achieved through direct investment in local building retrofit programs that can pay for cool roofs, solar panels, solar water heaters, smart meters, energy efficient lighting, energy efficient appliances, energy efficient windows, insulation, and water conservation measures for homes within the geographic area of the project.

(CARB, 2017 Climate Change Scoping Plan at p. 102 [emphasis added].) CARB’s 2017 Scoping Plan Update also emphasizes the need to address VMT as an integral piece of GHG mitigation. “CARB staff is *more convinced than ever* that, in addition to achieving GHG reductions from cleaner fuels and vehicles, *California must also reduce VMT.*” (CARB, 2017 Climate Change Scoping Plan at p. 101 [emphasis added].) Further, the 2017 Scoping Plan Update emphasizes the co-benefits of VMT reduction, including reduction of toxic air pollutants, improved public health, decreased traffic congestion, and increased environmental justice. These important quality of life factors are important to consider along with the GHG emissions reduction benefits of policies to reduce VMT.

## 2. CARB’s Staff Proposal for Increasing MPOs’ SB 375 GHG Emissions Reduction Targets

CARB staff has recommended increased GHG emissions reduction targets under SB 375 for the State’s MPOs and has emphasized the importance of VMT reduction in reaching those targets. CARB staff is currently holding public workshops about the recommended target increases prior to CARB Board consideration early this year.

The revised targets call for “greater per capita GHG emission reductions from SB 375 than are currently in place, which for 2035, translate into targets that either match or exceed the emission reduction levels contained in the MPOs’ currently adopted SCSs. CARB staff believes that to achieve the intent of the legislation and to maximize community co-benefits, the *per capita GHG emission reduction targets should be achieved predominantly through strategies that reduce VMT.*” (CARB SB 375 Staff Proposal at p. 19.) In fact, “CARB’s recommended targets are equivalent to reducing VMT a half a mile per person per day.” (*Id.* at p. 28.) CARB recognized that SB 375 and other VMT reduction strategies “need to provide a 25 percent reduction in statewide per capita greenhouse gas emissions relative to 2005 by 2035” to meet the statewide goals. (*Id.* at p. 29.) For the San Diego Association of Governments (“SANDAG”), CARB staff has recommended a 2035 reduction target of 21%, which is higher than the 2035 target in SANDAG’s current RTP/SCS and higher than the 18% target requested by SANDAG.

SANDAG’s RTP/SCS model for the unincorporated County is based on land use inputs from the County’s approved 2011 GPU. The land use designations in the 2011 GPU are the product of over a decade of community input and stakeholder negotiations and are generally considered to adhere to smart growth principles of locating density near existing infrastructure and transit. Any amendment to the County’s 2011 GPU would necessarily alter the VMT modelling performed by SANDAG to determine its VMT reductions in the current RTP/SCS. General Plan Amendments proposed on unincorporated County lands typically require densification of rural lands farther from existing infrastructure and transit than the 2011 GPU’s planned density.

For example, the Newland Sierra project is a proposed General Plan Amendment being processed by the County that would add over 2,100 homes to an area currently zoned for 99 homes and is located between Escondido and the Riverside County line more than six miles from the nearest transit center. The General Plan Amendments proposed in the unincorporated County necessarily add long vehicle trips over and above those considered in the RTP/SCS model, which

relied on the 2011 GPU's land use designations. The CAP's Mitigation Measure GHG-1 does not consider project siting or VMT reduction strategies as mitigation for General Plan Amendment projects; instead, Mitigation Measure GHG-1 allows the General Plan Amendment projects to meet their GHG mitigation requirement by merely purchasing carbon offset credits from anywhere in the world. The County has not analyzed the impacts of this approach on County-wide VMT or on SANDAG's ability to meet its SB 375 requirements.

SANDAG has analyzed the impact of aggressive land use policies to increase densification and determined that these policies would have minimal benefit for GHG emissions reduction efforts. Neither SANDAG nor the County, however, has analyzed the impacts of a *less* dense development pattern on unincorporated County lands and how such sprawl planning would inhibit VMT-reduction efforts. Yet, Mitigation Measure GHG-1 would pre-approve a GHG mitigation program for sprawl projects that relies on purchasing carbon offset credits while ignoring local VMT reduction and consistency with SANDAG's VMT-reduction plans.

3. The County Should Analyze Potential VMT Impacts According to a Separate Model

No analysis has been performed to determine if the addition of sprawl development projects would inhibit SANDAG's efforts to reduce VMT and meet its SB 375 targets through its RTP/SCS. SANDAG submitted a comment letter to the County regarding the CAP and specifically requested that the CAP consider smart growth policies. In response to this comment, the County indicated that its CAP adheres to smart growth principles because it is consistent with the existing General Plan. The County's response, however, ignored that the CAP's mitigation plan for General Plan Amendments would allow for new sprawl projects to contradict the underlying smart growth principles in the General Plan. Rather than addressing any VMT reduction goals or requirements, or demonstrating their consistency with SANDAG's existing adopted VMT reduction strategy, the County has indicated that these new General Plan Amendments would address GHG mitigation solely through the purchase of carbon offset credits for their onsite emissions from anywhere in the world.<sup>1</sup> No mitigation would be provided for any General Plan Amendment project's VMT impacts or increased GHG emissions associated with those VMT impacts.

Because these General Plan Amendment projects would necessarily alter the underlying inputs for SANDAG's previous VMT analysis and because no VMT reduction is required by the CAP for General Plan Amendment projects, the County should analyze VMT according to a separate model, adding the land use densities for the General Plan Amendments currently in process with the County and any other relevant scenarios. Only then will the public and decision makers be able to understand the impacts of the CAP's offset program for General Plan Amendment projects on SANDAG's VMT-reduction efforts.

---

<sup>1</sup> See Comment and Response L4-3 at <https://www.sandiegocounty.gov/content/dam/sdc/pds/advance/cap/publicreviewdocuments/FinalPublicReviewDocs/RTCs/L4.pdf>.

This information must be provided by the County to the public and other agencies through the CEQA process. As the California Supreme Court emphasized last year in *Banning Ranch Conservancy v. City of Newport Beach* (2017) 2 Cal.5th 918, 942, public agencies must provide relevant information about “related regulations” of other agencies and their impacts on a proposed project, rather than ignore those agencies and their regulations. Contrary to that ruling, the County has simply chosen to ignore the impact of its CAP and its “offsets for everyone from anywhere in the world” mitigation strategy upon the regulatory program for reduction of VMT administered by SANDAG. As the Supreme Court stated in *Banning Ranch Conservancy*:

To be prejudicial, a failure to account for related regulations must substantially impair the EIR’s informational function. Here, the City’s failure to discuss ESHA requirements and impacts was neither insubstantial nor merely technical. The omission resulted in inadequate evaluation of project alternatives and mitigation measures.

(2 Cal.5th, *supra*, at 942.)

Likewise, the County’s failure to analyze how its expected new projects (that are allowed to move forward with GHG offsets alone) could increase VMT and interfere with the “related regulations” of SANDAG’s attainment of VMT reductions required by CARB’s goals was a prejudicial information deficiency. With the proper information about the impact of these project’s on SANDAG’s efforts to reduce VMT, the County could have considered mitigation measures and alternatives in its CAP which would support SANDAG’s efforts, rather than thwart them. Instead, with this VMT information missing, no such mitigation measures or alternatives were considered. Indeed, no analysis was conducted to determine the extent that increased VMT resulting from the contemplated new projects would increase associated GHG emissions inevitably resulting from increased VMT.

#### 4. The County’s Approach Spurns VMT Reduction

A starting point for any consideration of SANDAG’s efforts to attain VMT reduction goals is an analysis of how the expected General Plan Amendments noted by the County in its cumulative impacts analysis, may change SANDAG’s current VMT conclusions. However, the County’s EIR contains absolutely no analysis of this issue.

Recent public statements from County Supervisor Ron Roberts and County Planning Director Mark Wardlaw indicate an approach that supplants VMT reduction measures with vehicle and fuel technology programs. At the CARB Board of Directors meeting approving the 2017 Scoping Plan Update, San Diego County Supervisor Ron Roberts, who is also a member of the CARB Board, vehemently opposed the use of VMT as a metric:

I think it’s one of the worst metrics. I said that when I was first here in 1995. It’s a pathetic metric for anything. It’s a political metric. It’s not a performance metric. As we increasingly electrify vehicles, cars, and trucks, and buses, and everything else, you’ll

see that clearly. And I think you'll still — I think you'll see it today. We've seen it in San Diego County the relationship is an inverse one. And there's a lot of reasons for that. And this Air Board has been a strong part of that, and I'm very proud that that's the case. But I think it's something that we need to have a better understanding. And when you're measuring the wrong thing, it seems to me your chances of success are far more limited. So I've registered that concern in the past. A lot of people keep hanging their hat on it.

(CARB Board of Directors Meeting Transcript, December 14, 2017 at p. 80:6-21.) Similarly, Supervisor Ron Roberts called VMT a “stupid metric” at a February 2, 2018 SANDAG meeting.

In addition, at the San Diego County Planning Commission's January 18 hearing on the CAP, Planning Director Mark Wardlaw stated that “electric vehicle and fuel cell vehicle programs shift that fuel from the carbon-based to a non-carbon-based which addresses the intent of VMT reduction.”

These comments by Supervisor Roberts and Director Wardlaw indicate a lack of concern regarding increased VMT within San Diego County from sprawl development projects. This approach contradicts CARB's emphasis on reducing VMT as an integral component of meeting the State's GHG emissions reduction targets. We encourage CARB to coordinate with SANDAG and the County to ensure VMT reductions remain a priority in land use planning and GHG mitigation. If VMT is to be discarded as a guidepost for GHG emission reduction policies in San Diego County or Statewide – as is preferred by Supervisor Roberts and Director Wardlaw – analysis of this policy shift should be performed and presented to the public and decision makers prior to implementation.

If the County decides that it no longer cares about VMT as a metric for its General Plan policies, this will put SANDAG in the impossible position of attempting to meet VMT reduction targets in the face of the County's plan to allow unlimited new development in rural areas so long as GHG offsets are purchased from some location around the globe. The County has not provided an analysis of the specific VMT impacts from the CAP's Mitigation Measure GHG-1. The County includes sprawl projects, which are currently being processed by the County, in its model that are not included in SANDAG's model, which was based on the 2011 County General Plan and used for the 2015 SANDAG RTP/SCS. Such a shift in County policy must be analyzed prior to Board approval to understand the impacts not only on unincorporated County lands, but also on Countywide VMT and SANDAG's ability to meet its targets under SB 375.

5. The CAP Should Evaluate a Mitigation Measure or Alternative Requiring General Plan Amendment Projects to Be Located in Smart Growth Areas

SANDAG submitted a comment letter on the Draft CAP, which included a comment encouraging the CAP to embrace smart growth policies. The FSEIR's response indicates that the CAP is consistent with SANDAG's RTP/SCS because the CAP does not propose land use changes to the 2011 General Plan. (FSEIR, Response to Comments L4-3.) A similar statement

is included in Master Response 2. (*Id.* at p. 8-15.) The response from the County does not say anything about the impact of the County's new GHG offset policies contained in the Climate Action Plan on vehicle miles traveled or SANDAG's smart growth policies. The response does not describe the impact on GHG emissions associated with increased vehicle miles traveled from allowing growth in the County's rural areas. These responses lead to the conclusion that General Plan Amendment projects would cause an inconsistency with SANDAG's RTP/SCS. They also fail to adequately respond to SANDAG's comment.

Curiously, Master Response 2 also includes a contradictory statement that Mitigation Measure GHG-1 "would ensure" that General Plan Amendment projects are consistent with the RTP/SCS. This is not accurate. Mitigation Measure GHG-1 does not include any requirements for measuring or monitoring the impacts of General Plan Amendments on VMT, nor does it provide for any policy to encourage VMT reduction, and the FSEIR admits that adherence to approved land uses in the 2011 General Plan is necessary for consistency with the RTP/SCS.

Responses to comments are an important part of the CEQA process. "The primary reason for soliciting comments from interested parties is to allow the lead agency to identify, at the earliest possible time, the potential significant adverse effects of the project and alternatives and mitigation measures that would substantially reduce these effects." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal.4th 1112, 1129 [citation omitted]; see also *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 735 ["Comments are an integral part of the EIR and should be relied upon by the decisionmakers."] [citation omitted].) Responses to comments must be in good faith and rely on factual information. (*Ballona Wetlands Land Trust v. City of Los Angeles* (2011) 201 Cal.App.4th 455, 475 ["An agency must evaluate and respond to timely comments on the draft EIR that raise significant environmental issues. Responses must describe the disposition of the issues raised in the comments. If the agency rejects a recommendation or objection concerning a significant environmental issue, the response must explain the reasons why. Responses must articulate 'good faith, reasoned analysis in response,' and not mere '[c]onclusory statements unsupported by factual information.'"] [citations omitted].)

The inaccurate statement in Master Response 2 that Mitigation Measure GHG-1 "would ensure" that General Plan Amendment projects are consistent with the RTP/SCS does not comply with CEQA's requirements. Rather than a good faith response, this response contains a clear inaccuracy and provides no response regarding why the County might believe that its plan is consistent with the RTP/SCS. Although the RTP/SCS is not under the County's jurisdiction, recent case law from the California Supreme Court holds that a lead agency must analyze a project's environmental impacts affecting a different jurisdiction. (See *Banning Ranch Conservancy, supra*, 2 Cal.5th at 937 ["To the fullest extent possible, the lead agency should integrate CEQA review with these related environmental review and consultation requirements."].)

The County should also study a mitigation measure or alternative to limit General Plan Amendments to areas identified by SANDAG as "smart growth" areas as identified by urban area transit boundaries on SANDAG's Smart Growth Concept Map. (See **Attachment A.**) SANDAG's RTP/SCS notes that approximately half of its emissions reductions would result

from transit and transportation demand management projects, while a quarter of the reductions result from changing land uses and a quarter from increasing the cost of driving. (SANDAG, San Diego Forward: Regional Plan at Appendix C at 3 (2015)<sup>2</sup>.) As such, it is vital to locate unplanned residential development in smart growth areas near transit and jobs. Changing land use patterns must favor smart growth over sprawl to be consistent with the RTP/SCS.

Recent opinions from the Supreme Court and Court of Appeal addressing the adequacy of SANDAG's previous RTP/SCS emphasized the importance of analyzing a "smart growth" mitigation measure or alternative. (*Cleveland Nat'l Forest Found. v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 506 ["The reductions mandated by Senate Bill 375 may be achieved through a variety of means, including 'smart growth' planning to maximize building densities at locations served by public transit and to locate residences near needed services and shopping to reduce automobile dependency."]; *Cleveland Nat'l Forest Found. v. San Diego Assn. of Governments* (2017) 17 Cal.App.5th 413, 433–34 [failure to address smart growth in mitigation and alternatives].)

The FSEIR admits that "the nature of the unincorporated county is low-density development that is not conducive to non-driving trips" and that "[t]rip distances are longer in the unincorporated county." (FSEIR at 8-29.) Consequently, limiting unplanned development to smart growth areas is even more important for ensuring consistency with the RTP/SCS's VMT reduction goals.

The CAP indicates that proposed GHG emissions reductions from the transportation sector are disproportionately low compared to emissions generated by on-road transportation because the County lacks authority to regulate transportation. The County, however, has plenary authority over land use and could achieve greater emissions reductions from on-road transportation by committing to only allow increased density from General Plan Amendments in smart growth areas that will not increase VMT. To the contrary, many of the currently proposed General Plan Amendment projects, such as Newland Sierra, add density to rural lands, creating sprawl and increasing the County's VMTs.

In addition to exercising its land use authority to require or emphasize siting General Plan Amendment projects in smart growth areas, Mitigation Measure GHG-1 could be amended to address VMT. It could require a specific percentage of a project's emissions reductions derive from VMT or require that a General Plan Amendment project not increase Countywide VMT. Such mitigation or alternatives should be analyzed by the County prior to project approval.

### **III. MITIGATION MEASURE GHG-1 IS INCONSISTENT WITH THE COUNTY'S GENERAL PLAN**

The State Planning and Zoning Law requires the County's project approvals to be consistent with the General Plan. (*Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 570–71.) "A project is inconsistent with a general plan 'if it conflicts with a general

---

<sup>2</sup> San Diego Forward: The Regional Plan, including Appendix C, may be accessed at <http://www.sdfoward.com/previous-plan>.

plan policy that is fundamental, mandatory, and clear.” (*Spring Valley Lake Assn. v. City of Victorville* (2016) 248 Cal.App.4th 91, 100 [citing *Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 782]; see also *California Native Plant Society v. City of Rancho Cordova* (2009) 172 Cal.App.4th 603, 635–636 [finding General Plan inconsistency for failure to abide by its “mandatory” policy requiring coordination with State and federal wildlife agencies to mitigate impacts to special status species].)

The County’s General Plan prioritizes GHG emissions reductions within San Diego County. The General Plan’s EIR found that the GHG and climate change impacts from the County’s operations and from community sources were “potentially significant” – that without mitigation the County would fail to comply with AB 32. As a result, the General Plan EIR includes mitigation measures for GHG and climate change impacts, including the adoption of a CAP. (County General Plan EIR, Mitigation Measure CC-1.2 (2011).) The CAP, therefore, is intended to mitigate impacts from GHG emissions *within San Diego County*.

The County’s General Plan requires the County to exercise its land use jurisdiction to site projects in areas that will reduce VMT. Policy COS-14.1 states as follows: “Land Use Development Form. Require that development be located and designed to reduce vehicular trips (and associated air pollution) by utilizing compact regional and community-level development patterns while maintaining community character.” As discussed above, however, Mitigation Measure GHG-1 has no requirements for project siting or VMT-reduction.

County staff maintains that the CAP is not a land use plan. This statement draws a false distinction. The County has plenary land use authority for unincorporated lands and may constrain land use decisions – even if the document doing so is not labeled a “land use plan.” For example, the Conservation and Open Space Element requires project siting to avoid sensitive habitat areas and species. (See e.g., Policy COS-2.2: “Habitat Protection through Site Design. Require development to be sited in the least biologically sensitive areas and minimize the loss of natural habitat through site design.”) In addition, the Safety Element requires project siting to avoid high fire risk areas. (See, e.g., Policy S-1.1: “Minimize Exposure to Hazards. Minimize the population exposed to hazards by assigning land use designations and density allowances that reflect site specific constraints and hazards.”) County staff’s claim that no land use provisions may be included in the CAP because it is not explicitly labeled a “land use plan,” therefore, is inaccurate and does not relieve the County of its obligation to comply with Policy COS-14.1 and site projects in a way that limits VMT.

The General Plan also includes provisions requiring GHG reductions to be local. While the CAP proposes to amend these provisions to remove the word “local,” it continues to require emissions reductions to be within the unincorporated County. The CAP’s proposal for Goal COS-20 in strikethrough and underline form reads as follows: “Reduction of ~~local~~ community-wide (i.e., unincorporated County) and County Operations ~~GHG~~ greenhouse gas emissions contributing to climate change that meet or exceed requirements of the Global Warming Solutions Act of 2006, as amended by Senate Bill 32 (as amended, Pavley, California Global Warming Solutions Act of 2006; emissions limit).” In addition the CAP’s proposed changes to Policy COS 20.1 reads as follows: “Prepare, maintain, and implement a ~~climate change action plan with a baseline inventory of GHG emissions from all sources; GHG emissions reduction~~

targets and deadlines, and enforceable GHG emissions reduction measures. Climate Action Plan for the reduction of community-wide (i.e., unincorporated County) and County Operations greenhouse gas emissions consistent with the California Environmental Quality Act (CEQA) Guidelines section 15183.5.” In any event, even with the CAP’s proposed amendments to these General Plan provisions, emissions reductions should remain within the unincorporated County.

Mitigation Measure GHG-1, however, would allow for the purchase of unlimited carbon credits from other continents. If the County is changing its policy to eliminate the requirement that GHG emissions reductions are must be obtained locally, it must amend its General Plan to make this policy change explicit and must perform the requisite accompanying environmental analysis to determine the impacts of this change in policy. This has not been done.

Finally, several General Plan provisions require inter-jurisdictional coordination.

- Goal LU-4: “Inter-jurisdictional Coordination. Coordination with the plans and activities of other agencies and tribal governments that relate to issues such as land use, community character, transportation, energy, other infrastructure, public safety, and resource conservation and management in the unincorporated County and the region.”
- Policy LU-4.1: “Regional Planning. Participate in regional planning to ensure that the unique communities, assets, and challenges of the unincorporated lands are appropriately addressed with the implementation of the planning principles and land use requirements, including the provisions of SB375.”
- Policy COS-20.3: “Regional Collaboration. Coordinate air quality planning efforts with federal and State agencies, SANDAG, and other jurisdictions.”

These policies mandate coordination of regional planning and explicitly require coordination with SANDAG and to ensure planning adheres to SB 375’s principles. A General Plan requirement for “coordination” cannot be satisfied by mere solicitation and rejection of input from the agencies; instead, it requires greater engagement. (*California Native Plant Society v. City of Rancho Cordova, supra*, 172 Cal.App.4th. at 642.) Here, no such coordination occurred. Despite Golden Door’s requests, the County has not sought input from SANDAG about the impact of Mitigation Measure GHG-1 on SANDAG’s VMT-reduction policies or ability to meet existing and proposed SB 375 targets. The County has not modeled potential VMT increases to determine the impact of Mitigation Measure GHG-1 on SANDAG’s RTP/SCS. The County even admits no coordination has occurred with SANDAG in its response to the Golden Door’s comments on this issue. (See Response to Comments X29-5: “The County acknowledges that as a jurisdiction with land use authority, it is important to coordinate on regional planning matters, and as a matter of course it has previously coordinated with SANDAG on the County’s existing General Plan and continues to coordinate with SANDAG and other agencies on regional planning efforts.”) This response does not state that the County has coordinated with SANDAG with respect to the CAP.

Mitigation Measure GHG-1's inconsistencies with the County's General Plan represent a fatal flaw that must be addressed prior to approval of the CAP.

#### **IV. MITIGATION MEASURE GHG-1 SHOULD INCORPORATE CEQA'S STANDARD FOR FEASIBILITY IN DETERMINING GEOGRAPHIC PRIORITIES FOR EMISSIONS REDUCTIONS**

Mitigation Measure GHG-1 does not provide quantitative limits on the emissions reductions that must be achieved by any of the listed geographic priority levels. As such, 100 percent of emissions reductions may be achieved by purchase of offset credits from international sources. The County's response to this concern is to require all "feasible" mitigation to be achieved in each geographic priority area before allowing emissions reductions to be obtained from a subsequent geographic priority area on the list.

The County, however, has been inconsistent in describing how it will determine when feasible mitigation has been exhausted for each geographic priority. At the Planning Commission hearing, County Counsel William Witt stated that feasibility determinations would be made consistent with CEQA's standard for feasibility. At the same time, County staff described a process whereby County staff members would determine feasibility of potential mitigation measures after project approvals and without public input and review—which contradicts settled CEQA law regarding feasibility. The County's response to written comments made to the Planning Commission doubles down on its contradiction to settled CEQA law to reiterate that feasibility findings will not be made by the Board in a public proceeding pursuant to CEQA's requirements.

"Feasibility" and its counterpart, "infeasibility," are terms of art under the California Environmental Quality Act ("CEQA"). An agency may reject a proposed project alternative or mitigation measure and approve a project, despite significant environmental impacts, only if the agency makes appropriate findings that the mitigation is infeasible. (Pub. Res. Code § 21081.5; *Cal. Native Plant Soc'y v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 982–83.) This finding must appear in the CEQA findings, not merely in the statement of overriding considerations. (*Cal. Native Plant Soc'y, supra*, 177 Cal.App.4th at 983; *Rialto Citizens for Responsible Growth v. City of Rialto* (2012) 208 Cal.App.4th 899, 948 n.20.) A measure is "infeasible" if it is incapable of being accomplished in a successful manner within a reasonable time. (Pub. Res. Code § 21061.1.) A finding of infeasibility must be supported by substantial evidence. (*Cal. Native Plant Soc'y, supra*, 177 Cal.App.4th at 982; *Preservation Action Council v. City of San Jose* (2006) 141 Cal.App.4th 1336, 1352–53; *Ctr. for Biological Diversity v. Cty. of San Bernardino* (2010) 185 Cal.App.4th 866, 883–85.) A finding of feasibility or infeasibility must be made at the time of project approval, and may not be deferred to a later date or to the agency staff for their own determination.

We encourage the County to revise the CAP in order to clarify that meeting CEQA's infeasibility standards is required for a General Plan Amendment project to move from one geographic priority level to the next in Mitigation Measure GHG-1. Given the ample confusion caused by the County's contradictory response thus far, explicit clarification is necessary to ensure the public that the County's approach to offsets will comply with CEQA's feasibility

requirements and allow the public to review and comment on mitigation for General Plan Amendment projects prior to the Board's consideration, rather than leaving such determinations to staff after project approval and without any public process. To be consistent with CEQA and the General Plan, one of the two options we have attached hereto as **Attachment B** should be considered.<sup>3</sup>

Project applicants and the public should be aware of the high standard required to make a finding of "economic" infeasibility. We are concerned that the CAP's focus on cost-benefit analyses may cause confusion with respect to findings of economic infeasibility. Specifically, the statement on page 8-41 of the FSEIR that "[r]elative costs are also used as a feasibility metric for County deliberation" is misleading with regard to CEQA's standards for findings of economic infeasibility. Mere loss of profitability is insufficient to demonstrate economic infeasibility. "What is required is evidence that the additional costs or lost profitability are sufficiently severe so as to render it impractical to proceed with the project." (*Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 599 [quoting *Citizens of Goleta Valley v. Bd. of Supervisors* (1988) 197 Cal.App.3d 1167, 1181].) Economic infeasibility findings must be supported by adequate, relevant economic evidence. (*Uphold Our Heritage, supra*, 147 Cal.App.4th at 601-602; *see also Save Round Valley Alliance v. Cty. of Inyo* (2007) 157 Cal.App.4th 1437, 1462; *Cty. of San Diego v. Grossmont-Cuyamaca Cmty. College* (2006) 141 Cal.App.4th 86, 108.)

## V. CONCERNS REGARDING AVAILABILITY OF LOCAL PROJECTS FOR OFFSET CREDIT

While we encourage and support every effort to provide GHG mitigation on-site, we are also concerned about the availability of GHG reduction projects in local communities if on-site mitigation is found to be infeasible. The CAP's Master Response 12 notes that only one project within San Diego County is included on the approved registries for offset projects. At this time, however, credits are not available from that project – a reforestation project – because the trees have not reached maturity. (FSEIR at 8-52.)

We understand that the CAP's GHG Reduction Measure T-4.1 requires the development of local direct investment projects. In fact, well over half of the CAP's anticipated emissions reductions would result from this measure. Proposals for potential local projects, however, will not be available in 2020. At this time, therefore, the amount of emissions reductions that could be obtained by this measure is unknown, and none will be available until 2020 at the earliest. Moreover, because Measure T-4.1 is included in the CAP's GHG reduction strategies, it is required mitigation for the General Plan's *approved* land uses pursuant to General Plan Mitigation Measure CC-1.2. Measure T-4.1's local direct investment projects may not be "double counted" for General Plan Amendment projects' reductions under Mitigation Measure GHG-1. As a result, these potential future local projects may not be relied upon to satisfy geographic priority levels within the County. Even if local projects become available eventually,

---

<sup>3</sup> In addition, the County did not make readily available the proposed General Plan Amendment text for the CAP in time to satisfy Brown Act requirements. We independently contacted the County to receive the proper resolution.

they will not be available to offset emissions from General Plan Amendment projects unless and until enough local projects are developed to satisfy all of the mitigation required for the existing General Plan's emissions and an excess remains to be allocated to General Plan Amendments. This is highly speculative. Consideration of geographic priority levels for local offsets, therefore, is illusory.

As the Board is aware, there are large General Plan Amendment projects expected to be presented to the Board later this year for approval. For example, Newland Sierra proposes over 2,100 residential units and the Property Specific Requests propose over 1,800 residential units. The Newland Sierra Draft EIR proposes to reduce only 18 percent of its emissions reductions on-site, and the PSRs do not provide specific proposals for on-site mitigation. Because the County admittedly has zero local projects from which offset credits may be purchased, these large projects will necessarily have to rely on purchase of carbon offset credits from far away sources.

The County should make a considerable effort to promote development of local mitigation projects. Only once sufficient projects have been developed to satisfy Measures T-4.1, T-3.5, and other measures relying on local projects, should additional local projects be considered as mitigation for General Plan Amendment projects' GHG impacts. The CAP should clarify that development of such local projects is a prerequisite to processing General Plan Amendments relying on off-site mitigation. Without the development of such projects, geographic priority levels 2 and 3 of the Mitigation Measure GHG-1 are illusory. In that case, any off-site mitigation could only occur outside the County, which would be inconsistent with the County's General Plan and CARB's guidance.

## **VI. THE CAP'S GHG REDUCTION MEASURES MUST MEET CEQA'S CRITERIA FOR DEFINITE AND ENFORCEABLE MITIGATION**

Mitigation measures must be feasible and enforceable (14 Cal. Code Regs. § 15126.4, subd. (a)(1), (2)) and must provide adequate information to ascertain their enforceability. (*Sierra Club v. Cty of Fresno* (2014) 226 Cal.App.4th 704, 750–51.) Development of mitigation measures cannot be deferred to a later date. “Impermissible deferral of mitigation measures occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR.” (*City of Long Beach v. Los Angeles Unified School Dist.* (2009) 176 Cal.App.4th 889, 915, 916 [citations omitted].) The purpose of CEQA's mitigation requirements “*is to ensure that feasible mitigation measures will actually be implemented as a condition of development, and not merely adopted and then neglected or disregarded.*” (*Federation of Hillside & Canyon Associations v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261 [emphasis in original] [citing Pub. Res. Code § 21002.1, subd. (b)]; see also *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 93 [invalidating mitigation measures that are “nonexclusive, undefined, untested and of unknown efficacy”].)

Here, the CAP itself is a mitigation measure. The General Plan's EIR found significant impacts to climate change and proposed preparation of the CAP as Mitigation Measure CC-1.2. CEQA's requirements for mitigation measures, therefore, apply to all GHG emissions-reducing measures within the CAP. The FSEIR errs in Master Response 13 by stating that the CAP's

GHG reduction measures are not mitigation measures under CEQA. (See FSEIR at p. 8-53.) This response should be revised and clarified.

In addition, as we expressed in a previous letter, we are concerned that consideration of the cost-benefit analyses completed after the Planning Commission's October hearing on the CAP results in deferral of mitigation and a shifting project description. CEQA requires a stable project description. (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 192, 193.) The County should clarify which measures are being implemented to meet the CAP's emissions reduction requirements under Mitigation Measure CC-1.2. CEQA does not permit the "weight" or "emphasis" of various mitigation measures to be considered after project approval and public review, but instead requires definite and enforceable mitigation measures that meet defined criteria for reducing a project's impacts. (See *Federation of Hillside & Canyon Associations*, *supra*, 83 Cal.App.4th at 1261.)

Additionally, we are concerned that GHG offset projects included in the CAP will not be enforceable. It is not clear whether the County has the rights to enforce such projects, including any agreement with the entity producing the offset credits. It is further unclear what regulatory agency will oversee which of the registries listed in the CAP. This lack of oversight could lead to enforcement issues down the road.

Finally, Mitigation Measure GHG-1 fails as mitigation for cumulative impacts from General Plan Amendments because it does not take into account all GHG emissions from General Plan Amendments. Mitigation Measure GHG-1 requires mitigation for emissions from construction and from operations (see FSEIR at 2.7-39, 2.7-40), but does not include other emissions associated with such projects, such as emissions from induced traffic cause by off-site road improvements or other activities. By failing to mitigate for these impacts, the mitigation measure is incomplete.

## **VII. ANALYSIS OF THE CAP'S ENERGY IMPACTS SHOULD BE PROVIDED**

Because Mitigation Measure GHG-1 is only aimed at reducing GHG impacts, the CAP fails to analyze or mitigate any potential energy impacts that may result from General Plan Amendments. Because the CAP provides this plan for allowing purchase of offset credits to mitigate GHG impacts from General Plan Amendment projects, it should include strategies for reducing energy impacts on such project sites. Failure to consider and analyze the potentially significant energy impacts violates the statutory requirement that the mitigation measures in an EIR include "measures to reduce the wasteful, inefficient, and unnecessary consumption of energy." (Pub. Res. Code § 21100(b)(3); see also *People v. County of Kern* (1976) 62 Cal.App.3d 761, 774.)

### **VIII. THE COUNTY’S RESPONSE TO PUBLIC COMMENTS ARE INSUFFICIENT**

The County has failed to adequately respond to public comments on the Draft and Final CAP and the SEIR.<sup>4</sup> The County repeatedly makes conclusory statements that are not supported by specific references to empirical information, scientific authorities, or explanatory information are insufficient as responses to comments made by agencies or the public. (CEQA Guidelines § 15088(c).) For example, the County ignores requests that it account for VMT in its mitigation program for General Plan Amendments by simply stating that the CAP is not a land use plan—despite the Golden Door pointing out that the County has plenary land use authority on unincorporated lands. (See Response X29-5.)

Further, the County has failed to demonstrate a good faith, reasoned analysis of the CAP comments, in violation of CEQA. (CEQA Guidelines § 15088(c).) The Golden Door provided specific recommendations for the County to consider in order to ensure that a General Plan Amendment does not entirely rely on offsets outside of the County rather than reducing GHG emissions on site. (See Golden Door Comment O14-12.) Rather than analyzing these potential recommendations, the County simply stated that the Golden Door provided no evidence that these alternative approaches would be successful. (See County RTC O14-12.) Under CEQA, rejected recommendations major environmental issues must be addressed in detail, and the lead agency should explain its reasons for not accepting those suggestions. (CEQA Guidelines § 15088(c); *County of Kern, supra*, 62 Cal.App.3d at 761.) The County has failed to adequately describe why it would not be accepting the proposed recommendations, beyond a few sentences stating that the proposals are best analyzed at the project level.

### **IX. ENVIRONMENTAL JUSTICE IS AN IMPORTANT CONSIDERATION UNDER CARB’S 2017 SCOPING PLAN**

The 2017 CARB Scoping Plan discusses the importance of GHG reductions benefitting environmental justice communities. We are concerned that due to the lack of consideration for VMT and local offset projects in Mitigation Measure GHG-1 that the County’s CAP does not adequately address CARB’s concerns and provide benefits to the environmental justice communities. The CAP’s GHG mitigation measure for General Plan Amendments should make benefits to environmental justice communities a priority.

---

<sup>4</sup> The County erroneously labels comments on the Final CAP and Final SEIR as “late letters.” Despite that the County released the final documents only ten days prior to the Planning Commission hearing on the CAP, many commenters were able to provide timely comments prior to the Planning Commission’s comment deadline.

Thank you for your time and attention to our comments. Please do not hesitate to contact us should you have any questions or comments.

Best regards,

## OPTION ONE

RESOLUTION OF THE COUNTY OF SAN DIEGO BOARD OF SUPERVISORS ADOPTING THE GENERAL PLAN AMENDMENT (GPA) PDS2016-GPA-16-007, AMENDING THE 2011 GENERAL PLAN UPDATE GOAL COS-20 AND POLICY COS-20.1; GPA 16-007

WHEREAS, pursuant to Government Code Sections 65350 et seq., GPA 16-007 has been prepared, being the first amendment to the Conservation and Open Space Element of the County General Plan in the Calendar Year 2018; and

WHEREAS, GPA 16-007 has been filed by the County of San Diego, consisting of an amendment to the Conservation and Open Space Element of the County General Plan; and

WHEREAS, the County has determined that it is in its best interest to obtain GHG reductions from global sources; and

WHEREAS, on January 18, 2018, the Planning Commission, pursuant to Government Code Sections 65351 and 65353 held a duly advertised public hearing on GPA 16-007; and

WHEREAS, the Planning Commission has made its detailed recommendations concerning the above item; and

WHEREAS, the Planning Commission reviewed and considered the information contained in the Final Supplemental Environmental Impact Report (SEIR) dated August 2017, on file with Planning & Development Services as Environmental Review Number (ER) PDS2016-ER-16-00-003 prior to making its recommendation to approve the project; and

WHEREAS, on \_\_\_\_\_, \_\_\_\_\_, 2018, the Board of Supervisors, pursuant to Government Code Section 65355 held a duly advertised public hearing on GPA 16-007; and

WHEREAS, on \_\_\_\_\_, \_\_\_\_\_, 2018, the Board of Supervisors has made findings pursuant to Attachment \_\_\_\_\_, Environmental Findings, of the Board of Supervisors Planning Report for the project.

NOW THEREFORE BE IT RESOLVED that the Board of Supervisors takes the following actions:

1. Approve the amendment to the Conservation and Open Space Element of the County General Plan in GPA 16-007, as identified in Exhibit A.

BE IT FURTHER RESOLVED that the amended documents shall be endorsed in the manner provided by the Board of Supervisors.

BE IT FURTHER RESOLVED that the Board of Supervisors finds that the GPA 16-007 is consistent with the San Diego County General Plan and the Program Environmental Impact Report in that the goals, objectives, and policies of all the elements of the plan have been or will be met.

BE IT FURTHER RESOLVED that this Resolution shall take effect and be in force from and after 30 days after its adoption.

Approved as to Form and Legality  
County Counsel

By: William Witt, Senior Deputy

## GENERAL PLAN AMENDMENT (PDS2016-GPA-16-007) for the CLIMATE ACTION PLAN

January 8, 2018

The changes to the County of San Diego 2011 General Plan Update (GPU) goal and policy, and 2011 General Plan Update Program Environmental Impact Report (EIR) mitigation measures are provided below and shown in underline (underline) for new additions and ~~strikeout~~ for deletions:

### 1) GPU Goal: COS-20 (Governance and Administration)

Reduction of ~~local~~ community-wide (i.e., unincorporated County) and County Operations GHG greenhouse gas emissions contributing to climate change that meet or exceed requirements of the Global Warming Solutions Act of 2006, as amended by Senate Bill 32 (as amended, Pavley, California Global Warming Solutions Act of 2006: emissions limit). ~~Reductions may come from global sources.~~

(Reference: [2011 General Plan Update Page 5-38](#))

### 2) GPU Policy: COS-20.1 (~~Climate Change Action Plan~~)

Prepare, maintain, and implement a ~~climate change action plan with a baseline inventory of GHG emissions from all sources; GHG emissions reduction targets and deadlines, and enforceable GHG emissions reduction measures.~~ Climate Action Plan for the reduction of community-wide (i.e., unincorporated County) and County Operations greenhouse gas emissions consistent with the California Environmental Quality Act (CEQA) Guidelines Section 15183.5. ~~Reductions may come from global sources consistent with following geographic priorities: 1) project design features/on-site reduction measures; 2) off-site within the unincorporated areas of the County of San Diego; 3) off-site within the County of San Diego; 4) off-site within the State of California; 5) off-site within the United States; and 6) off-site internationally. All feasible reductions from one geographic priority must be exhausted before reductions from a subsequent priority may be obtained. Feasibility determinations will be made by the Board of Supervisors pursuant to CEQA section 21081.5.~~

### 3) GPU Program EIR Mitigation Measure (MM) CC-1.2

~~Prepare a County Climate Change Action Plan with an update baseline inventory of greenhouse gas emissions from all sources, more detailed greenhouse gas emissions reduction targets and deadlines; and a comprehensive and enforceable GHG emissions reduction measures that will achieve a 17% reduction in emissions from County operations from 2006 by 2020 and a 9% reduction in community emissions between 2006 and 2020. Once prepared, implementation of the plan will be monitored and progress reported on a regular basis. Climate Action Plan for the reduction of community-wide (i.e., unincorporated County) and County Operations greenhouse gas emissions consistent with State legislative targets, as described in General Plan Goal COS-20, and consistent with CEQA Guidelines Section 15183.5 or as amended, as referenced in General Plan Policy COS-20.1. As described in Section 15183.5, the key elements of the Climate Action Plan would include:~~

“CEQA Guidelines Section 15183.5(b)(1):

(1) Plan Elements. A plan for the reduction of greenhouse gas emissions should:

- (A) Quantify greenhouse gas emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;
- (B) Establish a level, based on substantial evidence, below which the contribution to greenhouse gas emissions from activities covered by the plan would not be cumulatively considerable;
- (C) Identify and analyze the greenhouse gas emissions resulting from specific actions or categories of actions anticipated within the geographic area;
- (D) Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
- (E) Establish a mechanism to monitor the plan’s progress toward achieving the level and to require amendment if the plan is not achieving specified levels;
- (F) Be adopted in a public process following environmental review.”

Once prepared, implementation of the Climate Action Plan will be monitored and progress reported on a regular basis, as follows:

- Implementation Monitoring Report – prepared annually;
- Greenhouse Gas Emissions Inventory – updated every two years; and
- Climate Action Plan – updated every five years.

Mitigation may be obtained from global sources.

(Reference: [2011 General Plan Update Program EIR Page](#))

#### 4) GPU Program EIR MM CC-1.7

~~Incorporate the California ARB's recommendations for a climate change CEQA threshold into the County Guidelines for Determining Significance for Climate Change. These recommendations will include energy, waste, water, and transportation performance measures for new discretionary projects in order to reduce GHG emissions. Should the recommendation not be released in a timely manner, the County will prepare and adopt its own threshold for GHG emissions and shall include this threshold in the County Guidelines for Determining Significance for Climate Change.~~

(Reference: [2011 General Plan Update Program EIR Page 2.17-30 and Page 2.17-31](#))

#### 5) GPU Program EIR MM CC-1.8

~~Revise Prepare County Guidelines for Determining Significance for Climate Change (Guidelines) based on the Climate Change Action Plan. The ~~revisions~~ Guidelines will include guidance for identify the specific actions proposed discretionary projects will need to take to achieve greater energy, water, waste, and transportation efficiency demonstrate consistency with the Climate Action Plan pursuant to Section 15183.5 of the CEQA Guidelines or as amended, as described in the 2011 General Plan Update Program EIR Mitigation Measure CC-1.2, as amended.~~

(Reference: [2011 General Plan Update Program EIR Page 2.17-31](#))

## OPTION 2

The geographic priority list in Mitigation Measure GHG-1, located on pages 2.7-38 and 2.7-39, will be amended as follows (additional text in underline, deleted text in ~~strikethrough~~):

The County will consider, to the satisfaction of the Director of Planning & Development Services (PDS), the following geographic priorities for GHG reduction features, and GHG reduction projects and programs: 1) project design features/on-site reduction measures; 2) off-site within the unincorporated areas of the County of San Diego; and 3) off-site within the County of San Diego; ~~4) off-site within the State of California; 5) off-site within the United States; and 6) off-site internationally~~

# Decades of Leadership

From the first law to protect rivers from the impact of gold mining in 1884, to decades of work to fight smog, the Golden State has set the national – and international – standard for environmental protection. California pushes old boundaries, encounters new ones, and figures out ways to break through those as well. This is part of the reason why California has grown to become both the 6th largest economy in the world, and home to some of the world’s strongest environmental protections. And, we have seen our programs and policies adopted by others as they seek to protect public health and the environment.

California’s approach to climate change channels and continues this spirit of innovation, inclusion, and success. The 2030 target of 40 percent emissions reductions below 1990 levels guides this Scoping Plan, as the economy evolves to reduce greenhouse gas (GHG) emissions in every sector. It also demonstrates that we are doing our part in the global effort under the Paris Agreement to reduce GHGs and limit global temperature rise below 2 degrees Celsius in this century.

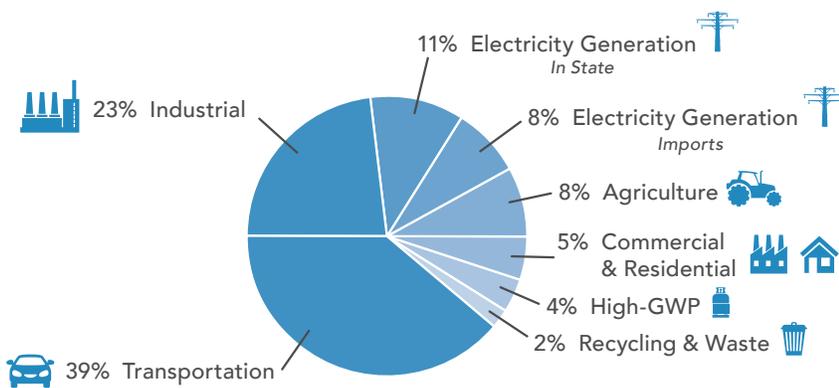

California’s 2017 Climate Change Scoping Plan: The Strategy for Achieving California’s 2030 Greenhouse Gas Target (Plan) builds on the state’s successes to date, proposing to strengthen major programs that have been a hallmark of success, while further integrating efforts to reduce both GHGs and air pollution. California’s climate efforts will:

- Lower GHG emissions on a trajectory to avoid the worst impacts of climate change;
- Support a clean energy economy which provides more opportunities for all Californians;
- Provide a more equitable future with good jobs and less pollution for all communities;
- Improve the health of all Californians by reducing air and water pollution and making it easier to bike and walk; and
- Make California an even better place to live, work, and play by improving our natural and working lands.

Governor Brown signs SB 32 recommitting California’s efforts to curb climate change.

## The Climate Imperative – We Must Act

---

The evidence that the climate is changing is undeniable. As evidence mounts, the scientific record only becomes more definitive – and makes clear the need to take additional action now.

In California, as in the rest of the world, climate change is contributing to an escalation of serious problems, including raging wildfires, coastal erosion, disruption of water supply,

threats to agriculture, spread of insect-borne diseases, and continuing health threats from air pollution.

The drought that plagued California for years devastated the state's agricultural and rural communities, leaving some of them with no drinking water at all. In 2015 alone, the drought cost agriculture in the Central Valley an estimated \$2.7 billion, and more than 20,000 jobs. Last winter, the drought was broken by record-breaking rains, which led to flooding that tore through freeways, threatened rural communities, and isolated coastal areas. This year, California experienced the deadliest

wildfires in its history. Climate change is making events like these more frequent, more catastrophic and more costly. Climate change impacts all Californians, and the impacts are often disproportionately borne by the state's most vulnerable and disadvantaged populations.

# California is on Track – But There is More to Do

Although the California Global Warming Solutions Act of 2006 – also known as AB 32 – marked the beginning of an integrated climate change program, California has had programs to reduce GHG emissions for decades. The state’s energy efficiency requirements, Renewable Portfolio Standard, and clean car standards have reduced air pollution and saved consumers money, while also lowering GHG emissions.

## ENVIRONMENTAL PROGRESS AND A RESILIENT ECONOMY

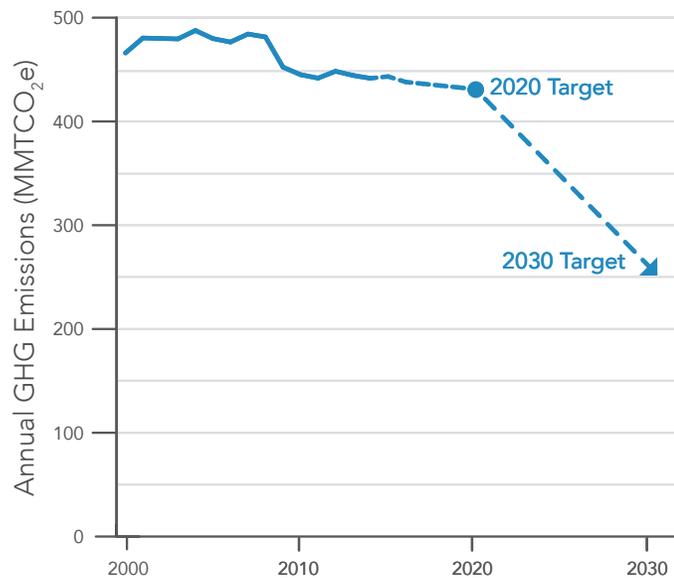

The California economy has grown while becoming less carbon intensive.

AB 32 set California’s first GHG target called on the state to reduce emissions to 1990 levels by 2020. California is on track to exceed its 2020 climate target, while the economy continues to grow. Since the launch of many of the state’s major climate programs, including Cap-and-Trade, economic growth in California has consistently outpaced economic growth in the rest of the country. The state’s average annual growth rate has been double the national average – and ranks second in the country since Cap-and-Trade took effect in 2012. In short, California has succeeded in reducing GHG emissions while also developing a cleaner, resilient economy that uses less energy and generates less pollution.

Importantly, the State’s 2020 and 2030 targets have not been set in isolation. They represent benchmarks, consistent with prevailing climate science, charting an appropriate trajectory forward that is in line with California’s role in stabilizing global warming below dangerous thresholds. As we consider efforts to reduce emissions to meet the State’s near-term requirements, we must do so with an eye toward reductions needed beyond 2030. The Paris Agreement – which calls for limiting global warming to well below 2 degrees Celsius and pursuing efforts to limit it to 1.5 degrees Celsius – frames our path forward.

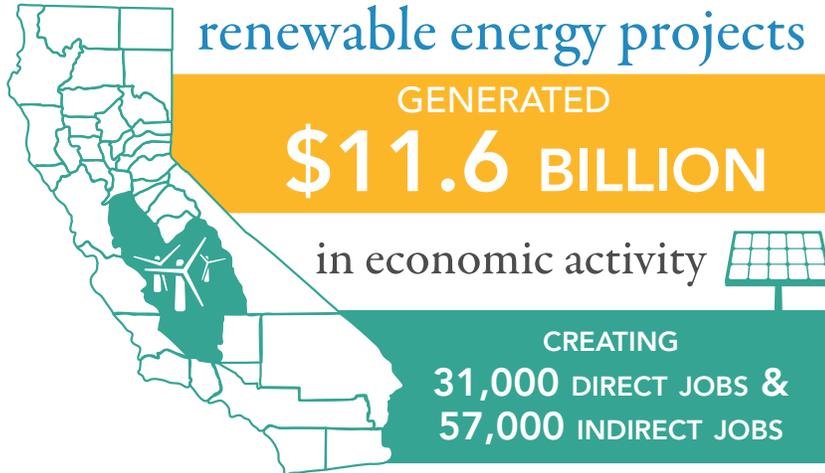

## CALIFORNIA’S PATH FORWARD

# California's Path to 2030

Executive Order B-30-15 and SB 32 extended the goals of AB 32 and set a 2030 goal of reducing emissions 40 percent from 2020 levels. This action keeps California on target to

## FROM 2002-2015 SAN JOAQUIN VALLEY renewable energy projects

achieve the level of reductions scientists say is necessary to meet the Paris Agreement goals. This is an ambitious goal – calling on the State to double the rate of emissions reductions. Nevertheless, it is an achievable goal.

This Plan establishes a path that will get California to its 2030 target. Given our ambitious goals, this Plan is built on unprecedented outreach and coordination. Over 20 state agencies collaborated to produce the Plan, informed by 15 state agency-sponsored workshops and more than 500 public comments. The broad range of state agencies involved reflects the complex nature of addressing climate change, and the need to work across institutional

boundaries and traditional economic sectors to effectively reduce GHG emissions. As part of the Plan development, alternative strategies were considered and evaluated, ranging from carbon taxes to individual facility caps to relying solely on sector-specific regulations. In addition, efforts were made to ensure that the Plan would benefit all Californians. To this end, the Environmental Justice Advisory Committee (EJAC), a Legislatively created advisory body, convened almost 20 community meetings throughout California to discuss the climate strategy, and held 19 meetings of its own to provide recommendations on the Plan.

This Plan draws from the experiences in developing and implementing previous plans to present a path to reaching California's 2030 GHG reduction target. The Plan is a

package of economically viable and technologically feasible actions to not just keep California on track to achieve its 2030 target, but stay on track for a low- to zero-carbon economy by involving every part of the state. Every sector, every local government, every region, every resident is part of the solution. The Plan underscores that there is no single solution but rather a balanced mix of strategies to achieve the GHG target. This Plan highlights the fact that a balanced mix of strategies provides California with the greatest level of certainty in meeting the target at a low cost while also improving public health, investing

in disadvantaged and low-income communities, protecting consumers, and supporting economic growth, jobs and energy diversity. Successful implementation of this Plan relies, in part, on long-term funding plans to inform future appropriations necessary to achieve California's long-term targets.

## CALIFORNIA'S CLIMATE POLICY PORTFOLIO

-  Double building efficiency
-  Cleaner freight and goods movement
-  50% renewable power
-  Slash potent "super-pollutants" from dairies, landfills and refrigerants
-  More clean, renewable fuels
-  Cap emissions from transportation, industry, natural gas, and electricity
-  Cleaner zero or near-zero emission cars, trucks, and buses
-  Invest in communities to reduce emissions
-  Walkable/Bikeable communities with transit

# California's Climate Vision

## Create Inclusive Policies and Broad Support for Clean Technologies

Remarkable progress over the past 10 years has put the global energy and transportation sector on a transformative path to cleaner energy. Far outpacing previous predictions, today solar and wind power are often less expensive than coal or natural gas, and they now comprise the majority of global investment in the power sector. Electric vehicle battery costs have tumbled even more quickly than solar costs, while performance has improved dramatically, and the auto industry is committed to an electric future.

California's policies have created markets for energy efficiency, energy storage, low carbon fuels, renewable power – including utility-scale and residential-scale solar – and zero-emission vehicles. Our companies are thriving, making those markets grow. California is home to nearly half of the zero-emission vehicles in the U.S., 40 percent of North American clean fuels investments, the world's best known electric car manufacturer, and the world's leading ride-sharing services. California is further advancing efficient land use policies that reduce auto dependency. Altogether, we're unleashing nonlinear transitions to clean energy and clean transportation technologies that will put California on the path to meeting our 2030 target and the goals of the Paris Agreement.

California policymaking has succeeded through thoughtful planning, bolstered by an open public process that solicits the best ideas from a wide array of sources, and by integrating effective regulation with targeted investments to provide broad market support for clean technologies. A key element of California's approach continues to be careful monitoring and reporting on the results of our programs and a willingness to make mid-course adjustments. As the State looks to 2030 and beyond, all sectors of the economy must benefit from these ideas to create a new and better future.

California is home to

NEARLY **50%**

**CLEAN TRANSPORTATION**

### CUMULATIVE CALIFORNIA ZEV SALES PROJECTIONS

Experience has shown clean technology and markets continue to outpace expectations.

## LEGISLATIVE LEADERSHIP ON CLIMATE

The California Legislature has shaped the State's climate change program, setting out clear policy objectives over the next decade:

- 40% reduction in GHG emissions by 2030;
- 50% renewable electricity;
- Double energy efficiency savings;
- Support for clean cars;
- Integrate land use, transit, and affordable housing to curb auto trips;
- Prioritize direct reductions;
- Identify air pollution, health, and social benefits of climate policies;
- Slash "super pollutants";
- Protect and manage natural and working lands;
- Invest in disadvantaged communities; and
- Strong support for Cap-and-Trade.

The benefits of innovative technologies need to reach all residents and businesses. Air pollution reductions and the associated health benefits should be targeted to communities where they are needed most. All Californians need access to clean transportation options that enable healthy communities to develop and thrive, including walking, cycling, transit, rail, and clean vehicle options.

Although GHG reductions can help to reduce harmful air pollution, California must concurrently employ other strategies to accelerate reductions of pollutants from large industrial sources that adversely impact communities. Newly passed AB 617 strengthens existing criteria and toxic air pollutant programs and our partnerships with local air districts to further reduce harmful air pollutants and protect communities. More fundamentally, AB 617 establishes a comprehensive statewide program – the first of its kind – to address air pollution where it matters most: in neighborhoods with the most heavily polluted air.

## CALIFORNIA'S GOALS

California's environmental justice and equity movement is establishing a blueprint for the nation and world. The State is pioneering targeted environmental and economic development programs to help those most in need. So far, half of all California Climate Investments, stemming from the State's Cap-and-Trade-Program, have been used to provide benefits in the 25 percent of California communities that are most disadvantaged by environmental and socio-economic burdens. By increasingly engaging with, and investing in, these communities – investing in technical assistance resources, holding listening sessions, improving our programs, and accelerating our efforts to bring the cleanest technologies to mass market – all California residents can have clean air to breathe, clean water to drink, and opportunities to participate in the cleaner economy.

## ACHIEVING SUCCESS IN EQUITY AND ACCESS

- Continue to engage local organizations and invest in disadvantaged communities to ensure broad access to clean technologies;
- Ensure air pollution reductions happen where they are needed the most;
- Integrate across programs and agencies to ensure complementary policies provide maximum benefits to disadvantaged communities;
- Implement California Energy Commission and CARB recommendations to overcome barriers to clean energy and clean transportation options for low-income residents;
- Provide energy-efficient affordable housing near job centers and transit; and
- Implement AB 617 to dramatically improve air quality in local communities through targeted action plans.

## Enhance Industrial Efficiency & Competitiveness

---

California leads the country in manufacturing and industrial efficiency. For every dollar spent on electricity, our manufacturers produce 55 percent more value than the national average. And the efficiency of California industry continues to grow at rates faster than the national average. High efficiency rates, coupled with the Cap-and-Trade Program's firm emission cap, allow economic activity to increase without corresponding increases in GHG emissions. In other words, the more California produces, the better it is for the planet. Maintaining and extending our successful programs – from the Cap-and-Trade Program and Low Carbon Fuel Standard to zero-emission, renewable energy and energy efficiency programs – will reduce GHGs, increase energy cost savings, offer businesses flexibility to reduce emissions at low cost and provide clear policy and market direction, and certainty, for business planning and investment. This will encourage continued research, evaluation, and deployment of innovative strategies and technology to further reduce emissions in the industrial sector through advances in energy efficiency and productivity, increased access to cleaner fuels, and carbon capture, utilization and storage.

### ACTION ON HFCs

Hydrofluorocarbons (HFCs) represent one of the biggest opportunities to reduce GHGs in the State through 2030 due to their high climate impacts, and in many cases, offer energy efficiency and financial savings, as well. The world recently agreed to phase down their use, but California has committed to move more quickly, in line with the scope of the opportunity for cost-effective emissions reductions in the State.

### ACHIEVING SUCCESS IN INDUSTRIAL EFFICIENCY AND COMPETITIVENESS

- Evaluate and implement policies and measures to continue reducing GHG, criteria, and toxic air contaminant emissions from sources such as refineries;
- Improve productivity and strengthen economic competitiveness by further improving energy efficiency and diversifying fuel supplies with low carbon alternatives;
- Prioritize procurement of goods that have lower carbon footprints
- Support and attract industry that produces goods needed to reduce GHGs; and
- Cut energy costs and GHG emissions by quickly transitioning to efficient HFC alternatives.

## Prioritize Transportation Sustainability

---

California's transportation system underpins our economy. The extensive freight system moves trillions of dollars of goods each year and supports nearly one-third of the state economy and more than 5 million jobs. The way we plan our communities impacts everything from household budgets to infrastructure needs, productivity lost to congestion, protection of natural and working landscapes, and our overall health and well-being. And transportation is the largest source of GHG, criteria, and toxic diesel particulate matter emissions in the state.

### RENEWABLE DIESEL USE

*has increased 7000% since 2011*

California's ability to remain an economic powerhouse and environmental leader requires additional efforts to improve transportation sustainability with a comprehensive approach that includes regulation, incentives, and investment.

This approach addresses a full range of

transportation system improvements relating to efficient land use, affordable housing, infrastructure for cyclists and pedestrians, public transit, new vehicle technologies, fuels and freight. One example is the deployment of the nation's first high-speed rail system, which will include seamless connections to local transit.

The approach is working: California is home to nearly half of the country's zero-emission vehicles. Innovative alternative fuel producers and oil companies are bringing more low carbon fuels to market than required by the Low Carbon Fuel Standard. And, the State has committed to investing billions in zero-emission vehicles and infrastructure, land use planning, and active transportation options such as walking and biking. In fact, renewable fuels in the heavy-duty vehicle sector are displacing diesel fossil fuel as quickly as renewable power is replacing fossil fuels on the electricity grid. California's climate policies will also reduce fossil fuel use and decouple the state from volatile global oil prices. CARB's analyses show fossil fuel demand will decrease by more than 45 percent by 2030, which means Californians will be using less gasoline and diesel resulting in healthier air and cost-savings on transportation fuels. These benefits will be further amplified as we move away from light-duty combustion vehicles.

By re-doubling our efforts, California can make sure that markets tip quickly and definitively in the favor of electric cars, trucks, buses, and equipment, while increasing the use of clean, low carbon fuels where zero-emissions options are not yet available. Local transportation planning can make communities become healthier and more vibrant and connected – encouraging housing, walking, biking and transit policies that reduce GHGs and promote good quality of life. And, we can work to ensure that an efficient sustainable freight system continues to power our ever-growing economy.

## ACHIEVING SUCCESS IN TRANSPORTATION SUSTAINABILITY

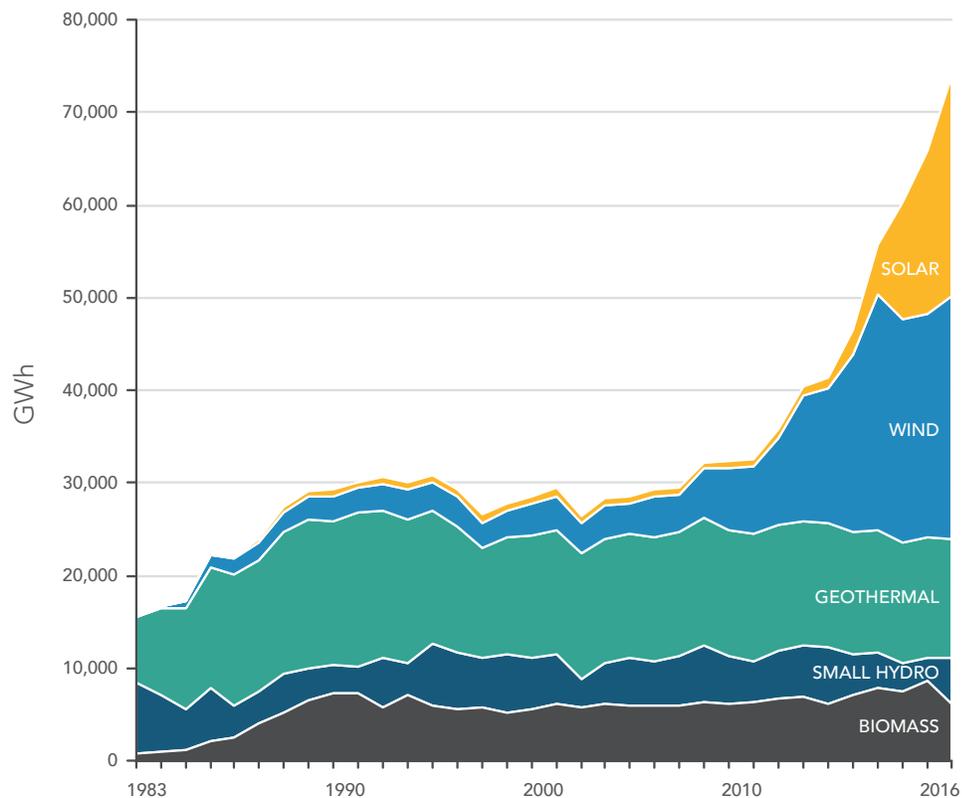

- Connect California's communities with a state-of-the-art high-speed rail system;
- Promote vibrant communities and landscapes through better planning efforts to curb vehicle-miles-traveled and increase walking, biking and transit;
- Build on the State's successful regulatory and incentive-based policies to quickly make clean cars, trucks, buses, and fuels definitive market winners;
- Coordinate agency activities to ensure that emerging automated and connected vehicle technologies reduce emissions; and
- Improve freight and goods movement efficiency and sustainability to enable California's continued economic growth.

## Continue Leading on Clean Energy

California is well ahead of schedule in meeting its renewable energy targets. Wind and solar generation have grown exponentially in recent years, while hydroelectric, geothermal, and biomass have consistently contributed renewable power to our energy supply. Californians are the ones who will take action to meet energy efficiency targets, integrate renewable power through demand response, and drive demand for net zero energy buildings. This includes self-generation which also grew exponentially in recent years with installed solar totaling 2,000 megawatts (MW) in 2014 and 5,100 MW of the total statewide self-generation installed solar in 2015. By June 2017, solar installed in California was about 5,800 MW, far exceeding the State's goals.

**INCREASING RENEWABLE ELECTRICITY GENERATION (IN & OUT OF STATE)**

The Renewable Portfolio Standard, Carbon Pricing, and lower costs for renewable technology are delivering real environmental benefits.

While at this time natural gas is an important energy source, we must move toward cleaner heating fuels and replicate the progress underway for electricity. As with electricity, this starts with efficiency and demand reduction, including building and appliance electrification where these advancements make sense. It calls for minimizing fugitive methane leaks throughout the system, including beyond California’s borders where 90 percent of the natural gas used here originates. And, it includes using more renewable gas – a valuable in-state resource made from waste products – especially in the transportation sector. Replacing fossil fuels with renewable gas can reduce potent short-

## Reaching California’s Clean Electricity Goals

The State’s 3 largest investor-owned utilities are on track to achieve a 50% RPS by 2020.

lived climate pollutants, and state policies should support this effort. Reducing demand for natural gas, and moving toward renewable natural gas, will help California achieve its 2030 climate target. However, switching from natural gas to electricity – where feasible and demonstrated to reduce GHGs – is needed to stay on track to achieve our long-term goals.

### ACHIEVING SUCCESS IN CLEAN ENERGY

- Effectively integrate at least 50 percent renewables as the primary source of power in the State through coordinated planning, additional deployments of energy storage, and grid regionalization;
- Utilize distributed resources and engage customers by making net zero energy buildings standard, implement Existing Buildings Energy Efficiency Action Plan to double existing building efficiency, and increase access to energy efficiency, renewable energy, and energy use data; and
- Reduce the use of heating fuels while concurrently making what is used cleaner by minimizing fugitive methane leaks, prioritizing natural gas efficiency and demand reduction, and enabling cost-effective access to renewable gas.

## Put Waste Resources to Beneficial Use

---

Effectively managing waste streams is perhaps the most basic of environmental tenets. “Reduce, re-use, and recycle” is a mantra known even to elementary school students. For decades California law has reduced waste reaching landfills and recaptured value from waste streams through recycling and composting. California law requires reducing, recycling, or composting 75 percent of solid waste generated by 2020. The State also has specific goals for diverting organic waste, which decomposes in landfills to produce the super pollutant methane. State law also directs edible food to hungry families rather than having it discarded.

Capturing value from waste makes sense. As described in the Healthy Soils Initiative, compost from organic matter provides soil amendments to revitalize farmland, reduces irrigation and landscaping water demand, and potentially increases long-term carbon storage in rangelands. Organic matter can also provide a clean, renewable energy source in the form of bioenergy, biofuels, or renewable natural gas.

California should take ownership of its waste and adhere to a waste “loading order” that prioritizes waste reduction, re-use, and material recovery over landfilling. The State can take steps to reduce waste from packaging, which constitutes about one-quarter of California’s waste stream. It can invest in and streamline in-state infrastructure development to support recycling, remanufacturing, composting, anaerobic digestion, and other beneficial uses of organic waste. And, it can help communities in their efforts to recover food for those in need.

### ACHIEVING SUCCESS IN PUTTING WASTE RESOURCES TO BENEFICIAL USE

- Develop and implement programs, including edible food waste recovery, to divert organics from landfills and reduce methane emissions;
- Develop and implement a packaging reduction program; and
- Identify a sustainable funding mechanism to support waste management programs, including infrastructure development to support organics diversion.

# Support Resilient Agricultural and Rural Economies and Natural and Working Lands

California’s natural and working landscapes, like forests and farms, are home to the most diverse sources of food, fiber, and renewable energy in the country. They underpin the state’s water supply and support clean air, wildlife habitat, and local and regional economies. They are also the frontiers of climate change. They are often the first to experience the impacts of climate change, and they hold the ultimate solution to addressing climate change and its impacts. In order to stabilize the climate, natural and working lands must play a key role.

Work to better quantify the carbon stored in natural and working lands is continuing, but given the long timelines to change landscapes, action must begin now to restore and conserve these lands. We should aim to manage our natural and working lands in California to reduce GHG emissions from business-as-usual by at least 15-20 million metric tons in 2030, to complement the measures described in this Plan.

Natural and working lands can be better incorporated into California’s climate change mitigation efforts by encouraging collaboration with local and regional organizations and increasing investment to protect, enhance, and innovate in our rural landscapes and communities. The State is partnering with tribes to preserve carbon, protect tribal forest lands and increase their land base. Transportation and land use planning should minimize the footprint of the built environment, while supporting and investing in efforts to restore, conserve and strengthen natural and working lands. California’s forests should be healthy carbon sinks that minimize black carbon emissions where appropriate, supply new markets for woody waste and non-merchantable timber, and provide multiple ecosystem benefits. Rehabilitating and strengthening wetlands and tidal environments, and incorporating natural landscapes into urban environments will also help make natural and working lands part of the state’s climate solution. Finally, California farmers can be a powerful force in the fight against climate change, in how they manage their lands, tend their crops, and husband their livestock.

Improved forest management on tribal lands has preserved almost 3 million metric tons of carbon in California and the revenues from the carbon offsets have been used to secure ownership of ancestral lands.

## ACHIEVING SUCCESS IN SUPPORTING RESILIENT AGRICULTURAL AND RURAL ECONOMIES AND NATURAL AND WORKING LANDS

- Protect, enhance and innovate on California’s natural and working lands to ensure natural and working lands become a net carbon sink over the long-term;
- Develop and implement the Natural and Working Lands Implementation Plan to maintain these lands as a net carbon sink and avoid at least 15-20 metric tons of GHG emissions by 2030;
- Measure and monitor progress by completing CARB’s Natural and Working Lands Inventory and implementing tracking and performance monitoring systems; and
- Unleash opportunity in the agricultural sector by improving manure management, boosting soil health, generating renewable power, electrifying operations, utilizing waste biomass, and increasing water, fertilizer, and energy use efficiency to reduce super pollutants.

## Secure California's Water Supplies

Water is California's lifeblood. It sustains communities and drives the economy. An elaborate network of storage and delivery systems has enabled the state to prosper and grow. But this aging system was built for a previous time and is increasingly challenged by the realities of climate change and population growth.

### THE WATER-ENERGY NEXUS

- About 12% of the total energy used in the state is related to water, with 2% for conveyance, treatment and distribution, and 10% for end-customer uses like heating and cooling.
- The water-energy nexus provides opportunities for conservation of these natural resources as well as reduction of GHGs.

Producing, moving, heating and treating water demands significant energy and produces commensurately significant emissions. As California looks to the future, meeting new demands and sustaining prosperity requires increased water conservation and efficiency, improved coordination and management of various water supplies, greater understanding of the water-energy nexus, and deployment of new technologies in drinking water treatment, groundwater remediation and recharge, and potentially brackish and seawater desalination. State efforts must support systemic shifts toward conservation, efficiency, and renewable energy in the water sector.

### ACHIEVING SUCCESS IN SECURING CALIFORNIA'S WATER SUPPLIES

- Increase water savings by certifying innovative technologies for water conservation and developing and implementing new conservation targets, updated agricultural water management plans, and long term conservation regulations;
- Develop a voluntary registry for GHG emissions from energy use associated with water; and
- Continue to increase the use of renewable energy to operate the State Water Project.

# Cleaning the Air and Public Health

The benefits of this Plan are broader than just climate change – implementation of the Plan will also help improve public health. The Plan incorporates freight and mobile source strategies which will deliver reductions in criteria and toxic air pollutants to improve air quality.

## Climate Plan Provides Health Benefits in 2030

AVOIDED  
PREMATURE DEATHS

~ 3,300

VALUE OF AVOIDED  
HEALTH IMPACTS

\$1.2-1.8 billion

VALUE OF AVOIDED  
DAMAGES USING  
SOCIAL COST OF CARBON

\$1.9-11.2 billion

California continues to seek ways to improve implementation of its climate program and its ability to address the unique set of impacts facing the state's most pollution burdened communities. In addition, CARB's environmental justice efforts are intended to reach far beyond climate change. While this Plan provides a path for reducing GHG emissions in disadvantaged communities, it also includes new tools that will complement the Plan and lead to further air quality improvements.

In particular, implementation of AB 617 will improve air quality in local communities, in partnership with local air districts, using targeted investments in neighborhood-level air monitoring and the development of air pollution reduction action plans with strong enforcement programs. These plans will require pollution reductions from both mobile and stationary sources. Through these efforts, CARB anticipates, and will work for, increased data transparency and the adoption of new statewide air pollutant emission controls that will not only confer short-term benefits to those most in need of improvement, but which will ultimately benefit all Californians.

Under the leadership of CARB's first executive-level environmental justice liaison, the agency is also laying a roadmap to better serve California's environmental justice communities in the design and implementation across its broader programs.

# Successful Example of Carbon Pricing and Investment

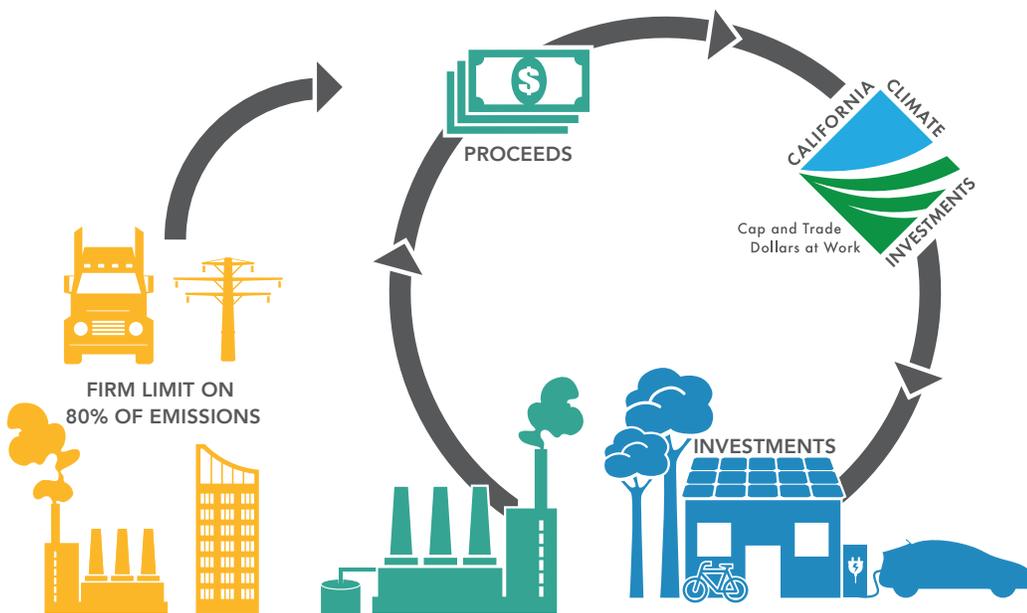

The Cap-and-Trade Program is fundamental to meeting California’s long-range climate targets at low cost. The Cap-and-Trade Program includes GHG emissions from transportation, electricity, industrial, agricultural, waste, residential and commercial sources, and caps them while complementing the other measures needed to meet the 2030 GHG target. Altogether, the emissions covered by the Cap-and-Trade program total 80 percent of all GHG emissions in California. California’s response to climate change has led to many innovative programs designed to reduce GHG emissions, including the Renewable Portfolio and Low Carbon Transportation Standards, but the Cap-and-Trade Program guarantees GHG emissions reductions through a strict overall emissions limit that decreases each year, while trading provides businesses with flexibility in their approach to reducing emissions. The Cap-and-Trade Program also generates revenue when the allowances to emit pollution are auctioned. Some of the revenue is returned directly to electricity ratepayers, and the rest is dedicated to reducing GHG emissions by making Legislatively directed investments in California with an emphasis on programs or projects that benefit disadvantaged and low-income communities.

## CAP-AND-TRADE PROGRAM

- Firm, declining cap provides highest certainty to achieve 2030 target.
- Low cost GHG emission reductions minimize impact on consumers and economy.
- Flexibility for businesses
- Can be linked with similar programs worldwide.

Including the latest budget, approximately \$5 billion has been appropriated to reduce GHG emissions, reduce air pollutant emissions where reductions are needed most, grow markets for clean technologies, and spur emissions reductions in sectors not covered by Cap-and-Trade. These investments are strengthening the economy and improving public health – especially in the areas of the state most burdened by pollution. So far, half of the \$1.2 billion spent provides benefits to disadvantaged communities, and one-third of those investments were made directly in those communities.

## CALIFORNIA’S CARBON PRICING & INVESTMENTS OVERVIEW

## CAP-AND-TRADE DOLLARS AT WORK (2017)

California's Cap-and-Trade Program is the most comprehensive, effective, and well-designed carbon market on the planet. Today, the Program is linked with a similar program in Quebec and will link with a similar program in Ontario beginning in 2018. Nearly 40 countries and over 20 subnational entities – altogether representing nearly a quarter of global emissions – have developed, or are developing, emissions trading programs. Each of them looks to California and our linked Western Climate Initiative Partners as they design, implement, and refine their own programs.

Nearly 30,000 projects installing efficiency measures in homes

105,000+ rebates issued for zero-emission and plug-in hybrid vehicles

16,000+ acres of land preserved or restored

200+ transit agency projects funded, adding or expanding transit options

6,200+ trees planted in urban areas

1,100+ new affordable housing units under contract

50% of projects benefiting Disadvantaged Communities (\$614M)

140,000+ total projects implemented

## Fostering Global Action

Through the State's leadership in the Cap-and-Trade Program, innovative sector-specific policies that are reducing technology costs and GHG emissions, and community-scale engagement and investments to reduce GHGs and promote equity, California is playing a significant role in addressing global climate change.

Governor Brown has stated that climate change is the most important issue of our lifetime, and has promoted scientifically sound approaches to address climate change in California and beyond. He has participated in international climate discussions at the United Nations headquarters in New York, the United Nations Climate Change Conference in Paris, the Vatican, and the Climate Summit of the Americas in Canada – calling on other subnational and national leaders to join California in the fight against climate change. He has signed climate change agreements with leaders from Chile, China, the Czech Republic, Israel, Japan, Mexico, the Netherlands, other North American states and provinces, and Peru. He has joined an unprecedented alliance of heads of state, city and state leaders – convened by the World Bank Group and International Monetary Fund – to urge countries and companies around the globe to put a price on carbon. And California is a founding member of the International Zero Emission Vehicle (ZEV) Alliance, a coalition of national and subnational governments working to accelerate the adoption of ZEVs and make all new

cars zero emissions. Delegations from around the world travel to Sacramento to meet with the architects and implementers of California's climate policies to learn how to successfully combine strong greenhouse gas policies with a strong economy.

Perhaps most significant is the Under2Coalition. It is a global climate pact – spearheaded by Governor Brown – among states, provinces, countries, and cities all committing to do their part to limit the increase in global average temperatures below the dangerous levels. Signatories commit to either reducing greenhouse gas emissions 80 to 95 percent below 1990 levels by 2050 or achieving a per capita annual emission target of less than 2 metric tons by 2050. More than 200 jurisdictions from 38 countries and six continents have now signed or endorsed the agreement. Together, members of the Under2Coalition represent more than 1.2 billion people and \$28.8 trillion in GDP, equivalent to 39 percent of the global economy.

## Unleashing the California Spirit

---

This Plan is a declaration of California's path forward. It builds on the State's successful approach to addressing climate change and harnesses the California spirit to propel a cleaner economy, while serving as an example for others.

But this Plan will not be successful on its own. Our collective, and individual, efforts must reach every sector of California's economy, and every community in the state. As California faces the challenge of climate change, it will succeed as it always has – through open, inclusive processes, through support of clean technology markets, and through a relentless pursuit of a healthy California for all.

There should be no doubt that California is united in understanding the need to act, and in the will to act. Investments in clean, low-carbon options will pay off – for the environment and the economy. Investments and training in education and workforce development for a lower carbon economy are a critical part of this transition.

This Plan is only the beginning. All of the measures in the Plan will be developed in their own public process, shaped not just by the vision of this Plan, but also by the best understanding of the technology, costs and impacts on communities – and by input from a broad range of stakeholders and perspectives with the recognition that achieving the 2030 target is a milestone on our way to the deeper GHG reductions needed to protect the environment and our way of life. The Plan also proposes developing a long-term funding plan to inform future appropriations necessary to achieve our long-term targets, which will send clear market and workforce development signals.

Climate change presents unprecedented challenges, but just as we have always done, Californians will tackle them with innovation, inclusion and ultimately, success.

# Chapter 1

## INTRODUCTION

### Background

---

In November 2016, California Governor Edmund G. Brown affirmed California’s role in the fight against climate change in the United States, noting, “We will protect the precious rights of our people and continue to confront the existential threat of our time–devastating climate change.” By working to reduce the threat facing the State and setting an example, California continues to lead in the climate arena. This Scoping Plan for Achieving California’s 2030 Greenhouse Gas Target (Scoping Plan or 2017 Scoping Plan) identifies how the State can reach our 2030 climate target to reduce greenhouse gas (GHG) emissions by 40 percent from 1990 levels, and substantially advance toward our 2050 climate goal to reduce GHG emissions by 80 percent below 1990 levels. By selecting and pursuing a sustainable and clean economy path for 2030, the State will continue to successfully execute existing programs, demonstrate the coupling of economic growth and environmental progress, and enhance new opportunities for engagement within the State to address and prepare for climate change.

This Scoping Plan builds on and integrates efforts already underway to reduce the State’s GHG, criteria pollutant, and toxic air contaminant emissions. Successful implementation of existing programs has put California on track to achieve the 2020 target. Programs such as the Low Carbon Fuel Standard and Renewables Portfolio Standard are delivering cleaner fuels and energy, the Advanced Clean Cars Program has put more than a quarter million clean vehicles on the road, and the Sustainable Freight Action Plan will result in efficient and cleaner systems to move goods throughout the State. Enhancing and implementing these ongoing efforts puts California on the path to achieving the 2030 target. This Scoping Plan relies on these, and other, foundational programs paired with an extended, more stringent Cap-and-Trade Program, to deliver climate, air quality, and other benefits.

In developing this Scoping Plan, it is paramount that we continue to build on California’s success by taking effective actions. We must rapidly produce real results to avoid the most catastrophic impacts of climate change. The Scoping Plan identifies policies based on solid science and identifies additional research needs, while also recognizing the need for flexibility in the face of a changing climate. Ongoing research to better understand systems where our knowledge is weaker will allow for additional opportunities to set targets and identify actionable policies. Further, a long-term funding plan to inform future appropriations is critical to achieve our long-term targets, which will send clear market and workforce development signals.

### Climate Legislation and Directives

California has made progress on addressing climate change during periods of both Republican and Democratic national and State administrations. California’s governors and legislature prioritize public health and the environment. A series of executive orders and laws have generated policies and actions across State government, among local and regional governments, and within industry. These policies also have encouraged collaboration with federal agencies and spurred partnerships with many jurisdictions beyond California’s borders. Moving forward, California will continue its pursuit of collaborations and advocacy for action to address climate change. The following list provides a summary of major climate legislation and executive orders that have shaped California’s climate programs.

Assembly Bill 32 (AB 32) (Nuñez, Chapter 488, Statutes of 2006), the California Global Warming Solutions Act of 2006.

- Cut the State’s GHG emissions to 1990 levels by 2020 with maintained and continued reductions post 2020.
- First comprehensive climate bill in California, a defining moment in the State’s long history of environmental stewardship.

- Secured the State’s role as a national and global leader in reducing GHGs.

Pursuant to AB 32, the California Air Resources Board (CARB or Board) prepared and adopted the initial Scoping Plan to *“identify and make recommendations on direct emissions reductions measures, alternative compliance mechanisms, market-based compliance mechanisms, and potential monetary and non-monetary incentives”* in order to achieve the 2020 goal, and to achieve *“the maximum technologically feasible and cost-effective GHG emissions reductions”* by 2020 and maintain and continue reductions beyond 2020. AB 32 requires CARB to update the Scoping Plan at least every five years.

## **Executive Order B-30-15**

In his January 2015 inaugural address, Governor Brown identified actions in five key climate change strategy “pillars” necessary to meet California’s ambitious climate change goals. These five pillars are:

- Reducing today’s petroleum use in cars and trucks by up to 50 percent.
- Increasing from one-third to 50 percent our electricity derived from renewable sources.
- Doubling the efficiency savings achieved at existing buildings and making heating fuels cleaner.
- Reducing the release of methane, black carbon, and other short-lived climate pollutants.
- Managing farm and rangelands, forests, and wetlands so they can store carbon.

Consistent with these goals, Governor Brown signed Executive Order B-30-15 in April 2015:

- Establishing a California GHG reduction target of 40 percent below 1990 levels by 2030.
- Calling on CARB, in coordination with sister agencies, to update the AB 32 Climate Change Scoping Plan to incorporate the 2030 target.
- Building out the “sixth pillar” of the Governor’s strategy—to safeguard California in the face of a changing climate—highlighting the need to prioritize actions to reduce GHG emissions and build resilience in the face of a changing climate.

## **Senate Bill 350 (SB 350) (De Leon, Chapter 547, Statutes of 2015), Golden State Standards**

- Required the State to set GHG reduction planning targets through Integrated Resource Planning in the electricity sector as a whole and among individual utilities and other electricity providers (collectively known as load serving entities).
- Codified an increase in the Renewables Portfolio Standard (RPS) to 50 percent by 2030<sup>1</sup> and doubled the energy savings required in electricity and natural gas end uses as discussed in the Governor’s inaugural address.

## **Senate Bill 32 (SB 32) (Pavley, Chapter 249, Statutes of 2016), California Global Warming Solutions Act of 2016: emissions limit and Assembly Bill 197 (AB 197) (E. Garcia, Chapter 250, Statutes of 2016), State Air Resources Board: greenhouse gases: regulations.**

SB 32 affirms the importance of addressing climate change by codifying into statute the GHG emissions reductions target of at least 40 percent below 1990 levels by 2030 contained in Governor Brown’s Executive Order B-30-15. The 2030 target reflects the same science that informs the agreement reached in Paris by the 2015 Conference of Parties to the United Nations Framework Convention on Climate Change (UNFCCC), aimed at keeping the global temperature increase below 2 degrees Celsius (°C). The California 2030 target represents the most ambitious GHG reduction goal for North America. Based on the emissions reductions directed by SB 32, the annual 2030 statewide target emissions level for California is 260 million metric tons of carbon dioxide equivalent (MMTCO<sub>2</sub>e).

The companion bill to SB 32, AB 197, provides additional direction to CARB on the following areas related to the adoption of strategies to reduce GHG emissions.

- Requires annual posting of GHG, criteria, and toxic air contaminant data throughout the State, organized by local and sub-county level for stationary sources and by at least a county level for mobile sources.
- Requires CARB, when adopting rules and regulations to achieve emissions reductions

<sup>1</sup> <http://www.cpuc.ca.gov/renewables/>

and to protect the State's most affected and disadvantaged communities, to consider the social costs of GHG emissions and prioritize both of the following:

- Emissions reductions rules and regulations that result in direct GHG emissions reductions at large stationary sources of GHG emissions and direct emissions reductions from mobile sources.
- Emissions reductions rules and regulations that result in direct GHG emissions reductions from sources other than those listed above.
- Directs CARB, in the development of each scoping plan, to identify for each emissions reduction measure:
  - The range of projected GHG emissions reductions that result from the measure.
  - The range of projected air pollution reductions that result from the measure.
  - The cost-effectiveness, including avoided social costs, of the measure.

CARB has begun the process to implement the provisions of AB 197. For instance, CARB is already posting GHG, criteria pollutant and toxic air contaminant data. CARB also incorporated air emissions data into a visualization tool in December 2016 in response to direction in AB 197 to provide easier access to this data.<sup>2</sup>

### **Senate Bill 1383 (SB 1383) (Lara, Chapter 395, Statutes of 2016), Short-lived climate pollutants: methane emissions: dairy and livestock: organic waste: landfills**

- Requires the development, adoption, and implementation of a Short-Lived Climate Pollutant Strategy.<sup>3, 4</sup>
- Includes the following specific goals for 2030 from 2013 levels:
  - 40 percent reduction in methane.
  - 40 percent reduction in hydrofluorocarbon gases.
  - 50 percent reduction in anthropogenic black carbon.<sup>5</sup>

Short-lived climate pollutants (SLCPs), such as black carbon, fluorinated gases, and methane, are powerful climate forcers that have a dramatic and detrimental effect on air quality, public health, and climate change. These pollutants create a warming influence on the climate that is many times more potent than that of carbon dioxide. In March 2017, the Board adopted the Short-Lived Climate Pollutant Reduction Strategy (SLCP Strategy) establishing a path to decrease GHG emissions and displace fossil-based natural gas use. Strategies include avoiding landfill methane emissions by reducing the disposal of organics through edible food recovery, composting, in-vessel digestion, and other processes; and recovering methane from wastewater treatment facilities, and manure methane at dairies, and using the methane as a renewable source of natural gas to fuel vehicles or generate electricity. The SLCP Strategy also identifies steps to reduce natural gas leaks from oil and gas wells, pipelines, valves, and pumps to improve safety, avoid energy losses, and reduce methane emissions associated with natural gas use. Lastly, the SLCP Strategy also identifies measures that can reduce hydrofluorocarbon (HFC) emissions at national and international levels, in addition to State-level action that includes an incentive program to encourage the use of low-Global Warming Potential (GWP) refrigerants, and limitations on the use of high-GWP refrigerants in new refrigeration and air-conditioning equipment.

### **Assembly Bill 1504 (AB 1504) (Skinner, Chapter 534, Statutes of 2010): Forest resources: carbon sequestration**

- Requires the Board of Forestry and Fire Protection to adopt district forest practice rules and regulations in accordance with specified policies to, among other things, assure the continuous growing and harvesting of commercial forest tree species.
- Requires the Board of Forestry and Fire Protection to ensure that its rules and regulations that govern the harvesting of commercial forest tree species consider the capacity of forest resources to sequester carbon dioxide emissions sufficient to meet or exceed the sequestration target of 5 million metric tons of carbon dioxide annually, as established in the first AB 32 Climate Change Scoping Plan.

<sup>5</sup> Senate Bill No.1383. [leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill\\_id=201520160SB1383](http://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201520160SB1383)

## **Senate Bill 1386 (SB 1386) (Wolk, Chapter 545, Statutes of 2016): Resource conservation, natural and working lands**

- Declares it the policy of the State that protection and management of natural and working lands, as defined, is an important strategy in meeting the State's GHG reduction goals.
- Requires State agencies to consider protection and management of natural and working lands in establishing policies and grant criteria, and in making expenditures, and "implement this requirement in conjunction with the State's other strategies to meet its greenhouse gas emissions reduction goals."

## **Assembly Bill 398 (AB 398) (E. Garcia, Chapter 135, Statutes of 2017): California Global Warming Solutions Act of 2006: market-based compliance mechanisms: fire prevention fees: sales and use tax manufacturing exemption**

- Clarifies the role of the State's Cap-and-Trade Program from January 1, 2021, through December 31, 2030, continuing elements of the current program, but requiring CARB to make some post-2020 refinements.
- Establishes a Compliance Offsets Protocol Task Force to provide guidance to CARB in approving new offset protocols that increase projects with direct, in-state environmental benefits.
- Establishes the Independent Emissions Market Advisory Committee to report annually on the environmental and economic performance of the Cap-and-Trade Program and other climate policies.
- Identifies legislative priorities for allocating auction revenue proceeds, to include but not be limited to: air toxic and criteria air pollutants from stationary and mobile sources; low- and zero-carbon transportation alternatives; sustainable agricultural practices that promote transition to clean technology, water efficiency, and improved air quality; healthy forests and urban greening; short-lived climate pollutants; climate adaptation and resiliency; and climate and clean energy research.

In addition, AB 398 requires CARB to designate the Cap-and-Trade Program as the mechanism for reducing GHG emissions from petroleum refineries and oil and gas production facilities in this update to the Scoping Plan. With respect to local air districts, AB 398 states that it does not limit or expand the district's existing authority, including the authority to regulate criteria pollutants and toxic air contaminants, except that it prohibits an air district from adopting or implementing a rule for the specific purpose of reducing emissions of carbon dioxide from stationary sources that are subject to the Cap-and-Trade Program.

## **Assembly Bill 617 (AB 617) (C. Garcia, Chapter 136, Statutes of 2017): Nonvehicular air pollution: criteria air pollutants and toxic air contaminants.**

This bill was passed as a companion to AB 398 (E. Garcia, 2017) to strengthen air quality monitoring and reduce air pollution at a community level, in communities affected by a high cumulative burden of exposure to pollution. CARB is required to prepare a monitoring plan by October 1, 2018, that assesses the State's current air monitoring network with recommendations for a set of high-priority locations around the State to deploy community focused air monitoring systems. Local air districts must deploy air monitoring systems in the selected high priority locations by July 1, 2019. Thereafter, CARB will evaluate and select additional locations for community air monitoring on an annual basis. The air districts must also deploy air monitoring systems within one year of CARB's selection of the high-priority locations. In addition to the monitoring plan, the bill requires CARB to develop a statewide strategy to reduce criteria pollutants and toxic air contaminants (TACs) in communities affected by high cumulative exposure burdens through approved community emissions reduction programs developed by local air districts, in partnership with residents in the affected communities; requires CARB to establish a uniform system of annual reporting of criteria pollutants and TACs for the existing statewide air monitoring network; and expedites implementation of best available retrofit control technology in non-attainment areas.

Tables summarizing the legislation described in this section, along with other climate related legislation and programs are included in Appendix H and organized by sector.

## Initial Scoping Plan and First Update to the Scoping Plan

The Initial Scoping Plan<sup>6</sup> in 2008 presented the first economy-wide approach to reducing emissions and highlighted the value of combining both carbon pricing with other complementary programs to meet California's 2020 GHG emissions target while ensuring progress in all sectors. The coordinated set of policies in the Initial Scoping Plan employed strategies tailored to specific needs, including market-based compliance mechanisms, performance standards, technology requirements, and voluntary reductions. The Initial Scoping Plan also described a conceptual design for a cap-and-trade program that included eventual linkage to other cap-and-trade programs to form a larger regional trading program.

AB 32 requires CARB to update the scoping plan at least every five years. The First Update to the Scoping Plan<sup>7</sup> (First Update), approved in 2014, presented an update on the program and its progress toward meeting the 2020 limit. It also developed the first vision for long-term progress beyond 2020. In doing so, the First Update laid the groundwork for the goals set forth in Executive Orders S-3-05<sup>8</sup> and B-16-2012<sup>9</sup>. It also identified the need for a 2030 mid-term target to establish a continuum of actions to maintain and continue reductions, rather than only focusing on targets for 2020 or 2050.

## Building on California's Environmental Legacy

California's successful climate policies and programs have already delivered emissions reductions resulting from cleaner, more fuel-efficient cars and zero emission vehicles (ZEVs), low carbon fuels, increased renewable energy, and greater waste diversion from landfills; water conservation; improved forest management; and improved energy efficiency of homes and businesses. Beyond GHG reductions, these policies and programs also provide an array of benefits including improved public health, green jobs, and more clean energy choices. The 2030 GHG emissions reduction target in SB 32 will ensure that the State maintains this momentum beyond 2020, mindful of the State's population growth and needs. This Scoping Plan identifies a path to simultaneously make progress on the State's climate goals as well as complement other efforts such as the State Implementation Plans (SIPs) and community emissions reduction programs to help improve air quality in all parts of the State.

California's future climate strategy will require continued contributions from all sectors of the economy, including enhanced focus on zero- and near-zero emission (ZE/NZE) vehicle technologies; continued investment in renewables, such as solar roofs, wind, and other types of distributed generation; greater use of low carbon fuels; integrated land conservation and development strategies; coordinated efforts to reduce emissions of short-lived climate pollutants (methane, black carbon, and fluorinated gases); and an increased focus on integrated land use planning to support livable, transit-connected communities and conservation of agricultural and other lands. Requirements for GHG reductions at stationary sources complement efforts of local air pollution control and air quality management districts (air districts) to tighten criteria and toxics air pollution emission limits on a broad spectrum of industrial sources, including in disadvantaged communities historically located adjacent to large stationary sources. Finally, meeting the State's climate, public health, and environmental goals will entail understanding, quantifying, and addressing emissions impacts from land use decisions at all governmental levels.

## Purpose of the 2017 Scoping Plan

This Scoping Plan incorporates, coordinates, and leverages many existing and ongoing efforts and identifies new policies and actions to accomplish the State's climate goals. Chapter 2 of this document includes a description of a suite of specific actions to meet the State's 2030 GHG limit. In addition, Chapter 4 provides a broader description of the many actions and proposals being explored across the sectors, including the natural resources sector, to achieve the State's mid and long-term climate goals.

Guided by legislative direction, the actions identified in this Scoping Plan reduce overall GHG emissions in California and deliver policy signals that will continue to drive investment and certainty in a low carbon

8 [www.gov.ca.gov/news.php?id=1861](http://www.gov.ca.gov/news.php?id=1861)

9 [www.gov.ca.gov/news.php?id=17472](http://www.gov.ca.gov/news.php?id=17472)

economy. This Scoping Plan builds upon the successful framework established by the Initial Scoping Plan and First Update, while identifying new, technologically feasible, and cost-effective strategies to ensure that California meets its GHG reduction targets in a way that promotes and rewards innovation, continues to foster economic growth, and delivers improvements to the environment and public health, including in disadvantaged communities. The Plan includes policies to require direct GHG reductions at some of the State's largest stationary sources and mobile sources. These policies include the use of lower GHG fuels, efficiency regulations, and the Cap-and-Trade Program, which constrains and reduces emissions at covered sources.

## Process for Developing the 2017 Scoping Plan

This Scoping Plan was developed in coordination with State agencies, through engagement with the Legislature, and with open and transparent opportunities for stakeholders and the public to engage in workshops and other meetings. Development also included careful consideration of, and coordination with, other State agency plans and regulations, including the Cap-and-Trade Program, Low Carbon Fuel Standard (LCFS), State Implementation Plan, California Sustainable Freight Action Plan, California Transportation Plan 2040, Forest Carbon Plan, and the Short-Lived Climate Pollutant Strategy, among others.

To inform this Scoping Plan, CARB, in collaboration with the Governor's Office and other State agencies, solicited comments and feedback from affected stakeholders, including the public, and the Environmental Justice Advisory Committee (EJAC or Committee). The process to update the 2017 Scoping Plan began with the Governor's Office Pillar Symposia, which included over a dozen public workshops, and featured a series of Committee and environmental justice community meetings.<sup>10</sup>

One key message conveyed to CARB during engagement with the legislature, EJAC, and environmental justice communities was the need to emphasize reductions at large stationary sources, with a particular focus on multi-pollutant strategies for these sources to reduce GHGs and harmful criteria and toxic air pollutants that result in localized health impacts, especially in disadvantaged communities. Other consistent feedback for CARB included the need for built and natural infrastructure improvements that enhance quality of life, increase access to safe and viable transportation options, and improve physical activity and related health outcomes.

## Updated Climate Science Supports the Need for More Action

Climate scientists agree that global warming and other shifts in the climate system observed over the past century are caused by human activities. These recorded changes are occurring at an unprecedented rate.<sup>11</sup> According to new research, unabated GHG emissions could allow sea levels to rise up to ten feet by the end of this century—an outcome that could devastate coastal communities in California and around the world.<sup>12</sup>

California is already feeling the effects of climate change, and projections show that these effects will continue and worsen over the coming centuries. The impacts of climate change have been documented by the Office of Environmental Health Hazard Assessment (OEHHA) in the Indicators of Climate Change Report, which details the following changes that are occurring already:<sup>13</sup>

- A recorded increase in annual average temperatures, as well as increases in daily minimum and maximum temperatures.
- An increase in the occurrence of extreme events, including wildfire and heat waves.
- A reduction in spring runoff volumes, as a result of declining snowpack.
- A decrease in winter chill hours, necessary for the production of high-value fruit and nut crops.
- Changes in the timing and location of species sightings, including migration upslope of flora and fauna, and earlier appearance of Central Valley butterflies.

<sup>13</sup> Office of Environmental Health Hazard Assessment, Indicators of Climate Change (website): [oehha.ca.gov/climate-change/document/indicators-climate-change-california](http://oehha.ca.gov/climate-change/document/indicators-climate-change-california)

In addition to these trends, the State's current conditions point to a changing climate. California's recent historic drought incited land subsidence, pest invasions that killed over 100 million trees, and water shortages throughout the State. Recent scientific studies show that such extreme drought conditions are more likely to occur under a changing climate.<sup>14,15</sup> The total statewide economic cost of the 2013–2014 drought was estimated at \$2.2 billion, with a total loss of 17,100 jobs.<sup>16</sup> In the Central Valley, the drought cost California agriculture about \$2.7 billion and more than 20,000 jobs in 2015, which highlights the critical need for developing drought resilience.<sup>17</sup> Drought affects other sectors as well. An analysis of the amount of water consumed in meeting California's energy needs between 1990 and 2012 shows that while California's energy policies have supported climate mitigation efforts, the performance of these policies have increased vulnerability to climate impacts, especially greater hydrologic uncertainty.<sup>18</sup>

Several publications carefully examined the potential role of climate change in the recent California drought. One study examined both precipitation and runoff in the Sacramento and San Joaquin River basins, and found that 10 of the past 14 years between 2000 and 2014 have been below normal, and recent years have been the driest and hottest in the full instrumental record from 1895 through November 2014.<sup>19</sup> In another study, the authors show that the increasing co-occurrence of dry years with warm years raises the risk of drought, highlighting the critical role of elevated temperatures in altering water availability and increasing overall drought intensity and impact.<sup>20</sup> Generally, there is growing risk of unprecedented drought in the western United States driven primarily by rising temperatures, regardless of whether or not there is a clear precipitation trend.<sup>21</sup>

According to the U.S. Forest Service report, National Insect and Disease Forest Risk Assessment, 2013–2027,<sup>22</sup> California is at risk of losing 12 percent of the total area of forests and woodlands in the State due to insects and disease, or over 5.7 million acres. Some species are expected to lose significant amounts of their total basal area (e.g., whitebark pine is projected to lose 60 percent of its basal area; and lodgepole pine is projected to lose 40 percent). While future climate change is not modeled within the risk assessment, and current drought conditions are not accounted for in these estimates, the projected climate changes over a 15 year period (2013–2027) are expected to significantly increase the number of acres at risk, and will increase the risk from already highly destructive pests such as the mountain pine beetle. Extensive tree mortality is already prevalent in California. The western pine beetle and other bark beetles have killed a majority of the ponderosa pine in the foothills of the central and southern Sierra Nevada Mountains. A recent aerial survey by the U.S. Forest Service identified more than 100 million dead trees in California.<sup>23</sup> As there is usually a lag time between drought years and tree mortality, we are now beginning to see a sharp rise in mortality from the past four years of drought. In response to the very high levels of tree mortality, Governor Brown issued an Emergency Proclamation on October 30, 2015, that directed state agencies to identify and take action to reduce wildfire risk through the removal and use of the dead trees.

## CLIMATE IMPACTS AT THE COMMUNITY LEVEL

The California Energy Commission Cal-Adapt tool provides information about future climate conditions to help better understand how climate will impact local communities.

[cal-adapt.org](http://cal-adapt.org)

A warming climate also causes sea level to rise; first, by warming the oceans which causes the water to expand, and second, by melting land ice which transfers water to the ocean. Even if storms do not become more intense or frequent, sea level rise itself will magnify the adverse impact of any storm surge and high waves on the California coast. Some observational studies report that the largest waves are already getting higher and winds are getting stronger.<sup>24</sup> Further, as temperatures warm and GHG concentrations increase more carbon dioxide dissolves in the ocean, making it more acidic. More acidic ocean water affects a wide variety of marine species, including species that people rely on for food. Recent projections indicate that if no significant GHG mitigation efforts are taken, the San Francisco Bay Area may experience sea level rise between 1.6 to 3.4 feet, and in an extreme scenario involving the rapid loss of the Antarctic ice sheet, sea levels along California's coastline could rise up to 10 feet by 2100.<sup>25</sup> This change is likely to have substantial ecological and economic consequences in California and worldwide.<sup>26</sup>

While more intense dry periods are anticipated under warmer conditions, extremes on the wet end of the spectrum are also expected to increase due to more frequent warm, wet atmospheric river events and a higher proportion of precipitation falling as rain instead of snow. In recent years, atmospheric rivers have also been recognized as the cause of the large majority of major floods in rivers

all along the U.S. West Coast and as the source of 30-50 percent of all precipitation in the same region.<sup>27</sup> These extreme precipitation events, together with the rising snowline, often cause devastating floods in major river basins (e.g., California's Russian River). It was estimated that the top 50 observed floods in the U.S. Pacific Northwest were due to atmospheric rivers.<sup>28</sup> Looking ahead, the frequency and severity of atmospheric rivers on the U.S. West Coast will increase due to higher atmospheric water vapor that occurs with rising temperature, leading to more frequent flooding.<sup>29, 30</sup>

Climate change can drive extreme weather events such as coastal storm surges, drought, wildfires, floods, and heat waves, and disrupt environmental systems including our forests and oceans. As GHG emissions continue to accumulate and climate disruption grows, such destructive events will become more frequent. Several recent studies project increased precipitation within hurricanes over ocean regions.<sup>31, 32</sup> The primary physical mechanism for this increase is higher water vapor in the warmer atmosphere, which enhances moisture convergence in a storm for a given circulation strength. Since hurricanes are responsible for many of the most extreme precipitation events, such events are likely to become more extreme. Anthropogenic warming by

the end of the 21<sup>st</sup> century will likely cause tropical cyclones globally to become more intense on average. This change implies an even larger percentage increase in the destructive potential per storm, assuming no changes in storm size.<sup>33,34</sup> Thus, the historical record, which once set our expectations for the traditional range of weather and other natural events, is becoming an increasingly unreliable predictor of the conditions we will face in the future. Consequently, the best available science must drive effective climate policy.

California is committed to further supporting new research on ways to mitigate climate change and how to understand its ongoing and projected impacts. California's Fourth Climate Change Assessment and Indicators of Change Report will further update our understanding of the many impacts from climate change in a way that directly informs State agencies' efforts to safeguard the State's people, economy, and environment.<sup>35, 36</sup>

Together, historical data, current conditions, and future projections provide a picture of California's changing climate, with two important messages:

- Change is already being experienced and documented across California, and some of these changes have been directly linked to changing climatic conditions.
- Even with the uncertainty in future climate conditions, every scenario estimates further change in future conditions.

It is critical that California continue to take steps to reduce GHG emissions in order to avoid the worst of the projected impacts of climate change. At the same time, the State is taking steps to make the State more resilient to ongoing and projected climate impacts as laid out by the Safeguarding California Plan.<sup>37</sup> The Safeguarding California Plan is being updated in 2017 to present new policy recommendations and provide a roadmap of all the actions and next steps that state government is taking to adapt to the ongoing and inevitable effects of climate change. The Draft Safeguarding California Plan<sup>38</sup> is available and will be finalized after workshops and public comments. California's continuing efforts are vital steps toward minimizing the impact of GHG emissions and a three-pronged approach of reducing emissions, preparing for impacts, and conducting cutting-edge research can serve as a model for action.

## California's Greenhouse Gas Emissions and the 2030 Target

---

### Progress Toward Achieving the 2020 Limit

AB 32 directs CARB to develop and track GHG emissions and progress toward the 2020 statewide GHG target. California is on track to achieve the target while also reducing criteria pollutants and toxic air contaminants and supporting economic growth. As shown in Figure 1, in 2015, total GHG emissions decreased by 1.5 MMTCO<sub>2</sub>e compared to 2014, representing an overall decrease of 10 percent since peak levels in 2004. The 2015 GHG Emission Inventory and a description of the methodology updates can be accessed at: [www.arb.ca.gov/cc/inventory/inventory.htm](http://www.arb.ca.gov/cc/inventory/inventory.htm).

Per California Health and Safety Code section 38505, CARB monitors and regulates seven GHGs to reduce emissions: carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), sulfur hexafluoride (SF<sub>6</sub>), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and nitrogen trifluoride (NF<sub>3</sub>). The fluorinated gases are also referred to as "high global warming potential gases" (high-GWP gases). California's annual statewide GHG emission inventory has historically been the primary tool for tracking GHG emissions trends. Figure 1 provides the GHG inventory trend. Additional information on the methodology for the GHG inventory can also be found at: [www.arb.ca.gov/cc/inventory/data/data.htm](http://www.arb.ca.gov/cc/inventory/data/data.htm).

38 <http://resources.ca.gov/climate/safeguarding/>

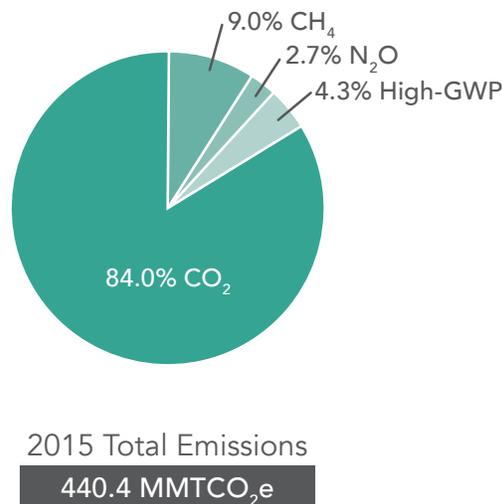

**FIGURE 1: CALIFORNIA GHG INVENTORY TREND**

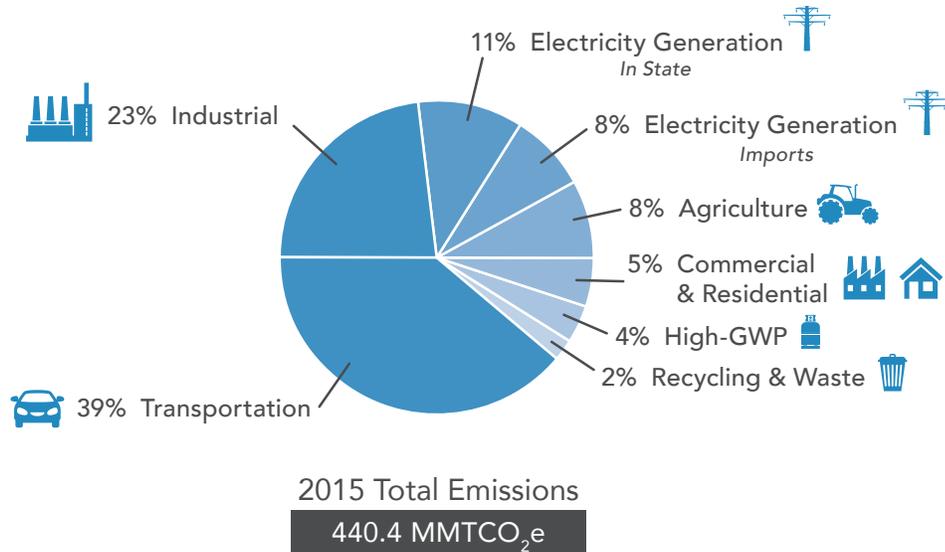

Carbon dioxide is the primary GHG emitted in California, accounting for 84 percent of total GHG emissions in 2015, as shown in Figure 2 below. Figure 3 illustrates that transportation, primarily on-road travel, is the single largest source of CO<sub>2</sub> emissions in the State. Upstream transportation emissions from the refinery and oil and gas sectors are categorized as CO<sub>2</sub> emissions from industrial sources and constitute about 50 percent of the industrial source emissions. When these emissions sources are attributed to the transportation sector, the emissions from that sector amount to approximately half of statewide GHG emissions. In addition to transportation, electricity production, and industrial and residential sources also are important contributors to CO<sub>2</sub> emissions.

Figures 2 and 3 show State GHG emission contributions by GHG and sector based on the 2015 GHG Emission Inventory.

**FIGURE 2: EMISSIONS BY GHG**

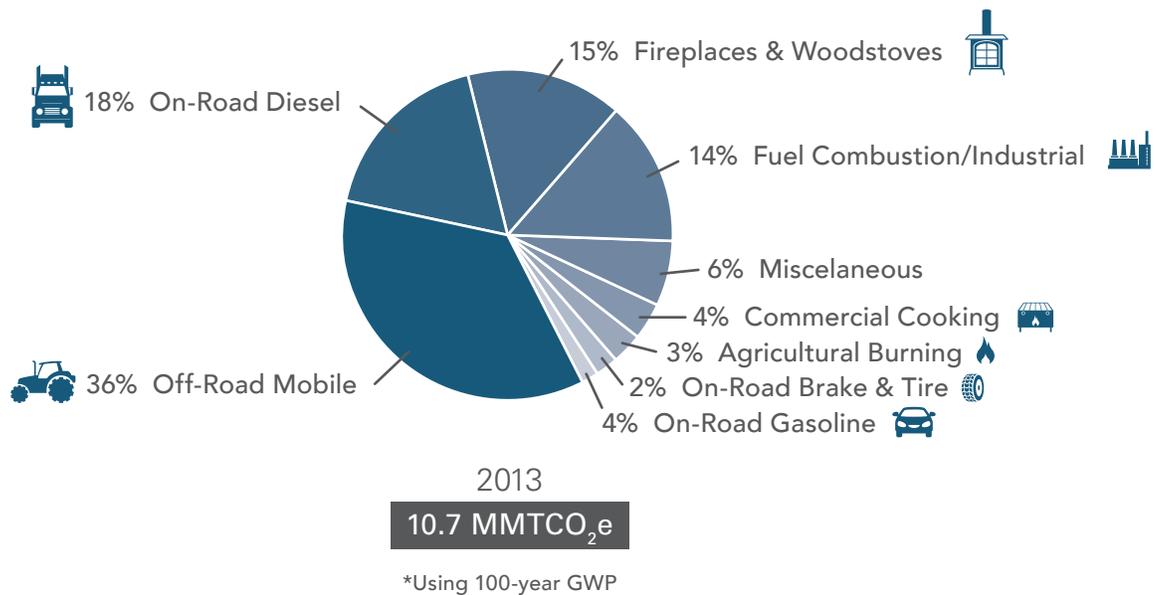

**FIGURE 3: EMISSIONS BY SECTOR**

In addition, CARB has developed a statewide emission inventory for black carbon in support of the SLCP Strategy, which is reported in two categories: non-forestry (anthropogenic) sources and forestry sources.<sup>39</sup> The black carbon inventory will help support implementation of the SLCP Strategy, but is not part of the State’s GHG Inventory that tracks progress towards the State’s climate targets. The State’s major anthropogenic sources of black carbon include off-road transportation, on-road transportation, residential wood burning, fuel combustion, and industrial processes (Figure 4). The forestry category includes non-agricultural prescribed burning and wildfire emissions.

**FIGURE 4: CALIFORNIA 2013 ANTHROPOGENIC BLACK CARBON EMISSION SOURCES\***

The exchange of CO<sub>2</sub> between the atmosphere and California’s natural and working lands sector is currently unquantified and therefore, excluded from the State’s GHG Inventory. A natural and working lands carbon inventory is essential for monitoring land-based activities that may increase or decrease carbon sequestration over time. CARB staff is working to develop a comprehensive inventory of GHG fluxes from all of California’s

<sup>39</sup> Per SB 1383, the SLCP Strategy only addresses anthropogenic black carbon.

natural and working lands using the Intergovernmental Panel on Climate Change (IPCC) design principles. CARB released the Natural and Working Lands Inventory with the 2030 Target Scoping Plan Update Discussion Draft.<sup>40</sup> This inventory provides an estimate of GHG emissions reductions and changes in carbon stock from some carbon pools in agricultural and natural and working lands. The CARB Natural and Working Lands Inventory includes an inventory of carbon stocks, stock-change (and by extension GHG flux associated with stock-change) with some attribution by disturbance process for the analysis period 2001-2010. Disturbance processes include activities such as conversion from one land category to a different category, fire, and harvest. The CARB Natural and Working Lands Inventory covers varieties of forests and woodlands, grasslands, and wetlands (biomass-stock-change only). The Inventory includes default carbon densities for croplands and urban/developed lands to facilitate stock-change estimation for natural lands that convert to cropland, natural lands that convert to developed lands, and for croplands that convert to developed lands.

## Greenhouse Gas Emissions Tracking

As described above, California maintains an economy-wide GHG inventory for the State that is consistent with IPCC practices to allow for comparison of statewide GHG emissions with those at the national level and with other international GHG inventories. Statewide GHG emissions calculations use many data sources, including data from other State and federal agencies. However, the primary source of data comes from reports submitted to CARB through the Regulation for the Mandatory Reporting of GHG Emissions (MRR). MRR requires facilities and entities with more than 10,000 metric tons of carbon dioxide equivalent (MTCO<sub>2</sub>e) of combustion and process emissions, all facilities belonging to certain industries, and all electric power entities to submit an annual GHG emissions data report directly to CARB. Reports from facilities and entities that emit more than 25,000 MTCO<sub>2</sub>e are verified by a CARB-accredited third-party verification body. More information on MRR emissions reports can be found at: [www.arb.ca.gov/cc/reporting/ghg-rep/reported-data/ghg-reports.htm](http://www.arb.ca.gov/cc/reporting/ghg-rep/reported-data/ghg-reports.htm).

All data sources used to develop the GHG Emission Inventory are listed in inventory supporting documentation at: [www.arb.ca.gov/cc/inventory/data/data.htm](http://www.arb.ca.gov/cc/inventory/data/data.htm).

Other State agencies, nonprofit organizations, and research institutions are developing and testing methodologies and models to quantify GHG fluxes from California's natural and working lands. CARB's ongoing work on the Natural and Working Lands Inventory will serve as one source of data to gauge the scope of GHG reduction potential from California's natural and working lands and monitor progress over time. CARB will evaluate other data sources and methodologies to validate or support the CARB inventory or project-scale tracking. Interagency work is also underway to integrate and account for the land use and management impacts of development, transportation, housing, and energy policies.

Greenhouse gas mitigation action may cross geographic borders as part of international and subnational collaboration, or as a natural result of implementation of regional policies. In addition to the State's existing GHG inventory, CARB has begun exploring how to build an accounting framework that also utilizes existing program data to better reflect the broader benefits of our policies that may be happening outside of the State. For GHG reductions outside of the State to be attributed to our programs, those reductions must be real and quantifiable, without any double counting, including claims to those reductions by other jurisdictions. CARB is collaborating with other jurisdictions to ensure GHG accounting rules are consistent with international best practices. Robust accounting rules will instill confidence in the reductions claimed and maintain support for joint action across jurisdictions. Consistency and transparency are critical as we work together with other jurisdictions on our parallel paths to achieve our GHG targets.

## California's Approach to Addressing Climate Change

---

### Integrated Systems

The State's climate goals require a comprehensive approach that integrates and builds upon multiple ongoing State efforts. As we address future mobility, we identify how existing efforts – such as the California Sustainable Freight Action Plan, Mobile Source Strategy, California Transportation Plan 2040, High-Speed

<sup>40</sup> CARB. 2016. California Greenhouse Gas Inventory - Forests and Other Lands. [www.arb.ca.gov/cc/inventory/sectors/forest/forest.htm](http://www.arb.ca.gov/cc/inventory/sectors/forest/forest.htm)

Rail,<sup>41</sup> urban planning, housing, and goals for enhancement of the natural environment – can complement each other while providing multiple environmental benefits, including air quality and climate benefits. The collective consideration of these efforts illuminates the synergies and conflicts between policies. For example, land disturbance due to increased renewables through utility scale wind and solar and transmission can release GHGs from soil and disturb grasslands and rangelands that have the potential to sequester carbon. Further, policies that support sustainable land use not only reduce vehicle miles traveled (VMT) and its related emissions, but may also avoid land disturbance that could result in GHG emissions or loss of sequestration potential in the natural environment. Identifying these types of trade-offs, and designing policies and implementation strategies to support goals across all sectors, will require ongoing efforts at the local, regional, and State level to ensure that sustainable action across both the built and natural environments help to achieve the State’s long-term climate goals.

## Promoting Resilient Economic Growth

California’s strategic vision for achieving at least a 40 percent reduction in GHG emissions by 2030 is based on the principle that economic prosperity and environmental sustainability can be achieved together. Policies, strategies, plans and regulations to reduce GHG emissions help California businesses compete in a global economy and spur new investments, business creation, and jobs to support a clean energy economy. California’s portfolio-based climate strategy can achieve great success when accompanied by consistent and rigorous GHG monitoring and reporting, a robust public process, and an effective enforcement program for the few that attempt to evade rules. The transition to a low-carbon future can strengthen California’s economy and infrastructure and produce other important environmental benefits such as reductions in criteria pollutants and toxic air contaminants, especially in California’s most vulnerable communities.

Actions that are presented in this Scoping Plan provide economic opportunities for the future, but progress toward our goals is already evident today. For example, in 2015, California added more than 20,000 new jobs in the solar sector. This was more than half of the new jobs in this industry across the nation. Employment in the clean economy grew by 20 percent between 2002 and 2012, which included the period of economic recession around 2008.<sup>42</sup> Shifting to clean, local, and efficient uses of energy reinvests our energy expenditures in our local economies and reduces risks to our statewide economy associated with exposure to volatile global and national oil and gas commodity prices. Indeed, a clean economy is a resilient economy.

Successfully driving economic transition will require cleaner and more efficient technologies, policies and incentives that recognize and reward innovation, and prioritizing low carbon investments. Enacting policies and incentives at multiple jurisdictional levels further ensures the advancement of land use and natural resource management objectives for GHG mitigation, climate adaptation, and other co-benefits. Intentional synergistic linkages between technological advances and resource stewardship can result in sustainable development. The development and implementation of Sustainable Communities Strategies (SCSs) pursuant to Senate Bill (SB) 375, which link transportation, housing, and climate policy, are designed to reduce per capita GHG emissions while improving air quality and expanding transportation and housing options. This Scoping Plan identifies additional ways, beyond SB 375, to promote the technologies and infrastructure required to meet our collective climate goals, while also presenting the vision for California’s continuing efforts to foster a sustainable, clean energy economy.

## Increasing Carbon Sequestration in Natural and Working Lands

California’s natural and working lands make the State a global leader in agriculture, a U.S. leader in forest products, and a global biodiversity hotspot. These lands support clean air, wildlife and pollinator habitat, rural economies, and are critical components of California’s water infrastructure. Keeping these lands and waters intact and at high levels of ecological function (including resilient carbon sequestration) is necessary for the well-being and security of Californians in 2030, 2050, and beyond. Forests, rangelands, farms,

---

41 California’s High-Speed Rail is part of the International Union of Railways (UIC) and California signed the Railway Climate Responsibility Pledge, which was commended by the Secretary of the UN Framework Convention on Climate Change as part of achieving global 2050 targets.

42 California Business Alliance for a Clean Economy. 2015. Clean Energy and Climate Change Summary of Recent Analyses for California. [clean-economy.org/wp-content/uploads/2015/01/Clean-Energy-Climate-Change-Analyses\\_January2015.pdf](http://clean-economy.org/wp-content/uploads/2015/01/Clean-Energy-Climate-Change-Analyses_January2015.pdf)

wetlands, riparian areas, deserts, coastal areas, and the ocean store substantial carbon in biomass and soils. Natural and working lands are a key sector in the State's climate change strategy. Storing carbon in trees, other vegetation, soils, and aquatic sediment is an effective way to remove carbon dioxide from the atmosphere. This Scoping Plan describes policies and programs that prioritize protection and enhancement of California's landscapes, including urban landscapes, and identifies next steps to ensure management actions are taken to increase the sequestration potential of those resources. We cannot ignore the relationships between energy, transportation, and natural working lands sectors or the adverse impacts that climate change is having on the environment itself. We must consider important trade-offs in developing the State's climate strategy by understanding the near and long-term impacts of various policy scenarios and actions on our State and local communities.

## Improving Public Health

The State's drive to improve air quality and promote community health and well-being as we address climate change remains a priority, as it has for almost 50 years. The State is committed to addressing public health issues, including addressing chronic and infectious diseases, promoting mental health, and protecting communities from exposure to harmful air pollutants and toxins. Several of the strategies included in this Plan were primarily developed to help California achieve federal and State ambient air quality standards for air pollutants with direct health impacts, but they will also deliver GHG reductions. Likewise, some climate strategies, such as GHG reduction measures that decrease diesel combustion from mobile sources, produce air quality co-benefits in the form of concurrent reductions in criteria pollutants and toxic air contaminants.

Climate change itself is already affecting the health of our communities and is exacerbating existing health inequities. Those facing the greatest health burdens include low-income individuals and households, the very young and the very old, communities of color, and those who have been marginalized or discriminated against based on gender or race/ethnicity.<sup>43</sup> Economic factors, such as income, poverty, and wealth, are among the strongest determinants of health. Addressing climate change presents an important opportunity to improve public health for all of California's residents and to further our work toward making our State the healthiest in the nation.

The major provisions of AB 617 (C. Garcia, 2017), to be completed by 2020, will ensure that as the State seeks to advance climate policy to meet the 2030 target, we will also act locally to improve neighborhood air quality. AB 617 requires strengthening and expanding community level air monitoring; expediting equipment retrofits at large industrial sources that are located in areas that are in nonattainment for the federal and State ambient air quality standards; requiring development of a statewide strategy to further reduce criteria pollutants and toxic air contaminants in communities faced with high cumulative exposure levels; and local air district-developed community emissions reductions plans that identify emissions reductions targets, measures, implementation schedules, and enforcement plans for these affected communities. By identifying and addressing the disproportionate impacts felt today and by planning, designing, and implementing actions for a sustainable future that considers both climate and air quality objectives, we can be part of the solution to make public health inequities an issue of the past.

## Environmental Justice

Fair and equitable climate action requires addressing the inequities that create and intensify community vulnerabilities. The capacity for resilience in the face of climate change is driven by living conditions and the forces that shape them. These include, but are not limited to, access to services such as health care, healthy foods, air and water, and safe spaces for physical activity; income; education; housing; transportation; environmental quality; and good health status. Strategies to alleviate poverty, increase access to economic opportunities, improve living conditions, and reduce health and social inequities will result in more climate-resilient communities. The transition to a low carbon California economy provides an opportunity to not only reduce GHG emissions, but also to reduce emissions of criteria pollutants and air toxins, and to create a healthier environment for all of California's residents, especially those living in the State's most disadvantaged communities. Policies designed to facilitate this transition and state-wide, regional, and local reductions,

<sup>43</sup> California Department of Public Health (CDPH). 2015. The Portrait of Promise: The California Statewide Draft Plan to Promote Health and Mental Health Equity. A Report to the Legislature and the People of California by the Office of Health Equity. Sacramento, CA: California Department of Public Health, Office of Health Equity.

must also be appropriately tailored to address the unique characteristics of economically distressed communities throughout the State's diverse geographic regions, including both rural and highly-urbanized areas. Equity considerations must likewise be part of the deliberate and thoughtful process in the design and implementation of all policies and measures included in the Scoping Plan. And CARB must ensure that its ongoing engagement with environmental justice communities will continue beyond the development of the Scoping Plan and be included in all aspects of its various air pollution programs. Additional detail on CARB's efforts to achieve these goals is provided in Chapter 5.

It is critical that communities of color, low-income communities, or both, receive the benefits of the cleaner economy growing in California, including its environmental and economic benefits. Currently, low-income customers enrolled in the California Alternate Rates for Energy (CARE) Program or the Family Electric Rate Assistance (FERA) Program are also eligible to receive a rebate under the California Climate Credit, or a credit on residential and small business electricity bills resulting from the sale of allowances received by investor-owned utilities as part of the Cap-and-Trade Program. SB 1018 (Committee on Budget and Fiscal Review, Chapter 39, Statutes of 2012) and other implementing legislation requires that Cap-and-Trade Program auction monies deposited into the Greenhouse Gas Reduction Fund (GGRF) be used to further the purposes of AB 32 and facilitate reduction of GHG emissions. Investments made with these funds not only reduce GHG emissions, but also provide other environmental, health, and economic benefits including, fostering job creation by promoting in-state GHG emissions reduction projects carried out by California workers and businesses.

Further, SB 535 (De Leon, Chapter 830, Statutes of 2012) and AB 1550 (Gomez, Chapter 369, Statutes of 2016) direct State and local agencies to make significant investments using GGRF monies to assist California's most vulnerable communities. Under SB 535 (de León, Chapter 830, Statutes of 2012), a minimum of 25 percent of the total investments were required to benefit disadvantaged communities; of that, a minimum of 10 percent were required to be located within and provide benefits to those communities. Based on cumulative data reported by agencies as of March 2016, the State is exceeding these targets. Indeed, 50 percent of the \$1.2 billion dollars spent on California Climate Investments projects provided benefits to disadvantaged communities; and 34 percent of this funding was used on projects located directly in disadvantaged communities.<sup>44</sup>

## Environmental Justice Advisory Committee

AB 32 calls for CARB to convene an Environmental Justice Advisory Committee (EJAC), to advise the Board in developing the Scoping Plan, and any other pertinent matter in implementing AB 32. It requires that the Committee be comprised of representatives from communities in the State with the most significant exposure to air pollution, including, but not limited to, communities with minority populations or low-income

populations, or both. CARB consulted 13 environmental justice and disadvantaged community representatives for the 2017 Scoping Plan process, starting with the first Committee meeting in December 2015. In February and April 2017, members of the California Air Resources Board held joint public meetings with the EJAC to discuss options for addressing environmental justice and disadvantaged community concerns in the Scoping Plan. The full schedule of Committee meetings and meeting materials is available on CARB's website.<sup>45</sup>

Starting in July 2016, the Committee hosted a robust community engagement process, conducting 19 community meetings throughout the State. To enhance this community engagement, CARB staff coordinated with staff from local government agencies and sister State agencies. At the community meetings, staff from State and local agencies participated in extensive, topic-specific "world café" discussions with local groups and individuals. The extensive dialogue between the EJAC, State agencies, and local agencies provided community residents the opportunity to share concerns and provide input on ways California can meet its 2030 GHG target while addressing a number of environmental and equity issues.

## Environmental Justice Advisory Committee Recommendations

The Committee's recommendations for the Scoping Plan were informed by comments received at community meetings described above and Committee member expertise. Recommendations were provided for the sector focus areas, overarching environmental justice policy, and California Climate Investments. The Committee also sorted their recommendations into five themes: partnership with environmental justice communities, equity, economic opportunity, coordination, and long-term vision. Finally, the Committee provided direction that their recommendations are intended "to be read and implemented holistically and not independently of each other." The EJAC's recommendations, in their entirety, are included in Appendix A and available at [www.arb.ca.gov/cc/ejac/meetings/04262017/ejac-sp-recommendations033017.pdf](http://www.arb.ca.gov/cc/ejac/meetings/04262017/ejac-sp-recommendations033017.pdf).

The Committee's overarching recommendations for partnership with environmental justice communities, equity, coordination, economic opportunity, and long-term vision include the following recommendations:

- Encourage long-term community engagement, a culture shift in California, and neighborhood-level solutions to promote the implementation of the State's climate plans, using strategies identified by the Committee.
- Improve the balance of reducing GHGs and compliance costs with other AB 32 goals of improving air quality in environmental justice communities while maximizing benefits for all Californians.
- Consider public health impacts and equity when examining issues in any sector and have CARB conduct an equity analysis on the Scoping Plan and each sector, with guidance from the Committee.
- Develop metrics to ensure actions are meeting targets and develop contingency plans for mitigation and adjustment if emissions increases occur as programs are implemented.
- Develop a statewide community-based air monitoring network to support regulatory efforts and monitor neighborhood scale pollution in disadvantaged communities.
- Coordinate strategies between State, federal, and local agencies for strong, enforceable, evidence-based policies to prevent and address sprawl with equity at the center.
- Maximize the accessibility of safe jobs, incentives, and economic benefits for Californians and the development of a just transition for workers and communities in and around polluting industries.
- Prioritize improving air quality in environmental justice communities and analyze scenarios at a neighborhood scale for all California communities.
- Ensure that AB 32 economic reviewers come from various areas around the State to represent insights on economic challenges and opportunities from those regions.
- Do not limit the Scoping Plan to examining interventions and impacts until 2030, or even 2050. Plan and analyze on a longer-term scale to prevent short-sighted mistakes and reach the long-term vision, as actions today and for the next 30 years will have impacts for seven generations.
- The Scoping Plan must prioritize GHG reductions and investments in California environmental justice communities first, before other California communities; and the innovation of new technologies or strategies to reach even deeper emissions cuts, whenever possible.
- Convene the Committee beyond the Scoping Plan development process.

The Committee's key Energy sector recommendations include:

- Developing aggressive energy goals toward 100 percent renewable energy by 2030, including a vision for a clean energy economy, and prioritizing actions in disadvantaged communities.

---

<sup>45</sup> [www.arb.ca.gov/cc/ejac/ejac.htm](http://www.arb.ca.gov/cc/ejac/ejac.htm)

- Setting goals for green buildings.
- Enforcing GHG reduction targets for existing buildings, and providing upgrades that enable buildings to use renewable energy technologies and water capture.
- Prioritizing and supporting community-owned technologies, such as community-owned solar, for environmental justice communities.

Key Water sector recommendations include:

- Encouraging water conservation and recycling.
- Prioritizing safe drinking water for all.

The Committee's key Industry sector recommendations include:

- Prioritizing direct emissions reductions in environmental justice communities.
- Replacing the Cap-and-Trade Program with a carbon tax or fee and dividend program.
- Eliminating offsets and the allocation of free allowances if the Cap-and-Trade Program continues.
- Analyze where GHG emissions are increasing and identify strategies to prevent and reduce such emissions in environmental justice communities.
- Committing to reductions in petroleum use.

The Committee's key Transportation sector recommendations include:

- Increasing access to affordable, reliable, clean, and safe mobility options in disadvantaged communities.
- Community-engaged land use planning.
- Maximizing electrification.
- Restricting sprawl and examining transportation regionally.
- Considering the development of green transportation hubs that integrate urban greening with transportation options and implement the recommendations of the SB 350 studies.

The Committee's key Natural and Working Lands, Agriculture, and Waste sector recommendations include:

- Reducing waste and mandating that local jurisdictions manage the waste they create.
- Returning carbon to the soil.
- Not burning biomass or considering it a renewable resource.
- Supporting healthy soils as a critical element to land and waste management.
- Integrating urban forestry within local communities.
- Exploring ways to allow and streamline the process for cultural and prescribed burning for land management and to prevent large-scale wildfires.
- Including an annual reduction of 5 million metric tons of CO<sub>2</sub>e from natural and working lands.

The Committee's recommendations for California Climate Investments include:

- Ensuring near-term technologies do not adversely impact communities and long-term investments move toward zero emissions.
- Requiring GGRF projects to be transformative for disadvantaged communities as defined by each community.
- Eliminating funding for AB 32 regulated entities.
- Providing technical assistance to environmental justice communities so they can better access funding and resources.
- Prioritizing projects identified by communities and ensuring all applicants have policies to protect against displacement or gentrification.

In April 2017, EJAC members provided a refined list of priority changes for the Scoping Plan from the full list of EJAC recommendations. CARB staff responded to each priority recommendation, describing additions to the Scoping Plan or suggested next steps for recommendations beyond the level of detail in the Plan. Appendix A includes the Priority EJAC Recommendations with CARB Responses and full list of EJAC Recommendations.

More information about the Committee and its recommendations on the previous Scoping Plans and this Scoping Plan is located at: [www.arb.ca.gov/ejac](http://www.arb.ca.gov/ejac).

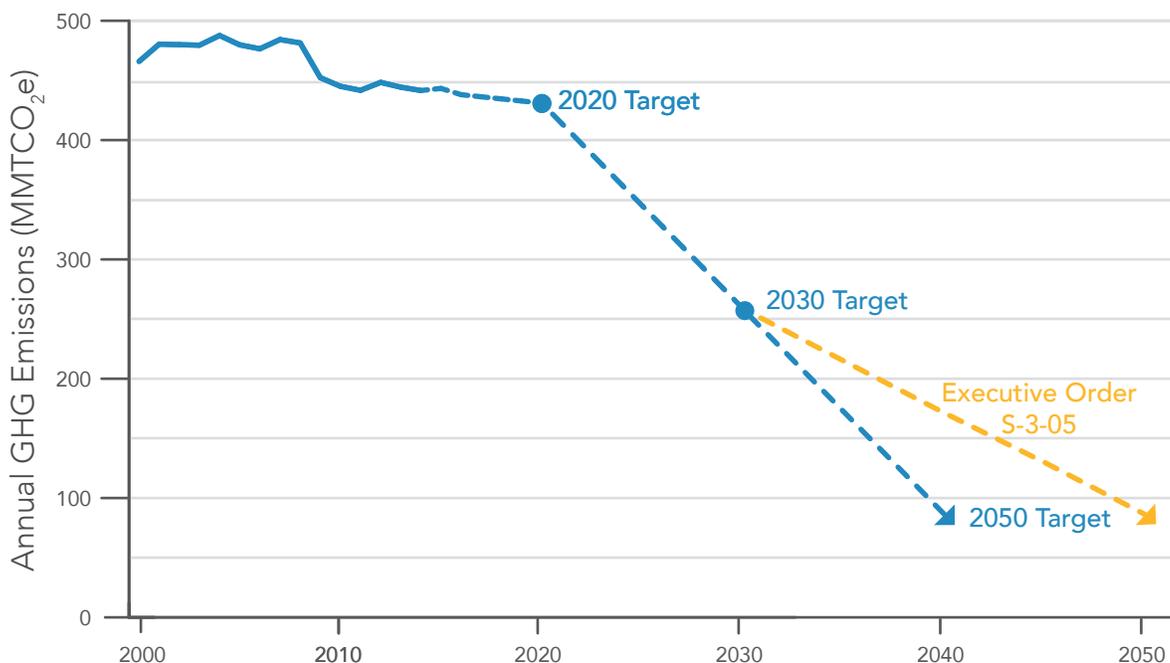

## Setting the Path to 2050

The State's 2020 and 2030 targets have not been set in isolation. They represent benchmarks, consistent with prevailing climate science, charting an appropriate trajectory forward that is in-line with California's role in stabilizing global warming below dangerous thresholds. As we consider efforts to reduce emissions to meet the State's near-term requirements, we must do so with an eye toward reductions needed beyond 2030, as well. The Paris Agreement – which calls for limiting global warming to well below 2 degrees Celsius and aiming to limit it below a 1.5 degrees Celsius – frames our path forward.

While the Scoping Plan charts the path to achieving the 2030 GHG emissions reduction target, we also need momentum to propel us to the 2050 statewide GHG target (80 percent below 1990 levels). In developing this Scoping Plan, we considered what policies are needed to meet our mid-term and long-term goals. For example, though Zero Net Carbon Buildings are not feasible at this time and more work needs to be done in this area, they will be necessary to achieve the 2050 target. To that end, work must begin now to review and evaluate research in this area, establish a planning horizon for targets, and identify implementation mechanisms. Concurrently, we must consider and implement policies that not only deliver critical reductions in 2030 and continue to help support the State's long-term climate objectives, but that also deliver other health, environmental and economic benefits. We should not just be planning to put 1.5 million ZEVs on the road by 2025 or 4.2 million on the road by 2030 – but rather, we should be comprehensively facilitating the market-wide transition to electric drive that we need to see materialize as soon as possible. This means that we need to be working towards making all fuels low carbon as quickly as possible, even as we incrementally ramp up volume requirements through the Low Carbon Fuel Standard. And it means that we need to support the broad array of actions and strategies identified in Chapter 4, and new ones that may emerge – to keep us on track to achieve deeper GHG reductions to protect the environment and our way of life. As with all investments, the approach taken must balance risk, reward, longevity, and timing.

Figure 5 illustrates the potential GHG reductions that are possible by making consistent progress between 2020 and 2050, versus an approach that begins with the 2030 target and then makes progress toward the 2050 level included in Executive Order S-3-05. Depending on our success in achieving the 2030 target, taking a consistent approach may be possible. It would achieve the 2050 target earlier, and together with similar actions globally, would have a greater chance of preventing global warming of 2°C. The strategy for achieving the 2050 target should leave open the possibility for both paths. Note that Figure 5 does not include emissions or sequestration potential from the natural and working lands sector or black carbon.

**FIGURE 5: PLOTTING CALIFORNIA'S PATH FORWARD**

## Intergovernmental Collaboration

Federal, state, Tribal, and local action can be complementary. We have seen federal action through the Clean Air Act, regulations for GHG emissions from passenger cars and trucks, development of the Clean Power Plan to limit GHGs from power plants, and the advancement of methane rules for oil and gas production. We have also seen recent federal efforts to delay or reverse some of these actions. As we have done in the past, California, working with other climate leaders, can take steps to advance more ambitious federal action and protect the ability of states to move forward to address climate change. Both collaboration and advocacy will mark the road ahead. However, to the extent that California cannot implement policies or measures included in the Scoping Plan because of the lack of federal action, we will develop alternative measures to achieve the reductions from the same sectors to ensure we meet our GHG reduction targets.

Regional, Tribal, and local governments and agencies are critical leaders in reducing emissions through actions that reduce demand for electricity, transportation fuels, and natural gas, and improved natural and working lands management. Many local governments already employ efforts to reduce GHG emissions beyond those required by the State. For example, many cities and counties improve their municipal operations by upgrading vehicle fleets, retrofitting government buildings and streetlights, purchasing greener products, and implementing waste-reduction policies. In addition, they may adopt more sustainable codes, standards, and general plan improvements to reduce their community's footprints and emissions. Many Tribes within and outside of California have engaged in consultations with CARB to develop robust carbon offset projects under California's Cap-and-Trade Program, in particular forest projects. In fact, Tribal forest projects represent a significant percentage of offset credits issued under the Program. These consultations and carbon sequestration projects are in addition to other Tribal climate-related efforts. The State will provide a supportive framework to advance these and other local efforts, while also recognizing the need to build on, and export, this success to other regional, Tribal, and local governments throughout California and beyond.

Local actions are critical for implementation of California's ambitious climate agenda. State policies, programs, and actions—such as many of those identified throughout this Scoping Plan—can help to support, incentivize, and accelerate local actions to achieve mutual goals for more sustainable and resilient communities. Local municipal code changes, zoning changes, or policy directions that apply broadly to the community within the general plan or climate action plan area can promote the deployment of renewable, zero emission, and low carbon technologies such as zero net energy buildings, renewable fuel production facilities, and zero emission charging stations. Local decision-making has an especially important role in achieving reductions of GHG emissions generated from transportation. Over the last 60 years, development patterns have led to sprawling suburban neighborhoods, a vast highway system, growth in automobile ownership, and under-prioritization of infrastructure for public transit and active transportation. Local decisions about these policies today can establish a more sustainable built environment for the future.

## International Efforts

California is not alone in its efforts to address climate change at the international level to reduce global GHG emissions. The agreement reached in Paris by the 2015 Conference of Parties to the United Nations Framework Convention on Climate Change (UNFCCC), aimed at keeping the global temperature rise below 2°C, is spurring worldwide action to reduce GHGs and support decarbonization across the global economy. In recent years, subnational governments have emerged to take on a prominent role. With the establishment of the Under 2 Memorandum of Understanding (MOU),<sup>46,47</sup> the Governors' Climate and Forests Task Force,<sup>48</sup> and the Western Climate Initiative,<sup>49</sup> among other partnership initiatives, subnational jurisdictions from the around the world are collaborating and leading on how best to address climate change.

---

46 Under 2 MOU website: [under2mou.org/](http://under2mou.org/)

47 One of the Brown Administration's priorities is to highlight California's climate leadership on the subnational level, and to ensure that subnational activity is recognized at the international level. In the year preceding the Paris negotiations, the Governor's Office recruited subnational jurisdictions to sign onto the Memorandum of Understanding on Subnational Global Climate Leadership (Under 2 MOU), which brings together states and regions willing to commit to reducing their GHG emissions by 80 to 95 percent, or to limit emissions to 2 metric tons CO<sub>2</sub>-equivalent per capita, by 2050. The governor led a California delegation to the Paris negotiations to highlight our successful climate programs and to champion subnational action and international cooperation on meeting the challenge of reducing GHG emissions. As of October 2017, 188 jurisdictions representing more than 1.2 billion people and more than one-third of the global economy had joined California in the Under 2 MOU.

48 Governors' Climate and Forests Task Force website: [www.gcftaskforce.org/](http://www.gcftaskforce.org/)

49 Western Climate Initiative website: [www.wci-inc.org/](http://www.wci-inc.org/)

From its inception, AB 32 recognized the importance of California’s climate leadership and engagement with other jurisdictions, and directed CARB to consult with the federal government and other nations to identify the most effective strategies and methods to reduce GHGs, manage GHG control programs, and facilitate the development of integrated and cost-effective regional, national, and international GHG reduction programs. California undertook a two-pronged approach: first, we assessed our State-specific circumstances to develop measures that would apply specifically in California; and second, we assessed which measures might lend themselves, through careful design and collaboration with other interested jurisdictions, toward linked or collaborative GHG reduction programs. Under the Clean Air Act, California has a special role as an innovator and leader in the area of motor vehicle emission regulations, which allows our State to adopt motor vehicle emission standards that are stricter than federal requirements. Partners around the country and the world emulate these motor vehicle standards, leading to widespread health benefits. Similarly, by enacting a comprehensive climate strategy that appeals to national and international partners, California can help lead the world in tackling climate change.

Today, the State’s Cap-and-Trade Program is linked with Québec’s program and scheduled to link with Ontario’s emissions trading system on January 1, 2018. Low carbon fuel mandates similar to California’s LCFS have been adopted by the United States Environmental Protection Agency (U.S. EPA) and by other jurisdictions including Oregon, British Columbia, the European Union, and the United Kingdom. Over two-dozen states have a renewables portfolio standard. California is a member of the Pacific Coast Collaborative with British Columbia, Oregon, and Washington, who collaborate on issues such as energy and sustainable resource management, among others.<sup>50</sup> California continues to discuss carbon pricing through a cap-and-trade program with international delegations. We have seen design features of the State’s Cap-and-Trade Program incorporated into other emerging and existing programs, such as the European Union Emissions Trading System, the Regional Greenhouse Gas Initiative, China’s emerging national trading program, and Mexico’s emerging pilot emission trading program.

Recognizing the need to address the substantial GHG emissions caused by the deforestation and degradation of tropical and other forests, California worked with a group of subnational governments to form the Governors’ Climate and Forests Task Force (GCF) in 2008.<sup>51</sup> The GCF is currently comprised of 38 different subnational jurisdictions— including states and provinces in Brazil, Colombia, Ecuador, Indonesia, Ivory Coast, Mexico, Nigeria, Peru, Spain, and the United States—that are contemplating or enacting programs for low-emissions rural development and reduced emissions from deforestation and land use. GCF members continue to engage in discussions to share information and experiences about the design of such programs and how the programs could potentially interact with carbon markets. Ongoing engagement between California and its GCF partners, as well as ongoing discussions with other stakeholders, continues to provide lessons on how such programs could complement California’s climate programs.<sup>52</sup>

Further, California’s High-Speed Rail is part of the International Union of Railways (UIC), and California has signed the Railway Climate Responsibility Pledge, which was commended by the Secretary of the UNFCCC as part of achieving the global 2050 targets. This initiative is to demonstrate that rail transport is part of the solution for sustainable and carbon free mobility.

California will continue to engage in multi-lateral forums that develop the policy foundation and technical infrastructure for GHG regulations in multiple jurisdictions through entities such as the International Carbon Action Partnership (ICAP), established by California and other partners in 2007. Members of the ICAP that have already implemented or are actively pursuing market-based GHG programs<sup>53</sup> share experiences and knowledge. California also participates in the Partnership for Market Readiness (PMR), a multilateral World Bank initiative that brings together more than 30 developed and developing countries to share experiences and build capacity for climate change mitigation efforts, particularly those implemented using market instruments.<sup>54</sup> In November 2014, CARB became a Technical Partner of the PMR, and CARB staff members have provided technical information on the design and implementation of the Cap-and-Trade Program at several PMR meetings.

50 Pacific Coast Collaborative website: [pacificcoastcollaborative.org/](http://pacificcoastcollaborative.org/)

51 Governors’ Climate and Forests Task Force Website: [www.gcftaskforce.org/](http://www.gcftaskforce.org/)

52 Continued collaboration on efforts to reduce emissions from tropical deforestation and to evaluate sector-based offset programs, such as the jurisdictional program in Acre, Brazil, further demonstrates California’s ongoing climate leadership and fosters partnerships on mutually beneficial low emissions development initiatives, including measures to encourage sustainable supply chain efforts by public and private entities.

53 International Carbon Action Partnership website: [icapcarbonaction.com/](http://icapcarbonaction.com/)

54 Partnership for Market Readiness website: [www.thepmr.org/](http://www.thepmr.org/)

Many foreign jurisdictions seek out California's expertise because of our history of success in addressing air pollution and climate change. California also benefits from these interactions. Expanding global action to fight air pollution and climate change expands markets for clean technology. This can bolster business for companies in California developing clean energy products and services and help to bring down the cost of those products globally and in California. Additionally, innovative policies and lessons learned from our partners' jurisdictions can help to inform future climate policies in California.

Governor Brown's focus on subnational collaborations on climate change and air quality has strengthened and deepened California's existing international relationships and forged new ones. These relationships are a critical component of reducing emissions of GHGs and other pollutants worldwide. As we move forward, CARB and other State agencies will continue to communicate and collaborate with international partners to find the most cost-effective ways to improve air quality, fight climate change, and share California's experience and expertise in reducing air pollution and GHGs while growing a strong economy. To highlight the State's resolve and support of other governments committed to action and tackling the threat of the global warming, on July 6, 2017, Governor Brown announced a major initiative to host world leaders at a Global Climate Action Summit planned for September 2018 in San Francisco.

## Chapter 2

### THE SCOPING PLAN SCENARIO

This chapter describes the State strategy for meeting the 2030 GHG target (also called the Scoping Plan Scenario), along with a short description of the four alternative scenarios, which were evaluated but ultimately rejected when compared against statutory and policy criteria and priorities that the State’s comprehensive climate action must deliver. All scenarios are set against the business-as-usual (BAU or Reference Scenario) scenario—what would GHG emissions look like if we did nothing beyond the existing policies that are required and already in place to achieve the 2020 limit. BAU includes the existing renewables requirements, advanced clean cars, the 10 percent reduction in carbon intensity Low Carbon Fuel Standard, and the SB 375 program for sustainable communities, among others. However, it does not include a range of new policies or measures that have been developed or put into statute over the past two years.

The Reference Scenario (BAU) shows continuing, but modest, reductions followed by a later rise of GHG emissions as the economy and population grow. The comprehensive analysis of all five alternatives indicates that the Scoping Plan Scenario—continuing the Cap-and-Trade Program—is the best choice to achieve the State’s climate and clean air goals. It also protects public health, provides a solid foundation for continued economic growth, and supports California’s quality of life.

All of the alternative scenarios briefly described in this chapter are the product of the Scoping Plan development process and were informed by public input, including that from EJAC, as well as Board and legislative direction over the course of two years. The scenarios all include a range of additional measures developed or required by legislation over the past two years with 2030 as their target date and include: extending the LCFS to an 18 percent reduction in carbon intensity beyond 2020, and the requirements of SB 350 to increase renewables to 50 percent and to double energy efficiency savings. They also all include the Mobile Source Strategy targets for more zero emission vehicles and much cleaner trucks and transit, the Sustainable Freight Action Plan to improve freight efficiency and transition to zero emission freight handling technologies, and the requirements under SB 1383 to reduce anthropogenic black carbon 50 percent and hydrofluorocarbon and methane emissions by 40 percent below 2013 levels by 2030. The recent adoption of AB 398 into State law on July 25, 2017, clarifies the role of the Cap-and-Trade Program through December 31, 2030.

Work is still underway on how to quantify the GHG emissions within the natural and working lands sector. As such, the analyses in this chapter do not include any estimates from this sector. Additional information on the current efforts to better understand GHG emissions fluxes and model the actions needed to support the goal of net carbon sequestration in natural and working lands can be found in Chapter 4. Even absent quantification data, the importance of this sector in achieving the State’s climate goals should be considered in conjunction with any efforts to reduce GHG emissions in the energy and industrial sectors.

During the development of the Scoping Plan, stakeholders suggested alternative scenarios to achieve the 2030 target. While countless scenarios could potentially be developed and evaluated, the four below were considered, as they were most often included in comments by stakeholders and they bracket the range of potential scenarios. Several of these alternative scenarios were also evaluated in the Initial AB 32 Scoping Plan in 2008 (All Regulations, Carbon Tax).<sup>55</sup> Since the adoption of the Initial AB 32 Scoping Plan, some of the alternative scenarios have been implemented or contemplated by other jurisdictions, which has helped in the analysis and the development of this Scoping Plan. This section provides a brief description of the alternatives. A full description of the alternatives and staff’s AB 197 and policy analyses are included in Appendix G.

55 CARB. 2009. Initial AB 32 Climate Change Scoping Plan Document.  
[www.arb.ca.gov/cc/scopingplan/document/scopingplandocument.htm](http://www.arb.ca.gov/cc/scopingplan/document/scopingplandocument.htm)

**Scoping Plan Scenario:** Ongoing and statutorily required programs and continuing the Cap-and-Trade Program. This scenario was modified from the January 2017 Proposed Scoping Plan to reflect AB 398, including removal of the 20 percent refinery measure.

**Alternative 1:** No Cap-and-Trade. Includes additional activities in a wide variety of sectors, such as specific required reductions for all large GHG sources, and more extensive requirements for renewable energy. Industrial sources would be regulated through command and control strategies.

**Alternative 2:** Carbon Tax. A carbon tax to put a price, but not limit, on carbon, instead of the Cap-and-Trade Program.

**Alternative 3:** All Cap-and-Trade. This alternative is the same as the Scoping Plan Scenario, while maintaining the LCFS at a 10 percent reduction in carbon intensity past 2020.

**Alternative 4:** Cap-and-Tax. This would place a declining cap on individual industrial facilities, and individual natural gas and fuel suppliers, while also requiring them to pay a tax on each metric ton of GHGs emitted.

Since the statutory direction on meeting a 2030 GHG target is clear, the issue of certainty of reductions is paramount. These alternatives vary greatly as to the certainty of meeting the target. The declining mass emissions cap under a cap-and-trade program provides certain and measurable reductions over time; a carbon tax, meanwhile, establishes some carbon price certainty, but does not provide an assurance on reductions and instead assumes that some degree of reductions will occur if costs are high enough to alter behavior.

There are also other considerations: to what extent does an alternative meet the target, but also deliver clean air benefits, prioritize reductions at large stationary sources, and allow for continued investment in disadvantaged communities? What is the cost of an alternative and what will be the impact on California consumers? Does an alternative allow for California to link with other jurisdictions, and support the Clean Power Plan<sup>56</sup> and other federal and international climate programs? Does an alternative provide for flexibility for regulated entities, and a cost-effective approach to reduce greenhouse gases?

The Scoping Plan Scenario provides a portfolio of policies and measures that balances this combination of objectives, including the highest certainty to achieve the 2030 target, while protecting the California economy and consumers. A more detailed analyses of the alternatives is provided in Appendix G.

## Scoping Plan Scenario

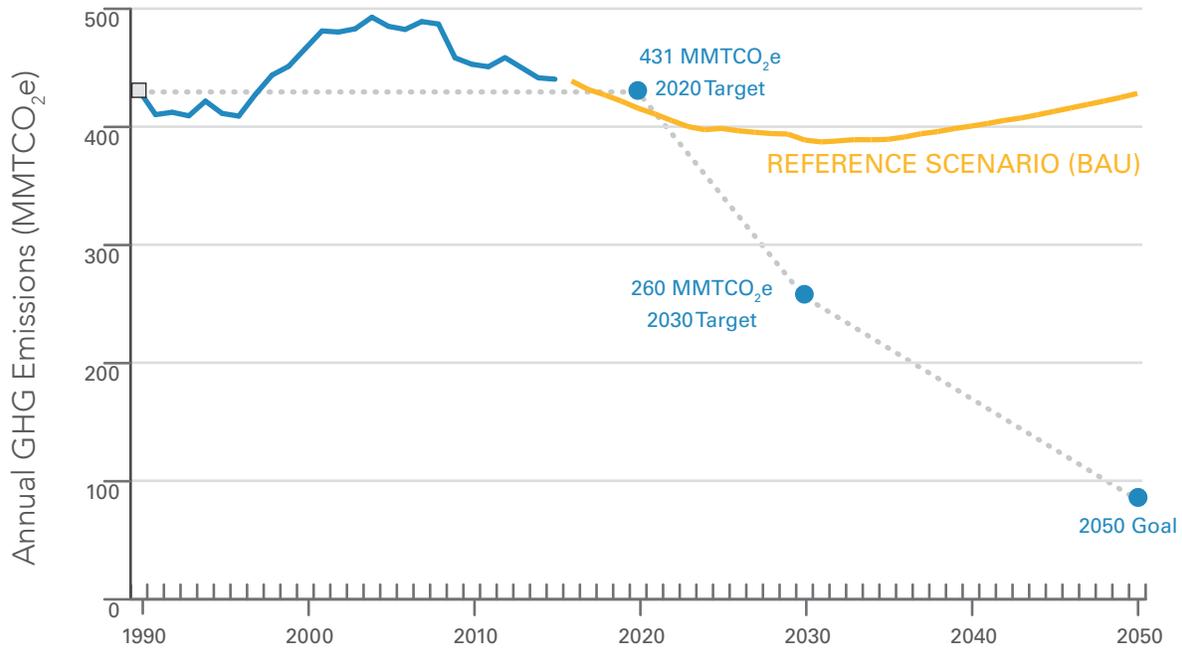

---

The development of the Scoping Plan began by first modeling a Reference Scenario (BAU). The Reference Scenario is the forecasted statewide GHG emissions through 2030 with existing policies and programs, but without any further action to reduce GHGs. Figure 6 provides the modeling results for a Reference Scenario for this Scoping Plan. The graph shows the State is expected to reduce emissions below the 2020 statewide GHG target, but additional effort will be needed to maintain and continue GHG reductions to meet the mid- (2030) and long-term (2050) targets. Figure 6 depicts a linear, straight-line path to the 2030 target. It should be noted that in any year, GHG emissions may be higher or lower than the straight line. That is to be expected as periods of economic recession or increased economic activity, annual variations in hydropower, and many other factors may influence a single or several years of GHG emissions in the State. CARB's annual GHG reporting and inventory will provide data on progress towards achieving the 2030 target. More details about the modeling for the Reference Scenario can be found in Appendix D.

---

<sup>56</sup> Although the Clean Power Plan is being challenged in legal and administrative processes, its requirements reflect U.S. EPA's statutory obligation to regulate greenhouse gases from the power sector. Thus it, and other federal programs, are a key consideration for Scoping Plan development.

**FIGURE 6: 2017 SCOPING PLAN REFERENCE SCENARIO**

The Scoping Plan Scenario is summarized in Table 1. As shown in the table, most of the measures are identified as “known commitments” (marked with “\*”), meaning that they are existing programs or required by statute. These commitments are not part of the Reference Scenario (BAU) in Figure 6 since their passage and implementation is related to meeting the Governor’s climate pillars, the 2030 climate target, or other long-term climate and air quality objectives. In addition to the known commitments, the Scoping Plan Scenario includes a post-2020 Cap-and-Trade Program.

**TABLE 1: SCOPING PLAN SCENARIO**

| Policy                                                                              | Primary Objective                                                                                                                                                                                                                                                 | Highlights                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Implementation Time Frame |

Table 2 summarizes the results of the modeling for the Reference Scenario and known commitments. Per SB 32, the 2030 limit is 260 MMTCO<sub>2</sub>e. That is a limit on total GHG emissions in a single year. At approximately 389 MMTCO<sub>2</sub>e, the Reference Scenario is expected to exceed the 2030 limit by about 129 MMTCO<sub>2</sub>e.

Table 2 also compares the Reference Scenario 2030 emissions estimate of 389 MMTCO<sub>2</sub>e to the 2030 target of 260 MMTCO<sub>2</sub>e and the level of 2030 emissions with the known commitments, estimated to be 320 MMTCO<sub>2</sub>e. And, in the context of a linear path to achieve the 2030 target, there is also a need to achieve cumulative emissions reductions of 621 MMTCO<sub>2</sub>e from 2021 to 2030 to reach the 2030 limit. While there is no statutory limit on cumulative emissions, the analysis considers and presents some results in cumulative form for several reasons. It should be recognized that policies and measures may perform differently over time. For example, in early years, a policy or measure may be slow to be deployed, but over time it has greater impact. If you were to look at its performance in 2021 versus 2030, you would see that it may not seem important and may not deliver significant reductions in the early years, but is critical for later years as it results in greater reductions over time. Further, once GHGs are emitted into the atmosphere, they can have long lifetimes that contribute to global warming for decades. Policies that reduce both cumulative GHG emissions and achieve the single-year 2030 target provide the most effective path to reducing climate change impacts. A cumulative construct provides a more complete way to evaluate the effectiveness of any measure over time, instead of just considering a snapshot for a single year.

**TABLE 2: 2030 MODELING GHG RESULTS FOR THE REFERENCE SCENARIO AND KNOWN COMMITMENTS**

| Modeling Scenario                      | 2030 GHG Emissions (MMTCO <sub>2</sub> e) | Cumulative GHG Reductions 2021–2030 (MMTCO <sub>2</sub> e) | Cumulative Gap to 2030 Target (MMTCO <sub>2</sub> e) |
|----------------------------------------|-------------------------------------------|------------------------------------------------------------|------------------------------------------------------|
| Reference Scenario (Business-as-Usual) | 389                                       | n/a                                                        | 621                                                  |
| Known Commitments                      | 320                                       | 385                                                        | 236                                                  |

As noted above, the known commitments are expected to result in emissions that are 60 MMTCO<sub>2</sub>e above the target in 2030, and have a cumulative emissions reduction gap of about 236 MMTCO<sub>2</sub>e. This means the known commitments do not decline fast enough to achieve the 2030 target. The remaining 236 MMTCO<sub>2</sub>e of estimated GHG emissions reductions would not be achieved unless further action is taken to reduce GHGs. Consequently, for the Scoping Plan Scenario, the Post-2020 Cap-and-Trade Program would need to deliver 236 MMTCO<sub>2</sub>e cumulative GHG emissions reductions from 2021 through 2030. If the estimated GHG reductions from the known commitments are not realized due to delays in implementation or technology deployment, the post-2020 Cap-and-Trade Program would deliver the additional GHG reductions in the sectors it covers to ensure the 2030 target is achieved. Figure 7 illustrates the cumulative emissions reductions contributions of the known commitments and the Cap-and-Trade Program from 2021 to 2030.

### Post-2020 Cap-and-Trade Program with Declining Caps

This measure would continue the Cap-and-Trade Program post-2020 pursuant to legislative direction in AB 398. The program is up and running and has a five-year-long record of auctions and successful compliance. In the face of a growing economy, dry winters, and the closing of a nuclear plant, it is delivering GHG reductions. This is not to say that California should continue on this road simply because the Cap-and-Trade Program is already in place. The analyses in this chapter, and the economic analysis in Chapter 3, clearly demonstrate that continuing the Cap-and-Trade Program through 2030 will provide the most secure, reliable, and feasible clean energy future for California—one that will continue to deliver crucial investments to improve the quality of life and the environment in disadvantaged communities.

Under this measure, funds would also continue to be deposited into the Greenhouse Gas Reduction Fund (GGRF) to support projects that fulfill the goals of AB 32, with AB 398 identifying a list of priorities for the Legislature to consider for future appropriations from GGRF. Investment of the Cap-and-Trade Program proceeds furthers the goals of AB 32 by reducing GHG emissions, providing net GHG sequestration, providing co-benefits, investing in disadvantaged communities and low-income communities, and supporting the long-term, transformative efforts needed to improve public and environmental health and

develop a clean energy economy. These investments support programs and projects that deliver major economic, environmental, and public health benefits for Californians. Importantly, prioritized investments in disadvantaged communities are providing a multitude of meaningful benefits to these communities some of which include increased affordable housing opportunities, reduced transit and transportation costs, access to cleaner vehicles, improved mobility options and air quality, job creation, energy cost savings, and greener and more vibrant communities.

Further, the Cap-and-Trade Program is designed to protect electricity and natural gas residential ratepayers from higher energy prices. The program includes a mechanism for electricity and natural gas utilities to auction their freely allocated allowances, with the auction proceeds benefiting ratepayers. The Climate Credit is a twice-annual bill credit given to investor-owned utility electricity residential customers. The total value of the Climate Credit for vintage 2013 auction allowances alone was over \$400 million. The first of these credits appeared on customer bills in April 2014.<sup>62</sup> Currently, natural gas utilities are permitted to use a portion of their freely allocated allowances to meet their own compliance obligations; however, over time, they must consign a larger percentage of allowances and continue to provide the value back to customers.

Additionally, under this measure, the State would preserve its current linkages with its Canadian partners and support future linkages with other jurisdictions, thus facilitating international action to address climate change. The high compliance rates with the Cap-and-Trade Program also demonstrate that the infrastructure and implementation features of the program are effective and understood by the regulated community. This measure also lends itself to integration with the Clean Power Plan requirements and is flexible to allow expansion to other sectors or regions.

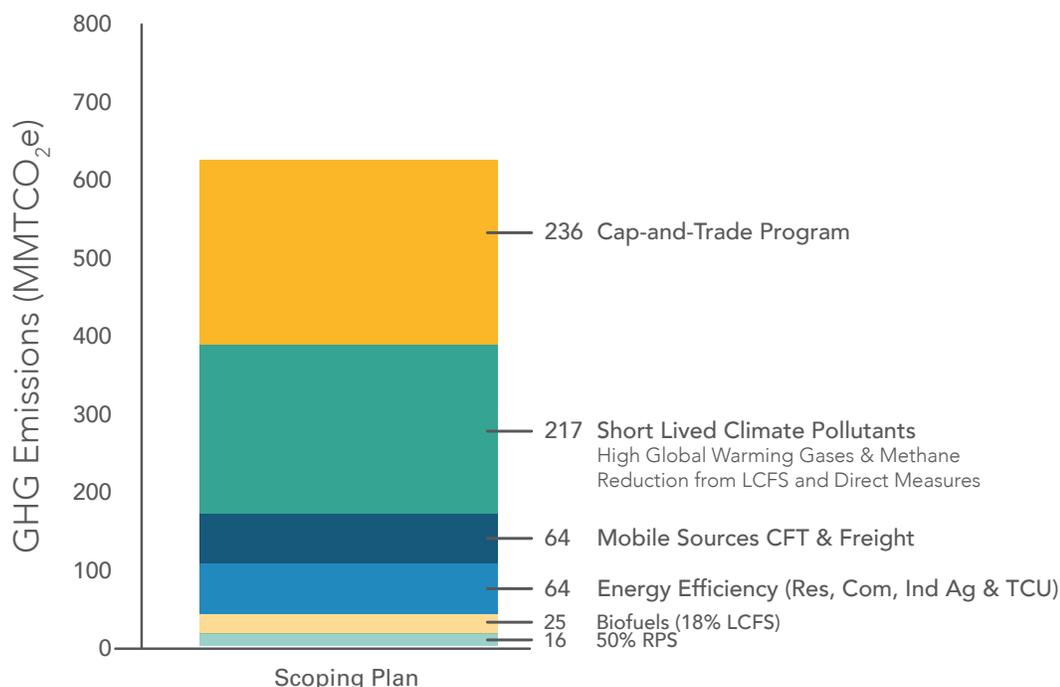

In late 2017, CARB began evaluating changes to program design features for post-2020 in accordance with AB 398.<sup>63</sup> This includes changes to the offset usage limit, direction on allocation, two price containment points, and a price ceiling – which, if in the unlikely event were to be accessed, must result in GHG reductions by compensating for any GHG emissions above the cap, ensuring the environmental integrity of the program. Changes to conform to the requirements of AB 398 will be subject to a public process, coordinated with linked partners, and be part of a future rulemaking that would take effect by January 1, 2021.

**FIGURE 7: SCOPING PLAN SCENARIO – ESTIMATED CUMULATIVE GHG REDUCTIONS BY MEASURE (2021–2030)<sup>64</sup>**

The Scoping Plan Scenario in Figure 7 represents an expected case where current and proposed GHG reduction policies and measures begin as expected and perform as expected, and technology is readily available and deployed on schedule. An Uncertainty Analysis was performed to examine the range of outcomes that could occur under the Scoping Plan policies and measures. The uncertainty in the following factors was characterized and evaluated:

- Economic growth through 2030;
- Emission intensity of the California economy;
- Cumulative emissions reductions (2021 to 2030) achieved by the prescriptive measures, including the known commitments; and
- Cumulative emissions reductions (2021 to 2030) that can be motivated by emission prices under the Cap-and-Trade Program.

The combined effects of these uncertainties are summarized in Figure 8. As shown in Figure 7, the Scoping Plan analysis estimates that the prescriptive measures will achieve cumulative emissions reductions of 385 MMTCO<sub>2</sub>e, the Cap-and-Trade Program will achieve 236 MMTCO<sub>2</sub>e, resulting in total cumulative emissions reductions of 621 MMTCO<sub>2</sub>e. These values are again reflected in the bar on the left of Figure 8. The results of the Uncertainty Analysis are summarized in the three bars on the right of the figure as follows:

- The cumulative emissions reductions required to achieve the 2030 emission limit has the potential to be higher or lower than the Scoping Plan estimate. The uncertainty analysis simulates an average required emissions reductions of about 660 MMTCO<sub>2</sub>e with a range of +130 MMTCO<sub>2</sub>e.<sup>65</sup> This estimate and the range are shown in Figure 8 as the bar on the right. Notably, the estimate of the average required emissions reductions is 40 MMTCO<sub>2</sub>e greater than the estimate in the Scoping Plan analysis.
- The prescriptive measures have the potential to underperform relative to expectations. Based on CARB staff assessments of the potential risk of underperformance of each measure, the average emissions reductions simulated to be achieved was 335 MMTCO<sub>2</sub>e, or about 13 percent below the Scoping Plan estimate. The range for the performance of the measures was about +50 MMTCO<sub>2</sub>e.

<sup>64</sup> The whole number values displayed in Figure 7 do not mathematically sum to 621 MMTCO<sub>2</sub>e, consistent with the modeling results summary in Table 2. This is a result of embedded significant figures and rounding for graphic display purposes. Please refer to the corresponding PATHWAYS modeling data spreadsheets for details.

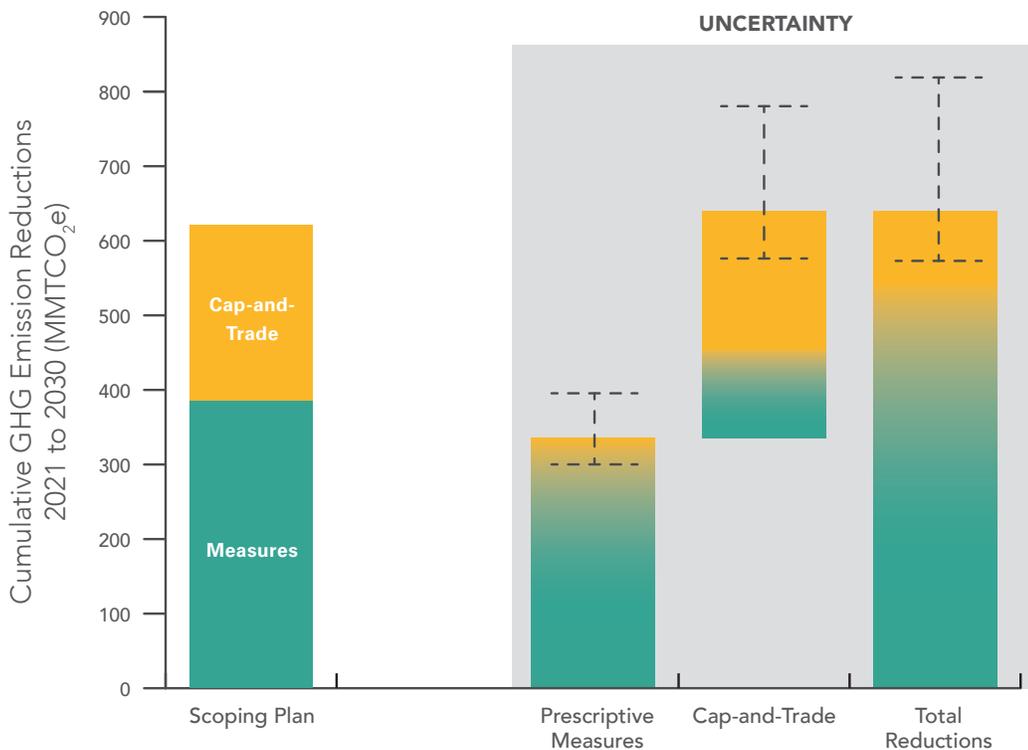

<sup>65</sup> The ranges presented are the 5<sup>th</sup> and 95<sup>th</sup> percentile observations in the Uncertainty Analysis. See Appendix E for details.

These values for the potential reductions achieved by the measures are shown in the figure.

- The Cap-and-Trade program is designed to fill the gap in the required emissions reductions over and above what is achieved by the prescriptive measures. Because the total required emissions reductions are uncertain, and the emissions reductions achieved by the prescriptive measures are uncertain, the required emissions reductions from the Cap-and-Trade Program are also uncertain. The Uncertainty Analysis simulated the average emissions reductions achieved by the Cap-and-Trade Program at about 305 MMTCO<sub>2</sub>e, or about 30 percent higher than the Scoping Plan estimate. The range was simulated to be about +120 MMTCO<sub>2</sub>e. These values for the potential reductions achieved by the Cap-and-Trade Program are shown in the figure.

The Uncertainty Analysis provides insight into the range of potential emissions outcomes that may occur, and demonstrates that the Scoping Plan, with the Cap-and-Trade Program, is extremely effective in the face of uncertainty, assuring that the required emissions reductions are achieved (see Appendix E for more detail). The Uncertainty Analysis also indicates that the Cap-and-Trade Program could contribute a larger or smaller share of the total required cumulative emissions reductions than expected in the Scoping Plan analysis.

**FIGURE 8: UNCERTAINTY ANALYSIS**

While the modeling results provide estimates of the GHG reductions that could be achieved by the measures, the results also provide other insights and highlight the need to ensure successful implementation of each measure. The SLCP Strategy will provide significant reductions with a focus on methane and hydrofluorocarbon gases. To ensure the SLCP Strategy implementation is successful, it will be critical to ensure programs such as LCFS maintain incentives to finance the capture and use of methane as a transportation fuel—further reducing the State’s dependence on fossil fuels. The modeling also shows that actions on energy efficiency could provide the same magnitude of GHG emissions reductions as the mobile source measures, but each effort will provide different magnitudes of air quality improvements and cost-effectiveness as discussed in Chapter 3.

Another way to look at this scenario is to understand the trajectory of GHG reductions over time, relative to the 2030 target. Figure 9 provides the trajectory of GHG emissions modeled for the Scoping Plan Scenario. Again, this depicts a straight-line path to the 2030 target for discussion purposes, but in reality GHG emissions may be above or below the line in any given year(s).

**FIGURE 9: SCOPING PLAN SCENARIO GHG REDUCTIONS**

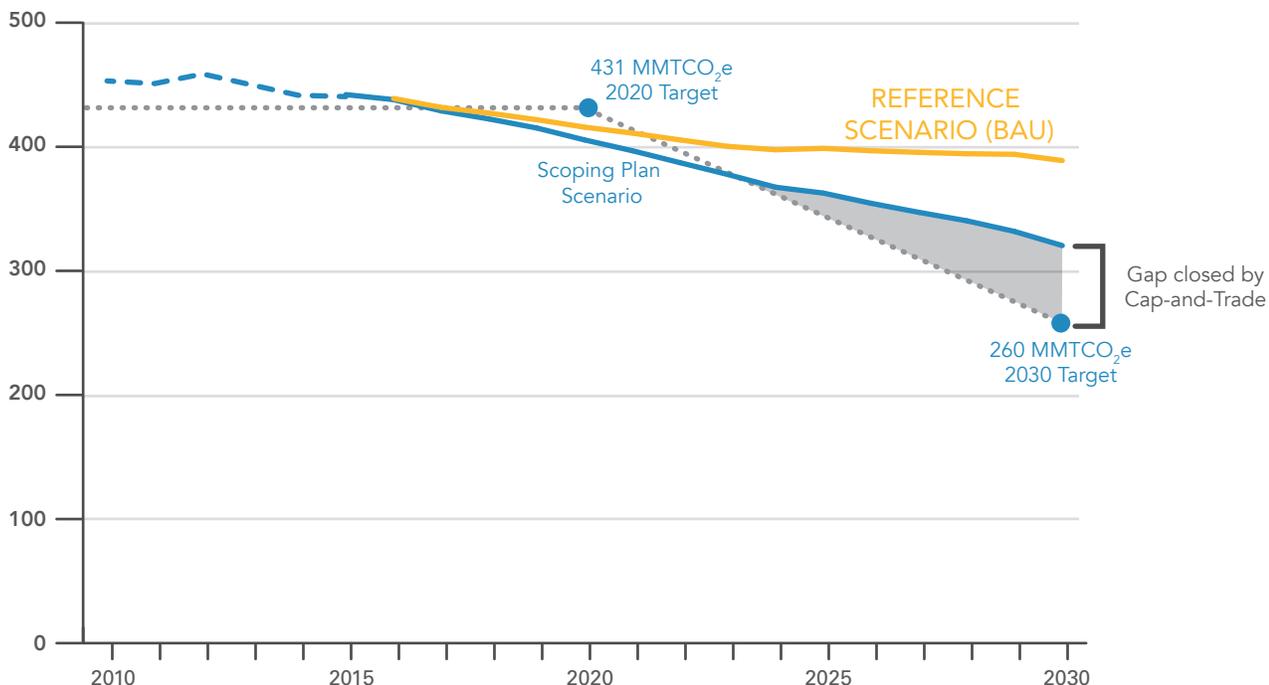

Figure 9 shows the Reference Scenario (yellow) and the version of the Scoping Plan Scenario that excludes the Cap-and-Trade Program (blue). Until 2023, the measures in the Scoping Plan Scenario constrain GHG emissions below the dotted straight line. After 2023, GHG emissions continue to fall, but at a slower rate than needed to meet the 2030 target. It is the Cap-and-Trade Program that will reduce emissions to the necessary levels to achieve the 2030 target. In this scenario, it is estimated that the known commitments will result in an emissions level of about 320 MMTCO<sub>2</sub>e in 2030. Thus, for the Scoping Plan Scenario, the Cap-and-Trade Program would deliver about 60 MMTCO<sub>2</sub>e in 2030 and ensure the 2030 target is achieved.

To understand how the Scoping Plan affects the main economic sectors, Table 3 provides estimated GHG emissions by sector, compared to 1990 levels, and the range of GHG emissions for each sector estimated for 2030. This comparison helps to illustrate which sectors are reducing emissions more than others and where to focus additional actions to reduce GHGs across the entire economy.

**TABLE 3: ESTIMATED CHANGE IN GHG EMISSIONS BY SECTOR (MMTCO<sub>2</sub>E)**

|                                 | 1990       | 2030 Scoping Plan Ranges <sup>66</sup> | % change from 1990 |
|---------------------------------|------------|----------------------------------------|--------------------|
| Agriculture                     | 26         | 24–25                                  | -8 to -4           |
| Residential and Commercial      | 44         | 38–40                                  | -14 to -9          |
| Electric Power                  | 108        | 30–53 <sup>67</sup>                    | -72 to -51         |
| High GWP                        | 3          | 8–11 <sup>68</sup>                     | 267 to 367         |
| Industrial                      | 98         | 83–90 <sup>69</sup>                    | -15 to -8          |
| Recycling and Waste             | 7          | 8–9 <sup>70</sup>                      | 14 to 29**         |
| Transportation (Including TCU)  | 152        | 103–111                                | -32 to -27         |
| Natural Working Lands Net Sink* | -7***      | TBD                                    | TBD                |
| Sub Total                       | 431        | 294–339                                | -32 to -21         |
| Cap-and-Trade Program           | n/a        | 34–79                                  | n/a                |
| <b>Total</b>                    | <b>431</b> | <b>260</b>                             | <b>-40</b>         |

\* Work is underway through 2017 to estimate the range of potential sequestration benefits from the natural and working lands sector.

\*\* The SLCP will reduce emissions in this sector by 40 percent from 2013 levels. However, the 2030 levels are still higher than the 1990 levels as emissions in this sector have grown between 1990 and 2013.

\*\*\* This number reflects net results and is different than the intervention targets discussed in Chapter 4.

The sector ranges may change in response to how the sectors respond to the Cap-and-Trade Program. While the known commitments will deliver some reductions in each sector, the Cap-and-Trade Program will deliver additional reductions in the sectors it covers. Annual GHG reporting and the GHG inventory will track annual changes in emissions, and those will provide ongoing assessments of how each sector is reducing emissions due to the full complement of known commitments and the Cap-and-Trade Program, as applicable.

## Scenario Modeling

There are a variety of models that can be used to model GHG emissions. For this Plan, the State is using the PATHWAYS model.<sup>70</sup> PATHWAYS is structured to model GHG emissions while recognizing the integrated nature of the industrial economic and energy sectors. For example, if the transportation sector adds more electric vehicles, PATHWAYS responds to reflect an energy demand increase in the electricity sector. However, PATHWAYS does not reflect any change in transportation infrastructure and land use demand associated with additional ZEVs on the road. The ability to capture a subset of interactive effects of policies and measures helps to provide a representation of the interconnected nature of the system and impacts to GHGs.

66 Unless otherwise noted, the low end of the sector range is the estimated emissions from the Scoping Plan Scenario and the high end adjusts the expected emissions by a risk factor that represents sector underperformance.

67 The high end of the electric power sector range is represented by the Scoping Plan Scenario, and the low end by enhancements and additional electricity sector measures such as deployment of additional renewable power, greater behind-the-meter solar PV, and additional energy efficiency. The electric power sector range provided in Table 3 will be used to help inform CARB’s setting of the SB 350 Integrated Resource Plan greenhouse gas emissions reduction planning targets for the sector. CARB, CPUC, and CEC will continue to coordinate on this effort before final IRP targets are established for the sector, load-serving entities, and publicly-owned utilities. State agencies will investigate the potential for and appropriateness of deeper electric sector reductions in light of the overall needs of the Scoping Plan to cost-effectively achieve the statewide GHG goals. Concurrently, CEC and CPUC are proceeding with their respective IRP processes using this range.

68 The sector emissions are anticipated to increase by 2030. As such, the high end of the sector range is the estimated emissions from the Scoping Plan Scenario and the low end adjusts the expected emissions by a risk factor that represents sector over performance.

69 This estimate does not account for the reductions expected in this sector from the Cap-and-Trade Program. The Cap-and-Trade line item includes reductions that will occur in the industrial sector.

70 CARB. 2016. AB 32 Scoping Plan Public Workshops. [www.arb.ca.gov/cc/scopingplan/meetings/meetings.htm](http://www.arb.ca.gov/cc/scopingplan/meetings/meetings.htm)

At this time, PATHWAYS does not include a module for natural and working lands. As such, PATHWAYS cannot be used to model the natural and working lands sector, the interactive effects of policies aimed at the economic and energy sectors and their effect on land use or conditions, or the interactive effects of policies aimed at the natural environment and their impact on the economic and energy sectors. For this Plan, external inputs had to be developed for PATHWAYS to supply biofuel volumes. The natural and working lands sector is also being modeled separately as described in Chapter 4. Moving forward, CARB and other State agencies will work to integrate all the sectors into one model to fully capture interactive effects across both the natural and built environments.

Lastly, the PATHWAYS assumptions and results in this Plan show the significant action that the State must take to reach its GHG reduction goals. It is important to note that the modeling assumptions may differ from other models used by other State agencies. Modeling exercises undertaken in future regulatory proceedings may result in different measures, programs, and program results than those used in the modeling for this Scoping Plan. State agencies will engage on their specific policies and measure development processes separately from CARB Scoping Plan activities, in public forums to engage all stakeholders.

## Uncertainty

Several types of uncertainty are important to understand in both forecasting future emissions and estimating the benefits of emissions reductions scenarios. In developing the Scoping Plan, we have forecast a Reference Scenario and estimated the GHG emissions outcome of the Scoping Plan using PATHWAYS. Inherent in the Reference Scenario modeling is the expectation that many of the existing programs will continue in their current form, and the expected drivers for GHG emissions such as energy demand, population growth, and economic growth will match our current projections. However, it is unlikely that the future will precisely match our projections, leading to uncertainty in the forecast. Thus, the single "reference" line should be understood to represent one possible future in a range of possible predictions. For the Scoping Plan Scenario, PATHWAYS utilized inputs that are assumptions external to the model. PATHWAYS was provided plausible inputs such as energy demand over time, the start years for specific policies, and the penetration rates of associated technologies. Each of the assumptions provided to PATHWAYS has some uncertainty, which is also reflected in the results. Thus, while the results presented in the Scoping Plan may seem precise due to the need for precision in model inputs, these results are estimates, and the use of ranges in some of the results is meant to capture that uncertainty.

Further, as noted in the November 7, 2016, 2030 Target Scoping Plan Workshop, "All policies have a degree of uncertainty associated with them."<sup>71</sup> As this Scoping Plan is meant to chart a path to achieving the 2030 target, additional work will be required to fully design and implement any policies identified in this Scoping Plan. During the subsequent development of policies, CARB and other State agencies will learn more about technologies, cost, and how each industry works as a more comprehensive evaluation is conducted in coordination with stakeholders. Given the uncertainty around assumptions used in modeling, and in performance once specific policies are fully designed and implemented, estimates associated with the Scoping Plan Scenario are likely to differ from what actually occurs when the Scoping Plan is implemented. One way to mitigate for this risk is to develop policies that can adapt and increase certainty in GHG emissions reductions. Periodic reviews of progress toward achieving the 2030 target and the performance of specific policies will also provide opportunities for the State to consider any changes to ensure we remain on course to achieve the 2030 target. The need for this periodic review process was anticipated in AB 32, as it calls for updates to the Scoping Plan at least once every five years. Additional information on the uncertainty analyses conducted in the development of this Scoping Plan is located in Appendix E.

71 Bushnell, James. Economic Modeling and Environmental Policy Choice. PowerPoint. Department of Economics, University of California, Davis. [www.arb.ca.gov/cc/scopingplan/meetings/110716/bushnellpresentation.pdf](http://www.arb.ca.gov/cc/scopingplan/meetings/110716/bushnellpresentation.pdf)

## Policy Analysis of Scoping Plan Scenario

---

The following key criteria were considered while evaluating potential policies beyond the known commitments. The results of the economic analysis (presented in Chapter 3) were also important in the design of this Scoping Plan.

- **Ensure the State achieves the 2030 target.** The strategy must ensure that GHG emissions reductions occur and are sufficient to achieve the 2030 target.
- **Provide air quality co-benefits.** An important concern for environmental justice communities is for any Scoping Plan to provide air quality co-benefits.
- **Prioritize rules and regulations for direct GHG reductions.** AB 197 requires CARB in developing this Scoping Plan to prioritize emissions reductions rules and regulations that result in direct emissions reductions at large stationary sources of GHG emissions sources and direct emissions reductions from mobile sources.
- **Provide protection against emissions leakage.** Require any policies to achieve the statewide limits to minimize emissions leakage to the extent possible. Emissions leakage can occur when production moves out-of-state, so there appears to be a reduction in California's emissions, but the production and emissions have just moved elsewhere. This loss in production may be associated with loss in jobs and decreases in the State's gross domestic product (GDP) and could potentially increase global GHG emissions if the production moves to a less efficient facility outside of California.
- **Develop greenhouse gas reduction programs that can be readily exported to other jurisdictions.** Currently, California's Cap-and-Trade Program is linked with Québec's program and is scheduled to link with Ontario's cap-and-trade program beginning in 2018. At the same time, California's ambitious policies such as the RPS, LCFS, and Advanced Clean Cars have resulted in other regions adopting similar programs.
- **Minimize costs and increase investment in disadvantaged and low-income communities, and low-income households.** Currently, Cap-and-Trade auction proceeds from the sale of State-owned allowances are appropriated for a variety of programs to reduce GHGs, and provide other environmental, health and economic benefits including job creation and economic development. Under AB 1550, a minimum of 25 percent of the proceeds are to be invested in projects located in and benefiting disadvantaged communities, with an additional minimum 10 percent to projects in low-income communities, and low-income households. It is important to understand if the strategy will require or result in funding to support these GHG reductions and associated benefits.
- **Avoid or minimize the impacts of climate change on public health by continuing reductions in GHGs.** Climate change has the potential to significantly impact public health, including increases in heat illness and death, air pollution-related exacerbation of cardiovascular and respiratory diseases, injury and loss of life due to severe storms and flooding, increased vector-borne and water-borne diseases, and stress and mental trauma due to extreme weather-related catastrophes.
- **Provide compliance flexibility.** Flexibility is important as it allows each regulated entity the ability to pursue its own path toward compliance in a way that works best for its business model. Flexibility also acknowledges that regulatory agencies may not have a complete picture of all available low-cost compliance mechanisms or opportunities even across the same sector. In addition, under AB 32 and AB 197, the strategy to reduce GHGs requires consideration of cost-effectiveness, which compliance flexibility provides.
- **Support the Clean Power Plan and other federal climate programs.** California will continue to support aggressive federal action, as well as to defend existing programs like the Clean Power Plan, which is the most prominent federal climate regulation applicable to stationary sources. The U.S. Supreme Court has repeatedly confirmed that federal greenhouse gas regulation must move forward under the federal Clean Air Act, so it is important to ensure that California's programs can support federal compliance as well. Although continuing litigation has stayed certain Clean Power Plan deadlines in the near term, and U.S. EPA has proposed to reconsider aspects of the rule as issued, the Clean Power Plan remains the law of the land. California is vigorously defending this important program, and is continuing to support federal climate regulation as is required by law. U.S. EPA also has a legal obligation to implement GHG controls for power plants, even if it proposes to alter the form of those controls in the future. Therefore, the Clean Power Plan and other federal efforts are important considerations for this Scoping Plan. With regard to the

Clean Power Plan, California power plants are expected to be within their limits as set forth by the State’s compliance plan, which was approved by CARB on July 27, 2017. However, the State still needs a mechanism to ensure the emissions for the covered electricity generating plants do not exceed the federal limits. This mechanism must be federally enforceable with regard to the affected power plants, and limit their emissions in accordance with the federal limit.

Table 4 uses the criteria listed above to assess the Scoping Plan Scenario. This assessment is based on CARB staff evaluation as well as the analyses described in Chapter 3.

**TABLE 4: POLICY ASSESSMENT OF THE SCOPING PLAN**

| Criteria                                                                                         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ensure the State Achieves the 2030 Target                                                        | <ul style="list-style-type: none"> <li>• Incorporates existing and new commitments to reduce emissions from all sectors</li> <li>• The Cap-and-Trade Program scales to ensure reductions are achieved, even if other policies do not achieve them. This is particularly critical given the uncertainty inherent in both CARB’s emission forecast and its estimate of future regulations.</li> </ul>                                                                                                                                                                                                                                               |
| Provide Air Quality Co-Benefits                                                                  | <ul style="list-style-type: none"> <li>• Reduced fossil fuel use and increased electrification (including plug-in hybrid electric, battery-electric, and hydrogen fuel cell vehicles) from policies such as the Mobile Source Strategy, enhanced LCFS and RPS, energy efficiency, and land conservation will likely reduce criteria pollutants and toxic air contaminants.</li> <li>• The Cap-and-Trade Program will ensure GHG emissions reductions within California that may reduce criteria pollutants and toxic air contaminants.</li> </ul>                                                                                                 |
| Prioritize Rules and Regulations for Direct GHG Reductions                                       | <ul style="list-style-type: none"> <li>• Advanced Clean Cars regulations require reduction in the light-duty vehicle sector.</li> <li>• Enhanced LCFS requires reductions in light-duty and heavy-duty transportation.</li> <li>• SB 350, RPS, and energy efficiency will reduce the need for fossil power generation.</li> <li>• The Cap-and-Trade Program constrains and reduces emissions across approximately 80 percent of California GHG emissions.</li> <li>• SB 1383 and the Short-lived Climate Pollutant Reduction Strategy require reductions in the agricultural, commercial, residential, industrial, and energy sectors.</li> </ul> |
| Protect Against Emissions Leakage                                                                | <ul style="list-style-type: none"> <li>• Free allowance allocation to minimize leakage, where supported by research.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Develop GHG Reduction Programs that can be Readily Exported to Other Jurisdictions               | <ul style="list-style-type: none"> <li>• Supports existing and future linkages, allows for larger GHG emissions reductions worldwide through collaborative regional efforts.</li> <li>• Provides leadership on how to integrate short-lived climate pollutants into the broader climate mitigation program.</li> </ul>                                                                                                                                                                                                                                                                                                                            |
| Minimize Costs and Invest in Disadvantaged and Low-Income Communities, and Low-Income Households | <ul style="list-style-type: none"> <li>• Continue to fund programs and projects that reduce GHGs and meaningfully benefit disadvantaged and low-income communities and low-income households through the Greenhouse Gas Reduction Fund.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                |
| Avoid or Minimize the Impacts of Climate Change on Public Health                                 | <ul style="list-style-type: none"> <li>• Reduces GHGs and provides leadership nationally and internationally for climate action.</li> <li>• Provides funding for programs such as home weatherization focused on disadvantaged communities, to mitigate potential cost impacts.</li> </ul>                                                                                                                                                                                                                                                                                                                                                        |
| Compliance Flexibility                                                                           | <ul style="list-style-type: none"> <li>• Regulated sources self-identify and implement some GHG emissions reductions actions, beyond those already required to comply with additional prescriptive measures.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Support the Clean Power Plan and other Federal Climate Programs                                  | <ul style="list-style-type: none"> <li>• Post-2020 Cap-and-Trade Program can be used to comply with the Clean Power Plan.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# Chapter 3

## EVALUATIONS

### Programs for Air Quality Improvement in California

---

For half a century, CARB has been a leader in measuring, evaluating, and reducing sources of air pollution that impact public health. Its air pollution programs have been adapted for national programs and emulated in other countries. Significant progress has been made in reducing diesel particulate matter (PM), which is a designated toxic air contaminant, and many other hazardous air pollutants. CARB partners with local air districts to address stationary source emissions and adopts and implements State-level regulations to address sources of criteria and toxic air pollution, including mobile sources. The key air quality strategies being implemented by CARB include the following:

- **State Implementation Plans (SIPs).**<sup>72</sup> These comprehensive plans describe how an area will attain national ambient air quality standards by deadlines established by the federal Clean Air Act. SIPs are a compilation of new and previously submitted plans, programs, air district rules, State regulations, and federal controls designed to achieve the emissions reductions needed from mobile sources, fuels, stationary sources, and consumer products. On March 23, 2017, CARB adopted the Revised Proposed 2016 State Strategy for the SIP, describing the commitments necessary to meet federal ozone and PM<sub>2.5</sub> standards over the next 15 years.
- **Diesel Risk Reduction Plan.**<sup>73</sup> The plan, adopted by CARB in September 2000, outlined 14 recommended control measures to reduce the risks associated with diesel PM and achieve a goal of 75 percent PM reduction by 2010 and 85 percent by 2020. Since 2000, CARB has adopted regulations to reduce smog-forming pollutants and diesel PM from mobile vehicles and equipment (e.g., trucks, buses, locomotives, tractors, cargo handling equipment, construction equipment, marine vessels, transport refrigeration units); stationary engines and portable equipment (e.g., emergency standby generators, prime generators, agricultural irrigation pumps, portable generators); and diesel fuels. Diesel PM accounts for approximately 60 percent of the current estimated inhalation cancer risk for background ambient air.<sup>74</sup> CARB staff continues to work to improve implementation and enforcement efforts and examine needed amendments to increase the community health benefits of these control measures.
- **Sustainable Freight Action Plan.**<sup>75</sup> This joint agency strategy was developed in response to Governor's Executive Order B-32-15 to improve freight efficiency, transition to zero emission technologies, and increase the competitiveness of California's freight system. The transition of the freight transport system is essential to support the State's economic development in the coming decades and reduce air pollution affecting many California communities.
- **AB 32 Scoping Plan.**<sup>76</sup> This comprehensive strategy is updated at least every five years and is designed to achieve the State's climate goals, which includes measures that achieve air pollutant reduction co-benefits.
- **AB 1807.**<sup>77</sup> AB 1807 (Tanner, 1983) created California's program to reduce exposure to air toxics. CARB uses a comprehensive process to prioritize the identification of substances that pose the greatest health threat and to develop airborne toxic control measures to reduce those exposures. CARB has reduced public exposure to toxic air contaminants (TACs) through control of motor vehicles, fuels, consumer products, and stationary sources, including adopting control measures for

industrial sources (e.g., perchloroethylene in automotive products; hexavalent chromium from cooling towers, automotive coatings and plating; ethylene oxide from sterilizers and aerators; dioxins from medical waste incinerators; perchloroethylene from dry cleaners; cadmium from metal melting).

- **AB 2588 Air Toxics “Hot Spots” Program.**<sup>78</sup> The Hot Spots Program supplements the AB 1807 program by requiring a statewide air toxics inventory, identification of facilities having localized impacts, notification of nearby residents exposed to a significant health risk, and facility risk management plans to reduce those significant risks to acceptable levels.
- **AB 617 Community Air Protection Program.** Together with the extension of the Cap-and-Trade Program and in recognition of ongoing air quality challenges, California has committed to expand its criteria and toxic emissions reductions efforts through the pursuit of a multipronged approach to reduce localized air pollution and address community exposure, framed by recently-signed new legislation, AB 617 (C. Garcia, 2017). AB 617 outlines actions in five core areas, to be completed in the 2018 to 2020 timeframe, to reduce criteria and toxic emissions in the most heavily impacted areas of the State:
  - **Community-scale air monitoring.** Ambient air monitoring is needed to evaluate the status of the atmosphere compared to clean air standards and historical data. Monitoring helps identify and profile air pollution sources, assess emerging measurement methods, characterize the degree and extent of air pollution, and track progress of emissions reductions activities. AB 617 requires a statewide assessment of the current air monitoring network and identification of priority locations where community-level air monitoring will be deployed.
  - **Statewide Strategy to reduce air pollutants impacting communities.** CARB will identify locations with high cumulative exposure to criteria and toxic pollutants, the sources contributing to those exposures, and select locations that will be required to develop a community action plan to reduce pollutants to acceptable levels.
  - **Community Action Plans to reduce emissions in identified communities.** High priority locations identified in the Statewide Strategy will need to prepare a community action plan that includes emissions reductions targets, measures, and an implementation timeline. The plan will be submitted to CARB for review and approval.
  - **Accelerated retrofits and technology clearinghouse.** This effort will focus on stationary source equipment at Cap-and-Trade facilities that, as of 2007, have not been retrofitted with BARCT-level emission controls for nonattainment pollutants. In addition, creation of a statewide clearinghouse that identifies BACT and BARCT technologies and emission levels for criteria pollutants and TACs will be developed to assist the air districts with the BARCT evaluation and identify available emission controls for the Statewide Strategy.
  - **Direct reporting of facility emissions data to CARB.** An improved, standardized emission inventory promotes a better understanding of actual emissions and helps identify major emission sources, priorities for emissions reduction, and data gaps requiring further work. AB 617 requires CARB to establish a uniform emission inventory system for stationary sources of criteria pollutants and TACs. Data integration and transparency-related efforts are already required by AB 197 (E. Garcia, 2016) and underway at CARB, so this new task will build on these efforts. Moreover, it is clear that better data reporting is necessary to identify localized exposure risk to harmful criteria and toxic pollutants and actions to address any localized impacts must be taken as quickly as possible.

To support efforts to advance the State’s toxics program, the Office of Environmental Health Hazard Assessment (OEHHA) finalized a new health risk assessment methodology, *Air Toxics Hot Spots Program Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments*, on March 6, 2015, which updates the previous version of the guidance manual and reflects advances in the field of risk assessment along with explicit consideration of infants and children.<sup>79</sup> Subsequently, CARB, in collaboration with the California Air Pollution Control Officers Association (CAPCOA), finalized a *Risk Management Guidance for Stationary Sources of Air Toxics* for the air districts to use to incorporate OEHHA’s new health risk assessment methodology into their stationary source permitting and AB 2588 Air Toxics Hot Spots programs.<sup>80</sup>

Together, all of these efforts will reduce criteria and toxics emissions in the State, with a focus on the most burdened communities. In particular, AB 617 responds to environmental justice concerns that the Cap-and-

78 CARB. 2016. AB 2588 Air Toxics “Hot Spots” Program. [www.arb.ca.gov/ab2588/ab2588.htm](http://www.arb.ca.gov/ab2588/ab2588.htm)

79 OEHHA. 2015. Notice of Adoption of Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments 2015. <http://oehha.ca.gov/air/crn/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0>

80 [www.arb.ca.gov/toxics/rma/rmgssat.pdf](http://www.arb.ca.gov/toxics/rma/rmgssat.pdf)

Trade Program does not force large GHG emitters to reduce air pollution which results in localized health impacts. Prior to the passage of AB 617, in February 2017, OEHHA published the first in a series of reports tasked with evaluating the impacts of California’s climate change programs on disadvantaged communities. The initial report focused on the Cap-and-Trade Program.<sup>81</sup> Future reports will focus on the impacts of other climate programs on disadvantaged communities. The report confirms disadvantaged communities are frequently located close to large stationary and mobile sources of emissions. It also notes there are complexities in trying to correlate GHGs with criteria and toxics emissions across industry and within sectors, although preliminary data review shows there may be some poor to moderate correlations in specific instances. Lastly, the report noted, “...the emissions data available at this time do not allow for a conclusive analysis.”

Two additional reports were released during this same period of time: a California Environmental Justice Alliance (CEJA) report focused on identifying equity issues for disadvantaged communities resulting from the implementation of the Cap-and-Trade Program<sup>82</sup> and a research paper examining the question of whether the Cap-and-Trade Program is causing more GHG emissions in disadvantaged communities when compared to other regions.<sup>83</sup> Both of these reports also confirmed that disadvantaged communities are disproportionately located close to large stationary and mobile sources of emissions. While the CEJA report noted, “Further research is needed before firm policy conclusions can be drawn from this preliminary analysis,” the research paper, in reference to GHGs, states, “By and large, the annual change in emissions across disadvantaged and non-disadvantaged communities look similar.”

While the reports do not provide evidence that implementation of the Cap-and-Trade Program is contributing to increased local air pollution, they do underscore the need to use all of the tools (e.g., enhanced enforcement, new regulations, tighter permit limits) available to the State and local agencies to achieve further emissions reductions of toxic and criteria pollutants that are impacting community health. Importantly, AB 617 provides a new framework and tools for CARB, in collaboration with local air districts, to deploy focused monitoring and ensure criteria and toxics emissions reductions at the State’s largest GHG emitters.

## AB 197 Measure Analyses

---

This section provides the required AB 197 estimates for the measures evaluated in this Scoping Plan. These estimates provide information on the relative impacts of the evaluated measures when compared to each other. To support the design of a suite of policies that result in GHG reductions, air quality co-benefits, and cost-effective measures, it is important to understand if a measure will increase or reduce criteria pollutants or toxic air contaminant emissions, or if increasing stringency at additional costs yields few additional GHG reductions. To this end, AB 197 (E. Garcia, Chapter 250, Statutes of 2016) requires the following for each potential reduction measure evaluated in any Scoping Plan update:

- The range of projected GHG emissions reductions that result from the measure.
- The range of projected air pollution reductions that result from the measure.
- The cost-effectiveness, including avoided social costs, of the measure.

As the Scoping Plan was developed, it was important to understand if any of the proposed policies or measures would increase criteria pollutant or toxic air contaminant emissions. Note the important caveats around some of the estimates; they must be considered when using the information in the tables below for purposes other than as intended.

## Estimated Emissions Reductions for Evaluated Measures

For many of the existing programs with known commitments, such as the Mobile Source Strategy, previous analyses provide emission factors or other methods for estimating the impacts required by AB 197. Where available, these values were used. In some cases, estimates are based on data from other sources, such as the California Public Utilities Commission (CPUC) Renewables Portfolio Standard Calculator. For newly proposed measures, assumptions were required to estimate the values. Consequently, the estimates for the newly proposed measures have substantial uncertainty. The uncertainty in the impacts of these measures would be reduced as the measures are defined in greater detail during the regulatory processes that are undertaken to

define and adopt the programs. For example, as a measure is developed in detail, ways to obtain additional co-pollutant reductions or avoid co-pollutant increases may be identified and evaluated.

Table 5 provides the estimates for the measures evaluated during the development of the Scoping Plan. Based on the estimates below, these measures are expected to provide air quality benefits. The table also provides important context, limitations, and caveats about the values. As shown, the table includes criteria pollutant and diesel PM estimates. As mentioned in the Diesel Risk Reduction Plan, diesel PM accounts for 60 percent of the current estimated inhalation cancer risk for background ambient air. As we do not have direct modeling results for criteria and toxic pollutant estimates from PATHWAYS, we are estimating air quality benefits by using reductions in GHGs to assign similar reductions for criteria and toxic pollutants. By assigning an arbitrary 1:1 relationship in changes between GHGs and criteria and toxic pollutants, the air quality reductions likely overestimate the actual reductions from implementation of the measures. As noted in the OEHHA report, the exact relationship between GHGs and air pollutants is not clearly understood at this time. Moving forward, CARB will continue to assess the nature of the exact relationship between GHGs and criteria and toxics emissions. All estimates in Table 5 have some inherent uncertainty. The table allows for assessing measures against each other and should not be used for other purposes without understanding the limitations on the how the air quality values are derived.

Table 6 provides a summary of the total estimated emissions reductions for the Scoping Plan Scenario as outlined in Table 1. Table 6 was developed by adding the estimated emissions reductions for all of the measures included within the Scoping Plan Scenario in Table 1. More detail on the estimates for the Scoping Plan Scenario, as well as the specific measures included in each of the other four alternative scenarios can be found in Appendix G. In 2030, the Scoping Plan scenario and alternatives will provide comparable GHG and air quality reductions. When there is a range, the measure or policy should be designed to maximize the benefit to the extent possible.

**TABLE 5: RANGES OF ESTIMATED AIR POLLUTION REDUCTIONS BY POLICY OR MEASURE IN 2030**

| Measure                                                                                       | Range of NO <sub>x</sub> Reductions (Tons/Day) | Range of VOC Reductions (Tons/Day) | Range of PM <sub>2.5</sub> Reductions (Tons/Day) | Range of Diesel PM Reductions (Tons/Day) |
|-----------------------------------------------------------------------------------------------|------------------------------------------------|------------------------------------|--------------------------------------------------|------------------------------------------|
| 50 percent RPS                                                                                | ~0.5                                           | <0.1                               | ~0.4                                             | < 0.01                                   |
| Mobile Sources CTF and Freight                                                                | 51–60                                          | 4.6–5.5                            | ~1.1                                             | ~0.2                                     |
| 18 percent Carbon Intensity Reduction Target for LCFS - Liquid Biofuels*                      | 3.5–4.4                                        | 0.5–0.6                            | 0.4–0.6                                          | ~0.5                                     |
| Short-Lived Climate Pollutant Strategy                                                        | –                                              | –                                  | –                                                | –                                        |
| 2x additional achievable energy efficiency in the 2015 Integrated Energy Policy Report (IEPR) | 0.4–0.5                                        | 0.5–0.7                            | < 0.1                                            | < 0.01                                   |
| Cap-and-Trade Program                                                                         | A                                              | A                                  | A                                                | 4–9                                      |

\* LCFS estimates include estimates of the NO<sub>x</sub> and PM<sub>2.5</sub> tailpipe benefits limited to renewable diesel consumed in the off-road sector.  
 – CARB is evaluating how to best estimate these values. Criteria and toxic values are shown in tons per day, as they are episodic emissions events with residence times of a few hours to days, unlike GHGs, which have atmospheric residence times of decades.  
 A Due to the inherent flexibility of the Cap-and-Trade Program, as well as the overlay of other complementary GHG reduction measures, the mix of compliance strategies that individual facilities may use is not known. However, based on current law and policies that control industrial and electricity generating sources of air pollution, and expected compliance responses, CARB believes that emissions increases at the statewide, regional, or local level due to the regulation are not likely. A more stringent post-2020 Cap-and-Trade Program will provide an incentive for covered facilities to decrease GHG emissions and any related emissions of criteria and toxic pollutants. Please see CARB’s Co-Pollutant Emissions Assessment for a more detailed evaluation of a cap-and-trade program and associated air emissions impacts: [www.arb.ca.gov/regact/2010/capandtrade10/capv6app.pdf](http://www.arb.ca.gov/regact/2010/capandtrade10/capv6app.pdf)  
 NO<sub>x</sub> = nitrogen oxides; VOC = volatile organic compound

Important: These estimates assume a 1:1 relationship between changes in GHGs, criteria pollutants, and toxic air contaminant emissions, and it is unclear whether that is ever the case. The values should not be considered estimates of absolute changes for other analytical purposes and only allow for comparison across measures in the table. The values are estimates that represent current assumptions of how programs may be implemented; actual impacts may vary depending on the design, implementation, and performance of the policies and measures. The table does not show interactions between measures, such as the relationship with increased transportation

electrification and associated increase in energy demand for the electricity sector. The measures in the Scoping Plan Scenario are shown in bold font in the table below. Additional details, including GHG reductions, are available in Appendix G.

**TABLE 6: SUMMARY OF RANGES OF ESTIMATED AIR POLLUTION REDUCTIONS FOR THE SCOPING PLAN SCENARIO IN 2030**

| Scenario              | Range of NO <sub>x</sub> Reductions (Tons/Day) | Range of VOC Reductions (Tons/Day) | Range of PM <sub>2.5</sub> Reductions (Tons/Day) | Range of Diesel PM Reductions (Tons/Day) |
|-----------------------|------------------------------------------------|------------------------------------|--------------------------------------------------|------------------------------------------|
| Scoping Plan Scenario | 48–73                                          | 5.1–7.3                            | 1.4–2.4                                          | 5–10                                     |

The total estimates for air pollution reductions provided in this table for the Scoping Plan Scenario are estimated by adding the air pollution benefits for the subset of individual measures examined in Table 5 and included in the Scoping Plan Scenario described in Table 1, and scaled by a risk adjustment factor to capture interactive effects and risks of under/over achieving on air pollution reductions. Appendix G includes details of the specific measures in the Scoping Plan Scenario and Alternatives. **All caveats in Table 5 apply to air quality estimates in this table.**

### Estimated Social Costs of Evaluated Measures

Consideration of the social costs of GHG emissions is a requirement in AB 197, including evaluation of the avoided social costs for measures within this Scoping Plan.<sup>84</sup> Social costs are generally defined as the cost of an action on people, the environment, or society and are widely used to evaluate the impact of regulatory actions. Social costs do not represent the cost of abatement or the cost of GHG reductions, rather social costs estimate the harm that is avoided by reducing GHGs.

Since 2008, federal agencies have been incorporating the social costs of GHGs, including carbon dioxide, methane, and nitrous oxide into the analysis of their regulatory actions. Agencies including the U.S. Environmental Protection Agency (U.S. EPA), Department of Transportation (DOT), and Department of Energy (DOE) are subject to Executive Order 12866, which directs agencies “to assess both the costs and benefits of the intended regulation...”.<sup>85</sup> In 2007, the National Highway Transportation Safety Administration (NHTSA) was directed by the U.S. 9<sup>th</sup> Circuit Court of Appeals to include the social cost of carbon in a regulatory impact analysis for a vehicle fuel economy rule. The Court stated that “[w]hile the record shows that there is a range of values, the value of carbon emissions reduction is certainly not zero.”<sup>86</sup>

In 2009, the Council of Economic Advisors and the Office of Management and Budget convened the Interagency Working Group on the Social Cost of Greenhouse Gases<sup>87</sup> (IWG) to develop a methodology for estimating the social cost of carbon (SC-CO<sub>2</sub>). This methodology relied on a standardized range of assumptions and could be used consistently when estimating the benefits of regulations across agencies and around the world. The IWG, comprised of scientific and economic experts, recommended the use of SC-CO<sub>2</sub> values based on three integrated assessment models (IAMs) developed over decades of global peer-reviewed research.<sup>88</sup>

In this Scoping Plan, CARB utilizes the current IWG supported SC-CO<sub>2</sub> values to consider the social costs of actions to reduce GHG emissions. This approach is in line with Executive Orders including 12866 and the OMB Circular A-4 of September 17, 2003, and reflects the best available science in the estimation of the socio-economic impacts of carbon.<sup>89</sup> CARB is aware that the current federal administration has recently withdrawn certain social cost of carbon reports as no longer representative of federal governmental policy.<sup>90</sup> However, this determination does not call into question the validity and scientific integrity of federal social

87 Originally titled the Interagency Working Group on the Social Cost of Carbon, the IWG was renamed in 2016.

88 Additional technical detail on the IWG process is available in the Technical Updates of the Social Cost of Carbon for Regulatory Impact Analysis – Under Executive Order 12866. Iterations of the Updates are available at: <https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/for-agencies/Social-Cost-of-Carbon-for-RIA.pdf>, <https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/scc-tds-final-july-2015.pdf>, and [https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/scc\\_tsd\\_final\\_clean\\_8\\_26\\_16.pdf](https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/scc_tsd_final_clean_8_26_16.pdf).

89 OMB circular A-4 is available at: <https://www.transportation.gov/sites/dot.gov/files/docs/OMB%20Circular%20No.%20A-4.pdf>.

90 See Presidential Executive Order, March 28, 2017, sec. 5(b).

cost of carbon work, or the merit of independent scientific work. Indeed, the IWG’s work remains relevant, reliable, and appropriate for use for these purposes.

The IWG describes the social costs of carbon as follows:

*The social cost of carbon (SC-CO<sub>2</sub>) for a given year is an estimate, in dollars, of the present discounted value of the future damage caused by a 1-metric ton increase in carbon dioxide (CO<sub>2</sub>) emissions into the atmosphere in that year, or equivalently, the benefits of reducing CO<sub>2</sub> emissions by the same amount in that year. The SC-CO<sub>2</sub> is intended to provide a comprehensive measure of the net damages – that is, the monetized value of the net impacts – from global climate change that result from an additional ton of CO<sub>2</sub>.*

*These damages include, but are not limited to, changes in net agricultural productivity, energy use, human health, property damage from increased flood risk, as well as nonmarket damages, such as the services that natural ecosystems provide to society. Many of these damages from CO<sub>2</sub> emissions today will affect economic outcomes throughout the next several centuries.<sup>91</sup>*

Table 7. presents the range of IWG SC-CO<sub>2</sub> values used in regulatory assessments including this Scoping Plan.<sup>92</sup>

**TABLE 7: SC-CO<sub>2</sub>, 2015-2030 (IN 2007 \$ PER METRIC TON)**

| Year | 5 Percent Discount Rate | 3 Percent Discount Rate | 2.5 Percent Discount Rate |
|------|-------------------------|-------------------------|---------------------------|
| 2015 | \$11                    | \$36                    | \$56                      |
| 2020 | \$12                    | \$42                    | \$62                      |
| 2025 | \$14                    | \$46                    | \$68                      |
| 2030 | \$16                    | \$50                    | \$73                      |

The SC-CO<sub>2</sub> is year specific, that is, the IAMs estimate the environmental damages from a given year in the future and discount the value of the damages back to the present. For example, the SC-CO<sub>2</sub> for the year 2030 represents the value of climate change damages from a release of CO<sub>2</sub> in 2030 discounted back to today. The SC-CO<sub>2</sub> increases over time as systems become stressed from the aggregate impacts of climate change and future emissions cause incrementally larger damages. Table 7 presents the SC-CO<sub>2</sub> across a range of discount rates – or the value today of preventing environmental damages in the future. A higher discount rate decreases the value placed on future environmental damages. This Scoping Plan utilizes the IWG standardized range of discount rates, from 2.5 to 5 percent to represent varying valuation of future damages.

The SC-CO<sub>2</sub> is highly sensitive to the discount rate. Higher discount rates decrease the value today of future environmental damages. This Scoping Plan utilizes the IWG standardized range of discount rates, from 2.5 to 5 percent to represent varying valuation of future damages. The value today of environmental damages in 2030 is higher under the 2.5 percent discount rate compared to the 3 or 5 percent discount rate, reflecting the trade-off of consumption today and future damages. The IWG estimates the SC-CO<sub>2</sub> across a range of discount rates that encompass a variety of assumptions regarding the correlation between climate damages and consumption of goods and is consistent with OMB’s Circular A-4 guidance.<sup>93</sup>

There is an active discussion within government and academia about the role of SC-CO<sub>2</sub> in assessing regulations, quantifying avoided climate damages, and the values themselves. In January 2017, the National Academies of Sciences, Engineering, and Medicine (NAS) released a report examining potential approaches for a comprehensive update to the SC-CO<sub>2</sub> methodology to ensure resulting cost estimates reflect the best available science. The NAS review did not modify the estimated values of the SC-CO<sub>2</sub>, but evaluated the models, assumptions, handling of uncertainty, and discounting used in the estimating of the SC-CO<sub>2</sub>. The report titled, “Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide,” recommends near-term improvements to the existing IWG SC-CO<sub>2</sub> as well as a long-term strategy to more comprehensive updates.<sup>94</sup> The State will continue to follow updates to the IWG SC-CO<sub>2</sub>, including changes

91 From The National Academies, Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide, 2017, available at: <http://www.nap.edu/24651>

92 The SC-CO<sub>2</sub> values as of July 2015 are available at: <https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/scc-tsd-final-july-2015.pdf>

93 The National Academies, Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide, 2017, available at: <http://www.nap.edu/24651>.

94 The National Academies, Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide, 2017, available at:

outlined in the NAS report, and incorporate appropriate peer-reviewed modifications to estimates based on the latest available data and science.

It is important to note that the SC-CO<sub>2</sub>, while intended to be a comprehensive estimate of the damages caused by carbon globally, does not represent the cumulative cost of climate change and air pollution to society. There are additional costs to society outside of the SC-CO<sub>2</sub>, including costs associated with changes in co-pollutants, the social cost of other GHGs including methane and nitrous oxide, and costs that cannot be included due to modeling and data limitations. The IPCC has stated that the IWG SC-CO<sub>2</sub> estimates are likely underestimated due to the omission of significant impacts that cannot be accurately monetized, including important physical, ecological, and economic impacts.<sup>95</sup> CARB will continue engaging with experts to evaluate the comprehensive California-specific impacts of climate change and air pollution.

### The Social Cost of GHG Emissions

Social costs for methane (SC-CH<sub>4</sub>) and nitrous oxide (SC-N<sub>2</sub>O) have also been developed using methodology consistent with that used in estimating the IWG SC-CO<sub>2</sub>. These social costs have also been endorsed by the IWG and have been used in federal regulatory analyses.<sup>96</sup> Along with the SC-CO<sub>2</sub>, the State also supports the use of the SC-CH<sub>4</sub> and SC-N<sub>2</sub>O in monetizing the impacts of GHG emissions.

While the SC-CO<sub>2</sub>, SC-CH<sub>4</sub>, and SC-N<sub>2</sub>O provide metrics to account for the social costs of climate change, California will continue to analyze ways to more comprehensively identify the costs of climate change and air pollution to all Californians. This will include following updates to the IWG methodology and social costs of GHGs and incorporating the SC-CO<sub>2</sub>, SC-CH<sub>4</sub>, and SC-N<sub>2</sub>O into regulatory analyses.

Table 9 presents the estimated social cost for each policy or measure considered in the development of the Scoping Plan in 2030. For each measure or policy, Table 9 includes the range of the IWG SC-CO<sub>2</sub> values that result from the anticipated range of GHG reductions in 2030 presented in Appendix G. The SC-CO<sub>2</sub> range is obtained using the IWG SC-CO<sub>2</sub> values in 2030 at the 2.5, 3, and 5 percent discount rates. These values (of \$16 using the 5 percent discount rate, \$50 using the 3 percent discount rate, and \$73 using the 2.5 percent discount rate) are translated into 2015 dollars and multiplied across the range of estimated reductions by measure in 2030 to estimate the value of avoided social costs from each measure in that year.<sup>97</sup>

Implementation of the SLCP Strategy will result in reduction of a variety of GHGs, including methane and HFCs, which reported in carbon dioxide equivalent (CO<sub>2</sub>e). While there is no social cost of CO<sub>2</sub>e, the avoided damages associated with the methane reductions outlined in the SLCP Strategy are estimated in Table 9 using the IWG SC-CH<sub>4</sub> as presented in Table 8.<sup>98</sup>

**TABLE 8: SC-CH<sub>4</sub>, 2015-2030 (IN 2007\$ PER METRIC TON)**

| Year | 5 Percent Discount Rate | 3 Percent Discount Rate | 2.5 Percent Discount Rate |
|------|-------------------------|-------------------------|---------------------------|
| 2015 | \$450                   | \$1000                  | \$1400                    |
| 2020 | \$540                   | \$1200                  | \$1600                    |
| 2025 | \$650                   | \$1400                  | \$1800                    |
| 2030 | \$760                   | \$1600                  | \$2000                    |

The range of SC-CH<sub>4</sub> is obtained using the IWG SC-CH<sub>4</sub> values in 2030 at the 2.5, 3, and 5 percent discount rates. The SC-CH<sub>4</sub> values (e.g., \$760 using the 5 percent discount rate, \$1,600 using the 3 percent discount rate, and \$2,000 using the 2.5 percent discount rate) are translated into 2015 dollars and multiplied across the range of estimated methane reductions in 2030 to estimate the value of climate benefits from the SLCP

 96 More information is available at: [https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/august\\_2016\\_sc\\_ch4\\_sc\\_n2o\\_addendum\\_final\\_8\\_26\\_16.pdf](https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/august_2016_sc_ch4_sc_n2o_addendum_final_8_26_16.pdf)  
 97 The IWG SC-CO<sub>2</sub> values are in 2007 dollars. In 2015 dollars, \$16, \$50, and \$73 in 2007 translates to about \$18, \$57, and \$83, respectively, based on the Bureau of Labor Statistics GDP Series Table 1.1.4.  
 98 [https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/august\\_2016\\_sc\\_ch4\\_sc\\_n2o\\_addendum\\_final\\_8\\_26\\_16.pdf](https://obamawhitehouse.archives.gov/sites/default/files/omb/inforeg/august_2016_sc_ch4_sc_n2o_addendum_final_8_26_16.pdf)

Strategy.<sup>99</sup> As the social cost associated with the SLCP Strategy does not include the impact associated with non-methane reductions, Table 9 underestimates the avoided social costs of this Scoping Plan as calculated using the IWG valuations.

As this Scoping Plan is a suite of policies developed to reduce GHGs to a specific level in 2030, any alternative scenario that also achieves the 2030 target (with the same proportion of carbon dioxide and methane reductions) will have the same avoided social cost, as estimated using the IWG social cost of GHGs, for the single year 2030. The social costs of alternatives could vary if the 2030 target is achieved with vastly different ratios of carbon dioxide to methane reductions. However, all alternatives in this Scoping Plan are anticipated to achieve the same proportion of carbon dioxide and methane reductions and will therefore all have the same estimated avoided social damage or social cost. This social cost, as estimated in 2030 using the IWG SC-CO<sub>2</sub> and SC-CH<sub>4</sub>, ranges from \$1.9 to \$11.2 billion using the 2.5 to 5 percent discount rates, and is estimated at \$5.0 to \$7.8 billion using the 3 percent discount rate. For example, in Table 9 the CH<sub>4</sub> reductions for the SCLP strategy are about 1 MMTCH<sub>4</sub>. That value is multiplied by the 2030 SC-CH<sub>4</sub> values in Table 8 for the 2030 values at the 2.5 and 5 percent discount rates to get a range of \$860 to \$2,260 in 2015 dollars.

---

<sup>99</sup> The IWG.SC-CH<sub>4</sub> values are in 2007 dollars. In 2015 dollars, the range of SC-CH<sub>4</sub> translates to about \$858, \$1,807, and \$2,259, for the 5 percent, 3 percent, and 2.5 percent discount rates, respectively. These values are based on the Bureau of Labor Statistics GDP Series Table 1.1.4.

**TABLE 9: ESTIMATED SOCIAL COST (AVOIDED ECONOMIC DAMAGES) OF POLICIES OR MEASURES CONSIDERED IN THE 2017 SCOPING PLAN DEVELOPMENT<sup>#</sup>**

| Measure (Measures in bold are included in the Scoping Plan)                                                                                                     | Range of Social Cost of Carbon \$ million USD (2015 dollars)** |

| Scoping Plan Scenario SC-CH <sub>4</sub>                                                                                                                        | \$860–\$2,260                                                  |
| <b>Scoping Plan Scenario (Total)</b>                                                                                                                            | <b>\$1,920–\$11,230</b>                                        |

**Note:** All values are rounded. The values for SC-CO<sub>2</sub> and SC-CH<sub>4</sub> in 2030 are presented in Tables 7 and 8.

\* Where enhancements have been made to a measure or policy, the ranges in emissions reductions are incremental to the original measure. For example, the ranges for the 25 percent LCFS are incremental to the emissions ranges for the 18 percent LCFS.

# Measures included in the Scoping Plan and the All Cap-and-Trade measure reflect emissions reductions from modeling changes after passage of AB 398. Emissions reductions from all other measures reflect modeling completed prior to passage of AB 398. See Appendix G for additional details.

\*\* All values have been rounded to the nearest 0 or 5.

~ Some measures do not show a significant change in 2030 when there is an incremental increase in measure stringency or when modeling uncertainty was factored.

## Social Costs of GHGs in Relation to Cost-Effectiveness

AB 32 includes a requirement that “rules and regulations achieve the maximum technologically feasible and cost-effective greenhouse gas emissions reductions.”<sup>100</sup> Under AB 32, cost-effectiveness means the relative cost per metric ton of various GHG reduction strategies, which is the traditional cost metric associated with emission control. In contrast, the SC-CO<sub>2</sub>, SC-CH<sub>4</sub>, and SC-N<sub>2</sub>O are estimates of the economic benefits, and not the cost of reducing GHG emissions.

There may be technologies or policies that do not appear to be cost-effective when compared to the SC-CO<sub>2</sub>, SC-CH<sub>4</sub>, and SC-N<sub>2</sub>O associated with GHG reductions. However, these technologies or policies may result in other benefits that are not reflected in the IWG social costs. For instance, the evaluation of social costs might include health impacts due to changes in local air pollution that result from reductions in GHGs, diversification of the portfolio of transportation fuels (a goal outlined in the LCFS) and reductions in criteria pollutant emissions from power plants (as in the RPS).

## Estimated Cost Per Metric Ton by Measure

AB 197 also requires an estimation of the cost-effectiveness of the potential measures evaluated for the Scoping Plan. The values provided in Table 10 are estimates of the cost per metric ton of estimated reductions for each measure in 2030. To capture the fuel and GHG impacts of investments made from 2021 through 2030 to meet the 2030 GHG goal, the table also includes an evaluation of the cost per metric ton based on the cumulative GHG emissions reductions and cumulative costs or savings for each potential measure from 2021 through 2030. While it is important to understand the relative cost effectiveness of measures, the economic analysis presented in Appendix E provides a more comprehensive analysis of how the Scoping Plan and alternative scenarios affect the State’s economy and jobs.

The cost (or savings) per metric ton of CO<sub>2</sub>e reduced for each of the measures is one metric for comparing the performance of the measures. Additional factors beyond the cost per metric ton that could be considered include continuity with existing laws and policies, implementation feasibility, contribution to fuel diversity and technology transformation goals, as well as health and other benefits to California. These considerations are not reflected in the cost per ton metric below.

Because many of the measures interact with each other, isolating the cost and GHG savings of an individual measures is analytically challenging. For example, the performance of the renewable electricity measure impacts the GHG savings and cost per ton associated with increasing the use of electric vehicles. Likewise, the increased use of electric vehicles may increase flexible loads on the electric system, enabling increased levels of renewable electricity to be achieved more cost effectively. Both the renewable electricity measure and the increased use of electric vehicles affect the cost of meeting the Low-Carbon Fuel Standard.

For most of the measures shown in Table 10, the 2030 cost per metric ton is isolated from the other measures by performing a series of sensitivity model runs in the California PATHWAYS model. This cost per metric ton is calculated as the difference in the 2030 annualized cost (or savings) with and without the measure. For the measures in the Scoping Plan Scenario, the analysis starts with the Scoping Plan Scenario PATHWAYS estimates, and then costs and emissions are recalculated with each measure removed individually. For measures included in the No Cap-and-Trade Scenario, the approach starts with the No Cap-and-Trade Scenario PATHWAYS estimates and then each measure is removed. Using this approach, the incremental impact on GHG emissions and costs for each measure is calculated. The incremental cost in 2030 is divided by the incremental GHG emission impact to calculate the cost per ton in 2030.

The same approach of removing each measure individually is used to estimate the incremental cost and emission impacts of each measure for the period 2021 to 2030. For each measure, its annual incremental costs from 2021 to 2030 are calculated and then discounted to 2021 using the discount rate used in PATHWAYS to levelize capital costs over the life of equipment. As a result, the discounted incremental cost of each measure is the total investment required from 2021 to 2030 to achieve each measure’s emissions reductions from 2021 to 2030 (including both incremental capital costs and incremental fuel savings/expenditures). This discounted cost for each measure was divided by its cumulative emissions reductions from 2021 to 2030 to calculate a cost per ton for the measure for the period. A second calculation was also made that divides each measure’s discounted cost by its discounted emissions reductions from 2021 to 2030. The

same discount rate is used to discount both incremental costs and emissions in this approach. The estimates are presented in the table below.

Costs that represent transfers within the state, such as incentive payments for early retirement of equipment, are not included in this California total cost metric. The cost ranges shown below represent some of the uncertainty inherent in estimating this metric. The details of how the ranges for each measure were estimated are described in the footnotes below. All cost estimates have been rounded representing further uncertainty in individual values.

It is important to note that this cost per metric ton does not represent an expected market price value for carbon mitigation associated with these measures. In addition, the single year (2030) values and the estimates that encompass 2021 to 2030 do not capture the fuel savings or GHG reductions associated with the full economic lifetime of measures that have been implemented by 2030, but whose impacts extend beyond 2030. The estimates also do not capture the climate or health benefits of the GHG mitigation measures. Table 10 also notes the measures for which sources other than the PATHWAYS model were used to develop estimates of the cost per metric ton. The estimates in the table indicate that the relative cost of the measures is reasonably consistent across the different measures of cost per metric ton. Measures that are relatively less costly using the 2030 cost per metric ton are also less costly using the cost per metric ton based on the period 2021 to 2030. However, for several measures the sign of the estimate differs, such that in 2030 the measure has a positive cost while there is a negative cost for the period 2021 to 2030. This difference in sign occurs because the measure includes increasingly costly investments toward the end of the period examined. By examining only 2030, the lower cost components of the measure that occur in earlier years are omitted, resulting in a higher cost estimate for 2030 alone.

**TABLE 10: ESTIMATED COST PER METRIC TON OF MEASURES CONSIDERED IN THE 2017 SCOPING PLAN DEVELOPMENT AND AVERAGED FROM 2021 THROUGH 2030**

Important: As individual measures are designed and implemented they will be subject to further evaluation and refinement and public review, which may result in different findings than presented below. The ranges are estimates that represent current assumptions of how programs may be implemented and may vary greatly depending on the design, implementation, and performance of the policies and measures. Measures in bold text are included in the Scoping Plan.

| Measure                                                                                                                                                                           | Cost/metric ton in 2030* | Cost/metric ton 2021-2030** |

\* Where enhancements have been made to a measure or policy, the cost per metric ton are incremental to the original measure. For example, the cost per metric ton for the 25 percent LCFS are incremental to the cost per metric ton for the 18 percent LCFS.

\*\* The lower values use a cost discount rate of 10 percent and cumulative emissions for the period 2021 to 2030. The higher values discount both costs and emissions using a discount rate of 10 percent.

a Cost estimate is based on PATHWAYS sensitivity analysis as described in the main text.

b Cost estimate is based on PATHWAYS sensitivity analysis as described in the main text.

c Liquid biofuel values are calculated as the average unsubsidized cost of biofuels supplied above that of an equivalent volume of fossil fuels. These values do not reflect impacts from other biofuel policies, such as the Renewable Fuel Standard or production tax credits, that are partially supported by fuel purchasers/taxpayers outside of California. Therefore, these values do not represent LCFS program costs or potential LCFS credit prices.

d See Appendix D

e Cost estimate is based on PATHWAYS sensitivity analysis as described in the main text.

f Cost estimate is based on PATHWAYS sensitivity analysis as described in the main text. The cost per metric ton does not represent the results of the CPUC's or CEC's standard cost-effectiveness evaluation tests

## Health Analyses

---

Climate mitigation will result in both environmental and health benefits. This section presents information about the potential health benefits of the Scoping Plan. The impacts are primarily from reduced particulate matter pollution, reduced toxics pollution (both diesel combustion particles and other toxic pollutants), and the health benefits of increased physical activity that will result from more active modes of transportation such as walking and biking in lieu of driving. CARB is using the AB 197 air quality estimates in Table 5 as a proxy to understand the potential health impacts from the Scoping Plan. There is uncertainty in the air quality estimates and that is carried through to the health impacts evaluation presented here. In the future, CARB will be working to explore how to better integrate health analysis and health considerations in the design and implementation of climate programs.

Because the health endpoints of each of these benefits is different (e.g., fewer incidences of premature mortality, lower cancer risk, and fewer incidences of heart disease), the methodologies for estimating the benefits differ. Further, the methodologies are statistical estimates of adverse health outcomes aggregated to the statewide level. Therefore, this information should only be used to understand the relative health benefits of the various strategies and should not be taken as an absolute estimate of the health outcomes of the Scoping Plan statewide, or within a specific community. The latter is a function of the unique exposure to air pollutants within each community and each individual's choice of more active transport modes that increase physical activity.

The estimates of health benefits in this section do not include any potential avoided adverse health impacts associated with a reduction in global climate change. While we recognize that mitigating climate change will, for example, prevent atmospheric temperature rise, thereby preventing increases in ozone in California, which will result in fewer breathing problems, the connection is difficult to estimate or model. Since it takes collective global action to mitigate climate change, the following analyses do not attempt to quantify the improved health outcomes from reducing or stopping the rise in global temperatures.

The estimated statewide health benefits of the Scoping Plan are dominated by reductions in particulate matter from mobile sources and wood burning and a switch to more active transport modes. In particular, the focus on the impacts of exposure to particulate matter from mobile sources is expected because this is a major cause of air pollution statewide. For this reason, the actions concerning mobile sources in the Scoping Plan were specifically developed with the goal of achieving health-based air quality standards by reducing criteria and toxics emissions as well as GHG emissions simultaneously. In addition, actions that support walkable communities not only result in reduced VMT and related GHG emissions, but promote active transport and increased physical activity that is strongly related to improved health.

Table 11 provides a summary of the total estimated health benefits from the relevant metrics for the Scoping Plan. The sections below summarize the methodologies used to estimate these benefits. More detail on how these estimates were calculated can be found in Appendix G. The air pollutant values used in estimating the health impacts are from Table 5 and all caveats in the estimation of the air quality impacts must be considered when reviewing the health impacts discussed below as the air pollutant values are likely overestimates based on assigned relationships to GHGs that may not be real.

### Potential Health Impacts of Reductions in Particulate Matter Air Pollution

CARB relied on an U.S. EPA-approved methodology to estimate the health impacts of reducing air pollution by actions in the Scoping Plan. This methodology relies on an incidents-per-ton factor to quantify the health benefits of directly emitted (diesel particles and wood smoke) and secondary PM<sub>2.5</sub> formed from oxides of nitrogen from reductions due to regulatory controls. It is similar in concept to the methodology developed by the U.S. EPA for comparable estimations<sup>101</sup>, but uses California air basin specific relationships between emissions and air quality. The basis of the methodology is an approximately linear relationship between changes in PM<sub>2.5</sub> emissions and estimated changes in health outcomes. In this methodology, the number of premature deaths is estimated by multiplying emissions by the incidents-per-ton scaling factor. The factors are derived from studies that correlate the number of incidents (premature deaths, hospitalizations, emergency room visits) associated with exposure to PM<sub>2.5</sub>.

## Potential Health Impacts of Reductions in Toxic Air Pollution

A number of factors complicate any attempt to evaluate the health benefits of reducing exposure to toxic air pollution. First, there are hundreds of individual chemicals of concern with widely varying health effects and potencies. Therefore, a single metric is of limited value in capturing the range of potential toxics benefits. Furthermore, unlike the criteria pollutants whose impacts are generally measured on regional scales, toxics pose concern for both near-source impacts and larger-scale photochemical transformations and transport. Finally, the accepted scientific understanding for cancer risk is that there is usually no safe threshold for exposures to carcinogens. Therefore, cancer risks are usually expressed as “chances per million” of contracting cancer over a (70-year) lifetime exposure (in Table 11 lifetime exposure is provided in the far right column).

In light of these complexities, CARB relied on the most recent National Air Toxics Assessment (NATA) conducted by the U.S. EPA.<sup>102</sup> The NATA 2011 models the potential risks from breathing emissions of approximately 180 toxic air pollutants across the country. Modeled cancer risk results are available by census tract. The NATA data cover industrial facilities, mobile sources (on-road and off-road), small area-wide sources, and more. CARB multiplied the NATA “cancer risk-per-million” values by census tract by the census tract’s population, in order to estimate a population-weighted metric that could be aggregated to the statewide level. This statistic should not be construed as actual real-world cancers (due to the many uncertainties in estimating the real-world levels of risk). Next, CARB applied the percent reductions in emissions due to Scoping Plan actions, in order to obtain an estimate of the “avoided incidence” of statistical lifetime cancers attributable to implementation of the Scoping Plan. Again, the “avoided incidence” is a construct designed to provide a useful statistical metric for comparative purposes among scenarios. It should not be construed to be a real-world parameter.

## Potential Health Impacts of Active Transportation

High levels of active transportation have been linked to improved health and reduced premature mortality by increasing daily physical activity, representing a major direct co-benefit of using active transportation as a strategy to reduce GHG emissions. The benefits of physical activity can be very large. Individuals who are active for approximately 12 minutes a day have a 20 percent lower risk of dying early than those who are active for just 5 minutes a day and those who are active an hour a day, have close to a 40 percent lower risk of premature death.<sup>103</sup>

The Scoping Plan includes reductions in VMT, which can be achieved in a number of ways, including increased active transportation. To estimate the potential health benefits of active transport, CARB staff reviewed work done by the California Department of Public Health (CDPH) concerning the potential health benefits associated with the Caltrans Strategic Management Plan. In this Management Plan, Caltrans set a target for increasing the adoption of active transportation, aiming for a doubling of walking and a tripling of bicycle trips by 2020 compared to 2010. While this plan itself is not part of the Scoping Plan, it helps provide a sense of the magnitude of health benefits associated with increased active transportation.

CDPH performed a risk assessment to compare the number of premature deaths due to physical inactivity and traffic injuries in the baseline year of 2010 to the year 2020, assuming that Caltrans’ walking and bicycling mode share targets were met.<sup>104</sup> CDPH’s methodology has been documented in a publicly available technical manual<sup>105</sup> and the model has appeared in many peer-reviewed research articles.<sup>106</sup> It has been in development

Whitfield, G. P., Meehan, L. A., Maizlish, N., & Wendel, A. M. (2016). The Integrated Transport and Health Impact Modeling

since 2009, and a California-specific version was released with a recent update in November 2016.<sup>107</sup>

CDPH estimated that 2,100 premature deaths annually would be avoided if Californians met the Management Plan’s 2020 targets were met by Californians compared to 2010 travel patterns. A recent paper by Dr. Maizlish et al<sup>108</sup> quantified the health co-benefits of the preferred Sustainable Communities Strategies scenarios (compared to the 2010 baseline travel pattern) for the major Metropolitan Planning Organizations using the same methodology and found that 940 deaths annually would be avoided. For both analyses, there were significant reductions in cause-specific premature mortality due to increased physical activity, which was slightly counteracted by a much smaller increase in fatal traffic injuries due to the increased walking and bicycling. When taken together, the health benefit of increasing active transportation greatly outweighed the increased mortality from road traffic collisions. The Scoping Plan goals related to active transportation are more aggressive than those in both the Maizlish et al. 2017 publication and the analysis by CDPH for the Management Plan. Therefore, CARB staff used the CDPH estimate of approximately 2,100 fewer premature deaths from the Management Plan as a lower bound of what could be realized through implementation of the VMT reductions and active transport goals called for in the Scoping Plan Scenario.

**TABLE 11: SUMMARY OF RANGES OF ESTIMATED HEALTH IMPACTS FOR THE SCOPING PLAN SCENARIO IN 2030**

|                    | Fewer Premature Deaths | Fewer Hospitalizations (all) | Fewer ER visits | Fewer cancers * |
|--------------------|------------------------|------------------------------|-----------------|-----------------|
| Diesel PM          | ~60-91                 | ~9-14                        | ~25-38          |                 |
| Secondary PM       | ~76-120                | ~11-17                       | ~33-50          |                 |
| Toxics             |                        |                              |                 | ~21-61          |
| Wood smoke         | ~1000                  | ~ 148                        | ~ 418           |                 |
| Active Transport** | >2100                  |                              |                 |                 |
| <b>Total</b>       | ~3300                  | ~180                         | ~500            | ~21-61          |

\* This metric should not be construed as actual real-world cancer cases. It is intended to be a comparative metric, based on the NATA estimates of lifetime cancer risk (chances-per-million over a 70 year life-time exposure) by census tract multiplied by the tract population.

\*\* Reduction in premature death assumes meeting the CSMP 2020 mode shift target.

Note: The numbers in the table represent individual avoided incidences.

## Future Health Activities

As Table 11 shows, the Scoping Plan measures would have significant potential positive health outcomes. The integrated nature of the strategies to reduce emissions of GHGs and criteria and toxics emissions could provide multiple benefits. Actions to reduce black carbon from wood smoke are reducing the same particles that lead to premature mortality. Reductions in fossil combustion will not only reduce GHG emissions, but also toxics emissions. Finally, reducing VMT with strategies that provide opportunities for people to switch to active transport modes can have very large health benefits resulting from increased physical activity.

In recognition of the potential for significant positive health benefits of the Scoping Plan, CARB is initiating a process to better understand how to integrate health analysis broadly into the design and implementation of our climate change programs with the goal of maximizing the health benefits. Although health impact assessments have been used to inform CARB's policymaking, these analyses have not been consistently integrated into the general up-front design of CARB programs. To begin the effort to increase health benefits from climate change mitigation policies, CARB will convene a public meeting in Spring 2018 to solicit input on how best to incorporate health analyses into our policy development. CARB staff will seek appropriate tools for these analyses and will assemble a team of academic advisors to provide input on the latest developments in methods and data sources.

## Economic Analyses

---

The following section outlines the economic impact of the Scoping Plan relative to the business-as-usual Reference Scenario. Additional detail on the economic analysis, including modeling details and the estimated economic impact of alternative scenarios is presented in Appendix E.

The Scoping Plan outlines a path to achieve the SB 32 target that requires less reliance on fossil fuels and increased investment in low carbon fuels and clean energy technologies. Through this shift, California can lead the world in developing the technologies needed to reduce the global risks of climate change. This builds on California's current successes of reducing GHG emissions while also developing a cleaner, resilient economy that uses less energy and generates less pollution. Innovation in low-carbon technologies will continue to open growth opportunities for investors and businesses in California. As modeled, the analysis in this Scoping Plan suggests that the costs of transitioning to this lower carbon economy are small, even without counting the potential opportunities for new industries and innovation in California. Under the Scoping Plan, the California economy, employment, and personal income will continue to grow as California businesses and consumers make clean energy investments and improve efficiency and productivity to reduce energy costs.

In 2030, the California economy is projected to grow to \$3.4 trillion, an average growth rate of 2.2 percent per year from 2021 to 2030. It is not anticipated that implementation of the Scoping Plan will change the growth of annual State Gross Domestic Product (GDP). Further, this growth in GDP will occur under the entire projected range of Cap-and-Trade Program allowance prices. Based on this analysis, in 2030 the California economy will take only three months longer to grow to the GDP estimated in the absence of the Scoping Plan—referred to as the Reference Scenario. The impact of the Scoping Plan on job growth is also negligible, with employment less than one half of one percent smaller in 2030 compared to the Reference Scenario.

Additionally, reducing GHG emissions 40 percent below 1990 levels under the Scoping Plan will lead to avoided social damages from climate change on the order of \$1.9 to \$11.2 billion, as estimated using the SC-CO<sub>2</sub> and SC-CH<sub>4</sub>, as well as additional potential savings from reductions in air pollution and petroleum dependence. These impacts are not accounted for in this economic analysis. The estimated impact to California households is also modest in 2030. In 2030, the average annual household impact of the Scoping Plan ranges from \$115 to \$280, depending on the price of reductions under the Cap-and-Trade Program.<sup>109</sup> Estimated personal income in California is also relatively unchanged by the implementation of the Scoping Plan.

---

<sup>109</sup> Household projections are obtained from the California Department of Finance and were access on March 16, 2017 at: <http://www.dof.ca.gov/Forecasting/Demographics/projections/>.

## Overview of Economic Modeling

Two models are used to estimate the economic impact of the Scoping Plan and California's continued clean energy transition: (1) the California PATHWAYS model, and (2) the Regional Economic Models, Inc. (REMI) Policy Insight Plus model. The California PATHWAYS model estimates the direct costs and GHG emissions reductions of implementing the prescriptive (or non-Cap-and-Trade) measures in the Scoping Plan relative to the BAU scenario.<sup>110</sup> Direct costs are the sum of the incremental changes in capital expenditures and fuel expenditures, including fuel savings for reduced energy use from efficiency measures. In most cases, reducing GHG emissions requires the use of more expensive equipment that can be operated using less fuel. In the Scoping Plan, the prescriptive measures modeled in PATHWAYS account for a portion of the GHG reductions required to meet the 2030 target. The remaining reductions are delivered through the Cap-and-Trade Program. The direct costs associated with the Cap-and-Trade Program are calculated outside of PATHWAYS based on an assumed range of Cap-and-Trade allowance prices from 2021 through 2030.

To estimate the future costs of the Scoping Plan, this economic analysis necessarily creates a hypothetical future California that is essentially identical to today, adjusted for currently existing climate policy as well as projected economic and population growth through 2030. The analysis cannot predict the types of innovation that will create efficiencies nor can it fully account for the significant economic benefits associated with reducing emissions. Rather, the economic modeling is conducted by estimating incremental capital and clean fuel costs of measures and assigning those costs to certain sectors within this hypothetical future.

The macroeconomic impacts of the Scoping Plan on the California economy are modeled using the REMI model with output from California PATHWAYS and estimated Cap-and-Trade Program costs as inputs. Additional methodological detail is presented in Appendix E.<sup>111</sup>

## Estimated Cost of Prescriptive Measures

As described above, the Scoping Plan combines new measures addressing legislative mandates and the extension of existing measures, including a comprehensive cap on overall GHG emissions from the State's largest sources of pollution. The PATHWAYS model calculates costs and GHG emissions reductions associated with the prescriptive measures in the Scoping Plan. Changes in energy use and capital investment are calculated in PATHWAYS and represent the estimated cost of achieving an estimated 50 to 70 percent of the cumulative GHG reductions required to reach the SB 32 target between 2021 and 2030. The Cap-and-Trade Program delivers any remaining reductions, as shown in Figure 8.

Table 12 outlines the cost of prescriptive measures by sector in 2030, compared to the Reference Scenario, as calculated in PATHWAYS. Estimated capital costs of equipment are leveled over the life of the equipment using a 10 percent discount rate and fuel costs are calculated on an annual basis.<sup>112</sup> The costs in Table 12 are disaggregated into capital costs and fuel costs, which includes the varying costs of gasoline, diesel, biofuels, natural gas, electricity and other fuels.<sup>113</sup> Table 12 assumes that all prescriptive measures deliver anticipated GHG reductions, and does not include any uncertainty in GHG reductions or cost.<sup>114</sup> The impact of uncertainty in GHG reductions is explored in more detail in Appendices E, which include additional detail on measure, cost, and Reference Scenario uncertainty.

The prescriptive measures result in incremental capital investments of \$6.7 billion per year in 2030, but these annual capital costs are nearly offset by annual fuel savings of \$6.6 billion in 2030. The incremental net cost of prescriptive measures in the Scoping Plan is estimated at \$100 million in 2030, which represents 0.03 percent of the projected California economy in 2030. The residential and transportation sectors are anticipated to see net savings in 2030 as fuel savings for these areas vastly outweigh annual capital investment. Several sectors will see a net cost increase from implementation of the prescriptive measures. The industrial sector sees higher fuel costs relative to the Reference Scenario. In the agriculture sector, capital expenditures are due to investments in more efficient lighting and the mitigation of agricultural methane and nitrogen oxides. Agricultural fuel costs increase due to higher electricity and liquid biofuel costs.

110 The PATHWAYS modeling is described in Chapter 2, and additional detail is presented in Appendix D.

111 Additional modeling details are available at the REMI PI+ webpage: <http://www.remi.com/products/pi>.

112 PATHWAYS costs are calculated in real \$2012. For this analysis, all costs are reported in \$2015. The PATHWAYS costs are inflated using Bureau of Economic Analysis (BEA) data available at: <https://www.bea.gov/iTable/iTable.cfm?ReqID=9#reqid=9&step=1&isuri=1&903=4>.

113 Additional information on the fuels included in PATHWAYS is available at: [www.arb.ca.gov/cc/scopingplan/meetings/1142016/e3pathways.pdf](http://www.arb.ca.gov/cc/scopingplan/meetings/1142016/e3pathways.pdf).

114 More information on the inputs to the California PATHWAYS model is available at: [www.arb.ca.gov/cc/scopingplan/scoping\\_plan\\_scenario\\_description2016-12-01.pdf](http://www.arb.ca.gov/cc/scopingplan/scoping_plan_scenario_description2016-12-01.pdf).

**TABLE 12: CHANGE IN PATHWAYS SECTOR COSTS IN 2030 RELATIVE TO THE REFERENCE SCENARIO (BILLION \$2015)<sup>115</sup>**

| End Use Sector <sup>116</sup>                     | Levelized Capital Cost | Fuel Cost     | Total Annual Cost |
|---------------------------------------------------|------------------------|---------------|-------------------|
| Residential                                       | \$0.1                  | -\$1.2        | -\$1.1            |
| Commercial                                        | \$1.8                  | -\$1.8        | \$0.1             |
| Transportation                                    | \$3.5                  | -\$3.8        | -\$0.3            |
| Industrial                                        | \$0.8                  | \$0.3         | \$0.5             |

Note: Table values may not add due to rounding.

### Estimated Cost of the Cap-and-Trade Program

The direct cost of achieving GHG reductions through the Cap-and-Trade Program is estimated outside of PATHWAYS. The Cap-and-Trade Program sets an economy-wide GHG emissions cap and gives firms the flexibility to choose the lowest-cost approach to reduce emissions. As with the prescriptive measures, the direct costs of any single specific GHG reduction activity under the Cap-and-Trade Program is subject to a large degree of uncertainty. However, as Cap-and-Trade allows covered entities to pursue the reduction options that emerge as the most efficient, overall abatement costs can be bounded by the allowance price. Covered entities should pursue reduction actions with costs less than or equal to the allowance price. An upper bound on the compliance costs under the Cap-and-Trade Program can therefore be estimated by multiplying the range of anticipated allowance prices by the anticipated GHG reductions needed (in conjunction with the reductions achieved through the prescriptive measures) to achieve the SB 32 target.

A large number of factors influence the allowance price, including the ease of substituting lower carbon production methods, consumer price response, the pace of technological progress, and impacts to the price of fuel. Other policy factors that also affect the allowance price include the use of auction proceeds from the sale of State-owned allowances and linkage with other jurisdictions.

Flexibility allows the Cap-and-Trade allowance price to adjust to changes in supply and demand while a firm cap ensures GHG reductions are achieved. This analysis includes a range of allowance prices bounded at the low end by the Cap-and-Trade auction floor price (C+T Floor Price) which represents the minimum sales price for allowances sold at auction and the Allowance Price Containment Reserve Price (C+T Reserve Price), which represents the price at which an additional pool of allowances will be made available to ensure entities can comply with the Cap-and-Trade Program and is the highest anticipated price under the Program. Table 13 outlines the projected allowance prices used in this analysis.<sup>117</sup>

115 PATHWAYS costs reported in \$2012 are inflated to \$2015 using the Bureau of Economic Analysis (BEA) data available at: <https://www.bea.gov/iTable/iTable.cfm?ReqID=9#reqid=9&step=1&isuri=1&903=4>.

116 Information on the end use sectors are available in the California PATHWAYS documentation available at: [www.arb.ca.gov/cc/scopingplan/scopingplan.htm](http://www.arb.ca.gov/cc/scopingplan/scopingplan.htm).

117 The Cap-and-Trade allowance price range is based on the Cap-and-Trade Regulation approved by the Office of Administrative

**TABLE 13: ESTIMATED RANGE OF CAP-AND-TRADE ALLOWANCE PRICE 2021–2030\***

| (\$2015)          | 2021   | 2025   | 2030   |
|-------------------|--------|--------|--------|
| C+T Floor Price   | \$16.2 | \$19.7 | \$25.2 |
| C+T Reserve Price | \$72.9 | \$76.4 | \$81.9 |

\* Based on current regulation in effect October 1, 2017

Uncertainty in the GHG reduction potential of prescriptive measures in the Scoping Plan can affect the cost of achieving the 2030 target. The aggregate emissions cap of the Cap-and-Trade Program ensures that the 2030 target will be met—irrespective of the GHG emissions realized through prescriptive measures. If GHG reductions anticipated under prescriptive measures do not materialize, the Cap-and-Trade Program will be responsible for a larger share of emissions reductions. Under that scenario, the demand for Cap-and-Trade allowances may rise, resulting in an increase in allowance price. While the Cap-and-Trade allowance price may rise, it is highly unlikely that it will rise above the C+T Reserve price, given the program design. If prescriptive measures deliver anticipated GHG reductions, demand for allowances will be low, depressing the price of allowances. However, the C+T Floor Price represents the lowest price at which allowances can be sold at auction.

Table 14 presents the estimated direct cost estimates for GHG reductions achieved through the Cap-and-Trade Program in 2030. These costs represent the lower and upper bounds of the cost of reducing GHG emissions to achieve the SB 32 target under the Scoping Plan. The estimated direct costs range from \$1.6 to \$5.1 billion dollars (in \$2015), depending on the allowance price in 2030. This range highlights the allowance price uncertainty that is a trade-off to the GHG reduction certainty provided by the Cap-and-Trade Program. The estimated cost of GHG reductions is calculated by multiplying the allowance price by the GHG emissions reductions required to achieve the SB 32 target.

## Sensitivity Analysis

In addition to uncertainty in the Cap-and-Trade allowance price and uncertainty in the GHG reductions achieved through the prescriptive measures, there is uncertainty in the GHG emissions that will occur under the Reference Scenario, as presented in Figure 6. There is also uncertainty in costs embedded within the Reference Scenario including the price of oil, other energy costs, and technology costs.

The PATHWAYS incremental cost results are also sensitive to the fossil fuel price assumptions. Altering the fuel price trajectory in the Reference Scenario directly impacts the incremental cost of achieving GHG reductions in the Scoping Plan, as the costs of the Scoping Plan are relative to the Reference Scenario.<sup>118</sup>

The PATHWAYS scenarios use fossil fuel price projections from the Annual Energy Outlook (AEO) 2015 reference case.<sup>119</sup> To estimate the impact of changes in future fuel prices on the estimated incremental cost of the Scoping Plan two sensitivities were conducted. In the low fuel price sensitivity, the AEO low oil and natural gas price case is used to project the future cost of fuels in the Reference Scenario. The cost of the Scoping Plan, relative to the Reference Scenario, increases under these conditions, since fuel savings are less valuable when fuel prices are low. A second sensitivity shows that high future oil and natural gas prices (as projected in the AEO high oil price case) reduce the net cost of the Scoping Plan, relative to the Reference Scenario. This is because avoided fuel savings are more valuable when fuel prices are high. Table 14 outlines the costs and savings from the Scoping Plan (both prescriptive measures and cap-and-trade) under the high and low fuel price sensitivities.

The price of oil and natural gas affects the value of fuel savings (as presented in Table 12), which are estimated to be significant using AEO reference oil and natural gas prices. Under the low fuel price sensitivity,

Law on September 18, 2017. Documentation is available at: [www.arb.ca.gov/regact/2016/capandtrade16/capandtrade16.htm](http://www.arb.ca.gov/regact/2016/capandtrade16/capandtrade16.htm)

118 In addition to the fuel cost sensitivities presented in this section, Appendix E includes an uncertainty analysis of the Scoping Plan Scenario and alternatives. This analysis addresses uncertainty in the Reference Scenario emissions, GHG reductions from each measure, as well as capital and fuel costs.

119 The high and low fuel price sensitivity ranges are derived from differences between the AEO 2016 High Oil Price or Low Oil Price forecast and the AEO 2016 reference case, and are applied as ratios to the base case fuel price assumptions (which are based on the AEO 2015 report). The AEO 2015 report is available at: [http://www.eia.gov/outlooks/aeo/pdf/0383\(2015\).pdf](http://www.eia.gov/outlooks/aeo/pdf/0383(2015).pdf) and the AEO 2016 report is available for download at: [http://www.eia.gov/outlooks/aeo/pdf/0383\(2016\).pdf](http://www.eia.gov/outlooks/aeo/pdf/0383(2016).pdf).

the net incremental cost of prescriptive measures is \$2.9 billion in 2030. Under the high fuel price sensitivity, the prescriptive measures result in net savings of \$4.9 billion in 2030. Table 14 also shows that these price uncertainties are captured within the analyzed range of allowance prices. As described above, changes in fuel prices may affect the price of Cap-and-Trade allowances, but the price is highly unlikely to go outside the range of prices bounded by the C+T Floor Price and C+T Reserve Price. The final column in Table 14 presents the estimated direct cost of the Scoping Plan, including both the prescriptive measures and a range of estimated costs to achieve GHG reductions under the Cap-and-Trade Program for varying projections of future fuel prices. The total cost, reflecting fuel and allowance price uncertainty, ranges from an annual savings to California of \$3.3 billion to an annual cost of \$8.0 billion in 2030. The net climate benefits, as estimated by the SC-CO<sub>2</sub> and SC-CH<sub>4</sub>, outweigh these direct costs.<sup>120</sup>

**TABLE 14: ESTIMATES OF DIRECT COST AND CLIMATE BENEFITS IN 2030 RELATIVE TO THE REFERENCE SCENARIO AND INCLUDING FUEL PRICE SENSITIVITY (BILLION \$2015)**

| Scenario                    | Prescriptive Measures | C+T Floor Price | C+T Reserve Price | 2030 Total Cost  |
|-----------------------------|-----------------------|-----------------|-------------------|------------------|
| Scoping Plan                | \$0.1                 | \$1.6           | \$5.1             | \$1.7 to \$5.2   |
| Low Fuel Price Sensitivity  | \$2.9                 | \$1.6           | \$5.1             | \$4.5 to \$8.0   |
| High Fuel Price Sensitivity | -\$4.9                | \$1.6           | \$5.1             | -\$3.3 to -\$0.2 |

Fuel price sensitivity is directly modeled in PATHWAYS, resulting in a range of impacts from prescriptive measures. The range of costs labeled “2030 Total Cost” includes the cost of prescriptive measures estimated in PATHWAYS and the impact of the Cap and-Trade Program calculated at the C+T Floor Price (the lower bounds) and the C+T Reserve Price (the upper bounds). The social cost of GHGs estimated range in 2030 is \$1.9 to \$11.2 billion.

### Macroeconomic Impacts

The macroeconomic impacts of the Scoping Plan are estimated using the REMI model. Annual capital and fuel costs (for example, the costs in Table 12) are estimated using PATHWAYS and input into the REMI model to estimate the impact of the Scoping Plan on the California economy each year relative to GDP, which is often used as a proxy for economic growth, as well as employment, personal income, and changes in output by sector and consumer spending. Table 15 presents key macroeconomic impacts of implementing the Scoping Plan, based on the range of anticipated allowance prices. In 2030, under the Scoping Plan, growth across the indicators is about one-half of one percent less than the Reference Scenario. The results in Table 15 include not only the estimated direct cost of the Cap-and-Trade Program, but also distribution of allowance value from the auction of Cap-and-Trade allowances to California and consumers. See Appendix E for more detail on the modeling of the return of allowance value under the Cap-and-Trade Program in REMI.

The Cap-and-Trade Program is modeled in REMI as an increase in production cost to sectors based on estimated future GHG emissions and anticipated free allowance allocation. If a sector is expected to receive free allocation of allowances, the value of those free allowances is not modeled as a cost in REMI. The analysis does include the estimated benefit to sectors due to the proceeds from the auction of cap-and-trade allowances and assumes that each year \$2 billion of proceeds from the auction of State-owned cap-and-trade allowances are distributed to the economic sectors currently receiving GGRF appropriations. These funds work to achieve further GHG reductions in California, lower the cost to businesses of reducing GHG emissions and protect disadvantaged communities. Any auction proceeds remaining after the distribution of \$2 billion through GGRF sectors are distributed evenly to consumers in California as a dividend. The estimated costs in Table 15 include the cost of the GHG reductions to sectors, as well as the benefit to those sectors when allowance proceeds are returned through the GGRF and as a dividend to consumers, as detailed in Appendix E.

<sup>120</sup> Climate benefits are estimated using the Social Cost of Carbon in 2030 across the range of discount rates from 2.5 to 5 percent. All values are reported in \$2015. Additional information on the Social Cost of Carbon is available from the National Academies of Sciences, Engineering, and Medicine at: <https://www.nap.edu/catalog/24651/valuing-climate-damages-updating-estimation-of-the-social-cost-of>.

**TABLE 15: MACROECONOMIC INDICATORS IN 2030 UNDER BASE FUEL PRICE ASSUMPTIONS**

|                                  | Reference Scenario (2030) | Scoping Plan (2030) | Percentage Change Relative to Reference Scenario |
|----------------------------------|---------------------------|---------------------|--------------------------------------------------|
| California GDP (Billion \$2015)  | \$3,439                   | \$3,430 to \$3,420  | -0.3 percent to -0.6 percent                     |
| Employment (Thousand Jobs)       | 23,522                    | 23,478 to 23,441    | -0.2 percent to -0.3 percent                     |
| Personal Income (Billion \$2015) | \$3,010                   | \$3,006 to \$3,008  | -0.1 percent to -0.1 percent                     |

Table 15 was estimated using the REMI model. The range of costs for the Scoping Plan represents the impact of achieving the SB 32 target through prescriptive measures and the Cap-and-Trade Program at the C+T Floor Price (the lower bounds) and the C+T Reserve Price (the upper bounds).

It is important to put the results of Table 15 into context of the growing \$3.4 trillion California economy in 2030. As noted earlier, the economic analysis does not include avoided social damages and other potential savings from reductions in air pollution and petroleum dependency.

Determining employment changes as a result of policies is challenging to model, due to a range of uncertainties and global trends that will influence the California economy, regardless of implementation of the Scoping Plan. The global economy is seeing a shift toward automation and mechanization, which may lead to slowing of employment across some industries globally, irrespective of California’s energy and low carbon investments. In California, employment is projected to reach 23.5 million jobs in 2030. In this analysis, implementing the Scoping Plan would slow the growth of employment by less than one-half of one percent in 2030.

Estimated personal income in California is relatively unchanged under the Scoping Plan relative to the Reference Scenario. Considering the uncertainty in the modeling, modest changes in the growth of personal income are not different from zero, which suggests that meeting the SB 32 target will not change the growth of personal income relative to the Reference Scenario.

When analyzing the estimated macroeconomic impacts, it is important to remember that a major substitution of electricity and capital away from fossil fuels is anticipated to have a very small effect on California GDP, employment, and personal income—less than one percent relative to the Reference Scenario in 2030. The economic impacts indicate that shifting money and investment away from fossil fuels and to clean energy is likely to have a negligible effect on the California economy. Additionally, it is certain that innovation will continue as new technologies are developed and implemented. While this analysis projects the costs and GHG reductions of current technologies over time, it does not capture the impact of new technologies that may shift the economy and California in unanticipated ways or benefits related to changes in air pollution and improvements to human health, avoided environmental damages, and positive impacts to natural and working lands. Thus, the results of this analysis very likely underestimate the benefits of shifting to a clean energy economy.

Consumer spending also shifts in response to implementation of the Scoping Plan relative to the Reference Scenario. As presented in Table 15, there is a negligible impact to consumer income, but small changes in income can alter the distribution of consumer spending among categories. In 2030, consumer spending is lower under the Scoping Plan than in the Reference Scenario across all analyzed allowance prices. Consumers spend less on fuels, electricity, natural gas, and capital as a result of measures in the Scoping Plan that reduce demand, increase efficiency, and drive technological innovations. The estimated impact to California households is also modest in 2030. The estimated cost to California households in 2030 ranges from \$115 to \$280, depending on the price of reductions under the Cap-and-Trade Program.<sup>121</sup>

The household impact is estimated using the per-household change in personal income as modeled in REMI and utilizing household estimates from the California Department of Finance. The household impact does not account for benefits from reduced climate impacts, health savings from reduced air pollution impacts, or lower petroleum dependence costs that might impact households. Additional details are presented in Appendix E.

As modeled, the household impact of the Scoping Plan comprises approximately one percent of average household expenditures in 2030. To ensure that vulnerable populations and low-income households are not

<sup>121</sup> Household projections are obtained from the California Department of Finance and are available at: <http://www.dof.ca.gov/Forecasting/Demographics/projections/>.

disproportionately affected by California's climate policy, CARB is taking steps to better quantify localized economic impacts and ensure that low-income households see tangible benefits from the Scoping Plan. Researchers at the University of California, Los Angeles (UCLA) are currently working on a retrospective analysis that will estimate the impacts across California communities of the implementation of AB 32, which will help identify areas of focus as 2030 measures are developed. The Cap-and-Trade Program will also continue to provide benefit to disadvantaged communities through the disbursement of GGRF funds.

The investments made in implementing the Scoping Plan will have long-term benefits and present significant opportunities for California investors and businesses, as upfront capital investments will result in long-term fuel and energy efficiency savings, the benefits of which will continue into the future. The California economy will continue to grow under the Scoping Plan, but it will grow more resilient, more sustainable, and will be well positioned to reap the long-term benefits of lower carbon investments.

## **Economic Modeling of Health Impacts**

Health benefits associated with reductions in diesel particulate matter (DPM) and nitrogen oxides (NO<sub>x</sub>) are monetized for inclusion in the macroeconomic modeling. The health benefits are estimated by quantifying the harmful future health effects that will be avoided by reducing human exposure to DPM and NO<sub>x</sub>, as detailed in Appendix G, and monetized by estimating a health effect's economic value to society. As previously noted the health impacts are based on air quality benefits estimated in Table 6, which have important limitations and likely overestimate the impacts of the Scoping Plan. Additional detail on the economic modeling of health impacts, including the monetization methodology and modeling results for all Scoping Plan scenarios, is presented in Appendix E. Including the monetized health impacts in the REMI modeling has no discernible impact on the overall results. The impact of including the monetized health impacts is indiscernible relative to the impact of the Scoping Plan.

## **Estimating the Economic Impact on Disadvantaged Communities (DACs)**

Implementing the Scoping Plan is estimated to have a small impact on the Statewide California economy through 2030. However, shifting from fossil fuels can disproportionately affect specific geographic regions whose local economies rely on fossil fuel intensive industries. These regions can also include vulnerable populations and disadvantaged communities who may be disproportionately impacted by poor air quality and climate.

The regional impacts of the Scoping Plan, including the impact to disadvantaged communities, are estimated using the REMI California County model, which represents the 58 counties and 160 sectors of the California economy. Utilizing the same inputs used for modeling the statewide impact of the Scoping Plan relative to the Reference Scenario, the California County model estimates how measures will affect employment, value added, and other economic indicators at the county level across the state.

The county-level REMI output is also used to estimate impacts on disadvantaged communities affected by the Scoping Plan by allocating county impacts proportional to their share of economic indicators unique to each census tract.<sup>122</sup> These indicators include industry output, industry consumption by fuel category, personal consumption, and population. The overall impact on employment across regions is not significant and there is no discernible difference in the impact to employment in disadvantaged communities. There is also no discernible impact to wages in disadvantaged communities across regions in California. Additional details on the regional modeling, including the results for the Scoping Plan and alternatives, is presented in Appendix E.

In addition to the regional modeling conducted in this analysis, there are currently three research contracts underway at CARB to quantify the impact of California's climate policy on regions and disadvantaged communities throughout California. As mentioned above, researchers from UCLA are estimating the improvements in health outcomes associated with AB 32, with a focus on disadvantaged communities. This research will be informed by input from technical advisory committees including a group focused on environmental justice.

---

<sup>122</sup> Census tracts are small geographic areas within greater metropolitan areas that usually have a population between 2,500 and 8,000 persons. More information on the composition of census tracts available here: [https://www.census.gov/geo/reference/gtc/gtc\\_ct.html](https://www.census.gov/geo/reference/gtc/gtc_ct.html). Disadvantaged census tracts are identified using CalEnviroScreen 2.0. Additional information is available at: <https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-version-20>.

There are also two studies currently underway to quantify the impact of GGRF funds. A UCLA contract focuses on quantifying jobs supported by GGRF funds in California, while a University of California, Berkeley contract is constructing methodologies to assess the co-benefits of GGRF projects across California. These research efforts will provide a regional analysis of the impact of and benefits to specific communities and sectors to ensure that all Californians see economic benefits, in addition to clean air benefits, from the implementing the Scoping Plan.

## Public Health

---

Many measures to reduce GHG emissions also have significant health co-benefits that can address climate change and improve the health and well-being of all populations across the State. Climate change is already affecting the health of communities.<sup>123</sup> Climate-related health impacts can include increased heat illness and death, increases in air pollution-related exacerbation of cardiovascular and respiratory diseases, injury and loss of life due to severe storms and flooding, increased vector-borne and water-borne diseases, and stress and mental trauma due to extreme weather-related catastrophes.<sup>124</sup> The urgency of action to address the impacts already being felt from a changing climate and the threats in coming decades provides a unique opportunity for California's leadership in climate action to reduce GHG emissions and create healthy, equitable, and resilient communities where all people thrive. This section discusses the link between climate change and public health. It does not analyze the specific measures included in the strategy but provides context for assessing the potential measures and scenarios.

### Achieving Health Equity through Climate Action

Many populations in California face *health inequities*, or unfair and unjust health differences between population groups that are systemic and avoidable.<sup>125</sup> Differences in environmental and socioeconomic determinants of health result in these health inequities. Those facing the greatest health inequities include low-income individuals and households, the very young and the very old, communities of color, and those who have been marginalized or discriminated against based on gender or race/ethnicity.<sup>126</sup> It is these very same populations, along with those suffering existing health conditions and certain populations of workers (e.g., outdoor workers), that climate change will most disproportionately impact.<sup>127</sup> The inequitable distribution of social, political, and economic power results in health inequities, while perpetuating systems (e.g., economic, transportation, land use, etc.) that drive GHG emissions. As a result, communities face inequitable living conditions. For example, low-income communities of color tend to live in more polluted areas and face climate change impacts that can compound and exacerbate existing sensitivities and vulnerabilities.<sup>128,129</sup> Fair and healthy climate action requires that the inequities creating and intensifying community vulnerabilities be addressed. Living conditions and the forces that shape them, such as income, education, housing, transportation, environmental quality, and access to services, significantly drive the capacity for climate resilience. Thus, strategies such as alleviating poverty, increasing access to opportunity, improving living conditions, and reducing health and social inequities will result in more climate-resilient communities. In fact, there are already many "no-regret" climate mitigation and adaptation measures available (discussed below) that can reduce health burdens, increase community resilience, and address social inequities.<sup>130</sup> Focusing efforts to achieve health equity can thus lead to significant progress in addressing human-caused climate change.

## Potential Health Impacts of Climate Change Mitigation Measures

### Socioeconomic Factors: Income, Poverty, and Wealth

Economic factors, such as income, poverty, and wealth, are collectively one of the largest determinants of health. As such, climate mitigation measures that yield economic benefits can improve population health significantly, especially if the economic benefits are directed to those most vulnerable and disadvantaged (including those living in poverty) who often face the most health challenges. From the poorest to richest ends of the income spectrum, higher income is associated with greater longevity in the United States.<sup>131,132,133</sup> The gap in life expectancy between the richest 1 percent and poorest 1 percent of Americans was almost 15 years for men in 2014, and about 10 years for women.<sup>134</sup> Early death among those living in poverty is not a result of those with higher incomes having better access to quality health care.<sup>135</sup> Only about 10-20 percent of a person's health status is accounted for by health care (and 20-30 percent attributed to genetics), while the remainder is attributed to the social determinants of health. These include environmental quality, social and economic circumstances, and the social, media, policy, economic, retail, and built environments— all of which in turn shape stress levels and behaviors, including smoking, diet, and exercise.<sup>136,137,138,139,140,141,142,143,144,145,146</sup> In fact, where people live, work, learn, and play is often a stronger predictor of life expectancy than their genetic and biological makeup.<sup>147</sup> The World Health Organization's Commission on the Social Determinants of Health concluded that the poor health of poor people, and the social gradient in health, are caused by the unequal distribution of power, income, goods, and services resulting from poor social policies and programs, unfair economic arrangements, and bad politics.<sup>148</sup> Thus, improving the conditions of daily life and tackling the inequitable distribution of power, money, and resources can remedy inequitable health outcomes.<sup>149</sup> Simply put, the more evenly distributed the wealth, the healthier a society is.<sup>150</sup>

The wealth-health gradient has significant implications for this Scoping Plan. State climate legislation and policies require prioritizing GHG reduction strategies that serve vulnerable populations and improve well-being for disadvantaged communities. As such, strategies that improve the financial security of communities facing disadvantages while reducing GHG emissions are win-win strategies. These include providing funds or services for GHG reduction programs (e.g., weatherization, energy efficiency, renewable energy, ZEVs, transit, housing, and others) to low-income individuals and households to help them reduce costs. Among the poorest 25 percent of people, per capita government expenditures are strongly associated with longer

life spans.<sup>151</sup> Successful strategies California has already implemented to assure the poor do not pay higher costs for societal GHG reductions include low-income energy discount programs, in combination with direct climate credits, and policies and programs that help Californians reduce electricity, natural gas, and gasoline consumption.<sup>152</sup> More such strategies could be pursued. To tackle the inequitable distribution of power that leads to disparate health outcomes, agencies can first assure their hearing and decision-making processes provide opportunities for civic engagement so people facing health inequities can themselves participate in decision-making about solutions. Whether it is absolute poverty or relative deprivation that leads to poor health, investments and policies that both lift up the poor and reduce wealth disparities will address the multiple problems of climate change mitigation, adaptation, and health inequities.

## Employment

Employment status impacts human health in many ways. Poor health outcomes of unemployment include premature death, self-rated ill-health (a strong predictor of poor health outcomes), and mental illness.<sup>153,154,155,156</sup> Economic strain related to unemployment can impact mental health and trigger stress that is linked to other health conditions.<sup>157,158</sup> Populations of color are overrepresented in the unemployment and under-employment ranks, which likely contributes to racial health inequities. In 2014, 14.7 percent of African-Americans, 12.1 percent of American Indians and Alaska Natives, and 9.8 percent of Latinos were unemployed, compared to 7.9 percent of Whites.<sup>159</sup> In addition to providing income, the work experience has health consequences. There is a *work status–health gradient* similar to the wealth–health gradient. Workers with lower occupational status have a higher risk of death,<sup>160</sup> increased blood pressure,<sup>161</sup> and more heart attacks.<sup>162,163</sup> Higher status workers often have a greater sense of autonomy, control over their work, and predictability, compared to lower status workers, whose lack of control and predictability translates to stress that shortens their lives.<sup>164</sup> Nonstandard working arrangements such as part-time, seasonal, shift, contract, or informal sector work have been linked to greater psychological distress and poorer physical health.<sup>165,166</sup> Women are heavily overrepresented in nonstandard work, as are people of color and people with low levels of education.<sup>167,168</sup>

The implementation of California’s climate change goals provides great opportunity to not only improve the habitability of the planet, but also to increase economic vitality, employ historically disadvantaged people

in secure jobs, and improve the health of the population. Measures in the Scoping Plan that aim to reduce GHGs can simultaneously improve health and social equity by prioritizing or requiring that: (1) infrastructure projects using public funds pay living wages, provide quality benefits to all employees, and minimize nonstandard work; (2) locals are hired as much as is feasible; (3) preference is given for women-owned and minority-owned businesses; (4) employers receiving public funds assess and reduce work stress and lack of workplace control; (5) projects benefiting from State climate investments prioritize hiring from historically hard-to-employ groups, such as youth (especially youth of color), formerly incarcerated people, and people with physical or mental illness; and (6) training is provided to these same groups to work in jobs in sectors that will support a sustainable economy.

## **Communications Supporting Climate Change Behaviors and Policies**

California's leadership on GHG reductions is exceptional. However, climate mitigation goals are often treated independently by sector, and the public does not see a unified message that changes must take place on every level in every sector to preserve human health and well-being. Climate strategy could be supported by public communications campaigns that link sectors and present a message of the need for bold action, along with the benefits that action can yield. Mass media communications and social marketing campaigns can help shift social and cultural norms toward sustainable and healthy practices. Messaging about the co-benefits of climate change policies in improving health and well-being can lead to increased community and decision-maker support among vulnerable groups for policies and measures outlined in the Scoping Plan.

## **Community Engagement Leads to Robust, Lasting, and Effective Climate Policies**

For California's climate change policies to be supported by the public and be implemented with enthusiasm, they must be developed through ample, genuine opportunities for community members to discuss and provide input. Californians' contributions to the policy arena strengthen the end products and assist in their implementation and enforcement.

Efforts to mitigate climate change through policy, environmental, and systems change present considerable opportunities to promote sustainable, healthy, resilient, and equitable communities. The measures in the Scoping Plan, and the way they are implemented, can help create living conditions that facilitate physical activity; encourage public transit use; provide access to affordable, fresh, and nutritious foods; protect the natural systems on which human health depends; spur economic development; provide safe, affordable, and energy-efficient housing; enable access to jobs; and increase social cohesion and civic engagement. These climate change mitigation measures can improve overall population health, as well as material conditions, access to opportunity, and health and well-being in communities facing health inequities. Approaching the policy solutions outlined in the Scoping Plan with a health and equity lens can ultimately help lead to a California in which all current and future generations of Californians can benefit and thrive.

## **Environmental Analysis**

---

CARB, as the lead agency, prepared a Draft Environmental Analysis (Draft EA) in accordance with the requirements of the California Environmental Quality Act (CEQA) and CARB's regulatory program (CARB's program has been certified as complying with CEQA by the Secretary of Natural Resources; see California Code of Regulation, title 17, sections 60006-60008; California Code of Regulation, title 14, section 15251, subdivision (d)). The resource areas from the CEQA Guidelines Environmental Checklist were used as a framework for a programmatic environmental analysis of the reasonably foreseeable compliance responses resulting from implementation of the measures proposed in the Scoping Plan to achieve the 2030 target. Following circulation of the Draft EA for an 80-day public review and comment period (January 20, 2017 through April 10, 2017), CARB prepared the Final Environmental Analysis Prepared for the Proposed Strategy for Achieving California's 2030 Greenhouse Gas Target (Final EA), which includes minor revisions to the Draft EA, and the Response to Comments on the Draft Environmental Analysis prepared for the Proposed Strategy for Achieving California's 2030 Greenhouse Gas Target (RTC). The Final EA is included as Appendix F to the 2017 Scoping Plan. The Final EA and RTC were posted on CARB's Scoping Plan webpage before the Board hearing in December 2017.

The Final EA provides a programmatic level of analysis of the adverse environmental impacts that are reasonably foreseeable as resulting from implementation of the proposed Scoping Plan measures; feasible mitigation measures; a cumulative impacts analysis and an alternatives analysis.

Collectively, the Final EA concluded that implementation of these actions could result in the following short-term and long-term beneficial and adverse environmental impacts:

- Beneficial long-term impacts to air quality, energy demand and greenhouse gas emissions.
- Less than significant impacts to energy demand, resources related to land use planning, mineral resources, population and housing, public services, and recreational services.
- Potentially significant and unavoidable adverse impacts to aesthetics, agriculture and forest resources, air quality, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, resources related to land use planning, noise, recreational services, transportation/traffic, and utilities and service systems.

The potentially significant and unavoidable adverse impacts are disclosed for both short-term construction-related activities and long-term operational activities, which explains why some resource areas are identified above as having both less-than-significant impacts and potentially significant impacts. For a summary of impacts, please refer to the table in Attachment B to the Final EA.

# Chapter 4

## KEY SECTORS

Climate change mitigation policies must be considered in the context of the sector's contribution to the State's total GHGs, while also considering any co-benefits for criteria pollutant and toxic air contaminant reductions. The transportation, electricity (in-state and imported), and industrial sectors are the largest contributors to the GHG inventory and present the largest opportunities for GHG reductions. However, to ensure decarbonization across the entire economy and to meet our 2030 GHG target, policies must be considered for all sectors. Policies that support energy efficiency, alternative fuels, and renewable power also can provide co-benefits for both criteria and toxic air pollutants.

The specific policies identified in this Scoping Plan are subject to additional analytical and public processes to refine the requirements and methods of implementation. For example, a change in the LCFS Carbon Intensity (CI) target would only take effect after a subsequent rulemaking for that regulation, which would include its own public process and environmental, economic, and public health analyses. As described in Chapter 2, many policies for reducing emissions toward the 2030 target are already known. This Scoping Plan identifies these and additional policies or program enhancements needed to achieve the remaining GHG reductions in a complementary, flexible, and cost-effective manner to meet the 2030 target. These policies should continue to encourage reductions beyond 2030 to keep us on track to stabilize the climate. Policies that ensure economy-wide investment decisions that incorporate consideration of GHG emissions are particularly important.

As we pursue GHG reduction targets, we must acknowledge the integrated nature of our built and natural environments, and cross-sector impacts of policy choices. The State's Green Buildings Strategy is one such example of this type of integrated approach. Buildings have tremendous cross-sector interactions that influence our health and well-being and affect land use and transportation patterns, energy use, water use, communities, and the indoor and outdoor environment. Green building regulations and programs offer complementary opportunities to address the direct and indirect effects of buildings on the environment by incorporating strategies to minimize overall energy use, water use, waste generation, and transportation impacts. The Governor's Green Buildings Executive Order B-18-12 for State buildings and the California Green Building Standards (CALGreen) Code<sup>169</sup> are key state initiatives supporting emissions reductions associated with buildings. Local governments are taking action by adopting "beyond code" green building standards. Additional efforts to maintain and operate existing buildings as third-party certified green buildings provides a significant opportunity to reduce GHG emissions associated with buildings. These foundational regulations and programs for reducing building-related emissions are described in more detail in Appendix H. Looking forward, there is a need to establish a path toward transitioning to zero net carbon buildings<sup>170</sup>, which will be the next generation of buildings that can contribute significantly to achieving long-term climate goals. A discussion of how the green buildings strategy can support GHG reductions to help meet the 2030 target is provided in Appendix I. Recent research activities have provided results to better quantify GHG emissions reductions of green buildings, and additional research activities need to continue to expand their focus to support technical feasibility evaluations and implementation. Research needs related to green buildings are included in Appendix I.

Further, each of the policies directed at the built environment must be considered in the broader context of the high-level goals for other sectors, including the natural and working lands sector. For example, policies that support natural and working lands can reduce emissions and sequester carbon, while also providing ecosystem benefits such as better water quality, increased water yield, soil health, reduced erosion, and

<sup>169</sup> The authority to update and implement the CALGreen Code is the responsibility of several State agencies identified in California Building Standards Law.

<sup>170</sup> A zero carbon building generates zero or near zero GHG emissions over the course of a year from all GHG emission sources associated, directly and indirectly, with the use and occupancy of the building (initial definition included in the May 2014 *First Update to the Climate Change Scoping Plan*).

habitat connectivity. These policies and co-benefits will be considered as part of the integrated strategy outlined above. Table 16 provides examples of the cross-sector interactions between and among the main sectors analyzed for the Scoping Plan that are discussed in this chapter (Energy, Transportation, Industry, Water, Waste Management, and Natural and Working Lands, including agricultural lands).

This chapter recognizes these interactions and relates these broad strategic options to the specific additional programs recommended in Chapter 2 of this document. Accordingly, Chapter 4 provides an overview of each sector's contributions to the State's GHG emissions, a description of both ongoing and proposed programs and policies to meet the 2030 target, and additional climate policy or actions that could be considered in the future. The wide array of complementary and supporting measures being contemplated or undertaken across State government are detailed here. The broad view of State action described in this chapter thus provides context for the narrower set of measures discussed in detail in Chapter 2 of this Scoping Plan. It is these measures in Chapter 2 that CARB staff has identified as specific actions to meet the 2030 target in SB 32.

The following phrases have specific meanings in this discussion of the policy landscape: "Ongoing and Proposed Measures" refers to programs and policies that are either ongoing existing efforts, or efforts required by statute, or which are otherwise underway or about to begin. These measures include, but are not limited to, those identified as necessary specific actions to meet the 2030 GHG target, and which are set apart and described in greater detail in Chapter 2. "Sector Measures" listed also include cross-cutting measures that affect many entities in the sector; some of these are also identified in Chapter 2. "Potential Additional Actions" are not being proposed as part of the specific strategy to achieve the 2030 target in this Scoping Plan. This Scoping Plan includes this broader, comprehensive, review of these measures because it aims to spur thinking and exploration of innovative new technologies and policies that may help the State achieve its long-term climate goals. Some of these items may not ever be formally proposed, but they are included here because CARB, other agencies, and stakeholders believe their potential should be explored with stakeholders in coming years.

**TABLE 16: CROSS-SECTOR RELATIONSHIPS**

| Sector                                                                                                               | Example Interactions with Other Sectors                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Low Carbon Energy

---

The energy sector in California is composed of electricity and natural gas infrastructure, which brings electricity and natural gas to homes, businesses, and industry. This vast system is critical to California's economy and public well-being, and pivotal to reducing its GHG emissions.

Historically, power plants generated electricity largely by combusting fossil fuels. In the 1970s and early 1980s, a significant portion of California's power supply came from coal and petroleum resources. To reduce air pollution and promote fuel diversity, the State has shifted away from these resources to natural gas, renewable energy, and energy efficiency programs, resulting in significant GHG emissions reductions. Emissions from the electricity sector are currently approximately 20 percent below 1990 levels and are well on their way to achieving deeper emissions cuts by 2030. Since 2008, renewable generation has almost doubled, coal generation has been reduced by more than half, and GHG emissions have been reduced by a quarter.

Carbon dioxide is the primary GHG associated with electricity and natural gas systems. The electricity sector, which is composed of in-State generation and imported power to serve California load, has made great strides to help California achieve its climate change objectives. Renewable energy has shown tremendous growth, with capacity from solar, wind, geothermal, small hydropower, and biomass power plants growing from 6,600 megawatts (MW) in 2010 to 27,500 MW as of June 2017.<sup>171</sup>

Renewable energy adoption in California has been promoted through the RPS and several funding mechanisms, such as the California Solar Initiative (CSI) programs, Self-Generation Incentive Program (SGIP), Net-Energy Metering (NEM), and federal tax credits. These mandates and incentives have spurred both utility-scale and small-scale customer-developed renewable energy projects. SB 350 increased the RPS requirement from 33 percent by 2020 to 50 percent by 2030.

SB 350 requires publicly-owned utilities under the jurisdiction of the California Energy Commission (CEC) and all load-serving entities under the jurisdiction of the California Public Utilities Commission (CPUC) to file integrated resource plans (IRPs) with the CEC and CPUC, respectively. Through their IRPs, filing entities will demonstrate how they will plan to meet the electricity sector's share of the State's 2030 GHG reduction target while ensuring reliability in a cost-effective manner. The CEC and CPUC have developed the guidelines that publicly-owned utilities and load-serving entities will follow to prepare and submit IRPs, and CARB is working collaboratively with CEC and CPUC to set the sector and utility and load-serving entity planning targets. The Scoping Plan provides information to help establish the range of GHG reductions required for the electricity sector, and those numbers will be translated into planning target ranges in the IRP process. The IRP processes as currently proposed by CEC and CPUC staff will grant publicly-owned utilities flexibility to determine the optimal way to reduce GHG emissions, and load serving entities some flexibility to achieve the electricity sector's share of the 2030 goal. The CPUC has developed a Reference System Plan to help guide investment, resource acquisition, and programmatic decisions to reach the State's policy goals, in addition to informing the development of individual load serving entities' IRPs.

Energy efficiency is another key component to reducing energy sector GHG emissions, and is another consideration in each agency's IRP process. Utilities have been offering energy efficiency programs, such as incentives, to California customers for decades, and CEC has continually updated building and appliance standards. In the context of IRPs, utility-ratepayer-funded energy efficiency programs will likely continue to play an important role in reducing GHG emissions in the electricity sector.

SB 350 requires CEC and CPUC to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas end uses by 2030. These targets can be achieved through appliance and building energy efficiency standards; utility incentive, rebate, and technical assistance programs; third-party delivered energy efficiency programs; and other programs. Achieving greater efficiency savings in existing buildings, as directed by Governor Brown in his 2015 inaugural speech, will be essential to meet the goal of doubling energy efficiency savings. In September 2015, CEC adopted the Existing Buildings Energy Efficiency Action Draft Plan, which is designed to provide foundational support and strategies to enable scaling of energy efficiency in the built environment. Pursuant to SB 350, CEC published an updated Existing Buildings Energy Efficiency Action Plan prior to January 2017. More than \$10 billion in private capital investment will be needed

---

<sup>171</sup> California Energy Commission. August, 2017. Tracking Progress. Renewable Energy – Overview. [http://www.energy.ca.gov/renewables/tracking\\_progress/documents/renewable.pdf](http://www.energy.ca.gov/renewables/tracking_progress/documents/renewable.pdf)

to double statewide efficiency savings in California.<sup>172</sup> Energy efficiency programs are one part of the broader green buildings strategy, which incorporates additional measures to minimize water use, waste generation, and transportation impacts. The green buildings strategy is described in further detail in Appendix I.

Heating fuels used for activities such as space and water heating in the residential, commercial, and industrial sectors represent a significant source of GHG emissions. Transitioning to cleaner heating fuels is part of the solution of achieving greater efficiency savings in existing buildings and has significant GHG emissions reductions potential. Examples of this transition can include use of renewable gas and solar thermal, as well as electrification of end uses in residential, commercial, and industrial sectors. However, achieving significant GHG emissions reductions can only be achieved by decarbonizing the electricity sector – switching from natural gas end uses to electricity generated by burning natural gas would not be effective. Electrification can complement renewables and energy storage if implemented in an integrated, optimized manner. Other hurdles that will have to be overcome include electric equipment performance across all California climate regions, seasonal variations of renewable generation, cost-effectiveness, and consumer acceptance of different heating fuel options.

Fossil-fuel-based natural gas is a significant fuel source for both in-State electricity generation and electricity imported into California. It is also used in transportation applications and in residential, commercial, industrial, and agricultural sector end uses. Greenhouse gas emissions from combustion of fossil natural gas decreased from 134.71 MMTCO<sub>2</sub>e in 2000 to 126.98 MMTCO<sub>2</sub>e in 2015, while natural gas pipeline fugitive emissions were estimated to be 4.0 MMTCO<sub>2</sub>e in 2015 and have been nearly unchanged since 2000.<sup>173</sup> Greenhouse gas-reduction strategies should focus on efficiency, reducing leakage from wells and pipelines, implementing the SLCP strategy, and studying the potential for renewable gas fuel switching (e.g., renewable hydrogen blended with methane or biomethane).

Moving forward, reducing use of fossil natural gas wherever possible will be critical to achieving the State's long-term climate goals. For end uses that must continue to rely on natural gas, renewable natural gas could play an important role. Renewable natural gas volume has been increasing from approximately 1.5 million diesel gallon equivalent (dge) in 2011 to more than 68.5 million dge in 2015, and continued substitution of renewable gas for fossil natural gas would help California reduce its dependence on fossil fuels. In addition, renewable gas can be sourced by in-vessel waste digestion (e.g., anaerobic digestion of food and other organics) and recovering methane from landfills, livestock operations, and wastewater treatment facilities through the use of existing technologies, thereby also reducing methane emissions. The capture and productive use of renewable methane from these and other sources is consistent with requirements of SB 1383.

Collectively, renewable energy and energy efficiency measures can result in significant public health and climate benefits by displacing air pollution and GHG emissions from fossil-fuel based energy sources, as well as by reducing the health and environmental risks associated with the drilling, extraction, transportation, and storage of fossil fuels, especially for communities living near fossil-fuel based energy operations.

As the energy sector continues to evolve and decarbonize, both the behavior of individual facilities and the design of the grid itself will change, with important distributional effects. Some power plants may operate more flexibly to balance renewables, emerging technologies (examples include storage, smart inverters, renewably-fueled fuel cells, and others) will become more prevalent, and aging facilities may retire and be replaced. In turn, this may shift patterns of criteria pollutant emissions at these facilities. Because many existing power plants are in, or near, disadvantaged communities, it is of particular importance to ensure that this transition to a cleaner grid does not result in unintended negative impacts to these communities.

Appendix H highlights the more significant existing policies, programs, measures, regulations, and initiatives that provide a framework for helping achieve GHG emissions reductions in this sector.

## Looking to the Future

This section outlines the high-level objectives and goals to reduce GHGs in this sector.

### Electricity Goals

- Achieve sector-wide, publicly-owned utility, and load-serving entity specific GHG reduction planning targets set by the State through Integrated Resource Planning.
- Reduce fossil fuel use.
- Reduce energy demand.

### Natural Gas Goals

- Ensure safety of the natural gas system.
- Decrease fugitive methane emissions.
- Reduce dependence on fossil natural gas.

## Cross-Sector Interactions

The energy sector interacts with nearly all sectors of the economy. Siting of power plants (including solar and wind facilities) and transmission and distribution lines have impacts on land use in California—be it conversion of agricultural or natural and working lands, impacts to sensitive species and habitats, or implications to disadvantaged, vulnerable, and environmental justice communities. Additionally, more compact development patterns reduce per capita energy demands, while less-compact sprawl increases them. Further, efforts to reduce GHG emissions in the transportation sector include electrification, such as PHEVs, BEVs, and FCEVs. Some industrial sources also use electricity as a primary or auxiliary source of power for manufacturing. In the future, industrial facilities may electrify their systems instead of relying on natural gas. These activities will increase demand in this sector. In addition, water is used in various applications in the energy sector, ranging in intensity from cooling of turbines and other equipment at power plants to cleaning solar photovoltaic panels. Given California's recent historic drought, water use for the electricity sector is an important consideration for operation, maintenance, and construction activities.

Continued planning and coordination with federal, State, and local agencies, governments, Tribes, and stakeholders will be crucial to minimizing environmental and health impacts from the energy sector, deploying new technologies, and identifying feedstocks.

## Efforts to Reduce Greenhouse Gases

The measures below include some required and new potential measures to help achieve the State's 2030 target and to support the high-level objectives for this sector. Some measures may be designed to directly address GHG reductions, while others may result in GHG reductions as a co-benefit.

### Ongoing and Proposed Measures – Electricity

- Per SB 350, with respect to Integrated Resource Plans, establish GHG planning targets for the electricity sector, publicly-owned utilities, and load-serving entities.
- Per SB 350, ensure meaningful GHG emissions reductions by publicly-owned utilities and load-serving entities through Integrated Resource Planning.
- Per AB 197, prioritize direct reductions at large stationary sources, including power-generating facilities.
- Per SB 350, increase the RPS to 50 percent of retail sales by 2030 and ensure grid reliability.
- Per Governor Brown's Clean Energy Jobs Plan, AB 327 (Perea, Chapter 611, Statutes of 2013), and AB 693 (Eggman, Chapter 582, Statutes of 2015), increase development of distributed renewable generation, including for low income households.
- Continue to increase use of distributed renewable generation at State facilities where space allows.
- Increase retail customers' use of renewable energy through optional utility 100 percent renewable energy tariffs.
- Continue GHG reductions through participation in the California Independent System Operator (CAISO) Energy Imbalance Market.

- Per SB 350, efforts to evaluate, develop, and deploy regionalization of the grid and integration of renewables via regionalization of the CAISO should continue while maintaining the accounting accuracy and rigor of California’s GHG policies.
- Per SB 350, establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas end uses by 2030.
- Per SB 350, implement the recommendations of the Barriers Study for increasing access to renewable energy generation for low-income customers, energy efficiency and weatherization investments for low-income customers, and contracting opportunities for local small business in disadvantaged communities.<sup>174</sup> And, track progress towards these actions over time to ensure disadvantaged communities are getting equal access and benefits relative to other parts of the State.
- Continue implementation of the Regulations Establishing and Implementing a Greenhouse Gases Emission Performance Standard for Local Publicly Owned Electric Utilities as required by SB 1368 (Perata, Chapter 598, Statutes of 2006), which effectively prohibits electric utilities from making new long-term investments in high-GHG emitting resources such as coal power.
- Per AB 802 (Williams, Chapter 590, Statutes of 2015), adopt the forthcoming CEC regulations governing building energy use data access, benchmarking, and public disclosure.
- Per AB 2868 (Gatto, Chapter 681, Statutes of 2016), encourage development of additional energy storage capacity on the transmission and distribution system.
- Per AB 758 (Skinner, Chapter 470, Statutes of 2009),<sup>175</sup> implement recommendations under State jurisdiction included in the AB 758 Action Plan developed by CEC.

## Ongoing and Proposed Measures – Natural Gas

- Implement the CARB Regulation for Greenhouse Gas Emission Standards for Crude Oil and Natural Gas Facilities to reduce fugitive methane emissions from storage and distribution infrastructure.
- Per SB 1371 (Leno, Chapter 525, Statutes of 2014), adopt improvements in investor-owned utility (IOU) natural gas systems to address methane leaks.
- Implement the SLCP Strategy to reduce natural gas leaks from oil and gas wells, pipelines, valves, and pumps to improve safety, avoid energy losses, and reduce methane emissions associated with natural gas use.
- Per SB 1383, CEC will develop recommendations for the development and use of renewable gas as part of its 2017 Integrated Energy Policy Report (IEPR).
- Per SB 1383, adopt regulations to reduce methane emissions from livestock manure and dairy manure management operations by up to 40 percent below the dairy sector’s and livestock sector’s 2013 levels by 2030, including establishing energy infrastructure development and procurement policies needed to encourage dairy biomethane projects. The regulations will take effect on or after January 1, 2024.
- Per SB 1383, reduce methane emissions at landfills by reducing landfill disposal of organic waste 75 percent below 2014 levels by 2025, including establishing energy infrastructure development and procurement policies needed to encourage in-vessel digestion projects and increase the production and use of renewable gas.
- Per SB 887 (Pavley, Chapter 673, Statutes of 2016), initiate continuous monitoring at natural gas storage facilities and (by January 1, 2018) mechanical integrity testing regimes at gas storage wells, develop regulations for leak reporting, and require risk assessments of potential leaks for proposed new underground gas storage facilities.
- Per Public Utilities (PU) Code 454.56, CPUC, in consultation with CEC, (1) identifies all potentially achievable cost-effective natural gas efficiency savings and establishes gas efficiency targets for the gas corporation to achieve, and (2) requires gas corporations to first meet unmet resource needs through available natural gas efficiency and demand reduction resources that are cost-effective, reliable, and feasible (PU Codes 890–

174 CEC. 2016. Low-Income Barriers Study, Part A: Overcoming Barriers to Energy Efficiency and Renewables for Low-Income Customers and Small Business Contracting Opportunities in Disadvantaged Communities. [http://docketpublic.energy.ca.gov/PublicDocuments/16-OIR-02/TN214830\\_20161215T184655\\_SB\\_350\\_LowIncome\\_Barriers\\_Study\\_Part\\_A\\_\\_Commission\\_Final\\_Report.pdf](http://docketpublic.energy.ca.gov/PublicDocuments/16-OIR-02/TN214830_20161215T184655_SB_350_LowIncome_Barriers_Study_Part_A__Commission_Final_Report.pdf)

175 AB 758 requires CEC, in collaboration with CPUC, to develop a comprehensive program to achieve greater energy efficiency in the State’s existing buildings.

- 900 provide public goods charge funding authorization for these programs).
- Per SB 185 (De Leon, Chapter 605, Statutes of 2015), implement the requirement for the California Public Employees' Retirement System (CalPERS) and the California State Teachers' Retirement System (CalSTRS) to sell their holdings in coal-producing companies by June 1, 2017, and explore extending divestiture requirements for additional fossil-fuel assets.

## Sector Measures

- Implement the post-2020 Cap-and-Trade Program.

## Potential Additional Actions

The actions below have the potential to reduce GHGs and complement the measures and policies identified in Chapter 2. These are included to spur thinking and exploration of innovation that may help the State achieve its long-term climate goals. It is anticipated that there will be workshops and other stakeholder forums in the years following finalization of the Scoping Plan to explore these potential actions.

- Further deploy fuel cells that use renewable fuels or those that generate electricity that is less carbon intensive than the grid.
- Increase use of renewable energy through long-term agreements between customers and utilities (such as Sacramento Municipal Utility District Solar Shares).
- Develop rules needed for the development of electricity storage technologies.
- Adopt a zero net energy (ZNE) standard for residential buildings by 2018/2019, and for commercial buildings by 2030.
- Through a public process, evaluate and set targets for the electrification of space and water heating in residential and commercial buildings and cleaner heating fuels that will result in GHG reductions, and identify actions that can be taken to spur market transformation in the 2021-2030 period.
- Expand the State Low-Income Weatherization Program (LIWP) to continue to improve energy efficiency and weatherize existing residential buildings, particularly for low-income individuals and households.
- Decrease usage of fossil natural gas through a combination of energy efficiency programs, fuel switching, and the development and use of renewable gas in the residential, commercial, and industrial sectors.
- Accelerate the deployment of heat pumps and the replacement of diesel generators.
- Consider enhanced energy efficiency (high efficiency air conditioners, light-emitting diode (LED) lamps, efficiency improvements in industrial process cooling and refrigeration, efficient street lighting).
- Promote programs to support third-party delivered energy efficiency projects.
- Per AB 33 (Quirk, Chapter 680, Statutes of 2016), consider large-scale electricity storage.
- Support more compact development patterns to promote reduced per capita energy demand (see the Transportation sector for specific policy recommendations).

## Industry

---

California's robust economy, with the largest manufacturing sector in the United States, is supported by a variety of sub-industrial sectors, some of which include cement plants, refineries, food processors, paper products, wineries, steel plants, and industrial gas, entertainment, technology and software, aerospace, and defense companies. Together, industrial sources account for approximately 21 percent of the State's GHG emissions—almost equal to the amount of GHG emissions from the energy sector. Emissions in this sector are mainly due to fuel combustion and, in some industries, process-related emissions. Changes in this sector strongly correlate with changes in the overall economy. For example, housing and construction growth usually increases demand for cement. Moving toward a cleaner economy and ensuring we meet the statewide targets requires us to address GHG emissions in this sector, which has the potential to provide local co-benefits in criteria pollutant and toxic air contaminant reductions in immediate surrounding locations, especially in vulnerable communities. At the same time, we must ensure there is a smooth path to a cleaner future to support a resilient and robust economy with a strong job force, including training opportunities for workers in disadvantaged communities, while continuing to support economic growth in existing and new industries.

Greenhouse gas emissions in the Industrial sector have remained relatively flat for the last few years while the State's economy has continued to grow, meaning the GHG emissions to produce each dollar of gross standard product is decreasing. Manufacturing accounts for approximately 10 percent of the gross state product.<sup>176</sup> In 2016, California industry exported \$163.6 billion in merchandise.<sup>177</sup>

Policies to address GHG emissions reductions must continue to balance the State's economic well-being with making progress toward achievement of the statewide limits.

As this sector is dominated by combustion-related emissions, policies and measures to supply cleaner fuels and more efficient technology are the key to reducing GHG emissions. Some sectors, such as cement and glass, also have significant process emissions, and it may be more challenging to address those process emissions, as they are related to chemical reactions and processes to meet safety, product-specific, or regulatory standards for the final products. Another important aspect for this sector is its role as the State transitions to a cleaner future. Infrastructure, including existing facilities and new facilities, can support the production of new technology to bolster the State's efforts to address GHGs. For example, existing refineries have an opportunity to move away from fossil fuel production and switch to the production of biofuels and clean technology. As the State works to double energy efficiency in existing buildings, there will be an increased demand for efficient lighting fixtures, building insulation, low-e<sup>178</sup> coatings for existing windows, or new windows—goods which could be produced in California. The predominant paths to reducing GHG emissions for the Industrial sector are: fuel switching, energy efficiency improvements, and process modifications. Carbon capture and sequestration also offers a potential new, long-term path for reducing GHGs for large stationary sources.

Relocation of production to outside the State would also reduce emissions, but this is disadvantageous for a couple of reasons and efforts are needed to avoid this outcome. First, AB 32 requires the State's climate policies to minimize emissions leakage, and relocation would shift GHG emissions outside of the State without the benefit of reducing pollutants that contribute to overall global warming impacts. Second, it could also reduce the availability of associated jobs and could impact a local tax base that supports local services such as public transportation, emergency response, and social services, as well as funding sources critical to protecting the natural environment and keeping it available for current and future generations.

Even while we continue to seek further GHG reductions in the sector, it is important to recognize the State has a long history of addressing health-based air pollutants in this sector. Many of the actions for addressing criteria pollutants and toxic air contaminants in the industrial sector are driven by California's local air district stationary source requirements to ensure progress toward achieving State and national ambient air quality standards. Some of those actions, such as use of Best Available Control Technology, have resulted in co-benefits in the form of GHG reductions. The State must continue to strengthen its existing criteria and toxic air pollutant programs and relationships with local air districts to ensure all Californians have healthy, clean air. This is especially true in disadvantaged communities.

AB 32 directed CARB to take several actions to address GHG emissions, such as early action measures, GHG reporting requirements for the largest GHG sources, and other measures. In response, the State adopted multiple measures and regulations, including regulations for high global warming potential (high-GWP) gases used in refrigeration systems and the semiconductor industry.<sup>179</sup> These regulations apply to specific GHGs and types of equipment that can be found across the economy. For example, high-GWP gases are found in refrigeration systems in large food processing plants and chemical and petrochemical facilities, among others.<sup>180</sup>

The State has also adopted the first in the world economy-wide cap-and-trade program that applies to all large industrial GHG emitters, imported electricity, and fuel and natural gas suppliers. As discussed in Chapters 2 and 3, the Cap-and-Trade Program is a key element of California's GHG reduction strategy. The

178 Low-e coatings reduce the emissivity, or heat transfer, from a window to improve its insulating properties.

179 CARB. Refrigerant Management Program. [www.arb.ca.gov/cc/rmp/rmp.htm](http://www.arb.ca.gov/cc/rmp/rmp.htm)

180 The U.S. Environmental Protection Agency (U.S. EPA) has also enacted regulations to reduce hydrofluorocarbon (HFC) emissions by prohibiting high-GWP refrigerants in new retail food refrigeration equipment and in chillers used for large air-conditioning applications. On the international level, the European Union F-gas regulations went into effect January 1, 2015. Those regulations prohibit high-GWP HFCs in new equipment and require a gradual phasedown in the production and import of HFCs. A similar HFC phasedown that would take place globally was the subject of international negotiations during the Montreal Protocol meeting in Rwanda in October, 2016. Those negotiations resulted in an agreement that will phase down the use of HFCs and put the world on track to avoid nearly 0.5°C of warming by 2100.

Cap-and-Trade Program establishes a declining limit on major sources of GHG emissions, and it creates a powerful economic incentive for major investment in cleaner, more efficient technologies. The Cap-and-Trade Program applies to emissions that cover about 85 percent of the State's GHG emissions. CARB creates allowances equal to the total amount of permissible emissions (i.e., the "cap") over a given compliance period. One allowance equals one metric ton of GHG emissions. Fewer allowances are created each year, thus the annual cap declines and statewide emissions are reduced over time. An increasing annual auction reserve (or floor) price for allowances and the reduction in annual allowance budgets creates a steady and sustained pressure for covered entities to reduce their GHGs. All covered entities in the Cap-and-Trade Program are still subject to the air quality permit limits for criteria and toxic air pollutants.

The Cap-and-Trade Program is designed to achieve the most cost-effective statewide GHG emissions reductions; there are no individual or facility-specific GHG emissions reductions requirements. Each entity covered by the Cap-and-Trade Program has a compliance obligation that is set by its GHG emissions over a compliance period, and entities are required to meet that compliance obligation by acquiring and surrendering allowances in an amount equal to their compliance obligation. Companies can also meet a limited portion of their compliance obligation by acquiring and surrendering offset credits, which are compliance instruments that are based on rigorously verified emissions reductions that occur from projects outside the scope of the Cap-and-Trade Program. Like allowances, each offset credit is equal to one metric ton of GHG emissions. The program began in January 2013 and achieved a near 100 percent compliance rate for the first compliance period (2013–2014). Reported and verified emissions covered by the Cap-and-Trade Program have been below the cap throughout the first years of the Program.<sup>181</sup>

Allowances are issued by CARB and distributed by free allocation and by sale at auctions. CARB also provides for free allocation to some entities covered by the Program to address potential trade exposure due to the cost of compliance with the Program and address concerns of relocation of production out-of-state and resulting emissions leakage. Offset credits are issued by CARB to qualifying offset projects. Secondary markets exist where allowances and offset credits may be sold and traded among Cap-and-Trade Program participants. Facilities must submit allowances and offsets to match their annual GHG emissions. Facilities that emit more GHG emissions must surrender more allowances or offset credits, and facilities that can cut their emissions need to surrender fewer compliance instruments. Entities have flexibility to choose the lowest-cost approach to achieving program compliance; they may purchase allowances at auction, trade allowances and offset credits with others, take steps to reduce emissions at their own facilities, or utilize a combination of these approaches. Proceeds from the sale of State-owned allowances at auction are placed into the Greenhouse Gas Reduction Fund.

It is important to note that while the Cap-and-Trade Program is designed to reduce GHGs for the industrial sector, there are recommendations from the EJAC (or Committee) for the State to pursue more facility-specific GHG reduction measures to achieve potential local air quality co-benefits, and AB 197 directs CARB to prioritize direct reductions at large stationary sources. The Committee has expressed a strong preference to forgo the existing Cap-and-Trade Program and rely on prescriptive facility level regulations.

We agree with the EJAC that more can and should be done to reduce emissions of criteria pollutants and toxic air contaminants. These pollutants pose air quality and related health issues to the communities adjacent to the sources of industrial emissions. Further, many of these communities are already disadvantaged and burdened by a variety of other environmental stresses. As described in Chapter 3, however, there is not always a direct correlation between emissions of GHGs, criteria pollutants, and toxic air contaminants. Also, relationships between these pollutants are complex within and across industrial sectors. The solution, therefore, is not to do away with or change the regulation of GHGs through the Cap-and-Trade Program to address these legitimate concerns; instead, consistent with the direction in AB 197 and AB 617, State and local agencies must evaluate and implement additional measures that directly regulate and reduce emissions of criteria and toxic air pollutants through other programs.

---

181 CARB. 2016. Mandatory Greenhouse Gas Emissions Reporting. [www.arb.ca.gov/cc/reporting/ghg-rep/ghg-rep.htm](http://www.arb.ca.gov/cc/reporting/ghg-rep/ghg-rep.htm)

## Looking to the Future

This section outlines the high-level objectives and goals to reduce GHGs in this sector.

### Goals

- Increase energy efficiency.
- Reduce fossil fuel use.
- Promote and support industry that provides products and clean technology needed to achieve the State's climate goals.
- Create market signals for low carbon intensity products.
- Maximize air quality co-benefits.
- Support a resilient low carbon economy and strong job force.
- Make California the epicenter for research, development, and deployment of technology needed to achieve a near-zero carbon future.
- Increase in-State recycling manufacturing.

### Cross-Sector Interactions

There are clear, direct relationships between the industrial sector and other sectors that go beyond the economic support that a strong economy provides. For instance, this sector could increase its use of renewable fuels such as biomethane, which would be sourced from landfills or dairies. Additionally, some industries could shift from raw materials to recycled materials to reduce waste and reduce GHG emissions associated with processing of raw materials. Further, addressing energy efficiency could reduce onsite heating, water, and fuel demand. Moreover, supporting mass-transit or ride share programs for employees would reduce VMT. Finally, upgrading existing facilities or repurposing existing infrastructure instead of constructing new facilities or infrastructure would support land conservation and smart growth goals.

### Efforts to Reduce Greenhouse Gases

The measures below include some required and new potential measures to help achieve the State's 2030 target and to support the high-level objectives for this sector. Some measures may be designed to directly address GHG reductions, while others may result in GHG reductions as a co-benefit.

### Ongoing and Proposed Measures

- At the October 2016 annual Montreal Protocol Meeting of Parties in Kigali, Rwanda, an international amendment to globally phase down HFC production was agreed upon by more than 150 countries. Depending on the level of future HFC emissions reductions expected for California from the Kigali Agreement, California may also: (1) consider placing restrictions on the sale or distribution of refrigerants with a GWP > 2,500, and (2) consider prohibiting refrigerants with a GWP >= 150 in new stationary refrigeration equipment and refrigerants with a GWP >= 750 for new stationary air-conditioning equipment. At the time the SLCP Strategy was finalized, U.S. EPA was expected to continue implementing certain HFC reductions under its Significant New Alternatives Policy (SNAP). Recent litigation may result in CARB implementing similar measures as state law instead.
- Develop a regulatory monitoring, reporting, verification, and implementation methodology for the implementation of carbon capture and sequestration projects.
- Implement the CARB Regulation for Greenhouse Gas Emission Standards for Crude Oil and Natural Gas Facilities to reduce fugitive methane emissions from storage and distribution infrastructure.

### Sector Measures

- Implement the post-2020 Cap-and-Trade Program.
- Continue and strategically expand research and development efforts to identify, evaluate, and help deploy innovative strategies that reduce GHG emissions in the industrial sector.
- Promote procurement policies that prioritize low carbon production to delivery options, including at the State and local government levels.
- Identify and remove barriers to existing grant funding for onsite clean technology or efficiency upgrades.

## Potential Additional Actions

The actions below have the potential to reduce GHGs and complement the measures and policies identified in Chapter 2. These are included to spur thinking and exploration of innovation that may help the State achieve its long-term climate goals. It is anticipated that there will be workshops and other stakeholder forums in the years following finalization of the Scoping Plan to explore these potential actions.

- Further deploy fuel cells that use renewable fuels or those that generate electricity that is less carbon intensive than the grid.
- Decrease usage of fossil natural gas through a combination of efficiency, fuel switching, and the development and use of renewable gas.
- Partner with California's local air districts to effectively use BARCT to achieve air quality and GHG reduction co-benefits at large industrial sources.
- Evaluate the potential for and promote electrification for industrial stationary sources whose main emissions are onsite natural gas combustion.
- Identify new funding for grants and tariff opportunities for onsite clean technology, efficiency upgrades, diesel generator replacement, or recycling manufacturing technology.
- Develop an incentive program to install low-GWP refrigeration systems in retail food stores.
- Evaluate and design additional mechanisms to further minimize emissions leakage in the Cap-and-Trade Program (e.g., border carbon adjustment).

## Transportation Sustainability

---

California's population is projected to grow to 50 million people by 2050. How and where the State grows will have important implications for all sectors of the economy, especially the transportation sector. Supporting this growth while continuing to protect the environment, developing livable and vibrant communities, and growing the economy is dependent on transitioning the State's transportation system to one powered by ZEVs (including PHEVs, BEVs, and FCEVs) and low carbon fuels. It must also offer other attractive and convenient low carbon transportation choices, including safe walking and bicycling, as well as quality public transportation. Investments should consider California's diverse communities and provide accessible and clean travel options to all while drastically reducing reliance on light-duty combustion vehicles.

The transportation system in California moves people between home, work, school, shopping, recreation, and other destinations, and connects ports, industry, residential communities, commercial centers, educational facilities, and natural wonders.<sup>182</sup> California's vast transportation system includes roads and highways totaling more than 175,000 miles and valued at approximately \$1.2 trillion, 500 transit agencies, 245 public-use airports, 12 major ports, and the nation's first high-speed rail system, now under construction.<sup>183</sup> Transportation infrastructure also includes sidewalks, bicycle paths, parking, transit stations and shelters, street trees and landscaping, signage, lighting, and other elements that affect the convenience, safety, and accessibility of transportation choices. Increasingly, technologies such as real-time, web- and mobile-enabled trip planning and ride-sourcing services are changing how people travel. In the near future, automated and connected vehicles, and unmanned aerial systems (e.g., drones) are expected to be part of our transportation landscape and to transform the way that people and freight are transported. Responsibility for the transportation system is spread across State, regional, and local levels.

Through effective policy design, the State has an opportunity to guide technology transformation and influence investment decisions with a view to mitigate climate and environmental impacts while promoting economic opportunities and community health and safety. The network of transportation technology and infrastructure, in turn, shapes and is shaped by development and land use patterns that can either support or detract from a more sustainable, low carbon, multi-modal transportation future. Strategies to reduce GHG emissions from the transportation sector, therefore, must actively address not only infrastructure and technology, but also coordinated strategies to achieve development, conservation, and land use patterns that align with the State's GHG and other policy goals.

Transportation also enables the movement of freight such as food, building materials, and other consumable products, as well as waste and recyclables. The California freight system includes myriad equipment and

---

<sup>182</sup> Caltrans. California Transportation Plan 2040, February 2016.

<sup>183</sup> Ibid.

facilities,<sup>184</sup> and is the most extensive, complex, and interconnected system in the country, with approximately 1.5 billion tons of freight valued at \$2.8 trillion shipped in 2015 to, through, and within California.<sup>185</sup> Freight-dependent industries accounted for over \$740 billion of California's GDP and over 5 million California jobs in 2014.<sup>186, 187</sup>

Transportation has a profound and varied impact on individuals and communities, including benefits such as economic growth, greater accessibility, and transport-related physical activity, and adverse consequences such as GHG emissions, smog-forming and toxic air pollutants, traffic congestion, and sedentary behaviors. The sector is the largest emitter of GHG emissions in California. Air pollution from tailpipe emissions contributes to respiratory ailments, cardiovascular disease, and early death, with disproportionate impacts on vulnerable populations such as children, the elderly, those with existing health conditions (e.g., chronic obstructive pulmonary disease, or COPD), low-income communities, and communities of color.<sup>188, 189, 190, 191, 192</sup> Importantly, transportation costs are also a major portion of most Californian's household budgets.<sup>193</sup> Additionally, dependence on cars has a direct impact on levels of physical activity, which is closely linked to multiple adverse health outcomes.

Fortunately, many measures that reduce transportation sector GHG emissions simultaneously present opportunities to bolster the economy, enhance public health, revitalize disadvantaged communities, strengthen resilience to disasters and changing climate, and improve Californians' ability to conveniently access daily destinations and nature. These opportunities are particularly important for those who are not able to, or cannot afford to, drive. In addition, a growing market demand for walkable, bikeable, and transit-accessible communities presents a significant opportunity to shift California's transportation systems toward a lower-carbon future while realizing significant public health benefits through increased levels of physical activity (e.g., walking and bicycling). In fact, transport-related physical activity could result in reducing risks from chronic diseases such as cardiovascular disease, diabetes, certain cancers, and more, to such an extent that it would rank among the top public health accomplishments in modern history, and help to reduce the billions of dollars California spends each year to treat chronic diseases. Just as California was the first to mitigate the contribution of cars and trucks to urban smog, it is leading the way toward a clean, low carbon, healthy, interconnected, and equitable transportation system.

Continuing to advance the significant progress already underway in the areas of vehicle and fuel technology is critical to the transportation sector strategy and to reducing GHG emissions in the transportation sector. The rapid technological and behavioral changes underway with automated and connected vehicles, unmanned aerial systems, and ride-sourcing services are redefining the transportation sector, and should be part of the solution for a lower carbon transportation sector. It is critical to support and accelerate progress on transitioning to a zero carbon transportation system, while ensuring VMT reductions are still achieved. The growing severity of climate impacts, persistent public health impacts and costs from air pollution,<sup>194</sup> and rapid technology progress that supports the expectation that cost parity between some ZEVs and comparable internal combustion vehicles will be attained in a few years, underscores the need for further

---

184 The freight system includes trucks, ocean-going vessels, locomotives, aircraft, transport refrigeration units, commercial harborcraft and cargo handling, industrial and ground service equipment used to move freight at seaports, airports, border crossings, railyards, warehouses, and distribution centers.

194 For example, a recent report by the American Lung Association estimates the costs of climate and air pollution from passenger vehicles in California to be \$15 billion annually. Holmes-Gen, B. and W. Barrett. 2016. Clean Air Future – Health and Climate Benefits of Zero Emission Vehicles. American Lung Association in California, October.

action on ZEVs. Therefore, CARB is signaling the need for additional policy and technical support on strategies to move toward a goal of achieving 100 percent ZEV sales in the light-duty vehicle sector. Austria, Germany, India, Netherlands, and Norway are all taking steps to, or have indicated a desire to, move to 100 percent ZEV sales in the 2020–2030 time frame.

In addition, policies that maximize the integration of electrified rail and transit to improve reliability and travel times, increase active transportation such as walking and bicycling, encourage use of streets for multiple modes of transportation, improve freight efficiency and infrastructure development, and shift demand to low carbon modes will need to play a greater role as California strives to achieve its 2030 and 2050 climate targets.<sup>195</sup>

The State's rail modernization program has identified critical elements of the rail network where improvements, either in timing of service or infrastructure, provide benefits across the entire statewide network, furthering the attractiveness of rail for a range of trip distances.<sup>196</sup> The State also uses the Transit and Intercity Rail Capital Program (TIRCP) and Low Carbon Transit Operations Program (LCTOP) to provide grants from GGRF to fund transformative improvements modernizing California's intercity, commuter, and urban rail systems, as well as bus and ferry transit systems, to reduce emissions of GHGs by reducing congestion and VMT throughout California. As the backbone of an electrified mass-transportation network for the State, the high-speed rail system catalyzes and relies on focused, compact, and walkable development well-served by local transit to funnel riders onto the system and provide alternative options to airplanes and automobiles for interregional travel. Concentrated development, such as that incentivized by the Affordable Housing and Sustainable Communities (AHSC) grant program, can improve ridership and revenue for the system while providing vibrant communities for all.

At the same time, more needs to be done to fully exploit synergies with emerging mobility solutions like ride-sourcing and more effective infrastructure planning to anticipate and guide the necessary changes in travel behavior, especially among millennials. Uniquely, high-speed rail affects air-miles traveled, diverting, at minimum, 30 percent of the intrastate air travel market in 2040.<sup>197</sup>

While most of the GHG reductions from the transportation sector in this Scoping Plan will come from technologies and low carbon fuels, a reduction in the growth of VMT is also needed. VMT reductions are necessary to achieve the 2030 target and must be part of any strategy evaluated in this Plan. Stronger SB 375 GHG reduction targets will enable the State to make significant progress toward this goal, but alone will not provide all of the VMT growth reductions that will be needed. There is a gap between what SB 375 can provide and what is needed to meet the State's 2030 and 2050 goals.

At the time of this writing, adoption of the first round of SCSs by MPOs is complete, and the second round of SCS planning is underway. Three MPO regions are in the very early stages of developing their third SCSs. To date, CARB staff reviewed the final determinations of 16 MPOs, and concluded that all 16 of those SCSs would achieve their targets, if implemented, with many of the MPOs indicating that they expect to exceed their targets. CARB staff recognizes the very strong performance in this first round of SCSs as a major success. Currently adopted sustainable communities strategies achieve, in aggregate, a 17 percent reduction in statewide per capita GHG emissions relative to 2005 by 2035.

Since 2014, CARB has been working with MPOs and other stakeholders to update regional SB 375 targets. At the same time, CARB has also conducted analysis for development of the Mobile Source Strategy and Scoping Plan that identifies the need for statewide per capita greenhouse gas emissions reductions on the order of 25 percent by 2035, to meet our climate goals. Many MPOs have identified challenges to incorporating additional strategies and reducing emissions further in their plans, principally tied to the need for additional and more flexible revenue sources. MPOs have submitted target update recommendations to CARB that in aggregate maintains a 17 percent reduction statewide, which includes commitments of 18 percent reduction by 2035 from each of the four largest MPOs in the State.

CARB is currently reviewing each MPOs target update recommendations alongside new State policies. State agencies have been working on new State-level VMT-related Policies and Measures (see Table 17) as part of this Scoping Plan intended to provide the State, MPOs, and local agencies with additional funding resources and tools to successfully meet the State's climate goals. CARB's preliminary review indicates that new State-level policies and measures will help support updated SB 375 targets that achieve up to 20 percent of the

needed statewide reduction, as well as help bridge the remaining VMT growth reduction gap.

Discussions among a broad suite of stakeholders from transportation, the building community, financial institutions, housing advocates, environmental organizations, and community groups are needed to begin the process to pursue and develop the needed set of strategies to ensure that we can achieve necessary VMT reductions, and that the associated benefits are shared by all Californians. Appendix C further details potential actions for discussion that can be taken by State government, regional planning agencies, and local governments, to achieve a broad, statewide vision for more sustainable land use and close the VMT gap.<sup>198</sup>

At the State level, a number of important policies are being developed. Governor Brown signed Senate Bill 743 (Steinberg, Chapter 386, Statutes of 2013), which called for an update to the metric of transportation impact in CEQA. That update to the CEQA Guidelines is currently underway. Employing VMT as the metric of transportation impact statewide will help to ensure GHG reductions planned under SB 375 will be achieved through on-the-ground development, and will also play an important role in creating the additional GHG reductions needed beyond SB 375 across the State. Implementation of this change will rely, in part, on local land use decisions to reduce GHG emissions associated with the transportation sector, both at the project level, and in long-term plans (including general plans, climate action plans, specific plans, and transportation plans) and supporting sustainable community strategies developed under SB 375. The State can provide guidance and tools to assist local governments in achieving those objectives.

Appendix H highlights the more significant existing policies, programs, measures, regulations, and initiatives that provide a framework for helping achieve GHG emissions reductions in this sector.

## Looking to the Future

This section outlines the high-level objectives and goals to reduce GHGs in this sector.

### Vibrant Communities and Landscapes / VMT Reduction Goals

- Implement and support the use of VMT as the metric for determining transportation impacts under CEQA, in place of level of service (LOS).
- Promote all feasible policies to reduce VMT, including:
  - Land use and community design that reduce VMT,
  - Transit oriented development,
  - Complete street design policies that prioritize transit, biking, and walking, and
  - Increasing low carbon mobility choices, including improved access to viable and affordable public transportation and active transportation opportunities.
- Complete the construction of high-speed rail integrated with enhanced rail and transit systems throughout the State.
- Promote transportation fuel system infrastructure for electric, fuel-cell, and other emerging clean technologies that is accessible to the public where possible, and especially in underserved communities, including environmental justice communities.
- Increase the number, safety, connectivity, and attractiveness of biking and walking facilities to increase use.
- Promote potential efficiency gains from automated transportation systems and identify policy priorities to maximize sustainable outcomes from automated and connected vehicles (preferably ZEVs), including VMT reduction, coordination with transit, and shared mobility, and minimize any increase in VMT, fossil fuel use, and emissions from using automated transportation systems.
- Promote shared-use mobility, such as bike sharing, car sharing and ride-sourcing services to bridge the “first mile, last mile” gap between commuters’ transit stops and their destinations.
- Continue research and development on transportation system infrastructure, including:
  - Integrate frameworks for lifecycle analysis of GHG emissions with life-cycle costs for pavement and large infrastructure projects, and
  - Health benefits and costs savings from shifting from driving to walking, bicycling, and transit use.
- Quadruple the proportion of trips taken by foot by 2030 (from a baseline

---

198 CARB. Potential State - Level Strategies to Advance Sustainable, Equitable Communities and Reduce Vehicle Miles of Travel (VMT) -- for Discussion. [www.arb.ca.gov/cc/scopingplan/meetings/091316/Potential%20VMT%20Measures%20For%20Discussion\\_9.13.16.pdf](http://www.arb.ca.gov/cc/scopingplan/meetings/091316/Potential%20VMT%20Measures%20For%20Discussion_9.13.16.pdf)

of the 2010–2012 California Household Travel Survey).

- Strive for a nine-fold increase in the proportion of trips taken by bicycle by 2030 (from a baseline of the 2010–2012 California Household Travel Survey).
- Strive, in passenger rail hubs, for a transit mode share of between 10 percent and 50 percent, and for a walk and bike mode share of between 10 percent and 15 percent.

## Vehicle Technology Goals

- Through a strong set of complementary policies—including reliable incentives, significant infrastructure investment, broad education and outreach, and potential regulation—aim to reach 100 percent ZEV sales in the light-duty sector (PHEVs, BEVs, and FCEVs) by 2050.
- Make significant progress in ZEV penetrations in non-light-duty sectors.
- Deploy low-emission and electrified rail vehicles.

## Clean Fuels Goals

- Electrify the transportation sector using both electricity and hydrogen.
- Promote research development and deployment of low carbon fuels such as renewable gas, including renewable hydrogen.
- Rapidly reduce carbon intensity of existing liquid and gaseous transportation fuels.

## Sustainable Freight Goals

- Increase freight system efficiency of freight operations at specific facilities and along freight corridors such that more cargo can be moved with fewer emissions.
- Accelerate use of clean vehicle and equipment technologies and fuels of freight through targeted introduction of zero emission or near-zero emission (ZE/NZE) technologies, and continued development of renewable fuels.
- Encourage State and federal incentive programs to continue supporting zero and near-zero pilot and demonstration projects in the freight sector.
- Accelerate use of clean vehicle, equipment, and fuels in freight sector through targeted introduction of ZE/NZE technologies, and continued development of renewable fuels. This includes developing policy options that encourage ZE/NZE vehicles on primary freight corridors (e.g., Interstate-710); examples of such policy options include a separated ZE/NZE freight lane, employing market mechanisms such as favorable road pricing for ZE/NZE vehicles, and developing fuel storage and distribution infrastructure along those corridors.

## Cross-Sector Interactions

The transportation sector has considerable influence on other sectors and industries in the State. California's transportation sector is still primarily powered by petroleum, and to reduce statewide emissions, California must reduce demand for driving; continue to reduce its gasoline and diesel fuel consumption; diversify its transportation fuel sources by increasing the adoption of low- and zero-carbon fuels; increase the ease and integration of the rail and transit networks to shift travel mode; and deploy ZE/NZE vehicles.

As California's population continues to increase, land use patterns will directly impact GHG emissions from the transportation sector, as well as those associated with the conversion and development of previously undeveloped land. Specifically, where and how the State population grows will have implications on distances traveled and tailpipe emissions; as well as on secondary emissions from the transportation sector, including emissions from vehicle manufacturing and distribution, fuel refining and distribution, demand for new infrastructure (including roads, transit, and active transportation infrastructure), demand for maintenance and upkeep of existing infrastructure. Conversion of natural and working lands further affects emissions, with the attendant impacts to food security, watershed health, and ecosystems. Less dense development also demands higher energy and water use. With the exception of VMT reductions, none of these secondary emissions are currently accounted for in the GHG models used in this Scoping Plan, but are nonetheless important considerations. Additionally, compact, lower-VMT future development patterns are essential to achieving public health, equity, economic, and conservation goals, which are also not modeled but are important co-benefits of the overall transportation sector strategy. For example, high-speed rail station locations were identified in downtown areas to reinforce existing city centers.

Achieving LCFS targets and shifting from petroleum dependence toward greater reliance on low carbon fuels also has the potential to affect land use in multiple ways. For example, increased demand for conventional biofuels could require greater use of land and water for purpose-grown crops, which includes interactions with the agricultural and natural and working lands sectors. On the other hand, continuing growth in fuels from urban organic waste, as well as waste biomass such as composting residues, by-processing residues and agricultural waste and excess forest biomass acts to alleviate the pressure on croplands to meet the need for food, feed, and fuel. Likewise, captured methane from in-vessel digestion, landfills or dairy farms for use in vehicles requires close interaction with the waste and farming sectors.

Also, as more electric vehicles and charging stations are deployed, drivers' charging behavior will affect the extent to which additional electric generation capacity and ancillary services are needed to maintain a reliable grid and accommodate a portfolio of 50 percent renewable electricity by 2030. Charging control and optimization technologies will determine how well integrated the electric and transportation sectors can become, including, for instance, the widespread use of electric vehicles as storage for excess renewable generation, vehicle to grid, smart charging, and/or smart grid. The GHG emissions intensity of electricity affects the GHG savings of fuel switching from petroleum-based fuels to electricity; the cleaner the electric grid, the greater the benefits of switching to electricity as a fuel. Similar to electric vehicles, hydrogen fuel cell electric vehicles have zero-tailpipe emissions and can mitigate GHGs and criteria pollutants. Greenhouse gas emissions could be further reduced with the use of renewable hydrogen, which can be produced using renewable electricity or renewable natural gas.

## Efforts to Reduce Greenhouse Gases

The measures below include some required and new potential measures to help achieve the State's 2030 target and to support the high-level objectives for the transportation sector. Some measures may be designed to directly address GHG reductions, while others may result in GHG reductions as a co-benefit.

## Ongoing and Proposed Measures – Vibrant Communities and Landscapes / VMT Reduction Goals

- Mobile Source Strategy – 15 percent reduction in total light-duty VMT from the BAU in 2050 (with measures to achieve this goal not specified; potential measures identified in Appendix C).
- Work with regions to update SB 375 Sustainable Communities Strategies targets for 2035 to better align with the 2030 GHG target and take advantage of State rail investments.
- Stronger SB 375 GHG reduction targets will enable the State to make significant progress toward the goal of reducing total light-duty VMT by 15 percent from expected levels in 2050, but alone will not provide all of the VMT reductions that will be needed. The gap between what SB 375 can provide and what is needed to meet the State's 2030 and 2050 goals needs to be addressed through additional VMT reduction measures such as those mentioned in Appendix C.
- Implement and support the adoption and use of VMT as the CEQA metric of transportation impact, such that it promotes GHG reduction, the development of multimodal transportation networks, and a diversity of land uses.
- Continue to develop and explore pathways to implement State-level VMT reduction strategies, such as those outlined in the document "Potential State-Level Strategies to Advance Sustainable, Equitable Communities and Reduce Vehicle Miles of Travel (VMT) – for Discussion"<sup>199</sup> – included in Appendix C – through a transparent and inclusive interagency policy development process to evaluate and identify implementation pathways for additional policies to reduce VMT and promote sustainable communities, with a focus on:
  - Accelerating equitable and affordable transit-oriented and infill development through new and enhanced financing and policy incentives and mechanisms,
  - Promoting stronger boundaries to suburban growth through enhanced support for sprawl containment mechanisms such as urban growth boundaries and transfer of development rights programs,
  - Identifying performance criteria for transportation and other infrastructure investments

<sup>199</sup> Refers to the document discussed at the September 2016 Public Workshop on the Transportation Sector to Inform Development of the 2030 Target Scoping Plan Update, also available at: [www.arb.ca.gov/cc/scopingplan/meetings/091316/Potential%20VMT%20Measures%20For%20Discussion\\_9.13.16.pdf](http://www.arb.ca.gov/cc/scopingplan/meetings/091316/Potential%20VMT%20Measures%20For%20Discussion_9.13.16.pdf)

- to ensure alignment with GHG reduction goals and other State policy priorities and expand access to transit, shared mobility, and active transportation choices,
- Promoting efficient development patterns that maximize protection of natural and working lands,
- Developing pricing mechanisms such as road user/VMT-based pricing, congestion pricing, and parking pricing strategies,
- Reducing congestion and related GHG emissions through commute trip reduction strategies, and
- Programs to maximize the use of alternatives to single-occupant vehicles, including bicycling, walking, transit use, and shared mobility options.
- Finalize analysis of the results of the pilot road usage charge program, implemented pursuant to SB 1077 (DeSaulnier, Chapter 835, Statutes of 2014), and evaluate deployment of a statewide program.
- Continue promoting active transportation pursuant to SB 99 (Committee on Budget and Fiscal Review, Chapter 359, Statutes of 2013) – The Active Transportation Program and beyond.
- Continue to build high-speed rail and broader statewide rail modernization pursuant to the funding program in SB 862 (Committee on Budget and Fiscal Review, Chapter 36, Statutes of 2014) and other sources.
- Encourage use of streets for multiple modes of transportation (including public transit and active transportation, such as walking and bicycling), and for all users, including the elderly, young, and less able bodied, pursuant to AB 1358 (Leno, Chapter 657, Statutes of 2008) – Complete Streets policies.
- Support and assist local and regional governments, through technical assistance, and grant and other local assistance programs, to develop and implement plans that are consistent with the goals and concepts in The Second Investment Plan for Fiscal Years 2016-2017 through 2018-2019<sup>200</sup> and its subsequent updates, and Appendix C: Vibrant Communities and Landscapes, including the following:
  - California Climate Investment programs such as Transformative Climate Communities Program, ensuring promotion of GHG reductions from neighborhood-level community plans in disadvantaged communities.
  - AB 2087 (Levine, Chapter 455, Statutes of 2016) – Help local and State agencies apply core investment principles when planning conservation or mitigation projects.
  - High speed rail station area plans.
  - Implementation of updated General Plan Guidelines.
- Per SB 350, implement the recommendations identified in the Barriers Study to accessing ZE/NZE transportation options for low-income customers and recommendations on how to increase access.<sup>201</sup> And, track progress towards these actions over time to ensure disadvantaged communities are getting equal access and benefits relative to other parts of the State.
- Take into account the current and future impacts of climate change when planning, designing, building, operating, maintaining, and investing in State infrastructure, as required under Executive Order B-30-15.

## Ongoing and Proposed Measures – Vehicle Technology

- Implement the Cleaner Technology and Fuels Scenario of CARB’s Mobile Source Strategy, which includes:
  - An expansion of the Advanced Clean Cars program, which further increases the stringency of GHG emissions for all light-duty vehicles, and 4.2 million zero emission and plug-in hybrid light-duty electric vehicles by 2030,
  - Phase 1 and 2 GHG regulations for medium- and heavy-duty trucks, and
  - Innovative Clean Transit.
- Periodically assess and promote cleaner fleet standards.
- Deploy ZEVs across all vehicle classes, including rail vehicles, along with the necessary charging infrastructure.
- Encourage State and federal incentive programs to continue supporting zero and near-zero pilot and demonstration projects.
- Collaborate with the U.S. Environmental Protection Agency to promulgate more

Available at: [www.arb.ca.gov/cc/capandtrade/auctionproceeds/16-17-updated-final-second-investment-planii.pdf](http://www.arb.ca.gov/cc/capandtrade/auctionproceeds/16-17-updated-final-second-investment-planii.pdf)

201 CARB. 2017. Low-Income Barriers Study, Part B: Overcoming Barriers to Clean Transportation Access for Low Income Residents. [www.arb.ca.gov/msprog/transoptions/draft\\_sb350\\_clean\\_transportation\\_access\\_guidance\\_document.pdf](http://www.arb.ca.gov/msprog/transoptions/draft_sb350_clean_transportation_access_guidance_document.pdf)

stringent locomotives requirements,<sup>202</sup> work with California seaports, ocean carriers, and other stakeholders to develop the criteria to incentivize introduction of Super-Low Emission Efficient Ships, and investigate potential energy efficiency improvements for transport refrigeration units and insulated truck and trailer cargo vans.

- Promote research, development, and deployment of new technology to reduce GHGs, criteria pollutants, and toxics.
- Implement a process for intra-state agency and regional and local transportation coordination on automated vehicles to ensure shared policy goals in achieving safe, energy efficient, and low carbon autonomous vehicle deployment that also contribute to VMT reductions.

## Ongoing and Proposed Measures – Clean Fuels

- Continue LCFS activities, with increasing stringency of at least 18 percent reduction in carbon intensity (CI).
- Continue to develop and commercialize clean transportation fuels through renewable energy integration goals, tax incentives, research investments, support for project demonstration, public outreach, setting procurement standards, including updating State and local procurement contracts.
- Per SB 1383 and the SLCP Strategy, adopt regulations to reduce and recover methane from landfills, wastewater treatment facilities, and manure at dairies; use the methane as a source of renewable gas to fuel vehicles and generate electricity; and establish infrastructure development and procurement policies to deliver renewable gas to the market.
- Accelerate deployment of alternative fueling infrastructure pursuant to the following:
  - SB 350 – CPUC to accelerate widespread transportation electrification.
  - Executive Order B-16-2012 and 2016 ZEV Action Plan – call for infrastructure to support 1 million ZEVs by 2020.
  - CEC’s Alternative and Renewable Fuel and Vehicle Technology Program (ARFVTP).
  - CPUC’s NRG settlement.
  - CALGreen Code provisions mandate installation of PEV charging infrastructure in new residential and commercial buildings.<sup>203</sup>
  - IOU electric vehicle charging infrastructure pilot programs.

## Ongoing and Proposed Measures – Sustainable Freight

- Implement the California Sustainable Freight Action Plan:
  - 25 percent improvement of freight system efficiency by 2030.
  - Deployment of over 100,000 freight vehicles and equipment capable of zero emission operation, and maximize near-zero emission freight vehicles and equipment powered by renewable energy by 2030.

## Ongoing and Proposed Measures – California and Transportation Plan

- Update every five years and implement California Transportation Plan.

## Sector Measures

- Implement the post-2020 Cap-and-Trade Program

## Potential Additional Actions

The actions below have the potential to reduce GHGs and complement the measures and policies identified in Chapter 2. These are included to spur thinking and exploration of innovation that may help the State achieve its long-term climate goals.

- Develop a set of complementary policies to make light-duty ZEVs clear market winners, with a goal of reaching 100 percent light-duty ZEV sales. This could include the following:
  - Reliable purchase/trade-in incentives for at least 10 years.
  - Dealer incentives for ZEV sales.
  - Policies to ensure operating cost savings for ZEVs relative to internal

<sup>202</sup> [www.arb.ca.gov/railyard/docs/final\\_locomotive\\_petition\\_and\\_cover\\_letter\\_4\\_13\\_17.pdf](http://www.arb.ca.gov/railyard/docs/final_locomotive_petition_and_cover_letter_4_13_17.pdf)

<sup>203</sup> Such as raceway and panel capacity to support future installation of electrical vehicle charging stations.

- combustion engines, including low cost electricity.
- Additional investments in charging and ZEV refueling infrastructure.
- A broad and effective marketing and outreach campaign.
- Collaborations with cities to develop complementary incentive and use policies for ZEVs.
- Targeted policies to support ZEV sales and use in low income and disadvantaged communities.
- Develop a Low-Emission Diesel Standard to diversify the fuel pool by incentivizing increased production of low-emission diesel fuels. This standard is anticipated to both displace consumption of conventional diesel with increased use of low-emission diesel fuels, and to reduce emissions from conventional fuels.
- Continue to develop and explore pathways to implement State-level VMT reduction strategies, such as those outlined in Appendix C through a transparent and inclusive interagency policy development process to evaluate and identify implementation pathways for additional policies to reduce VMT and promote sustainable communities, with a focus on the following:
  - Accelerating equitable and affordable transit-oriented and infill development through new and enhanced financing and policy incentives and mechanisms.
  - Promote infrastructure necessary for residential development in existing communities, and ensure any urban growth boundaries are paired with significant infill promotion strategies and removal of infill development barriers.
  - Identifying performance criteria for transportation and other infrastructure investments, to ensure alignment with GHG reduction goals and other State policy priorities, and improve proximity, expanded access to transit, shared mobility, and active transportation choices.
  - Promoting efficient development patterns that maximize protection of natural and working lands.
  - Developing pricing mechanisms such as road user/VMT-based pricing, congestion pricing, and parking pricing strategies.
  - Reducing congestion and related GHG emissions through programs to maximize the use of alternatives to single-occupant vehicles, including bicycling, walking, transit use, and shared mobility options for commute trips.
- Continue to promote research and standards for new and existing technologies to reduce GHGs, including but not limited to:
  - Low rolling resistance tires in the replacement tire market, subject to certification standards that identify tires as low rolling resistance tires or verify emissions reductions and potential fuel savings.
  - Impacts on VMT of car sharing, ride-sourcing, and other emerging mobility options.
  - Driving behaviors that reduce GHG emissions, such as ecodriving training and real-time feedback mechanisms.

## Natural and Working Lands Including Agricultural Lands

---

In his 2015 State of the State address, Governor Brown established 2030 targets for GHG emissions reductions and called for policies and actions to reduce GHG emissions from natural and working lands, including forests, rangelands, farms, wetlands, and soils. The passage of SB 1386 (Wolk, Chapter 535, Statutes of 2015-16) codified this policy and emphasized the important role natural and working lands play in the State's climate strategy. This Scoping Plan focuses renewed attention on California's natural and working lands and the contribution they make to meet the State's goals for carbon sequestration, GHG reduction, and climate change adaptation.

California's natural and working lands encompass a range of land types and uses, including farms, ranches, forests, grasslands, deserts, wetlands, riparian areas, coastal areas and the ocean-- as well as the green spaces in urban and built environments. These resources can be both a source and sink for GHG emissions. Policy in this sector must balance GHG emissions reductions and carbon sequestration with other co-benefits, such as clean air, wildlife and pollinator habitat, strong economies, food, fiber and renewable energy production, and water supply.<sup>204</sup>

Recent trends indicate that significant pools of carbon from these landscapes risk reversal: over the period 2001–2010 disturbance caused an estimated 150 MMT C loss, with the majority— approximately 120 MMT C—

---

204 [www.sierranevada.ca.gov/our-region/ca-primary-watershed](http://www.sierranevada.ca.gov/our-region/ca-primary-watershed)

lost through wildland fire.<sup>205</sup> At the same time, energy use, methane, and N<sub>2</sub>O emissions from the agricultural sector accounts for eight percent of the emissions in the statewide GHG inventory.

California's climate objective for natural and working lands is to maintain them as a carbon sink (i.e., net zero or negative GHG emissions) and, where appropriate, minimize the net GHG and black carbon emissions associated with management, biomass utilization, and wildfire events. In order to achieve this objective, this Plan directs the continued development of the broad and growing understanding of carbon dynamics on California's landscapes, statewide emission trends, and their responses to different land management scenarios. Further, in order to build a programmatic framework for achieving this long-term objective to maintain California's natural and working lands as a carbon sink, this Plan directs the State to quantify the carbon impacts of both publicly funded (e.g., bonds, special taxes, general fund) climate intervention activities on California's natural and working lands made through existing programs as well as potential regulatory actions on land management. This Plan proposes an intervention based reduction goal of at least 15-20 million metric tons by 2030 as a reasonable beginning point for further discussion and development based on the State's current preliminary understanding of what might be feasible. This Plan recognizes that achieving an initial statewide goal of sequestering and avoiding emissions in this sector by at least 15-20 million metric tons by 2030 through existing pathways and new incentives would provide a crucial complement to the measures described in this Scoping Plan and will inform the development of longer-term natural and working lands goals. Achieving this ambitious climate goal will require collaboration and support from State and local agencies, which must improve their capacity to participate and benefit from State climate programs, and set the path for natural and working lands to help the State meet its long-range climate goals.

## Looking to the Future

This section outlines how the State will achieve California's climate objectives to: (1) maintain them as a resilient carbon sink (i.e., net zero or negative GHG emissions), and (2) minimize the net GHG and black carbon emissions associated with management, biomass disposal, and wildfire events to 2030 and beyond.

Implementation will include policy and program pathways, with activities related to land protection; enhanced carbon sequestration; and innovative biomass utilization. The framework for this section is to:

- **Protect** land from conversion to more intensified uses by increasing conservation opportunities and pursuing local planning processes in urban and infrastructure development patterns that avoid greenfield development.
- **Enhance** the resilience of and potential for carbon sequestration on lands through management and restoration, and reduce GHG and black carbon emissions from wildfire and management activities. This enhancement includes expansion and management of green space in urban areas.
- **Innovate** biomass utilization such that harvested wood and excess agricultural and forest biomass can be used to advance statewide objectives for renewable energy and fuels, wood product manufacturing, agricultural markets, and soil health, resulting in avoided GHG emissions relative to traditional utilization pathways. Associated activities should increase the resilience of rural communities and economies.

To accomplish these objectives, the State, led by California Natural Resources Agency (CNRA), California Department of Food and Agriculture (CDFA), California Environmental Protection Agency (CalEPA) and CARB will complete a Natural and Working Lands (NWL) Climate Change Implementation Plan (Implementation Plan) in 2018 to evaluate a range of implementation scenarios for natural and working lands and identify long-term (2050 or 2100) sequestration goals that can be incorporated into future climate policy. The Implementation Plan will:

- Include a projection of statewide emissions under business-as-usual land use and management conditions and alternative scenarios, as well as a listing and quantitative assessment of conservation and management activities the state may pursue to achieve the NWL climate objectives and the statewide goals of at least 15-20 MMTCO<sub>2</sub>e emissions sequestering and avoidance from the NWL sector by 2030;
- Identify state departments, boards, conservancies, and CNRA and CDFA programs responsible for meeting the 15-20 MMTCO<sub>2</sub>e goal by 2030; and
- Identify methodologies to be used by State programs to account for the

---

<sup>205</sup> [www.arb.ca.gov/cc/inventory/sectors/forest/forest.htm](http://www.arb.ca.gov/cc/inventory/sectors/forest/forest.htm)

GHG impacts of prior state funded land use and management interventions, and to be used to estimate the GHG impacts of future interventions.

While growing trees and other vegetation, as well as soil carbon sequestration, reduce some of the carbon losses measured, climate change itself further stresses many of these systems and affects the ability of California's landscapes to maintain its carbon sink. The State will continue to rely on best available science to support actions and incentives to slow and reverse these trends, in concert with other production and ecological objectives of land use. The Forest Climate Action Team, Healthy Soils Initiative, State Coastal Conservancy's Climate Ready Program, various California Climate Investment programs, and CARB's compliance offset program already undertake portions of this work. As we move towards and maximize the ability of our land base to serve as a carbon sink, it will also be important to strengthen these individual activities through the coordination and aggregation of ecoregional plans that inform these interventions. These and future additional efforts can not only protect California's natural carbon stocks, they can also improve quality of life in urban and rural communities alike and increase the climate resilience of agricultural, forestry, and recreational industries and the rural communities they support; the State's water supply; biodiversity; and the safety and environmental health of all who call California home.

## **Research and Policy Needs**

Research is ongoing across agencies to advance the state of the science on NWL carbon dynamics, including a number of projects within the Fourth Climate Change Assessment, and a compendium of climate research being managed by the CNRA that will be completed in 2018. Additionally, California needs a well-defined reference case, or "business as usual" scenario to set a comprehensive and strategic path forward for California's lands and ocean environments to contribute to the State's climate goals. Finally, efforts must increase to gather, interpret, and unify best available science on the GHG and carbon sequestration impacts of land use and management practices applied across forests, cultivated agricultural lands, rangelands and grasslands, wetlands, coastal and ocean systems, desert ecosystems, and urban and other settled lands.

The Implementation Plan, as summarized above, will utilize the Protect-Enhance-Innovate framework and employ projections for carbon sequestration and GHG emissions from California's land base under reference case and increased management scenarios. The quantitative outputs of these projections, expressed as carbon dioxide equivalents will drive acreage needs for implementation using CO<sub>2</sub>e/acre results from multiple modeling efforts. The Implementation Plan will also identify GHG emissions quantification within and across programs and agencies and describe implementation monitoring and emissions inventories.

## **Natural and Working Lands Inventory**

In order to understand how carbon is released and sequestered by natural and working landscapes, CARB has worked extensively with other State agencies, academic researchers and the public to develop a Natural and Working Lands inventory that will guide this process. As with other sectors, the CARB Natural and Working Lands inventory represents a snapshot of emissions in recent years, using a combination of reported and measured data. A time lag exists between the last year of available data and the completion of the inventory to allow time for reporting and processing the data. For emission sources that are hard to individually measure, the CARB inventory estimates emissions based on "surrogates," such as the typical amount of travel on unpaved roads to estimate particulate matter emissions at the county level. The most recent inventory can also be "forecast" to project prevailing conditions in a future year based on rules and programs currently in place – known as a "business as usual projection" - along with scenarios to explore the benefits of further strategies to reduce emissions. Forecasts of business-as-usual and policy scenarios guide planning efforts.

As discussed below, ongoing research into forecasting emissions from Natural and Working Lands includes a project at Lawrence Berkeley National Laboratory funded by CNRA. CARB is monitoring this and other research activities and will incorporate results into a proposed inventory and forecasting methodology for Natural and Working Lands. CARB will solicit public feedback and review on the resulting product prior to completing the first full Natural and Working Lands Inventory by the end of 2018, as called for in SB 859. The Natural and Working Lands Inventory is spatially-resolved, so it can be segmented by county, watershed, or other regional planning areas. This spatial resolution allows local governments and regional organizations to use the inventory, along with more granular location-specific information, to track progress from projects in their jurisdictions.

CARB plans to update the forest component of the Natural and Working Lands inventory to include 2012 GHG emissions estimates, followed by emissions estimates for soil carbon, urban forestry, and croplands by mid-2018. Work currently in progress applies airborne and space-based technologies to monitor forest health and quantify emissions associated with land-based carbon. California and federal agencies are working with researchers and funding studies to enhance our understanding of the roles of forests and other lands in climate change using rapidly advancing remote sensing technology.<sup>206, 207</sup>

## CALAND Carbon Emissions Model

CNRA is managing the development of a CALAND model through Lawrence Berkeley National Laboratory, which will include a projection of business-as-usual emissions as well as a listing and quantitative assessment of conservation and management activities the State may pursue to achieve at least 15-20 MMT sequestration and GHG avoided emissions from the NWL sector by 2030.

CNRA, along with CARB and CDFA, will establish a formal public engagement process to gather external scientific expertise to inform development and finalization of the CALAND model for use in the Implementation Plan. Development of the Implementation Plan itself will also include a formal public process.

## Cross-Sector Interactions

Strategies that reduce GHG emissions or increase sequestration in the natural and working lands sector often overlap and result in synergies with other sectors, most notably at intersections with land use, biomass and waste utilization, energy and water. It will be important for the sector to make critical linkages to other sectors, including energy, transportation fuels, and waste, and develop plans to integrate the natural and working lands sector into existing models, such as PATHWAYS and REMI.

Landowner, local, and regional decisions affect land use development patterns and natural and working land conversion rates; conversely, conservation activities can support infill-oriented regional development and related transportation needs. As discussed earlier in the Transportation Sustainability section, under SB 375, Sustainable Communities Strategies (SCSs) aim to link transportation, housing, and climate policy to reduce per capita GHG emissions while providing a range of other important benefits for Californians. Some SCSs include policies, objectives or implementation measures relating to conservation and land protections, and to urban greening.<sup>208</sup> Protecting natural and working lands that are under threat of conversion can promote infill development, reduce VMT, limit infrastructure expansion, and curb associated GHG emissions. An integrated vision for community development, land conservation and management, and transportation is a key component of meeting our transportation and natural and working lands goals.<sup>209</sup>

Agricultural and commercial forestry operations produce biomass as both an objective (i.e., food and fiber production) and a waste by-product. How this material is utilized can either increase or decrease emissions associated with management and restoration activities, turn waste into usable products, displace fossil fuels used in energy and transportation, and increase carbon stored in durable wood products in the built environment. Finding productive ways to use this material offers new opportunities to reduce GHG emissions, promote carbon sequestration, and generate economic resources for forest, agricultural, and waste sectors and communities. California is investigating ways to transform how organic waste from the agricultural and municipal sectors is managed to meet SLCP emissions reductions targets required by SB 1383,<sup>210</sup> and to protect public health. Cross-sector synergies and complete waste inter-cycles, discussed further in the Waste Management section, result from conscientious treatment of these resources, including opportunities to improve soil health, increase renewable energy generation, and enhance market support for non-commercial products and waste. Productive utilization of dead and dying trees is a significant focus of the Governor's Tree Mortality Task Force, and efforts to resolve the current shortfall in utilization capacity is addressed in that State of Emergency Declaration as well as in SB 859.

Natural and working lands stewardship is essential to securing the State's water supply along the entire

210 SB1383 (Lara, Chapter 396, Statutes of 2016) requires a 50 percent reduction in anthropogenic black carbon emissions by 2030.

supply chain, from protection and management of the forested headwaters to preserving the ability of mountain meadows to retain and filter water ensuring flows and habitat in the Delta and its tributaries, end use efficiencies in agricultural and urban uses, and groundwater infiltration and utilization statewide. For example, more efficient water and energy use in farming operations could support GHG emissions reductions goals in the energy sectors. And improving forest health in the Sierra Nevada, Cascades, and other headwaters protects water quality and availability, in alignment with the California Water Action Plan.

## Potential Actions to Enhance Carbon Sequestration and Reduce Greenhouse Gases in NWL

While agricultural and forest lands comprise the greatest acreage of NWL statewide, representing significant opportunity for achieving the State's NWL climate goals, actions on all NWL remain critical. The land management strategies and targets included in these sections are illustrative of the types of actions that will be necessary to maintain all of California's NWL and urban green space as a net sink of carbon, and are being used to aid in development of scenario modeling. The Implementation Plan will use this scenario modeling to scope the scale of action needed to ensure resilient future landscapes and identify key areas for advancement.

### Agriculture's Role in Emissions Reductions and Carbon Sequestration

In 2030 and 2050, the agricultural sector must remain vibrant and strong. California's agricultural production is critical to global food security. It is also vulnerable to climate change. A study<sup>211</sup> by the University of California concluded that the drought in 2015 cost the state economy \$2.7 billion and 21,000 full time jobs. These losses are expected to ripple through rural communities for another several years. This illustrates the importance of strengthening agriculture while protecting resources and mitigating climate change.

As the State works to meet emissions reductions goals, the agricultural sector can reduce emissions from production, sequester carbon and build soil carbon stocks, and play a role in cross-sectoral efforts to maximize the benefits of natural and working lands.

Climate-smart agriculture is an integrated approach to achieving GHG reductions while also ensuring food security and promoting agricultural adaptation in the face of climate change. Conserving agricultural land, sequestering carbon in agricultural soils, employing a variety of techniques to manage manure on dairies, and increasing the efficiency of on-farm water and energy use are examples of practices that can achieve climate and food production goals across diverse agricultural systems. Climate-smart agriculture can support the Protect, Enhance, and Innovate goals.

Approximately 60 percent of agricultural emissions are methane emissions from the dairy and livestock sectors. Emissions come from the animals themselves, through enteric fermentation, as well as from manure management—especially at dairies. SB 1383 and the resultant SLCP Strategy identify a mix of voluntary, incentive-based, and potential regulatory actions to achieve significant emissions reductions from these sources. A variety of techniques can attain the best results for each specific farming operation; effectively implementing a broad mix of strategies will reduce the GHG emissions from the agricultural sector significantly. CARB and CDFA and other agencies are working together to solicit input from industry, environmental, and community groups to encourage early and meaningful action to reduce emissions from the livestock sector.

Over the last several years, farms have begun to optimize fertilizer applications to protect water quality, maintain high yields, and reduce emissions of N<sub>2</sub>O, a greenhouse gas. Farmers are required through the Irrigated Lands Regulatory Program to manage nitrogen fertilizers to protect water quality through the use of nitrogen management plans. Nitrogen management plans are a tool designed to prevent over-applications of nitrogen through an approach that accounts for the nitrogen inputs from water, soil amendments and other sources, and also accounts for nitrogen removed from the field. CDFA's Fertilizer Research and Education Program, in coordination with university researchers and others, has developed fertilization guidelines to optimize the rate, timing and placement of fertilizers for crops that represent more than half of the irrigated agriculture in California. Similarly, innovations in water management and the expansion of high efficiency irrigation methods also are contributing to N<sub>2</sub>O reductions.

---

211 Howitt, Richard E., Duncan MacEwan, Josué Medellín-Azuara, Jay R. Lund, Daniel A. Sumner. 2015. Economic Analysis of the 2015 Drought for California. Davis, CA: Center for Watershed Sciences, University of California – Davis.

California's farms and ranches have the ability to remove carbon from the atmosphere through management practices that build and retain soil organic matter. Adequate soil organic matter ensures the continued soil capacity to function as a vital living ecosystem with multiple benefits, producing food for plants, animals, and humans. The Healthy Soils Initiative, announced by Governor Brown in 2015, offers an opportunity to incentivize the management of farmland for increased carbon sequestration in soil, also augmenting co-benefits including improved plant health and yields, increased water infiltration and retention, reduced sediment erosion and dust, improved water and air quality, and improved biological diversity and wildlife habitat.

SB 859, signed into law in 2016, establishes the Healthy Soils Program at CDFA to provide incentives to farmers. It enables financial support for on-farm demonstration projects that "result in greenhouse gas benefits across all farming types with the intent to establish or promote healthy soils". It defines healthy soils as "soils that enhance their continuing capacity to function as a biological system, increase soil organic matter, improve soil structure and water-and nutrient-holding capacity, and result in net long-term greenhouse gas benefits."

As noted in the Cross-Sector Interactions section, State and local efforts to manage land for carbon sequestration must work in conjunction with existing plans, incentives, and programs protecting California's water supply, agricultural lands, and wildlife habitat. This Scoping Plan fits within a wide range of ongoing planning efforts throughout the State to advance economic and environmental priorities associated with natural and working lands.

## **The Role of Forests in Emissions Reductions and Carbon Sequestration**

Decades of fire exclusion, coupled with an extended drought and the impacts of climate change, have increased the size and intensity of wildfires and bark beetle infestations; exposed millions of urban and rural residents to unhealthy smoke-laden air from wildfires; and threatened progress toward meeting the state's long-term climate goals. Managing forests in California to be healthy, resilient net sinks of carbon is a vital part of California's climate change policy.

More than 100 million trees are dead, and recent wildfires have been among the most destructive and expensive in state history. As many as 15 million acres of California forests are estimated to be unhealthy and in need of some form of restoration, including more than 9 million acres managed by federal land management agencies and 6 million acres of State and privately managed forests.

California's urban forests also face multiple challenges, including drought and invasive exotic insects. Urban forests require maintenance to preserve the multiple values they provide and merit expansion to sequester carbon and secure other benefits to urban dwellers and the State.

The California Forest Carbon Plan (FCP), being developed by the Forest Climate Action Team (FCAT), seeks to establish California's forests as a more resilient and reliable long-term carbon sink, rather than a GHG and black carbon emission source, and confer additional ecosystem benefits through a range of management strategies.<sup>212</sup> The FCP emphasizes working collaboratively at the watershed or landscape scale to restore resilience to all forestlands in the state.

The current draft of the FCP places carbon sequestration and reducing black carbon and GHG emissions as one set of management objectives in the broader context of forest health and a range of other important forest co-benefits. California will manage for carbon alongside wildlife habitat, watershed protection, recreational access, traditional tribal uses, public health and safety, forest products, and local and regional economic development.

---

212 <http://www.fire.ca.gov/fcat/>

Federally managed lands play an important role in the achievement of the California climate goals established in AB 32 and subsequent related legislation and plans. Over half of the forestland in California is managed by the federal government, primarily by the USDA Forest Service Pacific Southwest Region, and these lands comprise the largest potential forest carbon sink under one ownership in the state. Several regulatory, policy, and financial challenges have hindered the ability of the Forest Service and Department of Interior agencies (Bureau of Land Management and National Park Service) to increase the pace and scale of restoration needed, such as the current budget structure to fund wildland fire suppression and the procedural requirements of a number of federal environmental and planning statutes. The State of California must continue to work closely and in parallel to the federal government's efforts to resolve these obstacles and achieve forest health and resilience on the lands that federal agencies manage.

## **Protection of Land and Land Use**

California will continue to pursue development and new infrastructure construction patterns that avoid greenfield development, limit conflicts with neighboring land uses, and increase conservation opportunities for NWL to reduce conversion to intensified uses. Success will depend on working through local and regional land use planning and permitting, as well as developing incentives for participation by local governments and individual landowners.

## **Enhance Carbon Sequestration and Resilience through Management and Restoration**

California will increase efforts to manage and restore land to secure and increase carbon storage and minimize GHG and black carbon emissions in a sustainable manner so that the carbon bank is resilient and provides other benefits such as water quality, habitat and recreation.

One tool to demonstrate the potential for greater management and restoration on NWL is the CALAND model. As detailed in the Discussion Draft<sup>213</sup> and discussed above, it considers a variety of management and restoration activities employed across the State. Version 1 of the CALAND model considered two potential scenarios, a "low" and a "high" rate of implementation to 2030, with resulting carbon sequestration outcomes to 2050. The acreages given in the "low" scenario all represent feasible implementation on public and private lands beyond current rates for the listed activity, given availability of additional funding and other supporting resources. The "high" scenario represents a more ambitious approach, requiring new programs and policies, including collaboration with federal partners, to support implementation.

The activities presented in the Discussion Draft and Version 2 of CALAND are not inclusive of all activities under this strategy. Modeling will continue beyond finalization of the Scoping Plan. Agencies and modelers will continue to identify and analyze land management and restoration activities to advance the State's climate goals and improvements in modeling projections or other quantification protocols.

Management and restoration activities under consideration to help reduce GHG emissions beyond those identified in initial modeling include, but are not limited to the following:

- Forest fuel reduction treatments, reforestation, other restoration activities, prescribed fire and managed ignition.
- Restoration of mountain meadows, managed wetlands in the Sacramento San Joaquin Delta, coastal wetlands and desert habitat.
- Increasing the extent of eelgrass beds.
- Creation and management of parks and other greenspace in urban areas, including expansion of the existing urban tree canopy.
- Implementation of U.S. Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS) management practices suitable for California agriculture including those practices identified in the Healthy Soils Incentive Program.
- Compost application to irrigated cropland.

Additional potential tools to encourage these activities include working with the federal government to fund more management on federal lands, mitigating for land conversion (as modeled by the High Speed Rail Authority), and revisiting the Forest Practices Act to enhance carbon sequestration benefits associated with timber production activities.

---

213 [www.arb.ca.gov/cc/scopingplan/2030target\\_sp\\_dd120216.pdf](http://www.arb.ca.gov/cc/scopingplan/2030target_sp_dd120216.pdf)

## Innovate NWL Waste Utilization Pathways

Excess materials generated by commercial agricultural and forestry operations, biomass and wood harvested through forest health and restoration treatments, and material that is generated in response to Tree Mortality Emergency activities, should be used in a manner that minimizes GHG and black carbon emissions and promotes public and environmental health. The Legislature and Governor Brown set an ambitious goal of 75 percent recycling, composting or source reduction of solid waste in landfills by 2020. The State and stakeholders must develop targeted policies or incentives to support durable markets for all of this diverted material. Market opportunities include production of renewable electricity and biofuels, durable wood products, compost and other soil amendments, animal feed and bedding, and other uses. Research, development, and implementation activities in energy, wood products, waste, and soil amendment fields should be spatially-scaled to better link waste generation with infrastructure development.

The goals of this sector, with the potential to reduce GHGs and complement the measures and policies identified in Chapter 2, are described in Looking to the Future. The development of the Implementation Plan will spur thinking and exploration of innovation that may help the State achieve its long-term climate goals.

## Waste Management

---

The Waste Management sector covers all aspects of solid waste<sup>214</sup> and materials management including reduction/reuse; recycling, and remanufacturing of recovered material; composting and in-vessel (anaerobic and aerobic) digestion; biomass management (chip and grind, composting, biomass conversion); municipal solid waste transformation; and landfilling. This sector also includes market development programs, such as the State's recycled-content product procurement program and a range of grant and loan programs. Data from CalRecycle's report, *2014 Disposal Facility-Based Characterization of Solid Waste in California*, shows that materials, such as organics, that decompose in landfills and generate methane comprise a significant portion of the waste stream. Methane is a potent SLCP with a global warming potential 25 times greater than that of carbon dioxide on a 100-year time horizon and more than 70 times greater than that of carbon dioxide on a 20-year time horizon.<sup>215</sup>

Within CARB's greenhouse gas inventory, emissions from the waste management sector consist of methane and nitrous oxide emissions from landfills and from commercial-scale composting, with methane being the primary contributor to the sector's emissions. The sector emitted 8.85 MMTCO<sub>2</sub>e in 2014, comprising approximately 2 percent of the State's GHG emissions.

Emissions from recycling and waste have grown by 19 percent since 2000. The majority of those emissions are attributed to landfills, despite the majority of landfills having gas collection systems in place.<sup>216</sup> Landfill emissions account for 94 percent of the emissions in this sector, while compost production facilities make up a small fraction of emissions.<sup>217</sup> The annual amount of solid waste deposited in California landfills grew from 37 million tons in 2000 to its peak of 46 million tons in 2005, followed by a declining trend until 2009 when landfilled solid waste stabilized to relatively constant levels. Landfill emissions are driven by the total waste-in-place, rather than year-to-year fluctuation in annual deposition of solid waste, as the rate and volume of gas produced during decomposition depends on the characteristics of the waste and a number of environmental factors. As a result, waste disposed in a given year contributes to emissions that year and in subsequent years.

In addition to direct emissions, the reduction, reuse, and recycling of waste materials decreases upstream GHG emissions associated with the extraction and processing of virgin materials and their use in production and transport of products. Although many of these upstream GHG emissions happen outside of California, California's waste policies can reduce both local and global GHG emissions and create jobs within the State.

214 In general, the term solid waste refers to garbage, refuse, sludges, and other discarded solid materials resulting from residential activities, and industrial and commercial operations. This term generally does not include solids or dissolved material in domestic sewage or other significant pollutants in water such as silt, dissolved or suspended solids in industrial wastewater effluents, dissolved materials in irrigation return flows or other common water pollutants.

215 Intergovernmental Panel on Climate Change. 2007. Climate Change 2007: Working Group I: The Physical Science Basis. 2.10.2 Direct Global Warming Potentials. Fourth Assessment Report. [www.ipcc.ch/publications\\_and\\_data/ar4/wg1/en/ch2s2-10-2.html](http://www.ipcc.ch/publications_and_data/ar4/wg1/en/ch2s2-10-2.html)

216 CARB. 2013. California Greenhouse Gas Inventory for 2000–2013 – by Category as Defined in the 2008 Scoping Draft Plan (based upon IPCC Fourth Assessment Report's Global Warming Potentials).

217 CARB. 2016. 2016 Edition California GHG Emission Inventory. California Greenhouse Gas Emission Inventory: 2000–2014. Version June 17, 2016.

While landfills are an effective and relatively safe way to manage some waste, disposal-centric activities result in squandering valuable resources and generate landfill gases as well as other risks. A large fraction of the organics in the waste stream can be diverted from landfills to composting or digestion facilities to produce beneficial products. Moreover, food waste is the largest component of organics disposed in landfills; a portion of this is edible and should be captured at its source and, for example, provided to food banks to feed people in need. A State waste management sector “loading order” should focus more attention on reducing how much waste we generate and recovering and recycling whatever resources we can, using landfills as a last resort.

Landmark initiatives like the Integrated Waste Management Act of 1989 (AB 939) demonstrate California’s efforts to build communities that consume less, recycle more, and take resource conservation to higher and higher levels. Statewide, Californians achieved a 49 percent recycling rate in 2014, and recycling programs support an estimated 75,000 to 115,000 green jobs in California. If California were to achieve a 75 percent statewide solid waste recycling rate by 2020—a goal set out by the Legislature in AB 341 (Chesboro, Chapter 476, Statutes of 2011)—by recycling and remanufacturing at in-state facilities, the State could potentially generate an additional 100,000 green jobs.<sup>218</sup> In addition to employment contributions, diversion of organic waste from landfills can generate positive environmental impacts. Compost from organic matter provides soil amendments to revitalize farmland, reduces irrigation and landscaping water demands, contributes to erosion control in fire-ravaged landscapes, and potentially increase long-term carbon storage in rangelands. Production and use of bioenergy in the form of biofuels and renewable natural gas has the potential to reduce dependency on fossil fuels for the transportation sector. For the energy sector, however, renewable natural gas faces safety, feasibility, and cost issues.

The State has a robust waste management system in place, with established programs that reduce air emissions through activities such as gas collection systems from landfills<sup>219</sup> and stringent recycling mandates. AB 939 required cities and counties to reduce the amount of waste going to landfills by 50 percent in 2000, and municipalities have nearly universally met this mandate. Californians dispose about 30 million tons of solid waste in landfills each year. To further reduce landfilled solid waste, the Legislature adopted AB 341 to achieve more significant waste reductions by setting a goal that 75 percent of solid waste generated be reduced, recycled, or composted by 2020, and by mandating commercial recycling. AB 1826 (Chesboro, Chapter 727, Statutes of 2014) added requirements regarding mandatory commercial organics recycling.

Although solid waste management has evolved over the last 27 years and diversion rates (which include more than recycling) have increased more than six-fold since 1989, if no further changes in policy are made, the State’s growing population and economy will lead to higher amounts of overall disposal along with associated increases in GHG emissions. The pathway to reducing disposal and associated GHG emissions will require significant expansion of the composting, anaerobic digestion, and recycling manufacturing infrastructure in the State.

To help reduce GHG emissions by 40 percent below 1990 levels by 2030 and meet California’s waste reduction goals, California’s waste management sector strives to achieve in-state processing and management of waste generated in California. To carry out this vision, we must work with residents and producers to reduce the volume of waste generated overall and capitalize on technology and social changes that might enable waste reduction. Packaging comprises approximately 8 million tons of waste landfilled in California annually, or about one quarter of the State’s total disposal stream. To reduce the climate change footprint of packaging, the State is promoting the inclusion of source reduction principles in packaging and product design; fostering recycling and recyclability as a front end design parameter for packaging and products that cannot be reduced; and encouraging recycling markets and market development for recycled-content products and packaging. CalRecycle is developing a packaging policy model containing components necessary for a mandatory comprehensive, statewide packaging program in California; this would need to be legislatively enacted to achieve a packaging reduction goal, such as 50 percent by 2030. CalRecycle is also continuing to work with stakeholder organizations and industry to explore complementary voluntary activities that have the potential to significantly decrease packaging disposal in California. In addition, large-scale shifts in materials management will be necessary, including steps to maximize recycling and diversion from landfills

---

218 CalRecycle. 2013. AB 341’s 75 Percent Goal and Potential New Recycling Jobs in California by 2020. July. [www.calrecycle.ca.gov/Publications/Documents/1463/20131463.pdf](http://www.calrecycle.ca.gov/Publications/Documents/1463/20131463.pdf)

219 CARB approved a regulation to reduce methane from municipal solid waste landfills as a discrete early action measure under AB 32. The regulation became effective June 17, 2010. Additional information is available at: [www.arb.ca.gov/regact/2009/landfills09/landfillfinalfro.pdf](http://www.arb.ca.gov/regact/2009/landfills09/landfillfinalfro.pdf)

and build the necessary infrastructure to support a sustainable, low carbon waste management system within California. Working together, State and local agencies will identify ways to increase the use of waste diversion alternatives and expand potential markets, obtain funds and incentives for building the infrastructure and strengthening markets, and evaluate the need for additional research to achieve California's GHG reduction and waste management goals.

Additional legislation codified since the First Scoping Plan Update outlines new opportunities and requirements to reduce GHG emissions from the waste sector, with a focus on reducing organic waste sent to landfills. SB 605 (Lara, Chapter 523, Statutes of 2014) requires that CARB develop a strategy to reduce SLCPs and SB 1383 requires the strategy to be implemented by January 1, 2018. CARB's recently adopted SLCP Reduction Strategy includes organic waste diversion targets for 2020 and 2025 consistent with SB 1383 to reduce methane emissions from landfills. It requires CalRecycle, in consultation with CARB, to adopt regulations to achieve statewide disposal targets to reduce landfilling of organic waste by: (1) 50 percent from the 2014 level by 2020, and (2) 75 percent from the 2014 level by 2025. Under SB 1383, of the edible food destined for the organic waste stream, not less than 20 percent is to be recovered to feed people in need by 2025. The regulations are to take effect on or after January 1, 2022, and CalRecycle, in consultation with CARB, must analyze the progress that the waste management sector, State government, and local government have made in achieving the 2020 and 2025 goals by July 1, 2020. It is estimated that the combined effect of the food waste prevention and rescue programs and organics diversion from landfills will reduce 4 MMTCO<sub>2</sub>e of methane in 2030 (using a 20-year GWP), but one year of waste diversion in 2030 is expected to result in a reduction of 14 MMTCO<sub>2</sub>e of emissions over the lifetime of waste decomposition.

## Looking to the Future

This section outlines the high-level objectives and goals to reduce GHGs in this sector.

### Goals

- Take full ownership of the waste generated in California.
- View waste as a resource and convert waste from all sectors to beneficial uses.
- Develop a sustainable, low carbon waste management system that processes collected waste within California and generates jobs, especially in disadvantaged communities.
- Maximize recycling and diversion from landfills.
- Reduce direct emissions from composting and digestion operations through improved technologies.
- Build the infrastructure needed to support a sustainable, low carbon waste management system within California.
- Increase organics markets which complement and support other sectors.<sup>220</sup>
- Capture edible food before it enters the waste stream and provide to people in need.
- Increase production of renewable transportation fuels from anaerobic digestion of waste.
- Recognize the co-benefits of compost application.

### Cross-Sector Interactions

The waste management sector interacts with all of the other sectors of the State's economy. Reducing waste, including food waste, is key to reducing the State's overall carbon footprint. Additionally, replacing virgin materials with recycled materials reduces the energy and GHGs associated with the goods we produce and consume.

California leads the United States in agricultural production in terms of value and crop diversity. Soil carbon is the main source of energy for important soil microbes and is key for making nutrients available to plants. Waste-derived compost and other organic soil amendments support the State's Healthy Soils Initiative being implemented by CDFA. In addition, the use of compost to increase soil organic matter in the agricultural sector provides other benefits, including reduced GHG emissions, conserved water, reduced synthetic (petroleum-based) fertilizer and herbicide use, and sequestered carbon.

---

<sup>220</sup> Examples may include renewable energy (biogas to renewable transportation fuels or electricity); soils (application of organics to agricultural soils for building soil organic matter and conserving water; application of organics to mulch for erosion control; application of organics to rangelands for increased carbon sequestration); and forests (support use of forest residues for erosion control; stabilization of fire-ravaged lands).

## Efforts to Reduce Greenhouse Gases

The measures below include some required and new potential measures to help achieve the State's 2030 target and to support the high-level objectives for this sector. Some measures may be designed to directly address GHG reductions, while others may result in GHG reductions as a co-benefit. In addition, to move forward with the goals of the waste management sector and achieve the 2030 target, certain actions are recommended to help set the groundwork. These actions affect several broad areas and are necessary for reducing the challenges facing this sector, and they are listed below as supporting actions.

### Ongoing and Proposed Measures

- Continue implementation of the Landfill Methane Control Measure.
- Continue implementation of the Mandatory Commercial Recycling Regulation and the Mandatory Commercial Organics Recycling requirements.
- As required by SB 1383:
  - By 2018, CARB will implement the SLCP Strategy.
  - CalRecycle will develop regulations to require 50 percent organic waste diversion from landfills from 2014 levels by 2020 and 75 percent by 2025, including programs to achieve an edible food waste recovery goal of 20 percent below 2016 levels by 2025. The regulations shall take effect on or after January 1, 2022. By July 1, 2020, analyze the progress that the waste sector, State government, and local governments have made in achieving these goals.
  - CEC will develop recommendations for the development and use of renewable gas as part of the 2017 Integrated Energy Policy Report. Based on these recommendations, adopt policies and incentives to significantly increase sustainable production and use of renewable gas.

### Potential Additional or Supporting Actions

The actions below have the potential to reduce GHGs and complement the measures and policies identified in Chapter 2. These are included to spur thinking and exploration of innovation that may help the State achieve its long-term climate goals.

- Establishing a sustainable State funding source (such as an increased landfill tip fee and new generator charge) for development of waste management infrastructure, programs, and incentives.
- Working with residents and producers to reduce the volume of waste generated overall and capitalize on technology and social changes that might enable waste reduction.
- Increasing organics diversion from landfills, building on established mandates (AB 341's 75 percent by 2020 solid waste diversion goal, AB 1594,<sup>221</sup> AB 1826,<sup>222</sup> AB 876<sup>223</sup>) and new short-lived climate pollutant targets for 2025 (SB 605, SB 1383) to be accomplished via prevention (including food rescue), recycling, composting/digestion, and biomass options.
- Addressing challenges and issues associated with significant expansion and construction of organics and recycling infrastructure in California that is needed to achieve recycling and diversion goals. Challenges and issues include permitting, grid/pipeline connection, funding, local siting, markets, and research.
- Developing programmatic Environmental Impact Reports (EIRs) and model permit and guidance documents to assist in environmental review and CEQA for new facilities.
- Providing incentives for expanded and new facilities to handle organics and recyclables to meet 2020 and 2030 goals.
- Providing incentives to develop and expand food rescue programs to reduce the amount of edible food being sent to landfills.
- Further quantifying co-benefits of compost products and addressing regulatory barriers that do not provide for consideration of co-benefits.
- Supporting existing and new clean technologies and markets for excess woody biomass from urban areas, forests, and agriculture.
- Supporting the development of transportation fuel production at digestion facilities to generate renewable transportation fuels.

<sup>221</sup> Assembly Bill 1594, Waste Management (Williams, Chapter 719, Statutes of 2014).

<sup>222</sup> Assembly Bill 1826, Solid Waste: Organic Waste (Chesbro, Chapter 727, Statutes of 2014).

<sup>223</sup> Assembly Bill 876, Compostable Organics (McCarty, Chapter 593, Statutes of 2015).

- Resolving issues of pipeline injection and grid connection to make renewable energy projects competitive.
- Supporting the use of available capacity at wastewater treatment plants that have digesters to process food waste.
- Working with local entities to provide a supportive framework to advance community-wide efforts that are consistent with, or exceed, statewide goals.
- Supporting research and development and pathways to market for dairy and codigestion digesters, including pipeline injection and interconnection.
- Supporting research on digestate characterization and end products.

## Water

---

Water is essential to all life, and is vital to our overall health and well-being. A reliable, clean, and abundant supply of water is also a critical component of California’s economy and has particularly important connections to energy, food, and the environment. California’s water system includes a complex infrastructure that has been developed to support the capture, use, conveyance, storage, conservation, and treatment of water and wastewater. This elaborate network of storage and delivery systems enables the State to prosper and support populations, amidst wide variability in annual precipitation rates and concentration of rain north of Sacramento, through storing and moving water when and where it is needed.

Local water agencies play an important role in delivering water to communities, farms, and businesses. Some purchase water from the major State and federal projects, treat the water as needed, and deliver it to their customers; others act as wholesale agencies that buy or import water and sell it to retail water suppliers. Some agencies operate their own local water supply systems, including reservoirs and canals that store and move water as needed. Many agencies rely on groundwater exclusively, and operate local wells and distribution systems. In recent decades, local agencies have developed more diversified sources of water supplies. Many agencies use a combination of imported surface water and local groundwater, and also produce or purchase recycled water for end uses such as landscape irrigation.<sup>224</sup>

The State’s developed surface and groundwater resources support a variety of residential, commercial, industrial, and agricultural activities. California’s rapidly growing population—estimated to reach 44 million by 2030<sup>225</sup> – is putting mounting pressure on the water supply system. In the future, the ability to meet most new demand for water will come from a combination of increased conservation and water use efficiency, improved coordination of management of surface and groundwater, recycled water, new technologies in drinking water treatment, groundwater remediation, and brackish and seawater desalination.<sup>226</sup>

One of the State’s largest uses of energy is attributed to several aspects of the water life cycle, including end uses such as heating and cooling, and water treatment and conveyance. Ten percent of the State’s energy use is associated with water-related end uses, while water and wastewater systems account for 2 percent of the State’s energy use.<sup>227</sup> Therefore, as water demand grows, energy demand may increase concurrently. Population growth drives demand for both water and energy resources, so both grow at about the same rates and in many of the same geographic areas.<sup>228</sup> This dynamic is further exacerbated by the precipitation-population mismatch between Northern and Southern California. Since the greatest energy consumption related to water is from delivery to end uses, the potential for energy savings also resides with water end users, where water conservation and efficiency play an important role.

The principal source of GHG emissions from the water sector comes from the fossil fuel-based energy consumed for water end uses (e.g., heating, cooling, pressurizing, and industrial processes), and the fossil fuel-based energy used to “produce” water (e.g., pump, convey, treat). Therefore, emissions reductions strategies are primarily associated with reducing the energy intensity of the water sector. Energy intensity is a measure of the amount of energy required to take a unit of water from its origin (such as a river or aquifer)

224 California Department of Water Resources. Regional Energy Intensity of Water Supplies. [www.water.ca.gov/climatechange/RegionalEnergyIntensity.cfm](http://www.water.ca.gov/climatechange/RegionalEnergyIntensity.cfm)

225 <http://www.dof.ca.gov/Forecasting/Demographics/projections/>

226 California Natural Resources Agency, California Department of Food and Agriculture, and California Environmental Protection Agency. California Water Action Plan.

227 California Department of Water Resources. Water-Energy Nexus: Statewide. Web page accessed November 2016 at: [www.water.ca.gov/climatechange/WaterEnergyStatewide.cfm](http://www.water.ca.gov/climatechange/WaterEnergyStatewide.cfm).

228 Ibid

and extract and convey it to its end use.<sup>229</sup> Within California, the energy intensity of water varies greatly depending on the geography, water source, and end use. The California Department of Water Resources (DWR) subdivides the State into 10 regions corresponding to the State’s major drainage basins. An interactive map on the DWR website allows users to see a summary of the energy intensity of regional water supplies, ignoring end-use factors.<sup>230</sup> As the energy sector is decarbonized through measures such as increased renewable energy and improved efficiency, energy intensities will also be reduced. It is also important to note that end user actions to reduce water consumption or replace fresh water with recycled water do not automatically translate into GHG reductions. The integrated nature of the water supply system means that a reduction by one end user can be offset by an increase in consumption by another user. Likewise, use of recycled water has the potential to reduce GHGs if it replaces, and not merely serves as an alternative to, an existing, higher-carbon water supply.

The State is currently implementing several targeted, agricultural, urban, and industrial-based water conservation, recycling, and water use efficiency programs as part of an integrated water management effort that will help achieve GHG reductions through reduced energy demand within the water sector. Appendix H highlights the more significant existing policies, programs, measures, regulations, and initiatives that provide a framework for helping achieve GHG emissions reductions in this sector.

While it is important for every sector to contribute to the State’s climate goals, ensuring universal access to clean water as outlined in AB 685 (Eng, Chapter 524, Statutes of 2012), also known as the “human right to water” bill, should take precedence over achieving GHG emissions reductions from water sector activities where a potential conflict exists. AB 685 states that it is the policy of the State that “every human being has the right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes.” As described in this section, water supplies vary in energy intensity and resulting GHGs, depending on the source of the water, treatment requirements, and location of the end user.

## Looking to the Future

This section outlines the high-level objectives and goals to reduce GHGs in this sector.

### Goals

- Develop and support more reliable water supplies for people, agriculture, and the environment, provided by a more resilient, diversified, sustainably managed water resources system with a focus on actions that provide direct GHG reductions.
- Make conservation a California way of life by using and reusing water more efficiently through greater water conservation, drought tolerant landscaping, stormwater capture, water recycling, and reuse to help meet future water demands and adapt to climate change.
- Develop and support programs and projects that increase water sector energy efficiency and reduce GHG emissions through reduced water and energy use.
- Increase the use of renewable energy to pump, convey, treat, and utilize water.
- Reduce the carbon footprint of water systems and water uses for both surface and groundwater supplies through integrated strategies that reduce GHG emissions while meeting the needs of a growing population, improving public safety, fostering environmental stewardship, aiding in adaptation to climate change, and supporting a stable economy.

## Cross-Sector Interactions

Water, energy, food, and ecosystems are inextricably linked, and meeting future climate challenges will require an integrated approach to managing the resources in these sectors.

Water is used in various applications in the energy sector, ranging in intensity from cooling of turbines and other equipment at power plants to cleaning solar photovoltaic panels. In 2003, CEC adopted a water conservation policy for power plants to limit the use of freshwater for power plant cooling, and has since encouraged project

---

<sup>229</sup> A broader definition of energy intensity could consider the “downstream” energy (i.e., wastewater treatment) as well as the upstream components. More robust data are needed, and the State is working to better quantify these upstream and downstream emissions.

<sup>230</sup> California Department of Water Resources. Regional Energy Intensity of Water Supplies. [www.water.ca.gov/climatechange/RegionalEnergyIntensity.cfm](http://www.water.ca.gov/climatechange/RegionalEnergyIntensity.cfm)

owners proposing to build new power plants in California to reduce water consumption with water-efficiency technologies such as dry cooling and to conserve fresh water by using recycled water. Likewise, energy is used in multiple ways and at multiple steps in water delivery and treatment systems, including energy for heating and chilling water; treating and delivering drinking water; conveying water; extracting groundwater; desalination; pressurizing water for irrigation; and wastewater collection, treatment, and disposal.

Although GHG reduction strategies for the water sector have the closest ties to energy, the water sector also interacts with the natural and working lands, agricultural, waste management, and transportation sectors. Water flows from mountains to downstream regions through natural and working lands, which provide habitat for many species and function to store water, recharge groundwater, naturally purify water, and moderate flooding. Protection of key lands from conversion results in healthier watersheds by reducing polluted runoff and maintaining a properly functioning ecosystem. California is the United States' leading agricultural production state in terms of value and crop diversity. Approximately nine million acres of farmland in California are irrigated.<sup>231</sup> In addition, water use is associated with livestock watering, feedlots, dairy operations, and other on-farm needs. Altogether, agriculture uses about 40 percent of the State's managed water supply.<sup>232</sup> In the end, agricultural products produced in California are consumed by humans throughout the world as food, fiber, and fuel. Wastewater treatment plants provide a complementary opportunity for the waste management sector to help process organic waste diversion from landfills. Treatment plants with spare capacity can potentially accommodate organic waste for anaerobic co-digestion of materials such as food waste and fats, oil, and grease from residential, commercial, or industrial facilities to create useful by-products such as electricity, hydrogen, biofuels, and soil amendments.<sup>233</sup> The water sector is also essential to our community health and long-term well-being, and measures must ensure that we continue to have access to clean and reliable sources of drinking water. Climate change threatens to impact our water supplies, for example, with long-term droughts leading to wells and other sources of water running dry. This can have devastating consequences, especially on communities already vulnerable and sensitive to changes in their water supply and natural hydrological systems, including rural communities who have limited options for water supplies. Water conservation and management strategies that are energy efficient can also ensure a continued supply of water for our health and well-being.

## Efforts to Reduce Greenhouse Gases

The measures below include some required and new potential measures to help achieve the State's 2030 target and to support the high-level objectives for this sector. Some measures may be designed to directly address GHG reductions, while others may result in GHG reductions as a co-benefit. In addition, several recommended actions are identified to help the water sector move forward with the identified goals and measures to achieve the 2030 target; these are listed as supporting actions.

## Ongoing and Proposed Measures

- As directed by Governor Brown's Executive Order B-37-16, DWR and State Water Resources Control Board (SWRCB) will develop and implement new water use targets to generate more statewide water conservation than existing targets (the existing State law requires a 20 percent reduction in urban per capita water use by 2020 [SBx7-7, Steinberg, Chapter 4, Statutes of 2009]). The new water use targets will be based on strengthened standards for indoor use, outdoor irrigation, commercial, industrial, and institutional water use.
- SWRCB will develop long-term water conservation regulation, and permanently prohibit practices that waste potable water.
- DWR and SWRCB will develop and implement actions to minimize water system leaks, and to set performance standards for water loss, as required by SB 555 (Wolk, Chapter 679, Statutes of 2015).
- DWR and CDFA will update existing requirements for agricultural water management plans to increase water system efficiency.

231 Hanson, Blaine. No date. Irrigation of Agricultural Crops in California. PowerPoint. Department of Land, Air and Water Resources University of California, Davis. [www.arb.ca.gov/fuels/lcfs/workgroups/lcfsustain/hanson.pdf](http://www.arb.ca.gov/fuels/lcfs/workgroups/lcfsustain/hanson.pdf)

232 Applied water use is the official terminology used by DWR. "Applied water refers to the total amount of water that is diverted from any source to meet the demands of water users without adjusting for water that is used up, returned to the developed supply, or considered irrecoverable."

233 An example of a resource recovering project that can help achieve methane reductions includes fuel cells that are integrated into wastewater treatment plants for both onsite heat and power generation and the production of renewable hydrogen.

- CEC will certify innovative technologies for water conservation and water loss detection and control.
- CEC will continue to update the State’s Appliance Efficiency Regulations (California Code of Regulations, Title 20, Sections 1601–1608) for appliances offered for sale in California to establish standards that reduce energy consumption for devices that use electricity, gas, and/or water.
- California Environmental Protection Agency (CalEPA) will oversee development of a voluntary registry for GHG emissions resulting from the water-energy nexus, as required by SB 1425 (Pavley, Chapter 596, Statutes of 2016).
- The State Water Project has entered long-term contracts to procure renewable electricity from 140 MW solar installations in California.
- As described in its Climate Action Plan, DWR will continue to increase the use of renewable energy to operate the State Water Project.

Overall, these actions will contribute to the broader energy efficiency goals discussed in the Low Carbon Energy section of this chapter.

### **Potential Additional or Supporting Actions**

The actions below have the potential to reduce GHGs and complement the measures and policies identified in Chapter 2. These are included to spur thinking and exploration of innovation that may help the State achieve its long-term climate goals.

- Where technically feasible and cost-effective, local water and wastewater utilities should adopt a long-term goal to reduce GHGs by 80 percent below 1990 levels by 2050 (consistent with DWR’s Climate Action Plan), and thereafter move toward low carbon or net-zero carbon water management systems.
- Local water and wastewater utilities should develop distributed renewable energy where feasible, using the expanded Local Government Renewable Energy Bill Credit (RES-BCT) tariff and new Net Energy Metering (which allow for installation without system size limit).
- In support of the Short-Lived Climate Pollutant Strategy, encourage resource recovering wastewater treatment projects to help achieve the goal of reducing fugitive methane by 40 percent by 2030, to include:
  - Determining opportunities to support co-digestion of food-related waste streams at wastewater treatment plants.
  - Incentivizing methane capture systems at wastewater treatment plants to produce renewable electricity, transportation fuel, or pipeline biomethane.
- Support compact development and land use patterns, and associated conservation and management strategies for natural and working lands that reduce per capita water consumption through more water-efficient built environments.

# Chapter 5

## ACHIEVING SUCCESS

Meeting, and exceeding, our mandated GHG reduction goals in 2020 and through 2030 requires building on California's decade of success in implementing effective climate policies. State agencies are increasingly coordinating planning activities to align with overarching climate, clean air, social equity, and broader economic objectives.

However, to definitely tip the scales in favor of rapidly declining emissions, we also need to reach beyond State policy-making and engage all Californians. Further progress can be made by supporting innovative actions at the local level—among governments, small businesses, schools, and individual households. Ultimately, success depends on a mix of regulatory program development, incentives, institutional support, and education and outreach to ensure that clean energy and other climate strategies are clear, winning alternatives in the marketplace—to drive business development and consumer adoption.

### Ongoing Engagement with Environmental Justice Communities

---

CARB continues seek ways to improve implementation of AB 32 and the unique set of impacts facing environmental justice communities. However, CARB's environmental justice efforts reach far beyond climate change. In 2001, the Board approved CARB's "Policies and Actions for Environmental Action,"<sup>234</sup> which expresses a broad commitment to environmental justice and makes it integral to all of CARB's programs, consistent with State directives at the time. Though over the years CARB has taken on a wide array of activities aimed at reducing environmental burdens on environmental justice communities, it has not knitted its various efforts together in a coherent narrative or maximized the impact of these activities by leveraging them off of each other.

This year, CARB appointed its first executive-level environmental justice liaison. Under her leadership, CARB will lay a roadmap for better serving California's environmental justice communities in the design and implementation of its programs, and identifying new actions CARB can take to advance environmental justice and social equity in all of its functions.

The extensive legislative framework addressing climate change, air quality, and environmental justice that has emerged since the passage of AB 32 has prompted CARB to step up its environmental justice efforts and articulate a vision that reflects the current context. CARB will initiate a public process, seeking advice and input from environmental justice advocates and other key stakeholders to inform the development of a new strategic plan for further institutionalizing environmental justice and social equity.

CARB understands that in addition to our programs to address climate change and reduce emissions of GHGs, more needs to be done to reduce exposure to toxic air and criteria pollutants and improve the quality of life in communities surrounding our largest emissions sources. To this end, and consistent with AB 617, AB 197, AB 1071, SB 535 and AB 1550, we will actively engage EJ advocates, communities, and relevant air districts in the development of programs that improve air quality and quantify the burdens placed on air quality in local communities. Measuring and monitoring air quality conditions over time and ongoing community engagement are integral to the success of CARB's efforts. This engagement will include substantive discussions with EJ stakeholders, gathering their input and providing adequate time for review before matters are taken to the Board for decision.

---

<sup>234</sup> [www.arb.ca.gov/ch/programs/ej/ejpolicies.pdf](http://www.arb.ca.gov/ch/programs/ej/ejpolicies.pdf)

CARB's approach to environmental justice will be grounded in five primary pillars: transparency, integration, monitoring, research, and enforcement.

- **Transparency:** CARB must improve communication and engagement with environmental justice stakeholders and deepen partnerships with local communities impacted by air pollution. CARB will continue to prioritize transparency in its decision-making processes and provide better access to the air quality, toxics, and GHG data CARB collects and stewards.
- **Integration:** Besides integrating environmental justice throughout all of CARB's programs, those programs must complement each other. To that end, CARB will endeavor to break down programmatic silos so that it is able to leverage its work and achieve more effective and timely results. Focused resources in individual communities can accelerate reduction in emissions, proliferation of clean vehicles and creation of jobs in the clean energy economy, while concurrently improving public health.
- **Monitoring:** Communities should be engaged in CARB's monitoring work. They can play a critical role in collecting their own data and adding to the coverage of other air monitoring efforts (e.g., CARB, local air districts). CARB has already invested in research on low-cost monitors that are accessible by communities, and it will continue to evaluate how community monitoring can make CARB more nimble in identifying and addressing "hotspots." Mobile monitoring projects similarly will allow CARB to better serve and protect residents of disadvantaged communities. CARB will continue to build partnerships with local communities and help build local capacity through funding and technical assistance.
- **Research:** CARB's research agenda is core to achieving its mission. To ensure that the research done by CARB responds to environmental justice concerns and has the greatest potential to improve air quality and public health in disadvantaged communities, CARB will engage communities groups early in the development of its research agenda and the projects that flow out from that agenda.
- **Enforcement:** Disadvantaged communities are often impacted by many sources of pollution. In order to improve air quality and protect public health, CARB will prioritize compliance with legal requirements, including enforcement actions if necessary, in environmental justice communities to ensure emissions of toxic and criteria pollutants in these communities are as low as possible.

Our inclusive approaches to further environmental justice in California's local communities may include an array of direct regulation, funding, and community capacity-building. CARB will continue to actively implement the provisions of AB 617, AB 197, AB 1071, SB 535, AB 1550, and other laws to better ensure that environmental justice communities see additional benefits from our clean air and climate policies. Our inclusive approaches to further environmental justice in California's local communities may include an array of direct regulation, funding, and community capacity-building.

## Enabling Local Action

---

Local governments are essential partners in achieving California's goals to reduce GHG emissions. Local governments can implement GHG emissions reduction strategies to address local conditions and issues and can effectively engage citizens at the local level. Local governments also have broad jurisdiction, and sometimes unique authorities, through their community-scale planning and permitting processes, discretionary actions, local codes and ordinances, outreach and education efforts, and municipal operations. Further, local jurisdictions can develop new and innovative approaches to reduce GHG emissions that can then be adopted elsewhere. For example, local governments can develop land use plans with more efficient development patterns that bring people and destinations closer together in more mixed-use, compact communities that facilitate walking, biking, and use of transit. Local governments can also incentivize locally generated renewable energy and infrastructure for alternative fuels and electric vehicles, implement water efficiency measures, and develop waste-to-energy and waste-to-fuel projects. These local actions complement statewide measures and are critical to supporting the State's efforts to reduce emissions. Local efforts can deliver substantial additional GHG and criteria emissions reductions beyond what State policy can alone, and these efforts will sometimes be more cost-effective and provide more cobenefits than relying exclusively on top-down statewide regulations to achieve the State's climate stabilization goals. To ensure local and regional engagement, it is also recommended local jurisdictions make readily available information regarding ongoing and proposed actions to reduce GHGs within their region.

Many cities and counties are already setting GHG reduction targets, developing local plans, and making progress toward reducing emissions. The Statewide Energy Efficiency Collaborative recently released a report, *The State of Local Climate Action: California 2016*,<sup>235</sup> which highlights local government efforts, including:

- In California, 60 percent of cities and over 70 percent of counties have completed a GHG inventory, and 42 percent of local governments have completed a climate, energy, or sustainability plan that directly addresses GHG emissions. Many other community-scale local plans, such as general plans, have emissions reduction measures incorporated as well (see Governor's Office of Planning and Research [OPR] Survey questions 23 and 24).<sup>236</sup>
- Over one hundred California local governments have developed emissions reduction targets that, if achieved, would result in annual reductions that total 45 MMTCO<sub>2</sub>e by 2020 and 83 MMTCO<sub>2</sub>e by 2050.<sup>237</sup>

Local air quality management and air pollution control districts also play a key role in reducing regional and local sources of GHG emissions by actively integrating climate protection into air quality programs. Air districts also support local climate protection programs by providing technical assistance and data, quantification tools, and even funding.<sup>238</sup> Local metropolitan planning organizations (MPOs) also support the State's climate action goals via sustainable communities strategies (SCSs), required by the Sustainable Communities and Climate Protection Act of 2008 (SB 375, Chapter 728, Statutes of 2008). Under SB 375, MPOs must prepare SCSs as part of their regional transportation plan to meet regional GHG reduction targets set by CARB for passenger vehicles in 2020 and 2035. The SCSs contain land use, housing, and transportation strategies that allow regions to meet their GHG emissions reductions targets.

To engage communities in efforts to reduce GHG emissions, CARB has partnered with Energy Upgrade California on the CoolCalifornia Challenge. It is a competition among California cities to reduce their carbon footprints and build more vibrant and sustainable communities. Three challenges have been completed. Most recently, the 2015–2016 Challenge included 22 cities and engaged nearly 3,200 households, each of which took actions to reduce energy use and carbon GHG emissions. In total, the participants reported savings of 5,638 MTCO<sub>2</sub> from completed actions, equivalent to emissions from more than 1,000 cars or from electricity used by more than 2,500 California homes in a year.

State agencies support these local government actions in several ways:

- [CoolCalifornia.org](http://CoolCalifornia.org) is an informational website that provides resources that assist local governments, small businesses, schools, and households to reduce GHG emissions. The local government webpage includes carbon calculators, a climate planning resource guide, a Funding Wizard that outlines grant and loan programs, and success stories. It also features ClearPath California, a no-cost GHG inventory, climate action plan development, and tracking tool developed through the Statewide Energy Efficiency Collaborative in coordination with CARB and the Governor's Office of Planning and Research (OPR).
- Chapter 8 of OPR's General Plan Guidelines<sup>239</sup> provides guidance for climate action plans and

237 These reductions include reductions from both state and local measures.

238 Examples include: (1) Bay Area Air Quality Management District (BAAQMD). 2016 Clean Air Plan and Regional Climate Protection Strategy. Available at: [www.baaqmd.gov/plans-and-climate/air-quality-plans/plans-under-development](http://www.baaqmd.gov/plans-and-climate/air-quality-plans/plans-under-development); (2) California Air Pollution Control Officers Association. California Emissions Estimator Model (CalEEMod). Available at: [www.caleemod.com/](http://www.caleemod.com/); (3) San Joaquin Valley Air Pollution Control District. Grants and Incentives. Available at: [valleyair.org/grants/](http://valleyair.org/grants/); (4) BAAQMD. Grant Funding. Available at: [www.baaqmd.gov/grant-funding](http://www.baaqmd.gov/grant-funding); (5) South Coast Air Quality Management District. Funding. Available at: [www.aqmd.gov/grants-bids/funding](http://www.aqmd.gov/grants-bids/funding); (6) Sacramento Metropolitan Air Quality Management District. Incentive Programs. Available at: [www.airquality.org/Residents/Incentive-Programs](http://www.airquality.org/Residents/Incentive-Programs).

239 <http://opr.ca.gov/planning/general-plan/>

other plans linked to general plans, which address the community scale approach outlined in CEQA Guidelines Section 15183.5(b), Plans for the Reduction of Greenhouse Gas Emissions.

- OPR hosts the Integrated Climate Adaptation and Resiliency Program, which is developing resources and case studies that outline the co-benefits of implementing emissions reduction strategies and addressing the impacts of climate change.
- CARB is developing a centralized database and interactive map that will display the current statewide status of local government climate action planning. Users can view and compare the details of emission inventories, planned GHG reduction targets and strategies, and other climate action details specific to each local government. This information will help jurisdictions around California identify what climate action strategies are working in other, similar jurisdictions across the State, and will facilitate collaboration among local governments pursuing GHG reduction strategies and goals. This database and map will be featured on the [CoolCalifornia.org](http://CoolCalifornia.org) website and are anticipated to be available in 2017.
- Additional information on local government activities is available on Cal-Adapt ([www.cal-adapt.org](http://www.cal-adapt.org)) and OPR ([www.opr.ca.gov](http://www.opr.ca.gov))

Further, a significant portion of the \$3.4 billion in cap-and-trade expenditures has either directly or indirectly supported local government efforts to reduce emissions, including, for example, the Affordable Housing and Sustainable Communities (AHSC) program and approximately \$142 million for project implementation and planning grants awarded under the Transformative Climate Communities program.

## Climate Action through Local Planning and Permitting

---

Local government efforts to reduce emissions within their jurisdiction are critical to achieving the State's long-term GHG goals, and can also provide important co-benefits, such as improved air quality, local economic benefits, more sustainable communities, and an improved quality of life. To support local governments in their efforts to reduce GHG emissions, the following guidance is provided. This guidance should be used in coordination with OPR's General Plan Guidelines guidance in Chapter 8, Climate Change.<sup>240</sup> While this guidance is provided out of the recognition that local policy makers are critical in reducing the carbon footprint of cities and counties, the decision to follow this guidance is voluntary and should not be interpreted as a directive or mandate to local governments.

### Recommended Local Plan-Level Greenhouse Gas Emissions Reduction Goals

CARB recommends statewide targets of no more than six metric tons CO<sub>2</sub>e per capita by 2030 and no more than two metric tons CO<sub>2</sub>e per capita by 2050.<sup>241</sup> The statewide per capita targets account for all emissions sectors in the State, statewide population forecasts, and the statewide reductions necessary to achieve the 2030 statewide target under SB 32 and the longer term State emissions reduction goal of 80 percent below 1990 levels by 2050.<sup>242</sup> The statewide per capita targets are also consistent with Executive Order S-3-05, B-30-15, and the Under 2 MOU that California originated with Baden-Württemberg and has now been signed or endorsed by 188 jurisdictions representing 39 countries and six continents.<sup>243,244</sup> Central to the Under 2 MOU is that all signatories agree to reduce their GHG emissions to two metric tons CO<sub>2</sub>e per capita by 2050. This limit represents California's and these other governments' recognition of their "fair share" to reduce GHG emissions to the scientifically based levels to limit global warming below two degrees Celsius. This limit is also consistent with the Paris Agreement, which sets out a global action plan to put the world on track to avoid dangerous climate change by limiting global warming to below 2°C.<sup>245</sup>

CARB recommends that local governments evaluate and adopt robust and quantitative locally-appropriate

---

240 <http://opr.ca.gov/planning/general-plan/>.

241 These goals are appropriate for the plan level (city, county, subregional, or regional level, as appropriate), but not for specific individual projects because they include all emissions sectors in the State.

242 This number represents the 2030 and 2050 targets divided by total population projections from California Department of Finance.

243 <http://under2mou.org/> California signed the Under 2 MOU on May 19, 2015. See [under2mou.org/wp-content/uploads/2015/05/California-appendix-English.pdf](http://under2mou.org/wp-content/uploads/2015/05/California-appendix-English.pdf) and [under2mou.org/wp-content/uploads/2015/05/California-Signature-Page.pdf](http://under2mou.org/wp-content/uploads/2015/05/California-Signature-Page.pdf).

244 The Under 2 MOU signatories include jurisdictions ranging from cities to countries to multiple-country partnerships. Therefore, like the goals set forth above for local and regional climate planning, the Under 2 MOU is scalable to various types of jurisdictions.

245 UNFCCC. The Paris Agreement. [unfccc.int/paris\\_agreement/items/9485.php](http://unfccc.int/paris_agreement/items/9485.php)

goals that align with the statewide per capita targets and the State's sustainable development objectives and develop plans to achieve the local goals. The statewide per capita goals were developed by applying the percent reductions necessary to reach the 2030 and 2050 climate goals (i.e., 40 percent and 80 percent, respectively) to the State's 1990 emissions limit established under AB 32.

Numerous local governments in California have already adopted GHG emissions reduction goals for year 2020 consistent with AB 32. CARB advises that local governments also develop community-wide GHG emissions reduction goals necessary to reach 2030 and 2050 climate goals. Emissions inventories and reduction goals should be expressed in mass emissions, per capita emissions, and service population emissions. To do this, local governments can start by developing a community-wide GHG emissions target consistent with the accepted protocols as outlined in OPR's General Plan Guidelines Chapter 8: Climate Change. They can then calculate GHG emissions thresholds by applying the percent reductions necessary to reach 2030 and 2050 climate goals (i.e., 40 percent and 80 percent, respectively) to their community-wide GHG emissions target. Since the statewide per capita targets are based on the statewide GHG emissions inventory that includes all emissions sectors in the State, it is appropriate for local jurisdictions to derive evidence-based local per capita<sup>246</sup> goals based on local emissions sectors and population projections that are consistent with the framework used to develop the statewide per capita targets. The resulting GHG emissions trajectory should show a downward trend consistent with the statewide objectives. The recommendation for a community-wide goal expands upon the reduction of 15 percent from "current" (2005-2008) levels by 2020 as recommended in the 2008 Scoping Plan.<sup>247</sup>

In developing local plans, local governments should refer to "The U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions,"<sup>248</sup> (community protocol) which provides detailed guidance on completing a GHG emissions inventory at the community scale in the United States – including emissions from businesses, residents, and transportation. Quantification tools such as ClearPath California, which was developed with California agencies, also support the analysis of community-scale GHG emissions. Per the community protocol, these plans should disclose all emissions within the defined geographical boundary, even those over which the local government has no regulatory authority to control, and then focus the strategies on those emissions that the jurisdiction controls. For emissions from transportation, the community protocol recommends including emissions from trips that extend beyond the community's boundaries. Local plans should also include the carbon sequestration values associated with natural and working lands, and the importance of jurisdictional lands for water, habitat, agricultural, and recreational resources. Strategies developed to achieve the local goals should prioritize mandatory measures that support the Governor's "Five Pillars" and other key state climate action goals.<sup>249</sup> Examples of plan-level GHG reduction actions that could be implemented by local governments are listed in Appendix B. Additional information and tools on how to develop GHG emissions inventories and reduction plans tied to general plans can be found in OPR's General Plan Guidelines and at [CoolCalifornia.org](http://CoolCalifornia.org).

These local government recommendations are based on the recognition that California must accommodate population and economic growth in a far more sustainable manner than in the past. While state-level investments, policies, and actions play an important role in shaping growth and development patterns, regional and local governments and agencies are uniquely positioned to influence the future of the built environment and its associated GHG emissions. Greenhouse gas emissions reduction strategies in Climate Action Plans (CAPs) and other local plans can also lead to important co-benefits, such as improved air quality, local economic benefits such as green jobs, more mobility choices, improved public health and quality of life, protection of locally, statewide, and globally important natural resources, and more equitable sharing of these benefits across communities.

Contributions from policies and programs, such as renewable energy and energy efficiency, are helping to achieve the near-term 2020 target, but longer-term targets cannot be achieved without land use decisions that allow more efficient use and management of land and infrastructure. Local governments have primary authority to plan, zone, approve, and permit how and where land is developed to accommodate population growth, economic growth, and the changing needs of their jurisdictions. Land use decisions affect GHG emissions associated with transportation, water use, wastewater treatment, waste generation and treatment, energy consumption, and conversion of natural and working lands. Local land use decisions play a particularly

---

246 Or some other metric that the local jurisdiction deems appropriate (e.g., mass emissions, per service population)

247 2008 Scoping Plan, page 27, [www.arb.ca.gov/cc/scopingplan/document/scopingplandocument.htm](http://www.arb.ca.gov/cc/scopingplan/document/scopingplandocument.htm)

248 <http://icleiusa.org/publications/us-community-protocol/>

249 [www.arb.ca.gov/cc/pillars/pillars.htm](http://www.arb.ca.gov/cc/pillars/pillars.htm)

critical role in reducing GHG emissions associated with the transportation sector, both at the project level, and in long-term plans, including general plans, local and regional climate action plans, specific plans, transportation plans, and supporting sustainable community strategies developed under SB 375.

While the State can do more to accelerate and incentivize these local decisions, local actions that reduce VMT are also necessary to meet transportation sector-specific goals and achieve the 2030 target under SB 32. Through developing the Scoping Plan, CARB staff is more convinced than ever that, in addition to achieving GHG reductions from cleaner fuels and vehicles, California must also reduce VMT. Stronger SB 375 GHG reduction targets will enable the State to make significant progress toward needed reductions, but alone will not provide the VMT growth reductions needed; there is a gap between what SB 375 can provide and what is needed to meet the State's 2030 and 2050 goals. In its evaluation of the role of the transportation system in meeting the statewide emissions targets, CARB determined that VMT reductions of 7 percent below projected VMT levels in 2030 (which includes currently adopted SB 375 SCSs) are necessary. In 2050, reductions of 15 percent below projected VMT levels are needed. A 7 percent VMT reduction translates to a reduction, on average, of 1.5 miles/person/day from projected levels in 2030. It is recommended that local governments consider policies to reduce VMT to help achieve these reductions, including: land use and community design that reduces VMT; transit oriented development; street design policies that prioritize transit, biking, and walking; and increasing low carbon mobility choices, including improved access to viable and affordable public transportation and active transportation opportunities. It is important that VMT reducing strategies are implemented early because more time is necessary to achieve the full climate, health, social, equity, and economic benefits from these strategies.

Once adopted, the plans and policies designed to achieve a locally-set GHG goal can serve as a performance metric for later projects. Sufficiently detailed and adequately supported GHG reduction plans (including CAPs) also provide local governments with a valuable tool for streamlining project-level environmental review. Under CEQA, individual projects that comply with the strategies and actions within an adequate local CAP can streamline the project-specific GHG analysis.<sup>250</sup> The California Supreme Court recently called out this provision in CEQA as allowing tiering from a geographically specific GHG reduction plan.<sup>251</sup> The Court also recognized that GHG determinations in CEQA should be consistent with the statewide Scoping Plan goals, and that CEQA documents taking a goal-consistency approach may soon need to consider a project's effects on meeting the State's longer term post-2020 goals.<sup>252</sup> The recommendation above that local governments develop local goals tied to the statewide per capita goals of six metric tons CO<sub>2</sub>e by 2030 and no more than two metric tons CO<sub>2</sub>e per capita by 2050 provides guidance on CARB's view on what would be consistent with the 2017 Scoping Plan and the State's long-term goals.

Production based inventories and emissions reduction programs are appropriate for local communities wanting to mitigate their emissions pursuant to CEQA Section 15183.5(b). Consumption based inventories are complementary to production based inventories and are appropriate as a background setting, disclosure, and as an outreach tool to show how personal decisions may change a person's or household's contribution to climate change. For additional information, see the OPR General Plan Guidelines.<sup>253</sup>

## Project-Level Greenhouse Gas Emissions Reduction Actions and Thresholds

Beyond plan-level goals and actions, local governments can also support climate action when considering discretionary approvals and entitlements of individual projects through CEQA. Absent conformity with an adequate geographically-specific GHG reduction plan as described in the preceding section above, CARB recommends that projects incorporate design features and GHG reduction measures, to the degree feasible, to minimize GHG emissions. Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development. There are recent examples of land use development projects in California that have demonstrated that it is feasible to design projects that achieve zero net additional GHG emissions. Several projects have received certification from the Governor under AB 900, the Jobs and Economic Improvement through Environmental Leadership Act (Buchanan, Chapter 354, Statutes of 2011), demonstrating an ability to design economically viable projects that create jobs while contributing no net additional GHG emissions.<sup>254</sup> Another example is the Newhall

250 CEQA Guidelines, § 15183.5, sub. (b).

251 Center for Biological Diversity v. California Dept. of Fish and Wildlife (2015) 62 Cal.4th 204, 229–230.

252 Id. at pp. 223–224.

253 <http://opr.ca.gov/planning/general-plan/>.

254 Governor's Office of Planning and Research. California Jobs. <http://www.opr.ca.gov/ceqa/california-jobs.html>

Ranch Resource Management and Development Plan and Spineflower Conservation Plan,<sup>255</sup> in which the applicant, Newhall Land and Farming Company, proposed a commitment to achieve net zero GHG emissions for a very large-scale residential and commercial specific planned development in Santa Clarita Valley.

Achieving net zero increases in GHG emissions, resulting in no contribution to GHG impacts, may not be feasible or appropriate for every project, however, and the inability of a project to mitigate its GHG emissions to net zero does not imply the project results in a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA. Lead agencies have the discretion to develop evidence-based numeric thresholds (mass emissions, per capita, or per service population) consistent with this Scoping Plan, the State's long-term GHG goals, and climate change science.<sup>256</sup>

To the degree a project relies on GHG mitigation measures, CARB recommends that lead agencies prioritize on-site design features that reduce emissions, especially from VMT, and direct investments in GHG reductions within the project's region that contribute potential air quality, health, and economic co-benefits locally. For example, on-site design features to be considered at the planning stage include land use and community design options that reduce VMT, promote transit oriented development, promote street design policies that prioritize transit, biking, and walking, and increase low carbon mobility choices, including improved access to viable and affordable public transportation, and active transportation opportunities. Regionally, additional GHG reductions can be achieved through direct investment in local building retrofit programs that can pay for cool roofs, solar panels, solar water heaters, smart meters, energy efficient lighting, energy efficient appliances, energy efficient windows, insulation, and water conservation measures for homes within the geographic area of the project. These investments generate real demand side benefits and local jobs, while creating the market signals for energy efficient products, some of which are produced in California. Other examples of local direct investments include financing installation of regional electric vehicle (EV) charging stations, paying for electrification of public school buses, and investing in local urban forests.

Local direct investments in actions to reduce GHG emissions should be supported by quantification methodologies that show the reductions are real, verifiable, quantifiable, permanent, and enforceable. Where further project design or regional investments are infeasible or not proven to be effective, it may be appropriate and feasible to mitigate project emissions through purchasing and retiring carbon credits. CAPCOA has developed the GHG Reduction Exchange (GHG Rx) for CEQA mitigation, which could provide credits to achieve additional reductions. It may also be appropriate to utilize credits issued by a recognized and reputable voluntary carbon registry. Appendix B includes examples of on-site project design features, mitigation measures, and direct regional investments that may be feasible to minimize GHG emissions from land use development projects.

California's future climate strategy will require increased focus on integrated land use planning to support livable, transit-connected communities, and conservation of agricultural and other lands. Accommodating population and economic growth through travel- and energy-efficient land use provides GHG-efficient growth, reducing GHGs from both transportation and building energy use.<sup>257</sup> GHGs can be further reduced at the project level through implementing energy-efficient construction and travel demand management approaches.<sup>258</sup> Further, the State's understanding of transportation impacts continues to evolve. The CEQA Guidelines are being updated to focus the analysis of transportation impacts on VMT. OPR's Technical Advisory includes methods of analysis of transportation impacts, approaches to setting significance thresholds, and includes examples of VMT mitigation under CEQA.<sup>259</sup>

---

255 <https://nrm.dfg.ca.gov/documents/ContextDocs.aspx?cat=NewhallRanchFinal>

256 CARB provided some guidance on development project thresholds in a paper issued in October 2008, which included a concept utilizing a bright-line mass numeric threshold based on capturing approximately 90 percent of emissions in that sector and a concept of minimum performance based standards. Some districts built upon that work to develop thresholds. For example, Santa Barbara County adopted a bright-line numeric threshold of 1,000 MTCO<sub>2</sub>e/yr for industrial stationary-source projects, and Sacramento Metropolitan Air Quality Management District adopted a 10,000 MTCO<sub>2</sub>e/yr threshold for stationary source projects and a 1,100 MTCO<sub>2</sub>e/yr threshold for construction activities and land development projects in their operational phase. CARB is not endorsing any one of these approaches, but noting them for informational purposes.

## Implementing the Scoping Plan

This Scoping Plan outlines the regulations, programs, and other mechanisms needed to reduce GHG emissions in California. CARB and other State agencies will work closely with State and local agencies, stakeholders, Tribes, and the public to develop regulatory measures and other programs to implement the Scoping Plan. CARB and other State agencies will develop regulations in accordance with established rulemaking guidelines. Per Executive Order B-30-15, as these regulatory measures and other programs are developed, building programs for climate resiliency must also be a consideration. Additionally, agencies will further collaborate and work to provide the institutional support needed to overcome barriers that may currently hinder certain efforts to reduce GHG emissions and to support the goals, actions, and measures identified for key sectors in Chapter 4. Table 17 provides a high-level summary of the Climate Change Policies and Measures discussed in the Scoping Plan, including, but not limited to, those identified specifically to achieve the 2030 target.

**TABLE 17: CLIMATE CHANGE POLICIES AND MEASURES**

| Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Lead Agency                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Implement SB 350 by 2030: <ul style="list-style-type: none"> <li>• Increase the Renewables Portfolio Standard to 50 percent of retail sales by 2030 and ensure grid reliability.</li> <li>• Establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas end uses by 2030.</li> <li>• Reduce GHG emissions in the electricity sector through the implementation of the above measures and other actions as modeled in IRPs to meet GHG emissions reductions planning targets in the IRP process. Load-serving entities and publicly-owned utilities meet GHG emissions reductions planning targets through a combination of measures as described in IRPs.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | CPUC, CEC, CARB                                                |
| Implement Mobile Source Strategy (Cleaner Technology and Fuels): <ul style="list-style-type: none"> <li>• At least 1.5 million zero emission and plug-in hybrid light-duty electric vehicles by 2025.</li> <li>• At least 4.2 million zero emission and plug-in hybrid light-duty electric vehicles by 2030.</li> <li>• Further increase GHG stringency on all light-duty vehicles beyond existing Advanced Clean Cars regulations.</li> <li>• Medium- and heavy-duty GHG Phase 2.</li> <li>• Innovative Clean Transit: Transition to a suite of to-be-determined innovative clean transit options. Assumed 20 percent of new urban buses purchased beginning in 2018 will be zero emission buses with the penetration of zero-emission technology ramped up to 100 percent of new sales in 2030. Also, new natural gas buses, starting in 2018, and diesel buses, starting in 2020, meet the optional heavy-duty low-NO<sub>x</sub> standard.</li> <li>• Last Mile Delivery: New regulation that would result in the use of low NO<sub>x</sub> or cleaner engines and the deployment of increasing numbers of zero-emission trucks primarily for class 3-7 last mile delivery trucks in California. This measure assumes ZEVs comprise 2.5 percent of new Class 3–7 truck sales in local fleets starting in 2020, increasing to 10 percent in 2025 and remaining flat through 2030.</li> <li>• Further reduce VMT through continued implementation of SB 375 and regional Sustainable Communities Strategies; forthcoming statewide implementation of SB 743; and potential additional VMT reduction strategies not specified in the Mobile Source Strategy but included in the document “Potential VMT Reduction Strategies for Discussion.”</li> </ul> | CARB, CalSTA, SGC, CalTrans<br>CEC, OPR, Local agencies        |
| Increase stringency of SB 375 Sustainable Communities Strategy (2035 targets).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | CARB                                                           |
| By 2019, adjust performance measures used to select and design transportation facilities. <ul style="list-style-type: none"> <li>• Harmonize project performance with emissions reductions, and increase competitiveness of transit and active transportation modes (e.g. via guideline documents, funding programs, project selection, etc.).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | CalSTA and SGC, OPR, CARB, GoBiz,<br>IBank, DOF, CTC, Caltrans |
| By 2019, develop pricing policies to support low-GHG transportation (e.g. low-emission vehicle zones for heavy duty, road user, parking pricing, transit discounts).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | CalSTA, Caltrans, CTC, OPR/SGC,<br>CARB                        |

| Implement the post-2020 Cap-and-Trade Program with declining annual caps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | CARB                                               |
| By 2018, develop Integrated Natural and Working Lands Implementation Plan to secure California’s land base as a net carbon sink: <ul style="list-style-type: none"> <li>Protect land from conversion through conservation easements and other incentives.</li> <li>Increase the long-term resilience of carbon storage in the land base and enhance sequestration capacity</li> <li>Utilize wood and agricultural products to increase the amount of carbon stored in the natural and built environments</li> <li>Establish scenario projections to serve as the foundation for the Implementation Plan</li> </ul> | CNRA and departments within, CDFR, CalEPA, CARB    |
| Establish a carbon accounting framework for natural and working lands as described in SB 859 by 2018                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | CARB                                               |
| Implement Forest Carbon Plan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | CNRA, CAL FIRE, CalEPA and departments within      |
| Identify and expand funding and financing mechanisms to support GHG reductions across all sectors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | State Agencies & Local Agencies                    |

## A Comprehensive Approach to Support Climate Action

Ultimately, successfully tipping the scales in the fight against climate change relies on our ability to incentivize clean technologies in the marketplace and to make other climate strategies clearly understood and easily accessible. We must support and guide our businesses as they continue to innovate and make clean technologies ever more attractive to ever more savvy consumers. Until the point that clean technologies become the best and lowest cost option—which is clearly on the horizon for many technologies, including renewable energy and electric cars—we must continue to support emerging markets through incentives and outreach efforts. More than just coordinating among agencies and providing institutional support as described above, we will succeed if we tackle climate change from all angles—through regulatory and policy development, targeted incentives, and education and outreach.

### Regulations and Programmatic Development

Our decade of climate leadership has demonstrated that developing mitigation strategies through a public process, where all stakeholders have a voice, leads to effective actions that address climate change and yield a series of additional economic and environmental co-benefits to the State. As we implement this Scoping Plan, State agencies will continue to develop and implement new and existing programs, as described herein. During any rulemaking process, there are many opportunities for both informal interaction with technical staff in meetings and workshops, and formal interaction at Board meetings, Commission business meetings, monthly public meetings, and others. Each State agency will consider all information and stakeholder input during the rulemaking process. Based on this information, the agency may modify proposed measures to reflect the status of technological development, the cost of the measure, the cost-effectiveness of the measures, and other factors before presenting them for consideration and adoption.

Further, to achieve cost-effective GHG reductions, California State agencies must consider the environmental impact of small businesses and provide mechanisms to assist businesses as GHG reduction measures are

implemented. CARB provides resources and tips for small businesses to prevent pollution, minimize waste, and save energy and water on [CoolCalifornia.org](http://CoolCalifornia.org). California's small businesses and their employees represent a valuable economic resource in the State and "greening" existing businesses is not only achievable, but sets an example for new businesses which will prove significant as California transitions to a low carbon state.

State agencies conduct environmental and environmental justice assessments of our regulatory actions. Many of the requirements in AB 32 overlap with traditional agency evaluations. In adopting regulations to implement the measures recommended in the Scoping Plan, or including in the regulations the use of market-based compliance mechanisms to comply with the regulations, agencies will ensure that the measures have undergone the aforementioned screenings and meet the requirements established in California Health and Safety Code Section 38562(b)(1-9) and Section 38570(b)(1-3).

## **Incentive Programs**

Financial incentives and direct funding are critical components of the State's climate framework. In particular, incentives and funding are necessary to support GHG emissions reductions strategies for priority sectors, sources, and technologies. Although California has a number of existing incentive programs, available funding is limited. It is critical to target public investments efficiently and in ways that encourage integrated, system wide solutions to produce deep and lasting public benefits. Significant investments of private capital, supported by targeted, priority investments of public funding, are necessary to scale deployment and to maximize benefits. Public investments, including through decisions related to State pension fund portfolios, can help incentivize early action to accelerate market transition to cleaner technologies and cleaner practices, which can also be supported by regulatory measures.

Many existing State funding programs work in tandem to reduce emissions from GHGs, criteria pollutants, and toxic air contaminants, and are helping to foster the transition to a clean energy economy and protect and manage land for carbon sequestration. State law, including Senate Bill 535 (De León, Chapter 830, Statutes of 2012) and Assembly Bill 1550 (Gomez, Chapter 369, Statutes of 2016) also requires focused investment in low income and disadvantaged communities.

The State will need to continue to coordinate and utilize funding sources, such as the Greenhouse Gas Reduction Fund (cap-and-trade auction proceeds), the Alternative and Renewable Fuel and Vehicle Technology Program (AB 118), Electric Program Investment Charge (EPIC) Program, Carl Moyer Program, Air Quality Improvement Program, and Proposition 39 to expand clean energy investments in California and further reduce GHG and criteria emissions. Additionally, programs including the Bioenergy Feed-In Tariff, created by Senate Bill 1122 (Rubio, Chapter 612, Statutes of 2012), Low Carbon Fuel Standard, Cap-and-Trade, Self-Generation Incentive Program, Federal Renewable Fuel Standard, utility incentives pursuant to Assembly Bill 1900 (Gatto, Chapter 602, Statutes of 2012), and others provide important market signals and potential revenue streams to support projects to reduce GHG emissions.

These programs represent just a portion of the opportunities that exist at the federal, State, and local levels to incentivize GHG emissions reductions. The availability of dedicated and long-lasting funding sources is critical to help meet the State's climate objectives and help provide certainty and additional partnership opportunities at the national, State, Tribal, regional, and local levels for further investing in projects that have the potential to expand investments in California's clean economy and further reductions in GHG emissions.

## **Public Education and Outreach Efforts**

California State agencies are committed to meaningful opportunities for public input and effective engagement with stakeholders and the public through the development of the Scoping Plan, and as measures are implemented through workshops, other meetings, and through the formal rulemaking process. Additionally, the State has broad public education and outreach campaigns to support markets for key technologies, like ZEVs and energy efficiency, as well as resources to support local and voluntary actions, such as [CoolCalifornia.org](http://CoolCalifornia.org).

In developing this Scoping Plan, there has been extensive outreach with environmental justice organizations and disadvantaged communities. The EJAC launched a community engagement process starting in July 2016, conducting 19 community meetings throughout the State and collecting hundreds of individual comments. To enhance the engagement opportunity, CARB coordinated with local government agencies and sister State agencies to hold collaborative discussions with local residents about specific climate issues that impact their

lives. This effort was well received and attended by local community residents and initiated a new community engagement endeavor for CARB. Recognizing the value of the input received and the opportunity to present California's climate strategy to communities across the State, CARB intends to continue this community involvement to generate awareness about California's climate strategy and be responsive to specific community needs as climate programs are implemented.

## EDUCATION AND ENVIRONMENT INITIATIVE

The California Environmental Protection Agency (CalEPA), the California Department of Education, and the California Natural Resources Agency have developed an environmental curriculum that is being taught in more than half of California's school districts. The [Education and Environment Initiative](#) (EEI) provides California's teachers with tools to educate students about the natural environment and how everyday choices can improve our planet and save money.

## Conclusion

---

This Scoping Plan continues more than a half-century of California's nation-leading efforts to clean our air, our water and improve the environment. But, climate change poses a challenge of unprecedented proportions that will, in one way or another, impact all Californians whether they are city dwellers in Los Angeles, San Diego or San Francisco, farmers in Salinas or the Central Valley, or the millions of Californians who live in the Sierra or in the desert areas.

This is the State's climate action plan, and in a very real sense it belongs to all those Californians who are feeling, and will continue to feel, the impacts of climate change. Californians want to see continued effective action that addresses climate change and benefits California – this Plan responds to both of these goals. The Plan was developed by the coordinated consensus of State agencies, but it is really California's Plan, because over the coming decades the approaches in this document will be carried out by all of us.

In this Scoping Plan, every sector in our thriving economy plays a crucial role. Tribes, cities, and local governments are already rising to the challenge, and will play increasingly important roles with everything from low-carbon and cleaner transit, to more walkable streets and the development of vibrant urban communities.

We will see a remarkable transformation of how we move throughout the state, away from cars that burn fossil fuels to cleaner, electric cars that will, in some cases, even drive themselves. Freight will be moved around the state by trucks that are vastly cleaner than those on the road now, with our ports moving towards zero- and near-zero emissions technologies. The heavily traveled Los Angeles-San Francisco corridor will be serviced by comfortable, clean and affordable high speed rail.

In addition to reducing GHGs, these efforts will slash pollution now created from using gasoline and diesel fuel statewide, with the greatest benefits going to the disadvantaged communities of our state which are so often located adjacent to ports, railyards, freight distribution centers and freeways. And, thanks to the continued investment of proceeds from the Cap-and-Trade Program in these same communities, we can continue to work on bringing the benefits of clean technology – whether electric cars or solar roofs – to those in our state who need them the most.

Climate change presents us with unprecedented challenges – challenges that cannot be met with traditional ways of thinking or conventional solutions. As Governor Brown has recognized, meeting these challenges will require "courage, creativity and boldness." The last ten years proved to ourselves, and the world, that Californians recognize the danger of climate change. It has also demonstrated that developing mitigation strategies through a public process where all stakeholders have a voice leads to effective actions that address climate change while yielding a series of co-benefits to the state. This Scoping Plan builds on those early steps and moves into a new chapter that will deliver a thriving economy and a clean environment to our children and grandchildren. It is a commitment to the future, but it begins today by moving forward with the policies in this Plan.

# California's 2030 Vision

## CAP-AND-TRADE

Firm limit on 80% of emissions

## CLEAN ENERGY

At least 50% renewable electricity

Double energy efficiency in existing buildings

## CLEAN FUELS

18% carbon intensity reduction

High density, transit-oriented housing

**NATURAL & WORKING LANDS RESTORATION**  
15-20 million metric tons of reductions

Walkable & bikable communities

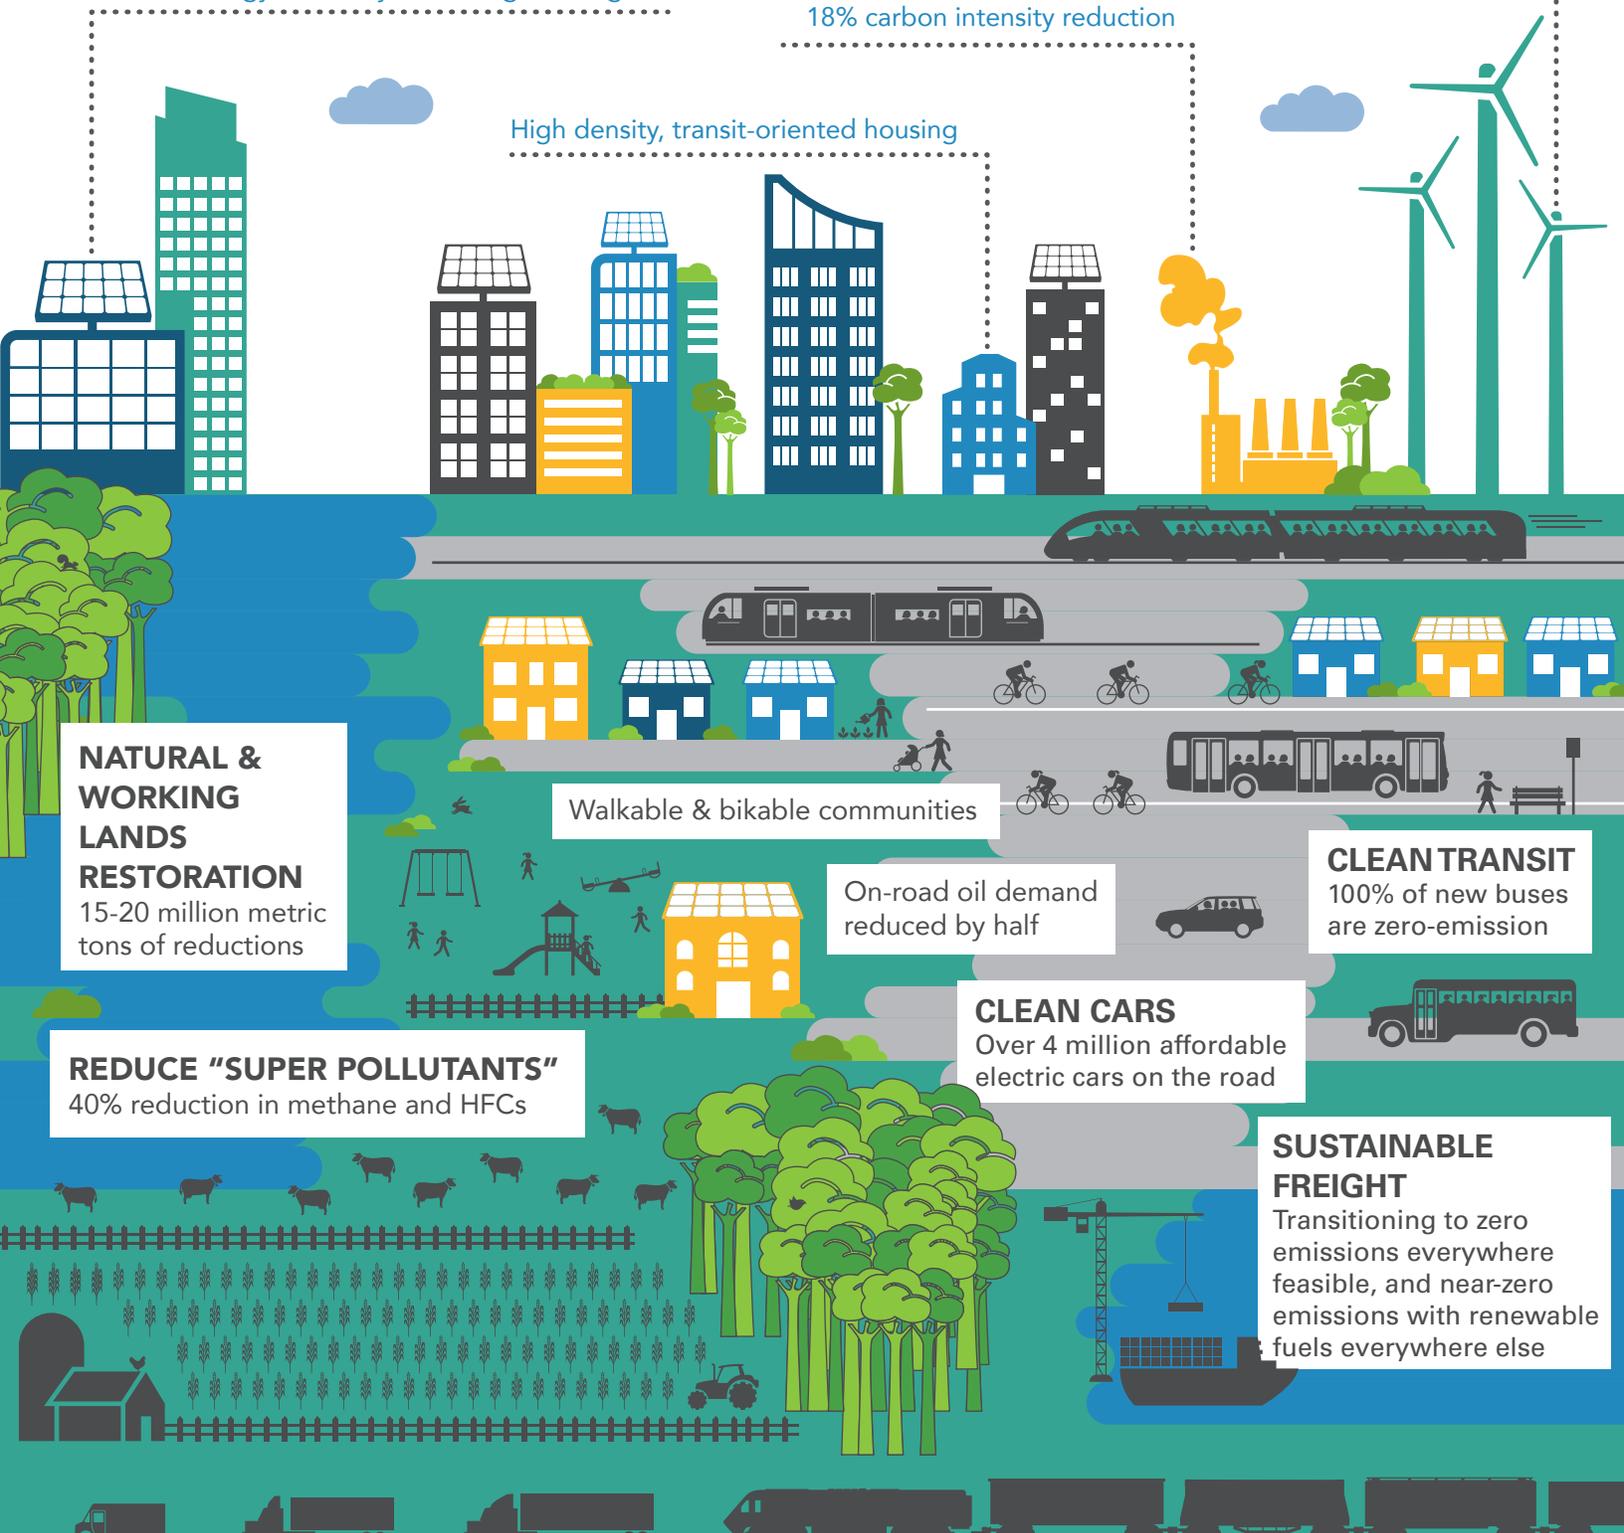

On-road oil demand reduced by half

**CLEAN TRANSIT**  
100% of new buses are zero-emission

**REDUCE "SUPER POLLUTANTS"**  
40% reduction in methane and HFCs

**CLEAN CARS**  
Over 4 million affordable electric cars on the road

**SUSTAINABLE FREIGHT**  
Transitioning to zero emissions everywhere feasible, and near-zero emissions with renewable fuels everywhere else

County of San Diego Board of Supervisors  
Wednesday, February 14, 2018, 9:00 A.M.  
Agenda Item 1

1 CHAIR KRISTIN GASPAR: We appreciate all  
2 of you for coming here today to make comments on  
3 the Climate Action Plan. Just wanted to give you  
4 a heads up that due to the high volume of speaker  
5 requests, we are going to be hearing each speaker  
6 for a total of 2 minutes for our individuals, and  
7 our group presentations will be a total of 10  
8 minutes.

9 Wanted to make you aware during the  
10 staff presentation in the event you need to trim  
11 your speaking points at all. Of course, as  
12 always, an "I agree" or "I disagree" when you  
13 come forward is very helpful. If you provide us  
14 new testimony, perhaps that we haven't heard, and  
15 reserve your time to say, "I agree with the  
16 points being said, and here's what I have to  
17 add."

18 So, thank you very much. This will help  
19 keep this meeting successful and maximize our  
20 public testimony this morning. I know our staff  
21 has a brief presentation as well this morning,  
22 and they've also agreed to trim it. Right, Mark?  
23 No.

24 MARK WARDLAW: No.

25 CHAIR KRISTIN GASPAR: No such luck.

1 Well, he's going to talk a little faster for us  
2 then. Good morning.

3 MARK WARDLAW: Good morning, Chairwoman  
4 Gaspar and Supervisors. I am Mark Wardlaw,  
5 Director of Planning and Services. This is a  
6 request for the Board of Supervisors to certify  
7 the Final Supplemental Environmental Impact  
8 Report and adopt the revised Climate Action Plan,  
9 including the errata and the supplemental  
10 information modifying Option 3, dated 2/13/2018,  
11 provided to the Board.

12 Presenting with me today are Rami  
13 Talleh, Deputy Director; Mary Kopaskie-Brown,  
14 Chief Advance Planning; and Darin Neufeld,  
15 Planning Manager. A representative of each County  
16 department involved in the development of the  
17 Climate Action Plan is also here to answer  
18 questions and provide information to the Board.

19 Also, the consultants that assisted the  
20 County in preparing the Climate Action Plan,  
21 Ascent Environmental and the University of San  
22 Diego Energy Policies Initiative Center and  
23 Ramboll, Inc., all recognized experts in climate  
24 action planning throughout the state, are also  
25 here to answer questions.

1 Today's presentation will include a  
2 summary of legislative and legal requirements,  
3 the revised Climate Action Plan, public input,  
4 costs, implementation, and the Supplemental  
5 Environmental Impact Report. The staff  
6 recommendation, options, including the modified  
7 Option 3, and the Planning Commission  
8 recommendation for implementing the Climate  
9 Action Plan will also be presented.

10 Legislation was signed by two governors  
11 establishing greenhouse gas reduction targets for  
12 2020 and 2030, and an executive order was issued  
13 establishing greenhouse gas reduction goals for  
14 2050. In 2011, the Board of Supervisors adopted  
15 the General Plan Update that included Mitigation  
16 Measure CC-1.2 that required the County to  
17 prepare an enforceable Climate Action Plan. The  
18 Board of Supervisors adopted the County's first  
19 Climate Action Plan in 2012, which was  
20 subsequently challenged in court. Litigation  
21 concluded in 2015, and the Board of Supervisors  
22 rescinded the Climate Action Plan.

23 Staff then began preparation of a  
24 completely new CEQA-qualified Climate Action  
25 Plan. On January 18th, 2018, the Planning

1 Commission held a hearing to consider the Climate  
2 Action Plan. The Climate Action Plan, along with  
3 the Planning Commission's recommendation, is  
4 being presented to the Board today. The County  
5 will return to court in March 2018.

6 Before developing the Climate Action  
7 Plan, the County reviewed over 40 climate action  
8 plans and sustainability plans from jurisdictions  
9 in California and outside of the state and county  
10 to identify climate action planning best  
11 practices. An inventory of greenhouse gases were-  
12 -emissions were completed by Sector to identify  
13 and quantify the major sources of greenhouse  
14 gases in the unincorporated county and by County  
15 operations county wide.

16 The inventory shows that the county  
17 emitted a total of 3.2 million metric tons of  
18 greenhouse gases in 2014, which is the base year.  
19 The three largest emitters include on-road  
20 transportation, electricity generation, and solid  
21 waste disposal. The County is on track to exceed  
22 the 3.1 million metric ton reduction target for  
23 2020 through State and County actions. The County  
24 must reduce greenhouse gas emissions by a total  
25 of 1.8 million metric tons to reach its 2030

1 reduction target. State actions and legislation,  
2 such as building codes and electrical vehicle  
3 regulations, will achieve reductions of 899,547  
4 metric tons, 50 percent of the 2030 target  
5 reductions.

6 The Climate Action Plan, as being  
7 considered by the Board today, includes actions  
8 required to reduce the County's remaining 2030  
9 target reductions of 897,145 metric tons. The  
10 Climate Action Plan is organized in 5 categories  
11 with 11 strategies and 30 measures. The measures  
12 include existing, expanded, and new programs that  
13 are implemented directly by the County or as  
14 requirements. Some programs include incentives,  
15 such as the vehicle retirement program.

16 The measures are practical, feasible,  
17 and diversified across the five categories to  
18 achieve the 2030 reductions. They are balanced in  
19 approach across tax payers, consumers, and  
20 businesses, with County programs representing 59  
21 percent of the reductions, or over 526,000 metric  
22 tons of the needed 897,145 metric tons of gas  
23 reductions.

24 Rami Talleh will now go over the next  
25 slides and will present the measures in the

1 Climate Action Plan and associated indicators.

2           RAMI TALLEH: Thank you, Mark. The  
3 energy efficiency related measures would reduce  
4 over 72,000 metric tons and include requiring new  
5 development to meet the anticipated state net  
6 zero energy standard, transitioning away from  
7 tank-based natural gas water heaters, requiring  
8 energy efficiency audits for existing buildings,  
9 and improving energy efficiency at County  
10 facilities. This table summarizes the reductions  
11 related to energy efficiency.

12           The renewable electricity related  
13 measures would offset 2.4 million megawatt hours  
14 of energy with renewable electricity in the  
15 unincorporated county and include requiring new  
16 nonresidential development to offset their  
17 electricity use by installing renewable  
18 electricity systems, promoting through incentives  
19 the installation of photovoltaics or solar panels  
20 on existing homes in the county, and achieving 90  
21 percent renewable electricity by 2030. This table  
22 summarizes the reductions related to renewable  
23 electricity that result in over 509,000 metric  
24 tons of reductions.

25           To achieve the 90 percent renewable

1 electricity, Measure E-2.1 establishes a county  
2 renewable energy program for the unincorporated  
3 county. Any renewable energy program could  
4 include a partnership with a public utility,  
5 community choice aggregate, referred to as a CCA,  
6 or expansion of the direct access program.

7 Staff recommends conducting a  
8 comparative analysis of these options for the  
9 program. The comparative analysis would consider  
10 existing and pending state and federal  
11 legislation and regulations, the source for  
12 electricity, whether new or existing, how new  
13 renewable electricity is generated and procured,  
14 participate rates, how rates are set, impacts on  
15 customers, and overall costs to the county to  
16 implement the renewable energy program.

17 The City of San Diego conducted a  
18 feasibility study on establishing a CCA and is  
19 also considering a partnership proposal from San  
20 Diego Gas and Electric, which would require  
21 California Public Utility Commission approval.  
22 Both identify ways to achieve 100 percent  
23 renewable energy for the City of San Diego  
24 residents. Other jurisdictions in the region are  
25 exploring CCAs, including the City of Solana

1 Beach, Riverside County, and jointly the Cities  
2 of Encinitas, Carlsbad, Del Mar, and Oceanside.  
3 Expansion of the direct access program would also  
4 require California Public Utilities Commission  
5 approval and could include both generation and  
6 procurement of renewable electricity.

7 Status updates on CCA feasibility  
8 studies, the outcome of the California Public  
9 Utilities Commission's evaluation on exit fees,  
10 and progress made by the City of San Diego on the  
11 renewable energy program, as directed by the  
12 Board, on February 15th, 2017, would be  
13 incorporated into the recommended comparative  
14 analysis, as would cost estimates for the various  
15 options.

16 Work on the comparative analysis will  
17 begin in 2018, and staff will report back to the  
18 Board in 2019. Based on Board direction at the  
19 time, a renewable energy program would be  
20 developed to commence in 2025 with 90 percent  
21 renewable energy achieved by 2030, based on a  
22 participation rate of 80 percent, which is  
23 consistent with other local jurisdictions. The  
24 cost to develop the renewable energy program is  
25 approximately \$2.2 million.

1           The transportation related measures  
2 respond to the region's diverse landscape of open  
3 space, rural villages, and agricultural lands.  
4 The measures address opportunities and  
5 constraints related to 2.3 million acres in the  
6 county and current opportunities for transit in  
7 the region. Because other jurisdictions, such as  
8 San Diego Association of Governments, North  
9 County Transit District, and the Metropolitan  
10 Transportation Transit System, have  
11 jurisdictional authority over implementing  
12 transit, the County has limited control over  
13 implementing transportation-based strategies.

14           The transportation related measures  
15 would reduce 152 million vehicle miles traveled  
16 and include preserving open space and  
17 agricultural lands, which reduce impacts related  
18 to transportation, energy use, waste, and water  
19 consumption, updating community plans to focus in  
20 the county's villages. As transit is expanded or  
21 becomes available in villages, they'll be  
22 transit-ready to support needed transit ridership  
23 and promote walking and cycling and increasing  
24 opportunities for telecommuting, car-sharing,  
25 vanpools, carpools, shuttles, bicycle parking

1 facilities, and transit subsidies. This table  
2 summarizes the reductions related to the  
3 transportation measures that result in over  
4 33,000 metric tons of reductions.

5 Fleet vehicle related measures would  
6 reduce over 18,000 metric tons of greenhouse  
7 gases and include requiring that construction  
8 vehicles use alternative fuel during new  
9 construction require--retiring older vehicles,  
10 installing 2,040 electrical vehicle charging  
11 stations to replace gas vehicle travel--miles  
12 traveled with electric vehicle miles traveled. A  
13 preliminary evaluation shows 1,500 potential  
14 locations in the unincorporated county where  
15 multiple chargers could be installed and reducing  
16 emissions from the County's vehicle fleets as  
17 operations allow.

18 This will be done by converting to  
19 cleaner fuels, including hybrid and electric. For  
20 vehicles that travel long distances or make  
21 frequent quick stops, the transition would be  
22 slower. This table summarizes the reductions  
23 related to fleet vehicle emissions.

24 Now, Mary Kopaskie-Brown will continue  
25 reviewing the measures and cost implementation

1 for the CAP.

2 MARY KOPASKIE-BROWN: Thank you, Rami.  
3 The solid waste measure would divert 75 percent  
4 of solid waste from landfills. This measure  
5 implements the county's strategic plan to reduce  
6 waste and increase waste diversion. This table  
7 summarizes the measures related to solid waste  
8 category that would result in over 5,700 metric  
9 tons of reductions.

10 The strategic plan to reduce waste set  
11 a goal to achieve 75 percent waste diversion by  
12 2025. Staff recommends including the supplemental  
13 EIR increase solid waste diversion alternative by  
14 continuing implementation along the diversion  
15 trajectory in the strategic plan and extend the  
16 goal to 80 percent waste diversion by 2030. This  
17 would increase the GHG reductions from 57,103 to  
18 79,052 metric tons.

19 The water consumption-related measures  
20 would result in 7.7 billion gallons of potable  
21 water being saved and include requiring water-  
22 efficient appliances and plumbing in new homes,  
23 reducing potable outdoor water use for homes  
24 through rain barrel incentives, and reducing  
25 potable water consumption in County facilities as

1 part of the County's strategic energy plans water  
2 use strategy. This table summarizes the measures  
3 related to water consumption that result in over  
4 17,000 metric tons of reductions.

5 The agriculture related measures would  
6 reduce over 12,000 metric tons of GHG and include  
7 converting farm equipment and stationary  
8 irrigation pumps to electric and increasing  
9 residential and county tree planting what will  
10 support carbon sequestration and carbon farming,  
11 which are themes that emerged as key priorities  
12 for stakeholders. This table summarizes the  
13 reductions related to agriculture.

14 Twenty-nine of the measures in the  
15 Climate Action Plan are specific programs and/or  
16 regulations. Measure T-4.1 establishes a local  
17 direct investment program that includes 51  
18 project methodologies that could reduce GHG in  
19 the unincorporated county. A preliminary  
20 assessment or survey of these project  
21 methodologies was completed. The survey included  
22 only those projects listed on one of the air  
23 resource board approved offset project  
24 registries, such as the American Carbon Registry,  
25 Climate Action Reserve, or Verified Carbon

1 Standard.

2           The County would develop and fund  
3 specific projects initiated locally. The County  
4 would invest its own funding and resources and  
5 identify grants and partnerships to achieve these  
6 reductions. Examples of projects could--that  
7 could be undertaken include weatherization of  
8 older buildings that target energy-efficiency  
9 improvements including insulation, air ceiling,  
10 and replacing appliances and central and heating  
11 cooling components, improving grassland  
12 management that includes changes to agricultural  
13 practices, grassland and rangeland restoration,  
14 soil carbon protection, and benefits from reduced  
15 erosion, and adopting alternative fertilizer and  
16 manure management that considers fertilizer type  
17 placement and timing of application.

18           Project methodologies can be scaled and  
19 implemented to meet the specific greenhouse gas  
20 emission reduction needs as the County implements  
21 the CAP to meet the 2030 reduction target. As an  
22 adaptive program, the local direct investment  
23 program would leverage and implement emerging  
24 technologies, identify partnerships that assist  
25 in reducing GHGs, respond to consumer habit

1 changes, and adjust to new legislation. The local  
2 direct investment program would be monitored  
3 yearly as part of the CAP monitoring process to  
4 ensure implementation of the project  
5 methodologies is achieving the GHG reductions.  
6 Once adopted, the local direct investment program  
7 will be enforceable and will commit the County to  
8 reduce GHG emissions.

9           Climate Action Plans for other  
10 California jurisdictions contain similar actions  
11 identified as part of the local direct investment  
12 program. However, none have grouped these  
13 projects into a single measure. For the program,  
14 staff will identify the projects to implement,  
15 timeframes, final cost estimates, and proposed  
16 funding sources. The program will be brought to  
17 the Board for consideration in 2020. This table  
18 summarizes the local direct investment program  
19 reductions in the CAP. Because the staff  
20 recommendation includes the supplemental EIR  
21 increased solid waste diversion alternative, the  
22 local direct investment GHG reductions would be  
23 153,511 metric tons.

24           Based on the 51 project methodologies  
25 identified in the preliminary assessment, staff

1 has prepared an example of how the local direct  
2 investment program could work. This example  
3 illustrates how the program could be developed  
4 and implemented and do not reflect the actual  
5 program. It focuses on some of the stakeholder  
6 comments received to prioritize project  
7 methodologies on environmental justice, including  
8 weatherization, carbon sequestration, and  
9 conversation of open space.

10 The example includes cumulative costs  
11 from 2021 to 2030 and shows how the project  
12 methodologies would be staggered in their  
13 implementation. This example shows the total GHG  
14 reductions needed would be 153,511 metric tons  
15 included in the staff recommendation, and 13  
16 project methodologies could achieve this  
17 reduction. The cumulative costs would be  
18 approximately \$51.6 million with an average  
19 annual cost of 5.1 million per year.

20 The County completed support studies  
21 for the Climate Action Plan, including an  
22 implementation cost study that detailed the cost  
23 to the County, a cost-effectiveness study,  
24 showing the cost to industry and residents, and  
25 the preliminary assessment of the local direct

1 investment program. The implementation cost study  
2 estimates the County costs over a six-year period  
3 and identifies potential budget impacts in the  
4 first years of implementation from fiscal year  
5 2017-'18 through fiscal year '22-'23.

6 The study quantifies costs at 236  
7 million over the six years, including staffing,  
8 capital costs, and operations and maintenance  
9 costs. The study found 94 percent, or 221  
10 million, are existing funded programs, such as  
11 installing photovoltaics, solid waste diversion,  
12 and reducing potable water at county facilities.  
13 Six percent, or 15 million are newer expanded  
14 unfunded programs, such as developing the  
15 renewable energy program.

16 The cost-effectiveness study provides  
17 estimated costs per measure to inform the County  
18 of its administrative and participation costs. It  
19 informs businesses and residence of potential  
20 impacts for their participation and identifies  
21 for each measure the cost to reduce one metric  
22 ton of greenhouse gas. It also estimates the cost  
23 for existing, new, and expanded programs at \$12  
24 per metric ton.

25 The analysis found that for new

1 residential development, the upfront costs to  
2 comply with the draft Final CAP valued in 2015  
3 dollars and discounted to present value and after  
4 applying incentives and rebates is \$15,381.

5 However, over the lifetime of the installation of  
6 these improvements, the net benefit, including  
7 the upfront cost, is \$5,728 per home. For new  
8 commercial development, the upfront cost to  
9 comply with new requirements is estimated at \$51  
10 per square foot. However, over the lifetime of  
11 the improvements, there is a net benefit of over  
12 \$20 per square foot.

13           The preliminary assessment of the local  
14 direct investment program includes a survey of  
15 the costs of local direct investment project  
16 methodologies and provides a range of high to--  
17 excuse me--low to high reductions and costs for  
18 each. The assessment shows that the range of cost  
19 to reduce 198,800 metric tons would range from a  
20 low of \$14 million to a high of \$55 million over  
21 the lifetime of the program.

22           Now, Darin Neufeld will walk you  
23 through the recommendations, options, and the  
24 CEQA review.

25           DARIN NEUFELD: Thank you, Mary. The

1 revised draft CAP presented today is responsive  
2 to many of the comments received from public.  
3 Based on this feedback, changes were made to the  
4 August 2017 draft CAP, including increasing the  
5 use of alternative fuels for construction  
6 projects in the unincorporated county from 10  
7 percent to 25 percent, increasing the local  
8 vehicle retirement program measure to retire  
9 1,600 vehicles rather than 800, increasing energy  
10 conservation at County facilities from 15 percent  
11 to 20 percent by 2030 and adding a new measure to  
12 install 2,040 electric vehicle charging stations  
13 in the unincorporated county.

14 Based on the input and revisions, the  
15 staff recommendation to the Board includes adopt  
16 the Climate Action Plan, including the  
17 supplemental EIR increased solid waste diversion  
18 alternative, which increases the diversion rate  
19 from 75 percent to 80 percent and a local direct  
20 investment program that reduces greenhouse gas  
21 emissions by 153,511 metric tons. The staff  
22 recommendation will result in 897,145 metric tons  
23 of GHG reductions.

24 Comments from the public cover topics  
25 such as improving energy efficiency and

1 generation of renewable electricity, increasing  
2 GHG reductions in the built environment and  
3 transportation category, identifying impacts for  
4 measures that go beyond State requirements,  
5 increasing the County's role as it relates to  
6 renewable energy, solid waste diversion, and  
7 other County initiatives and reducing potable  
8 water consumption, particularly from outdoor use.

9           The staff recommendation aligns with  
10 existing programs and anticipated State  
11 guidelines and relies on 90 percent renewable  
12 energy. This allows for future flexibility,  
13 recognizing the cost differential between 90  
14 percent and 100 percent renewable energy. It also  
15 balances costs across existing County programs  
16 that impact taxpayers, consumers, and businesses.

17           In addition to the staff  
18 recommendation, options were prepared in response  
19 to public comments. For the recommendation and  
20 all options, the measures are interrelated, and  
21 the reduction realized depends on the combination  
22 included. Changes to one measure will have an  
23 impact on other measures within the  
24 recommendation and that specific option. Like the  
25 recommendation, the options have been separately

1 modeled to show the reductions achieved by each  
2 measure to reach the \$897,145 metric tons of GHG  
3 reductions needed. Changes are captured with  
4 increases and decreases in the local direct  
5 investment program.

6 Option 1 is in response to comments  
7 related to increasing renewable energy and  
8 includes the staff recommendation adopting the  
9 supplemental EIR 100 percent renewable energy  
10 alternative and decreasing direct investments by  
11 53,317 metric tons.

12 The second option is in response to  
13 concerns related to potential increases to  
14 housing costs and include the staff  
15 recommendation removal of three measures or  
16 portions of measures that go beyond state  
17 requirements and effect new existing residential  
18 development, including Measure T-3.1; alternative  
19 fuel for construction equipment; Measure E-1.1,  
20 zero net energy for residential development; and  
21 Measure E-1.3 to improve building energy  
22 efficiency in existing development. This option  
23 would increase direct investments by 23,818  
24 metric tons.

25 The third option is in response to

1 concerns related to cost to housing affordability  
2 and new development and includes the staff  
3 recommendation removing in their entirety the  
4 three measures noted in Option 2 and removes two  
5 additional measures. These are Measure E-2.2,  
6 increase renewable energy in non-residential  
7 development, and Measure W-1.2 to reduce outdoor  
8 water use. This option would adopt the  
9 supplemental EIR 100 percent renewable energy  
10 alternative and would decrease direct investments  
11 by 12,666 metric tons.

12           The Planning Commission recommended  
13 Option 3 with one modification to Measure E-1.2,  
14 which is the use of alternatively-powdered water  
15 heaters in residential development. The Planning  
16 Commission recommended that this measure still be  
17 required for both new residential development and  
18 for water heater replacements in existing homes.  
19 However, for existing homeowners that meet  
20 certain income criteria, a program should be  
21 developed to help reduce the cost. The program,  
22 including a possible partnership with the Center  
23 for Sustainable Energy or the utility could  
24 include a rebate for households that meet a  
25 threshold set by the County.

1           Option 3 has been modified to adjust  
2 the renewable energy goal to 90 percent renewable  
3 electricity by 2030 while still addressing  
4 housing affordability and costs to development.  
5 Staff has recommended the 90 percent goal,  
6 because it provides greater flexibility in  
7 addressing the variables in the renewable energy  
8 program, such as exit fees, which will be studied  
9 as part of the comparative analysis.

10           Modified Option 3 includes the revised  
11 Climate Action Plan, the supplemental EIR 80  
12 percent increased solid waste diversion  
13 alternative, a local direct investment program of  
14 176,614 metric tons, 90 percent renewable energy  
15 by 2030 versus 100 percent renewable energy by  
16 2030, restoring Measure W-1.2, reducing outdoor  
17 water use, for a total of 26 measures.

18           And this option modifies two measures,  
19 Measure T-1.3, which is the acceleration of  
20 completion of 5 community plan updates so that 15  
21 community plans are updated and completed by  
22 2030, and Measure E-1.2, use alternatively-  
23 powered water heaters in residential development  
24 to incorporate incentives for existing homeowners  
25 replacing water heaters as recommended by the

1 Planning Commission.

2 The Climate Action Plan will be  
3 implemented and monitored over time. Existing  
4 programs, such as the tree planting program,  
5 conservation efforts, purchase of agricultural  
6 conservation easements, strategic energy plan,  
7 and strategic plan to reduce waste will continue  
8 or be expanded and monitored to ensure reductions  
9 in greenhouse gas emissions. New initiatives  
10 would be developed over the next two years,  
11 including a renewable energy program, a local  
12 direct investment program, and a new electric  
13 vehicle charging station pilot program.

14 New ordinances needed to implement the  
15 measures would also be prepared and adopted in  
16 the next two years. Staff would seek funding and  
17 identify potential partnerships for all of the  
18 measures in the CAP. Staff would return to the  
19 board for direction on all new projects,  
20 programs, and ordinances. Through annual  
21 monitoring, inventory updates every two years,  
22 and CAP updates every five years beginning in  
23 2025, the County would be able to adjust as  
24 needed.

25 Public review of the draft supplemental

1 EIR commenced on August 10th, 2017 and concluded  
2 on September 25th, 2017. A total of 148 comment  
3 letters were received. The draft supplemental EIR  
4 evaluated four project alternatives. These are  
5 the No Project Alternative, the Enhanced Direct  
6 Investment Program Alternative, the 100 Percent  
7 Renewable Energy Alternative, and the Increased  
8 Solid Waste Diversion Alternative. The CAP and  
9 supplemental EIR, have been updated to reflect  
10 the latest changes as a result of the CEQA public  
11 review process.

12 The project also includes guidelines  
13 for determining significance for climate change,  
14 a threshold of significance, and a CAP  
15 consistency review checklist to evaluate future  
16 development projects. The projects will require a  
17 statement of overriding considerations for the  
18 significant and unmitigated impacts as a result  
19 of the CAP. Despite these significant impacts,  
20 the CAP would provide a framework to reduce the  
21 County's greenhouse gas emissions, which would  
22 improve the quality of life and health for its  
23 residents, visitors, and employees.

24 I will now turn the presentation back  
25 to Mark Wardlaw

1                   MARK WARDLAW: Thank you, Darin. The  
2 Climate Action Plan presented today is a living  
3 document. It will be monitored on a yearly basis  
4 and can be responsive as part of our first update  
5 in 2025. It is practical, feasible, and  
6 diversified to reduce greenhouse gas emissions  
7 and considers input from stakeholders, such as  
8 taxpayers, the development community, residents,  
9 and environmental interests. County  
10 implementation costs and impacts have been  
11 assessed to maximize existing programs and to  
12 minimize new cost, and for new programs, costs  
13 have been identified where known.

14                   The Climate Action Plan and the  
15 Supplemental Environmental Impact Report before  
16 the Board today is achievable, enforceable, and  
17 measurable in its implementation. The Climate  
18 Action Plan implements the 2011 General Plan  
19 Update and the mitigation described therein.

20                   The Climate Action Plan is not a land  
21 use plan. It implements; it does not modify the  
22 general plan land use classification. Privately  
23 initiated general plan amendments that have been  
24 or will be submitted to the County are not  
25 included in the baseline inventory of the Climate

1 Action Plan. These General Plan amendment  
2 applications will be required to comply with CEQA  
3 and to mitigate their greenhouse gas impacts.

4           Regarding requests to grandfather  
5 General Plan amendments with vesting tentative  
6 maps, vesting protections already exist by State  
7 law in the Subdivision Map Act for approved  
8 vesting tentative maps. Including language in the  
9 Climate Action Plan does not provide any  
10 additional protection that is otherwise provided  
11 now by the state, but it would introduce a  
12 modification to a number of the interrelated  
13 documents included in the Climate Action Plan and  
14 would require time to prepare and identify the  
15 documents, and it raises the risk of  
16 recirculation. Staff does not recommend this  
17 addition to the Climate Action Plan.

18           General Plan amendments are evaluated  
19 in the supplemental EIR as required by CEQA,  
20 because they are current or reasonably  
21 foreseeable projects. General Plan amendments may  
22 be approved, approved with modifications, or  
23 denied by the Board when they come forward.

24           As included in your report on Page 15  
25 in Attachment G, if the Board were to select the

1 staff recommendation, the recommendation to the  
2 Board would be adopt the CEQA findings, including  
3 the significant effects of the project, the  
4 mitigation and monitoring program, and the  
5 statement of overriding considerations, the  
6 guidelines for determining significance for  
7 climate change, the greenhouse gas threshold of  
8 significance, the Climate Action Plan, and the  
9 Supplemental Environmental Impact Report  
10 increased solid waste diversion alternative, the  
11 Climate Action Plan consistency checklist, the  
12 report format and content requirements for  
13 climate change, the amendment to the General Plan  
14 environmental impact report mitigation measure,  
15 the open space conservation element amendment to  
16 the General Plan, and the resolution authorizing  
17 the chief administrative officer or designee to  
18 apply for and accept grant funding and to  
19 negotiate contracts to support implementation of  
20 the Climate Action Plan.

21 Any option that the Board wishes to  
22 approve must have been covered by the analysis in  
23 the Supplemental Environmental Impact Report and  
24 have findings documented and prepared for them.  
25 The staff recommendation options and the modified

1 option, and the Planning Commission  
2 recommendation have been analyzed, and the Board  
3 can act upon them today. Because the measures are  
4 interconnected and changes to one causes changes  
5 to others, adding or deleting reduction measures  
6 today will need to be evaluated to see how they  
7 might affect the overall ability of the Climate  
8 Action Plan to meet its reduction targets.

9 This concludes today's presentation,  
10 and staff is available to answer your questions.  
11 Thank you.

12 CHAIR KRISTIN GASPAR: Thank you, Mark.  
13 Excellent job.

14 MARK WARDLAW: Thank you.

15 CHAIR KRISTIN GASPAR: See, that was  
16 easy, right? Twenty slides and literally  
17 thousands of hours dumped into the development of  
18 this plan. So, whether you're here in support or  
19 opposition today on the CAP, I want to begin by  
20 just a round of applause for our staff for all of  
21 their efforts and the work that you did to get to  
22 this point today. Please join me.

23 Thank you for all of your work. We  
24 sincerely appreciate it, and we also appreciate  
25 your brief presentation, so we can move forward

1 with public comment, unless the Supervisors have  
2 additional questions to begin with.

3           Seeing none, let's call forward the  
4 public speakers. We appreciate your cooperation  
5 today, lining up in a nice orderly fashion to  
6 help move things forward. We'll get you in and  
7 out and on your way. Thank you.

8           ASSISTANT CLERK ANDREW POTTER: Thank  
9 you, Chairwoman Gaspar. There are 27 speakers and  
10 3 group presentations, 11 individuals in favor, 2  
11 group presentations in favor, 1 individual has  
12 expressed their support but does not need to  
13 address the Board, 16 individuals in opposition,  
14 1 group presentation in opposition, and 3  
15 individuals have expressed their opposition but  
16 do not need to address the Board.

17           I will first call forward the first  
18 group presentation in favor. That includes  
19 Reverend Gerald Brown, Haney Hong, and Ruben  
20 Guerra. You'll have ten minutes to address the  
21 Board. All three members of your group must  
22 provide testimony. Please self-regulate your time  
23 with the timer on the podium. And please begin by  
24 stating your name for the audio record.

25           HANEY HONG: Well, good morning there,

1 Charwoman Gaspar and members of the Board. I'm  
2 Haney Hong. I'm the President and CEO of the San  
3 Diego County Taxpayers Association. Thank you for  
4 the opportunity this morning to comment on the  
5 climate's--the County's Climate Action Plan.

6 Before I begin, let me echo Madam  
7 Chair, your comments about the staff and all the  
8 work that had to go into this. I just appreciate  
9 Director Wardlaw, how communicative you and your  
10 staff have been with me and other members of the  
11 coalition who we represent today, so thank you so  
12 much.

13 I'm speaking today on behalf of the  
14 Clear the Air Coalition, and joining me are my  
15 fellow co-chairs, better looking gentleman over  
16 here, Ruben Barrales, who is President of the  
17 Latino Leadership and Policy Forum, and Reverend  
18 Gerald Brown, Executive Director of the United  
19 African American Ministerial Action Council.

20 So, the Clear the Air Coalition is a  
21 diverse group of community business and civic  
22 leaders, and we're from throughout the San Diego  
23 region, and we form together to help achieve our  
24 climate action goals in a cost-effective manner--  
25 cost-effective.

1                   Now, we strongly support the County's  
2 efforts to reduce greenhouse gas emissions in a  
3 way that protects our local economy and local  
4 communities. Now, our coalition, we do not have a  
5 formal position on the proposed Climate Action  
6 Plan as a whole, but we do strongly support the  
7 staff's recommendation to conduct a thorough  
8 comparative analysis of options for achieving the  
9 County's renewable energy goals.

10                   The CAP's proposed three options for  
11 increasing the use of renewable energy, as  
12 briefed earlier by Director Wardlaw, expanded  
13 direct access, community choice aggregation, a  
14 partnership potentially with the utility should  
15 all be thoroughly studied in the months ahead, as  
16 they briefed, so that you can make an informed  
17 decision about which pathway is best for San  
18 Diego when it be--appears before you at a later  
19 date. I mean, it's surprising, right? The  
20 Taxpayers Association wants to dig into the  
21 numbers and wants to make sure that we look at  
22 this in a cost-effectiveness way.

23                   Now, speaking as that taxpayers'  
24 advocate, it's imperative that the County select  
25 an energy procurement model that meets the CAP's

1 environmental goals in that cost-effective  
2 manner, and we want to make the most efficient  
3 use of that limited kitty that we call the public  
4 treasury--our limited tax payer resources, and we  
5 want to get the best bang for buck. And that's  
6 why it's so important that we have that rigorous  
7 comparative analysis, and that's what will help  
8 ensure that this occurs.

9 So, let me invite Ruben to join me  
10 here.

11 RUBEN BARRALES: Thanks, Haney. Madam  
12 Chairwoman, members of the Board, and staff,  
13 thank you for allowing this time to go over some  
14 of the points that we want to emphasize.

15 As Haney mentioned, we think the  
16 comparative analysis is critical. It's important  
17 to get real environmental benefits and the real  
18 costs and risks to the County. To understand  
19 those thoroughly, a true apples-to-apples  
20 comparison needs to be done in terms of the three  
21 different options.

22 And we ask you to, please, also  
23 consider the changing the landscape, the evolving  
24 regulatory and legislative landscape that is  
25 going to put new demands and new mandates on the

1 utilities and others. And it will change the  
2 calculation in terms of the risks for the County  
3 and more importantly for the County taxpayers and  
4 rate payers. Exit fees, for example, that will be  
5 hopefully determined by the PUC later this year.  
6 There's pending legislation, again, that will  
7 impact many of the goals that we're trying to  
8 reach here and the mandates around them, again  
9 changing the risk calculation. So that  
10 comparative analysis needs to be thorough.

11 One for--one assumption, for example,  
12 in that comparative analysis, customer  
13 participation. So, the County, as I understand  
14 it, is anticipating about 80 percent customer  
15 utilization--eight out of ten customers utilizing  
16 the new program, opting in. Just so you know, the  
17 most--the first established CCA, Marin County,  
18 the participation rate for 80 or 100 percent  
19 renewable energy is 2.6 percent.

20 So, obviously, there are differences,  
21 but you really need to drill down and see what's  
22 the reality in terms of people opting into a more  
23 expensive program in terms of paying for their  
24 utilities. Are they going to do that in the 80  
25 percent numbers? Not sure. In Sonoma County, it's

1 just one-half of one percent participation by  
2 customers into the more expensive program.

3 So, again, need to look at those  
4 assumptions and make sure that we don't take on  
5 as San Diegans unnecessary risks and higher  
6 costs. And that's why we think that that  
7 comprehensive comparative analysis is so  
8 important.

9 Thank you for your time and thank you -  
10 - I want to thank staff for all the effort that  
11 they've put into this and thank you as a County.  
12 You're a leader, so we're proud as San Diegans  
13 that you're doing this and want to make sure it's  
14 done in a cost-effective way. Thank you.

15 REVEREND GERALD BROWN: Good morning,  
16 County Board of Supervisors and staff. My name is  
17 Reverend Gerald Brown. I have the privilege of  
18 serving as the Executive Director for the United  
19 African American Ministerial Action Council and  
20 as a co-chair of the Clean Air Coalition.

21 I'm also proud to be wearing my Love  
22 Your Heart button today. I just thought I'd  
23 mention it, because our Supervisor, Ron Roberts,  
24 is wearing it, and so I'll be looking around  
25 later on to make sure that everybody has it on.

1                   Like my colleagues, I believe reducing  
2 carbon emissions and creating a cleaner future is  
3 important to the communities we represent.  
4 Oftentimes, the communities my organization  
5 serves are the hardest hit by environmental  
6 challenges, like dirty air and unhealthy living  
7 conditions. But those aren't the only challenges  
8 we face. Many of my congregants are amongst the  
9 county's most economically vulnerable.

10                   It is, therefore, essential that we  
11 reduce emissions in a way that protects our  
12 economy, local jobs, and hardworking families.  
13 Determining the best path forward requires a  
14 comparative analysis of different options for  
15 increasing the use of renewable energy. This  
16 includes a true accounting of what these programs  
17 will cost and who will end up paying the tab and  
18 how much these programs will actually improve our  
19 local environment. Only then can we make an  
20 informed decision if the benefits are worth the  
21 risks as we work together to achieve our  
22 collective climate goals.

23                   We urge you to adopt staff's  
24 recommendation to conduct a thorough comparison  
25 analysis of the renewable energy options under

1 consideration and look forward to continuing our  
2 work with the County on this important endeavor.

3 We'd also like to submit a letter  
4 outlining the coalition's position into the  
5 record. Is that okay?

6 CHAIR KRISTIN GASPAR: You can hand it  
7 behind you to the Deputy Clerk. Thank you.

8 REVEREND GERALD BROWN: Thank you. I  
9 have 2 minutes and 51 seconds left.

10 CHAIR KRISTIN GASPAR: Do you want to  
11 sing?

12 REVEREND GERALD BROWN: I have one--I'm  
13 not going to sing, but I want to ask everyone to  
14 get their blood pressure done today.

15 MEMBER RON ROBERTS: All right. I--

16 CHAIR KRISTIN GASPAR: That's a good  
17 PSA.

18 MEMBER RON ROBERTS: Could I--it's not  
19 clear to me, and maybe, Haney, is there one of  
20 these one of these options that you're  
21 recommending at the end of all this?

22 HANEY HONG: So, the concern that I have  
23 with respect with the 90 versus 100 percent goal  
24 is that the key thing that I would offer for your  
25 consideration, when we think about the potential

1 risks that we might put on taxpayers with that  
2 marginal cost of trying to set a goal from 90 to  
3 100 percent, that is something that we cannot  
4 account for today. And I think it's very  
5 important that we do not sign up for a risk that  
6 we don't know how to quantify that. So, from a  
7 Taxpayers Association standpoint, those options  
8 that have--that include 90 percent renewable is  
9 what's key.

10 CHAIR KRISTIN GASPAR: Thank you very  
11 much.

12 HANEY HONG: Thank you.

13 CHAIR KRISTIN GASPAR: It appears we're  
14 out of time for the reverend to sing, but maybe  
15 next time.

16 HANEY HONG: Would you like me to sing?  
17 Just kidding.

18 CHAIR KRISTIN GASPAR: No, we didn't  
19 invite you. There's no mention of that. Thank  
20 you.

21 MEMBER RON ROBERTS: I want to thank  
22 Reverend Brown for his commercial on--this is  
23 Love Your Heart Day, and we're offering free  
24 blood pressure screenings all over San Diego  
25 County, and it reduces greenhouse gas. If people

1 take care of these problems, we don't have to  
2 rush them to a hospital later, so we want to get  
3 everybody healthy, and it helps us clean up the  
4 air. Thank you, Reverend Brown.

5 ASSISTANT CLERK ANDREW POTTER: I'll  
6 call forward the next group presentation in  
7 favor, Chris Fahey, Jim Waylon, and Gregg  
8 Haggart.

9 JIM WAYLON: Good morning, Chairman  
10 Gaspar, members of the Board of Supervisors.  
11 How's everybody today? Here after--this is--  
12 actually, we're going to try to take five  
13 minutes.

14 ASSISTANT CLERK ANDREW POTTER: I'm  
15 going to pause your time for just a remind folks  
16 to state their name for the audio record.

17 MR. JIM WAYLON: I will. It's Jim  
18 Waylon, J Waylon & Associates, 1660 Hotel Circle,  
19 North San Diego.

20 Like I said at the Planning Commission,  
21 staff deserves all the praise that they've been  
22 getting, because this, to me, is almost as  
23 significant as the MSCP was. When I think of its  
24 effect on the property owners in the county, this  
25 is number two, and it's probably a close number

1 two.

2 I'm going to go first, and then I'm  
3 going to introduce both Chris Fahey and Gregg  
4 Haggart. They're the CEOs respectively of the  
5 Haagen Companies and the Gildred Companies.  
6 They're local businesses who have made  
7 significant investments in renewable energy, and  
8 they're going to tell you why we think what  
9 you're doing is a good idea.

10 Number one, obviously, the County needs  
11 to finish the CAP. We're under the gun, and  
12 nobody likes that, but it's the reality we're in.  
13 We're going to recommend you proceed with Option  
14 3. In some ways simply because of the optics, it  
15 doesn't really matter between 90 and 100 percent  
16 effectively, but if I'm a crabby judge, I'm going  
17 to be looking at 100 percent a lot more than--  
18 favorably than I would 90 percent, because 100  
19 percent, what more can you do? It's all of the  
20 power.

21 I would expect litigation no matter  
22 what you do. It's probable, but there's nothing  
23 more substantial than saying, "We're going to  
24 provide all of our power to the unincorporated  
25 communities this way." I mean, what can they say?

1           And by the way, to Supervisor Horn, you  
2     made a comment earlier in the week about, "I  
3     don't want to get in the energy business." You're  
4     already in it, and the reason I say that is  
5     because you direct access today to acquire I  
6     think about 15 megawatts of power. Don't forget  
7     that purchasing power is significant. It gives  
8     you the opportunity, perhaps, to even make this  
9     pay for itself by deploying your buying power.

10           I also want to point out that it's  
11    obvious from the staff report that renewables get  
12    you over a third of the way to the targets.  
13    That's a big deal. That's more than anything  
14    else. And it's just--I won't call it low-hanging  
15    fruit, but it's there.

16           What are the benefits of doing this?  
17    First, it's using your buying power to make it  
18    cheaper. Second thing is by using the County's  
19    land use authority to facilitate commercial-scale  
20    renewable energy, that counts for the CAP. You  
21    don't have to do this. You don't have to provide  
22    a permitting process to get to renewable energy  
23    at a commercial scale, but you did. That counts,  
24    and it counts for something.

25           Next things, and specifically to

1 Supervisor Jacob and Supervisor Horn's districts,  
2 those areas could use local jobs. They could use  
3 local business benefits, and we could use some  
4 local tax revenues to get things going out there.  
5 And I would ask our union friends if we do  
6 proceed as we're proposing, I would like to see  
7 hiring halls and training out in the back  
8 country, so people who live there can avail  
9 themselves of these jobs. They're not many, but  
10 they're there.

11           And the last thing is community  
12 benefits, and not everybody is as enthusiastic  
13 about wind and solar as I am. Not everybody  
14 thinks they're an elegant feature on the  
15 landscape. I do. But it would be good if we  
16 proceed to provide a mechanism to take advantage  
17 of the County's buying power to also bring some  
18 benefits to the communities, who are undergoing  
19 the deployment of renewable energy at this scale.  
20 And if it works as might be possible, you might  
21 even be able to bring some finite community  
22 benefits like resource centers and other benefits  
23 for people who live out there.

24           And with that, I'll stop, and we can  
25 live with the modified option 3, but, as a

1 practical matter, there's not much difference  
2 between 90 and 100. But I really want to praise  
3 staff and the Board for grappling with this thing  
4 in face of what's probably going to be  
5 unreasonable opposition. And thank you so much  
6 for your time.

7 CHRISTOPHER FAHEY: Good morning,  
8 Chairwoman Gaspar, Board members. My name is  
9 Christopher Fahey. I'm President of the Haagen  
10 Company. I'm here representing the ownership of  
11 the Empire Ranch property, which is 4,000 acres  
12 of land just south of Boulevard, and we've been  
13 involved working with Jim Waylon, you know, on  
14 the renewable energy program and are here to  
15 support the Option 3. I did--I want to repeat  
16 Jim's, you know, comment about the--we're--we  
17 could live with the 90 percent. Think the 100  
18 percent optics are better. But either option,  
19 depending on how the county goes, either way it  
20 doesn't necessarily affect my position and our  
21 involvement in the process.

22 The Haagen family has owned the Empire  
23 Ranch for--you know, or been involved in it for  
24 almost 50 years, so they've been very involved in  
25 the back country, very involved in what's going

1 on out there, and we want to continue to be  
2 involved. We're currently in the process of  
3 working through the State system on checking out  
4 the availability of the connections for a  
5 potential 80-megawatt solar project, and we've  
6 passed our first step with the State agency and  
7 are continuing and have committed to proceed with  
8 it further.

9 One of our other commitments--one of  
10 the things I want to emphasize on this is that we  
11 are committed to involving and assisting the  
12 local communities to receive some benefit from  
13 these programs, not that just people come in and  
14 put a lot of trucks and dust and debris in their  
15 communities and then move on. We're committed  
16 long-term, obviously. The Hagen family's been in  
17 this property long term.

18 The--as Jim mentioned, the renewable  
19 energy line item of your CAP program is the  
20 single largest potential resource for achieving  
21 the goals of the CAP program. And if you'll look  
22 at that list, a lot of the list on your options,  
23 this is one of the few that doesn't necessarily  
24 have to require out-of-pocket monies from the  
25 County or the taxpayers. This is something that

1 developers, commercial developers will produce,  
2 are happy to produce and will get involved with  
3 the County's buying program and involvement. We  
4 think we can actually--you know, or we're  
5 assuming we can actually assist in the energy  
6 costs and availability for the local community.

7 And with that, I'll just finish up, say  
8 that, again, Option 3 gains our support, as a  
9 property owner in the back country and the  
10 district in San Diego. Thank you

11 GREGG HAGGART: Chairwoman Gaspar and  
12 Supervisors, my name is Greg Haggart. I'm the CEO  
13 of the Gildred Companies. I represent the Gildred  
14 family, who's had offices downtown San Diego  
15 since 1928.

16 I just want to give you a, in support  
17 of the Climate Action Plan and Option 3, I just  
18 want to give you a real-world example of how this  
19 is within your grasp. You can do this. We have--  
20 the Gildred family owns a 50-megawatt solar  
21 project that is fully permitted. We received our  
22 MUP. It's out by Acacia Wells. It's scheduled for  
23 commercial operations next year. Fifty megawatts  
24 delivers power to about 17,000 homes to put that  
25 in perspective.

1           There is a way to do this. You can buy  
2 power from a local entity in your county. You can  
3 get credit for it through your land use  
4 authority.

5           That's all I want to say. Thank you  
6 very much. We'd love to be able to do that.

7           CHAIR KRISTIN GASPAR: Thank you.  
8 Appreciate your presentation.

9           ASSISTANT CLERK ANDREW POTTER: Next,  
10 I'd like to call for the individual speakers in  
11 favor. I'll call for the first five. Frank  
12 Urtasun, Melanie Cohn, Eric Larson, Sophie  
13 Barnhorst, and Ally Barreter. You'll have two  
14 minutes to address the Board. Please begin by  
15 stating your name for the audio record.

16           FRANK URTASUN: Good morning, Madam  
17 Chair, members of the Board. I'm Frank Urtasun,  
18 representing Sempra Services. Let me first start  
19 off by applauding the county for its establish an  
20 updated Climate Action Plan. We also appreciate  
21 the opportunity to share our insights with San  
22 Diego and with San Diego County and other  
23 municipalities on ways to best achieve greenhouse  
24 gas reductions.

25           Over the past year or so, we have been

1 working with County staff on how best to  
2 establish a County Climate Action Plan that is  
3 real, cost-effective, and capitalizes on the  
4 greenhouse gas reductions advancements that our  
5 region has made to date.

6 I'm happy to report staff has been  
7 great to work with. As we have informed staff, we  
8 believe there are significant opportunities that  
9 have yet to be identified in this--in--for San  
10 Diego County to achieve cost-effective GHG  
11 emission reductions in the transportation sector.  
12 We also, however, understand that there will be  
13 opportunities to revisit this as you embark on  
14 the implementation phase.

15 More specifically, we believe that the  
16 vast majority of the vehicle trips that begin in  
17 one city in San Diego County end in another city  
18 within the county. This puts San Diego County in  
19 a unique position to promote and help fund  
20 alternative fuel vehicle programs that will lead  
21 to greater adoption of these vehicles.

22 Also, San Diego County has a unique  
23 ability to identify barriers to entry for  
24 alternative fuel vehicles. And having identified  
25 why more citizens are not using alternative fuel

1 vehicles to promote their use by placing more  
2 electric vehicle charging facilities along  
3 frequently travelled routes, incentivizing people  
4 to buy electric vehicles, and coordinating a  
5 regional strategy with cities throughout the  
6 county.

7 As for the energy sector, we applaud--  
8 we support staff's recommendation for a  
9 comparative analysis--

10 CHAIR KRISTIN GASPAR: Thank you.

11 FRANK URTASUN: --in how best to pursue  
12 the emissions targeted under the renewable energy  
13 strategy. Thank you for the opportunity to  
14 address you.

15 CHAIR KRISTIN GASPAR: Thank you. Next  
16 speaker, please.

17 MELANIE COHN: Good morning, Board  
18 members, I'm Melanie Cohn, Director of Regional  
19 Policy and Government Affairs at Biocom. I just  
20 wanted to say that we also support all the work  
21 that staff has done on the Climate Action Plan,  
22 and we have supported regional Climate Action  
23 Plans to reduce greenhouse gas emissions for the  
24 health of our communities.

25 We just ask that any potential

1 regulations that are enacted regarding the  
2 Climate Action Plan are weighed with what the  
3 cost to businesses will be in the region. We  
4 support full cost benefit analysis of all aspects  
5 of the plan, especially related to energy  
6 procurement and the three options included.

7 Thanks so much.

8 CHAIR KRISTIN GASPAR: Thank you. Next  
9 speaker, please.

10 SOPHIE BARNHORST: Good morning,  
11 Chairwoman Gaspar and Supervisors. My name is  
12 Sophie Barnhorst, and I'm here on behalf of the  
13 San Diego Regional Chamber of Commerce,  
14 representing over 2,500 members and around  
15 300,000 jobs. I first would like to quickly thank  
16 staff for all the outreach you've done to our  
17 organization and making sure to include us in  
18 this process. Thank you.

19 While the Chamber doesn't have an  
20 official position on the entire plan itself, I'm  
21 here today to express the Chamber's support for  
22 the energy portion of the CAP. The Chamber shares  
23 the County's goals to reduce greenhouse gas  
24 emissions in our atmosphere and greatly  
25 appreciates your efforts to do so in a way that

1 also benefits our local economy and the many  
2 small businesses that call San Diego home.  
3 Specifically related to the energy component of  
4 the CAP, we recognize that embarking on a program  
5 to reach our renewable energy goals is a  
6 significant decision with long-lasting impacts.

7 We understand that the Board of  
8 Supervisors will consider this decision in  
9 approximately 18 months, and it's critical you  
10 approach this decision with full understanding of  
11 the facts. What will the various cost options be?  
12 How much will each contribute to local greenhouse  
13 gas reductions? What are the true risks and  
14 benefits?

15 This is why we strongly support staff's  
16 recommendation to the County to conduct a  
17 thorough comparative analysis of the three  
18 proposed renewable energy pathways before  
19 selecting a desired approach. Only after such a  
20 thorough apples-to-apples comparison is done can  
21 the County make an informed decision about our  
22 renewable energy features that accomplishes our  
23 shared goals of improving both our environment  
24 and our economy. Thank you for your and  
25 consideration.

1 CHAIR KRISTIN GASPAR: Thank you. Next  
2 speaker, please.

3 ASSISTANT CLERK ANDREW POTTER: As the  
4 next speaker is approaching, I'd like to call for  
5 the remaining speakers in favor, Jeffrey Forrest,  
6 Richard Reinert, Matt Adams, Mike Nagi, Nicola  
7 Hedge, and Carla Farley.

8 ERIC LARSON: Chair Gaspar, members of  
9 the Board, I'm Eric Larson, executive director of  
10 the San Diego County Farm Bureau. We, too, would  
11 like to thank you and staff for what we've found  
12 to be a very inclusive process so far in reaching  
13 this recommendation that's before you.

14 With only five percent of greenhouse  
15 gas emissions attributed locally that farming, to  
16 proposed programs in the recommendation before  
17 you, we think is very appropriate for  
18 agriculture. That said, we believe local farms  
19 have immense capacity to help with the County's  
20 greenhouse gas reduction efforts. Let me give you  
21 three examples of items that are mentioned in the  
22 Climate Action Plan but not fully vetted and not  
23 fully taken advantage of agriculture.

24 First, composted municipal organic  
25 waste can be applied to rangeland, and we have

1 nearly 200,000 acres of rangeland in San Diego  
2 County. This results in improved soil moisture  
3 retention, additional forage production with a net  
4 result of increased carbon sequestration in the  
5 soil. And our experiments going on this here  
6 locally and in the state and it should be  
7 followed.

8           Second, agricultural crops in San Diego  
9 County are currently irrigated with potable  
10 water. Conversion of agriculture to recycled  
11 water would have considerable amounts--safe  
12 considerable amounts of potable water, and that  
13 water then could be moved to the urban uses.

14           Third, it's well documented that trees  
15 provide significant capacity for carbon  
16 sequestration. In fact, the plan before you calls  
17 for planting 180,000 trees. Over the past decade,  
18 farmers in San Diego County have removed over 1  
19 million trees. Due in large part to the high  
20 price of water, we can make a combination with  
21 the recycled water and the price of water. I  
22 think it creates a win-win for everybody and  
23 helps with carbon sequestration.

24           The common term for using farms as a  
25 means of reducing greenhouse gas emissions is

1 called carbon farming, a term I hope you're  
2 getting used to. I'd like to leave you with the  
3 idea that a carbon farming task force could lead  
4 to programs and techniques that significantly  
5 reduce greenhouse gas emissions in the County and  
6 assist with agricultural success. We hope you  
7 would endorse the concept and the County's  
8 participation in a carbon farming task force as  
9 part of your implementation plan. Thank you.

10 CHAIR KRISTIN GASPAR: Next speaker,  
11 please.

12 MIKE NAGY: Hi. Good morning, everybody.  
13 Good morning, Chair Gaspar, members of the Board.  
14 My name is Mike Nagy. I'm Public Affairs Manager  
15 for the San Diego County Apartment Association.  
16 We represent approximately 2400 members, and own  
17 and manage over 150,000 rental units in the  
18 region.

19 First, we would like to also echo the  
20 thanks and appreciation for County staff reaching  
21 out to us for addressing our many concerns and  
22 answering all of our questions.

23 The climate action that you consider  
24 before you today, please keep in mind that  
25 California and the San Diego region is in a major

1 housing affordability crisis. And so, when you're  
2 looking at considering reducing greenhouse gases,  
3 also please think of the many San Diegans that  
4 cannot afford to buy or rent in the region.  
5 Because we think that if we don't--if we adopt  
6 climate action plan that will be too--that create  
7 too onerous level of regulations or increase the  
8 cost of housing, then this exercise will be for  
9 nothing.

10 So, in terms of weighing all the  
11 separate options, we agree that the final Climate  
12 Action Plan, Option 3, we can also--I think we  
13 can probably also go with the modified--the 3-B  
14 option as well. I think we can support that.  
15 Anything that's going to--that meets the balance  
16 of both housing and the environment, I think we  
17 can support those policies that will promote  
18 that.

19 In consideration to--my original  
20 comments were going to be regarding to  
21 modification of E-1.2. Anything regarding  
22 creating some type of lower income program that  
23 provides assistance for smaller property owners  
24 to defray the costs, we would certainly  
25 appreciate that. Sixty-six percent of our members

1 are small, independent rental owners, so we hope  
2 that you can adopt Option 3 today and/or the  
3 modified 3-B version. Thank you.

4 CHAIR KRISTIN GASPAR: Thank you. Next  
5 speaker, please. You all are doing so well  
6 complying with the time. Thank you for that.  
7 Don't mess it up.

8 RICHARD RISNER: Yeah. Thanks. Good  
9 morning, all. And Happy Valentine's Day to the  
10 Board and all the staff. So, I really wanted to  
11 say that first.

12 My name is Richard Risner. I'm here  
13 representing the San Diego Chapter of the  
14 American Society of Landscape Architects. We're  
15 in support of this.

16 First, I'd like to say we're a diverse  
17 group of individuals that can help you achieve  
18 your Climate Action Plan, many of the goals  
19 within your Climate Action Plan. You know, we  
20 abide by many of the USGBC guidelines,  
21 specifically the Sustainable Sites Initiatives,  
22 which I think is something that's imperative for  
23 environmental resiliency.

24 Finally, I want to applaud you for  
25 being flexible and having this be a living

1 document that actually can adapt to technology  
2 and science as our environment changes. So, we're  
3 in favor of this. Thank you very much.

4 CHAIR KRISTIN GASPAR: Thank you.

5 RICHARD RISNER: Thank you.

6 CHAIR KRISTIN GASPAR: Next speaker,  
7 please.

8 JEFF FORREST: Good morning. My name is  
9 Jeff Forrest, Land Use attorney at Sheppard,  
10 Mullin, Richter & Hampton. I'm here today  
11 representing NAAOP and its 650 member companies  
12 who are on the leading edge of supplying high-  
13 quality mixed-use housing and creating new  
14 housing supply here in the County.

15 Attorneys are not known for their  
16 brevity, but I will try to keep this under two  
17 minutes. I want to thank the Board for its  
18 recognition that the San Diego region really is  
19 in a housing crisis, and we need to get new  
20 housing supply out there. To do that, we need a  
21 certain amount of stability in the rules, the GHG  
22 rules, that are applying to projects,  
23 particularly projects that are already in the  
24 regulatory pipeline. Some of them even go to the  
25 point where they have a vested right from the

1 State, through the Subdivision Map Act, and not  
2 have the rules constantly changing on them.

3 What we heard in the staff presentation  
4 was that, in fact, the staff has no intention of  
5 applying the cap to vested rights projects, and  
6 so that was good news for our member companies to  
7 hear.

8 I think there may be a little bit of  
9 confusion though as to what we mean by vested  
10 rights. Is it project that have approved  
11 tentative maps, or are we talking about projects  
12 that have a deemed-complete application for a  
13 vesting tentative map? And it's the latter is the  
14 one that we really see as being critical to the  
15 projects that are in the pipeline.

16 The County, back in 2003, actually  
17 adopted a pipeline policy. And I'll go ahead and  
18 pass this out. The pipeline policy was the same  
19 situation we are in now, where you had projects  
20 you were working on the General Plan Update and  
21 you had projects that were already in the  
22 pipeline. And you needed to figure out do those  
23 projects have to follow the new General Plan  
24 rules that were still being shaped, or do they  
25 follow the old rules? And the determination was

1 made that it was really dependent upon when those  
2 projects had filed their applications.

3 So, we just want to be clear that we  
4 think it's the application date, and if staff  
5 wants to provide that clarification, then maybe  
6 we don't need an amendment. But if they can't  
7 provide that clarification, then we probably do  
8 need to move forward with an amendment.

9 CHAIR KRISTIN GASPAR: Thank you. Next  
10 speaker, please.

11 SUPERVISOR BILL HORN: Is it possible  
12 maybe for staff to help us with that question?

13 MARK WARDLAW: May I answer that?

14 CHAIR KRISTIN GASPAR: Sure. Absolutely.  
15 Staff?

16 MARK WARDLAW: Through the Chair, the  
17 rules establishing vesting rights in the state of  
18 California are applied to the adoption of a  
19 development agreement, the construction of a  
20 project that has been approved, and then also  
21 through a vesting tentative map. So, the  
22 traditional definition of vested rights is that  
23 the application that has been approved vests its  
24 rights under those three conditions. And vesting  
25 tentative map, we have two right now in process,

1 that are General Plan Amendments. And so as a  
2 General Plan Amendment project, those  
3 applications are proceeding separately and  
4 independently.

5 And so, the Climate Action Plan doesn't  
6 include vesting provisions because it's not a  
7 land use document. In terms of permitting and  
8 then additional CEQA factors, I'll ask Bill Witt,  
9 with County Counsel, to address.

10 BILL WITT: We wouldn't recommend adding  
11 anything to the Climate Action Plan related to  
12 vesting rights, under the vesting tentative map  
13 requirements, the Subdivision Map Act or under  
14 existing law already provides requirements  
15 related to vesting tentative maps, and that would  
16 not change, whether or not this was added to the  
17 Climate Action Plan.

18 In addition, this potential change  
19 would have cascading effects throughout the  
20 document at this late stage. So, it would not  
21 only be in the CAP guidelines, but it potentially  
22 would affect the EIR and the findings.

23 CHAIR KRISTIN GASPAR: Does that satisfy  
24 the question?

25 SUPERVISOR BILL HORN: It does. The

1 question I have is, if they file litigation--I'm  
2 talking about the two projects we have in the  
3 pipeline right now--if they file--if opposition  
4 files litigation here, does it--what does it do  
5 to the effect of those GPAs to process?

6 CLAUDIA SILVA: It will depend on the  
7 nature of the litigation and the scope of their  
8 request. It would be very fact-specific. And to  
9 the extent any specific projects are identified,  
10 they would need to have an opportunity to also  
11 voice their position.

12 SUPERVISOR BILL HORN: So, as long as  
13 they came up with an analysis that it was zero  
14 emissions, would they be able to proceed?

15 CLAUDIA SILVA: Zero net emissions  
16 provisions are an ability of General Plan  
17 amendments to not have any emissions that are  
18 beyond the General Plan Update and what's already  
19 analyzed. Whether or not a court would include  
20 them in any scope of relief would be yet to be  
21 determined. But that would--that issue would  
22 remain, regardless of the language being  
23 proposed.

24 SUPERVISOR BILL HORN: Okay. Well, we're  
25 only talking about two that are active right now,

1 right? So, that's my concern. All right. Thank  
2 you very much. Thank you sir.

3 CHAIR KRISTIN GASPAR: Thank you. Sorry.  
4 Welcome to our next speaker.

5 NICOLA HEDGE: Hi. Good morning. Nicola  
6 Hedge with--the Director of Environment  
7 Initiatives at the San Diego Foundation. Thank  
8 you for the opportunity to share some comments.

9 While we don't have a formal position  
10 in opposition or support of the Climate Action  
11 Plan, as our region's largest community  
12 foundation, the San Diego Foundation encourages,  
13 supports and facilitates action on challenges and  
14 opportunities that affect the quality of life of  
15 each of our region's diverse communities,  
16 including climate change.

17 Since 2007, we've partnered with public  
18 agencies, all 18 cities in the region, including  
19 the County, to catalyze greater regional action.  
20 The current efforts of the County to adopt and  
21 ambitious Climate Action Plan are a critical next  
22 step to help our region meet our goals. And this  
23 Climate Action Plan will help to bring the County  
24 into line with other local government peers into  
25 the region, including 17 of the 18 cities which

1 have already adopted, or are also working on a  
2 Climate Action Plan. And it could help to advance  
3 the County's Live Well and General Plan goals.

4 We also know from our work to get  
5 shared vision for the future of the region that  
6 San Diegans want a future with more compact  
7 growth, vibrant community centers, convenient  
8 transportation options, and protected natural  
9 lands. And consistent annual polls of San Diego  
10 regional residents by our partners, more than  
11 eight in 10 San Diegans believe climate change is  
12 happening.

13 As such, while again we don't have a  
14 formal position, we strongly encourage the county  
15 to ensure that the climate plan achieves the  
16 following: Helps to limit the type of sprawl  
17 development that could increase greenhouse gas  
18 emissions and exacerbates risks from climate  
19 change, which scientists have detailed we will  
20 increasingly face, including drought and  
21 wildfire; that it's in line with regional efforts  
22 to reduce regional VMTs, especially from  
23 transportation; ensures open space is protected  
24 and seizes opportunities to incorporate  
25 innovations around renewable energy and carbon

1 farming.

2 It's critical that the County take  
3 action today, not just for today's generations,  
4 but also for future generations. Thank you.

5 CHAIR KRISTIN GASPAR: Thank you. Next  
6 speaker, please.

7 CARLA FARLEY: Good morning, Chairwoman  
8 Gaspar and the rest of our Board, County  
9 Supervisors. My name is Carla Farley. I'm the  
10 Vice President of the Greater San Diego  
11 Association of Realtors, which is our largest  
12 trade association here in San Diego, with over  
13 14,000 primary members, and just grown over  
14 20,000 collective members, and growing every day.

15 SDAR does share in the County's  
16 commitment to establish a sustainable and vibrant  
17 region, and we stand ready to support a plan that  
18 will accomplish our environmental goals. But we  
19 want to make sure that it's not imposing new  
20 burdens on our future and existing homeowners.

21 On behalf of the Association, I would  
22 like to thank our County staff, who worked with  
23 us a little earlier in this process to identify  
24 and eliminate some of the harmful provisions that  
25 would have unnecessarily increased housing costs,

1 and imposed a great deal of uncertainty on our  
2 industry.

3 Any decisions made today should take  
4 into consideration the impact the proposal will  
5 have on our housing supply and ultimately the  
6 cost of living here in San Diego.

7 We're building only at 50 percent of  
8 housing needs for our region today, which means  
9 the dream of homeownership is rapidly slipping  
10 away. San Diegans are forced to look elsewhere,  
11 drive long commutes, or worse, end up living on  
12 the streets. And we already know that that's a  
13 growing concern here in San Diego.

14 More than 40 percent of homeowners and  
15 60 percent of renters are now paying more than 30  
16 percent of their income on housing cost. These  
17 conditions are unsustainable. Unfortunately, our  
18 housing crisis will not be going away anytime  
19 soon.

20 While we appreciate the direction of  
21 Option 3, which aims to eliminate some of the  
22 more harmful and costly provisions of home  
23 owners, we urge our leaders here today to commit  
24 to opposing the costly mandates on housing and  
25 homeowners that would only perpetuate further

1 cost increases. Any requirements on homeowners  
2 should also be supported by incentives to comply.

3 CHAIR KRISTIN GASPAR: Thank you.

4 CARLA FARLEY: Thank you.

5 CHAIR KRISTIN GASPAR: Next speaker,  
6 please.

7 ANDREW POTTER: As the speaker is  
8 approaching the podium, I'd like to do a final  
9 call for [UNINTEL PHRASE].

10 MATTHEW ADAMS: Good morning. Matthew  
11 Adams with the Building Industry Association,  
12 producers of the most energy and water-efficient  
13 buildings in the world. And we're here today to  
14 speak on the Climate Action Plan.

15 I'd like to start first by recognizing  
16 the outreach by your staff, to the BIA, and other  
17 members of the regulated community. It was very  
18 extensive. It was very collaborative. And that  
19 kind of outreach is very much appreciated and I  
20 wanted to recognize your staff for those efforts.

21 Mark Wardlaw and his team, Michael de  
22 la Rosa, they were there all the time. And they  
23 didn't always tell us what we wanted to hear, but  
24 they always told us what we needed to hear, and  
25 that's very important.

1                   We're here today in support of Option 3  
2 because we all understand that the State has made  
3 climate change and greenhouse gas reductions its  
4 singular top priority. So, we need this  
5 collaborative process to hit these marks that  
6 have come down from the State. And we believe  
7 Option 3 puts you on the path to achieve those  
8 targets, which is why we stand before you.

9                   I know there's some discussions on a  
10 modified Option 3, which will deal with some  
11 water issues. Some things to keep in mind that if  
12 you have to do the water reductions, you also  
13 have that two-tree mandate, which is kind of in  
14 conflict with that reduction.

15                   And we'd also ask that you consider  
16 looking at opening the special landscape area,  
17 because you have areas because of biofiltration  
18 systems and slopes and the like, they need  
19 different kinds of plants. They need moderate  
20 water use plants, so have the deeper roots so the  
21 slopes stay in there. And you need certain plants  
22 in the biofiltration systems to keep them  
23 functioning. If you're reducing too much water to  
24 them, that will run into a problem.

25                   The special landscape areas, a

1 methodology by which you can figure out which  
2 ones you can remove from your water calculation  
3 to make it more palatable.

4 So, I thank you for that, and I  
5 absolutely agree with the issues on the vesting  
6 tentative maps as well. Thank you.

7 CHAIR KRISTIN GASPAR: Thank you.

8 ANDREW POTTER: Next I'd like to call  
9 forward the group presentation in opposition.  
10 David Engle, Linda Pratt and Bob Leter. You'll  
11 have 10 minutes to address the Board. All three  
12 members of your group must provide testimony.  
13 Please self-regulate your time with the timer on  
14 the podium, and begin by stating your name for  
15 the audio record.

16 DAVID ENGLE: Good morning. My name is  
17 David Engle. I reside in Del Mar, California. I'm  
18 a cofounder of Stay Cool for Grandkids, an all-  
19 volunteer San Diego nonprofit.

20 Stay Cool educates grandparents about  
21 the risk global warming poses to our grandkids.  
22 Our mission is to protect grandkids from the  
23 worst effects of climate change by encouraging  
24 policies that reduce emissions. I speak on behalf  
25 of our 275 members and their grandchildren. We

1 oppose adoption of the County's draft Climate  
2 Action Plan as currently written.

3           The science of global warming is clear.  
4 The atmospheric level of carbon dioxide, the  
5 primary cause of warming, has been rising  
6 steadily the 1950s. Unfortunately, CO2 is a very  
7 stable molecule that lasts a century or more.  
8 That means that each pound of CO2 we add to the  
9 air now will still be there when our grandkids  
10 are adults. And each additional pound of CO2  
11 contributes to more solar heat trapped in our  
12 atmosphere.

13           Climate scientists have warned us we  
14 are approaching the tipping point of CO2  
15 concentration that will guarantee dangerous and  
16 irreversible global warming. Unless we quickly  
17 reduce emissions, that tipping point will be  
18 exceeded in a decade or less. That is why strong,  
19 effective climate action plans by communities are  
20 important.

21           Stay Cool appreciates the County has  
22 drafted a Climate Action Plan, but we are  
23 disappointed in the implementation details, which  
24 we think are vague and likely to be ineffective.  
25 As the County's highest elected officials, you

1 have a duty to craft plans that serve the  
2 interests not only of today's adults but also the  
3 wellbeing of tomorrow's adults.

4 Perhaps some of you don't take the  
5 threats of global warming seriously and have  
6 wondered what's the hurry? Believe me, there is  
7 no time to waste.

8 I beseech you for the future of my  
9 granddaughter, Violet, and all the grandkids of  
10 San Diego County, do not approve an ineffective  
11 Climate Action Plan. You must do better for our  
12 grandchildren. Thank you.

13 LINDA GIANNELLI PRATT: My name is Linda  
14 Giannelli Prat and I reside in San Diego,  
15 California. My family lives in BonSol and has  
16 lived there since 1965. I joined Stay Cool for  
17 Grandkids to advocate for future generations.

18 Prior to retirement, I was part of the  
19 City of San Diego's team that developed their  
20 Climate Action Plan, and I do totally understand  
21 the complexities and the opportunities inherent  
22 in this planning process.

23 Let me just say that releasing the  
24 modified Option 3 after 5:00 PM last night,  
25 defeats the idea of an open and transparent

1 government. While I have not had the chance to  
2 review it, I already see that removing Zero Net  
3 Energy construction and reducing renewable energy  
4 back to 90 percent is supposedly offset by the  
5 local direct investment program. Quite frankly,  
6 the value of that program to reduce greenhouse  
7 gas emissions is seriously debatable.

8 I implore you to consider the weight of  
9 your decision on our grandchildren and future  
10 generations. Intergenerational equity is the  
11 heart of the lawsuit Juliana v. United States.  
12 The 21 plaintiffs ranging in age from 10 to 20  
13 years old state that the Federal Government's  
14 refusal to take serious action against climate  
15 change unlawfully puts the well-being of current  
16 generations ahead of future generations.

17 In November 2017, the 9th Circuit Court  
18 of Appeals allowed the suit to go to trial. Judge  
19 Aikin set a judicial precedent in her decision.  
20 She said, and I quote, "Exercising my reasoned  
21 judgment, I have no doubt that the right to a  
22 climate system capable of sustaining human life  
23 is fundamental to a free and ordered society."

24 Much has been said about the cost we  
25 might bear to achieve an effective CAP. Well, let

1 me tell you, children alive today may have a \$535  
2 trillion economic liability to pay for technology  
3 required to mitigate greenhouse gas emissions,  
4 according to a recent report. Added to that are  
5 the costs associated with increasing natural  
6 disasters, resource scarcity, and other climate  
7 impacts."

8                   In San Diego County, there are  
9 currently 750,000 children under the age of 18.  
10 Is it fair to pass on these economic, social and  
11 environmental burdens to them? The noblest motive  
12 is the public good. And that should be for today  
13 and the future.

14                   You can vote to send this plan back for  
15 meaningful improvements, because there is no time  
16 to delay.

17                   BOB LEITER: Hi, I'm Bob Leiter, and I  
18 live in Poway, along with my wife. And our kids  
19 and grandkids also live in Poway. And I'm a  
20 retired urban planner. I've worked with many of  
21 you over the years. I'm also a card-carrying  
22 grandfather. I have 17-year-old granddaughter and  
23 an eight-year-old grandson. So, I feel like I'm  
24 kind of representing two constituencies.

25                   One, urban planners have been heavily

1 involved in the planning and the implementation  
2 of climate action plans now in California over  
3 the last 10 years or so. And I really think it's  
4 important and I have a good understanding of it.  
5 But I also think the things that Linda and David  
6 talked about are important as a grandfather.

7 We've worked with your staff and your  
8 consultants for over a year and a half now trying  
9 to help them develop an ambitious and effective  
10 Climate Action Plan. I want to personally thank  
11 Mary Kopaskie Brown and Michael de la Rosa, who  
12 were sort of our shepherds through the process.

13 One of the good things the staff did  
14 was put us in contact with key staff in their  
15 department to help us understand the process and  
16 provide good input when it was needed.

17 However, at this point, we're opposed  
18 to the adoption of the plan in its current form,  
19 and I'd like to briefly review our seven  
20 recommendations for how you can improve the plan,  
21 which are set forth in the letter we submitted to  
22 you dated February 9th.

23 First, the final CAP should include  
24 additional built environment and transportation  
25 GHG reduction measures that will reduce vehicle

1 miles traveled. According to the staff report to  
2 the Planning Commission, and I heard it again  
3 today, the County has limited options under its  
4 control for implementing transportation-based  
5 strategies, and therefore, relies heavily on  
6 energy based solutions.

7 We strongly disagree with that  
8 statement. We believe the County has direct  
9 control over land use and transportation planning  
10 within your communities. And really, it was  
11 mentioned, the SANDAG has authority. The whole  
12 idea of SANDAG was to work collaboratively with  
13 local governments.

14 Good example, in Otay Ranch, the  
15 regional planning agency laid out the concept for  
16 a regional bus rapid transit development, but it  
17 was the City and the County that came up with the  
18 concept of where to locate the routes within the  
19 villages and creating a good village oriented  
20 development.

21 So, I do think the County has a long  
22 way to go in terms of adding built environment  
23 and transportation measures, and that that will  
24 seriously significantly improve the plan.

25 Secondly, it kind of goes along with

1 that, we think you should reduce your reliance on  
2 the direct investment program and clarify how the  
3 program would be effectively implemented. We  
4 understand the concept, but we think you're  
5 putting a lot--way too much reliance on that  
6 particular program.

7 Third, the final CAP should include an  
8 analysis that demonstrates how your plan and  
9 measures are consistent with the regional plans  
10 and other state and regional policies and plans.

11 Again, the way the State of California  
12 has approached greenhouse gas emission reduction,  
13 we're all in this together. The State, the  
14 regional agencies, Caltrans and the local  
15 governments all have a roll to play, and we want  
16 to make sure that there's been a good  
17 coordination of the planning between SANDAG and  
18 the County.

19 Next, we think there needs to be a  
20 better explanation in the plan for how the  
21 General Plan Amendments are being evaluated in  
22 relation to the adopted CAP. We still think  
23 there's confusion among the stakeholders about  
24 how that is actually going to work. We still  
25 support the 100 percent renewable energy by 2030,

1 as Linda has mentioned. We do think there should  
2 be a chapter on social equity issues and specific  
3 recommendations.

4 And finally, we agree with concerns  
5 about housing affordability, but we there needs  
6 to be additional analysis before modifying any  
7 conditions.

8 So, thank you for your time, and we  
9 appreciate your hard work on this.

10 CHAIR KRISTIN GASPAR: Thank you for  
11 your presentation.

12 ANDREW POTTER: I will now call for the  
13 individual speakers in opposition. I'll call  
14 forward the first five. Bill Tippetts, George  
15 Courser, Carl Yaeckel, Maris Brancheau and Chris  
16 Garrett. You'll have two minutes to address the  
17 Board. Please begin by stating your name for the  
18 audio record.

19 BILL TIPPETS: Good morning, Chair  
20 Gaspar, Board Members. Bill Tippetts, representing  
21 the Southwest Wetlands Interpretive Association.  
22 I don't normally agree with things that Jim  
23 Weiland would say about processes like this, but  
24 I do agree with his comment in this case that  
25 this is about as important as the MSCP.

1 Supervisor Jacob was there at the beginning. I  
2 was there at the beginning. This is the thing  
3 now. It's a decade old, if not generational  
4 thing.

5 SWIA has been involved in lots of CAPs  
6 for the last five years, and we think the staff's  
7 doing a very good job, but for five changes that  
8 we put in our letter. And we would not agree that  
9 the Board should adopt the CAP and certify the  
10 EIR unless those recommendations are included.

11 One is your own staff report says that  
12 you're going to apply--be consistent with the--  
13 one minute left?--with the state goals, but your  
14 baseline has to be the 2020 emissions number, not  
15 the 2012 baseline. It's in your own report. You  
16 can't do it that way because that really affects  
17 2030 and 2050 targets.

18 You need to go back--the staff should  
19 go back and be consistent with the GPU 2011 smart  
20 growth areas to reduce [UNINTEL]. Reliance on the  
21 untested development--the direct investment  
22 program is not appropriate. It's too untested.

23 Place reasonable limits on the use of  
24 offside credits. Right now, there is no limit  
25 that potentially a GPA could use offside credits

1 from Brazil. It's untested and inappropriate and  
2 does not have the County then reducing greenhouse  
3 within the County.

4 Fourth, include essential equity  
5 component. We think that's good. Do not remove  
6 those four measures--was five--now the four  
7 measures, because that was 60,000 metric tons per  
8 year of greenhouse gas savings that would have  
9 been through the building sector, and you've  
10 dumped that onto the direct investment program  
11 and other things that are less secure.

12 In summary, we would prefer to see  
13 Option 1 with our recommendations. Thank you very  
14 much.

15 CHAIR KRISTIN GASPAR: Thank you. You  
16 did it.

17 GEORGE COURSER: Good morning, Chair  
18 Gaspar, Supervisors. My name is George Courser.  
19 I'm a volunteer with Sierra Club, San Diego. And  
20 Sierra Club's had an extended conversation with  
21 the County to curb GHG inventory and emissions  
22 from vehicles.

23 Vehicle miles traveled account for 45  
24 percent of the emissions that [UNINTEL] SANDAG,  
25 AQMD, Caltrans and the California Office of

1 Planning and Research are all focused on  
2 reducing, getting cars off the road.  
3 Unfortunately, the proposed CAP shows that this  
4 has been more or less a one-sided conversation  
5 with the County regarding VMT reductions. And the  
6 advantages of reducing VMT are really obvious.  
7 However, they're largely ignored in this CAP,  
8 even though VMT is growing right amongst our  
9 County.

10 Sierra Club has sent the Supervisors  
11 and staff a white paper. It describes pretty much  
12 in detail what's going on with VMT and how to cut  
13 VMT. The basics of VMT reduction are pretty  
14 simple. We spend less time in our cars, we have  
15 less gas to buy, we reduce air pollution, and we  
16 have, you know, better air quality. And  
17 implementing VMT reduction strategies should be a  
18 core part of the CAP. We don't see that.

19 We can save, you know, the time going  
20 to work, the time in our neighborhoods shopping,  
21 and getting our kids to school. But  
22 unfortunately, CARB, SANDAG, Caltrans, AQMD, all  
23 the planning can't be accomplished unless the  
24 County is right there with them. And that's what  
25 we see lacking. Unfortunately, the situation, you

1 know, it points to a situation just last night.  
2 Sherman Heights, they had a community planning  
3 group. CARB staff was there addressing and  
4 interacting with the community. These... Well,  
5 thank you very much.

6 CHAIR KRISTIN GASPAR: We'll find--  
7 that's a cliffhanger for us.

8 GEORGE COURSER: Yes it is. Thank you.

9 CHAIR KRISTIN GASPAR: We're going to  
10 find out what happened. I think you just became  
11 the most popular person in the room. You might  
12 want to see him after the meeting to get the rest  
13 of the story. Good morning.

14 CARL YAECKEL: Good morning. My name is  
15 Carl Yaeckel. I am a local chapter leader and  
16 volunteer with Citizens Climate Lobby, and we're  
17 a nationwide nonpartisan group that works to  
18 build political will to find climate solutions.

19 Why are we here today? Why are you  
20 here? I know why I'm here. I'm here for a two-  
21 year-old girl named Olivia. And she has curly red  
22 hair and bright blue eyes, and she doesn't know a  
23 darned thing about climate change. But you do.  
24 And if you don't know, shame on you. The entire  
25 human race is facing a crisis and people all over

1 the world are looking to their leaders in  
2 government to lead.

3 So, you have a choice today, and you've  
4 had a choice through this whole process, and I  
5 fear you've made the wrong choice because I look  
6 at this and I say this is a plan put together by  
7 the lawyers--and I say that with love, because  
8 I'm a lawyer--to scrape by in your court case, to  
9 scrape by compliance with state law. But we need  
10 more than that from our leaders. We need more  
11 than state law requires. We need more than some  
12 grumpy judge may require next month.

13 We need you to lead us toward 100  
14 percent clean energy. And that's the spirit you  
15 have to have going forward, because the battle  
16 against climate change is going on all over the  
17 world and it has to be won everywhere or it will  
18 be won nowhere. Thank you.

19 CHAIR KRISTIN GASPAR: Thank you. Next  
20 speaker, please.

21 MARIS BRANCHEAU: Good morning. My name  
22 is Maris Brancheau and I represent the Protect  
23 our Communities Foundation, which is a 501(c)(3)  
24 based in Santa Ysabel, California, originally  
25 formed by Backcountry residents to protest the

1 Sunrise Powerlink, and existing today to promote  
2 smart energy and to protect Backcountry rural  
3 places from unnecessary energy infrastructure.

4 First, this plan does not conform to  
5 the requirements under CEQA that all viable  
6 alternatives be studied, because the County has  
7 rejected a distributed generation 100 percent  
8 alternative.

9 The County has enough rooftop space to  
10 meet its renewable energy needs, especially if  
11 the County were to survey the amount of space  
12 available in parking lots and on commercial  
13 rooftops. The CAP fails by rejecting the viable  
14 distributed generational alterative without a  
15 full analysis under CEQA.

16 Secondly, POC strongly supports the  
17 County moving towards off the grid solutions for  
18 the 10,000 or so meters in the unincorporated  
19 area that have been subjected to power shutoffs.  
20 And we're grateful to Supervisor Jacob for her  
21 recent letter to the CPUC about this matter.

22 Battery storage opportunities with  
23 large-scale battery projects recently launched in  
24 Vermont and Australia have shown that home solar  
25 and battery storage can generate 100 percent of

1 the energy needed, and we don't need these large  
2 solar projects that some of the other speakers  
3 were talking about.

4 Third, POC supports the position of the  
5 Sierra Club and the other environmental groups  
6 who have studied the proposed CAP and found it  
7 lacking. Saying no today might not be the easiest  
8 thing to do to send this back to staff, but it is  
9 the right thing to do, to make sure that the  
10 County has a legally defensible, properly  
11 evaluated, CEQA compliant plan to deal with the  
12 climate impacts of the General Plan Update.

13 Please send this CAP back for full  
14 analysis of a 100 percent distributed generation  
15 alternative. A reminder that this CAP is  
16 mitigation for all the entitlements approved  
17 under the General Plan Update in 2011. Thank you.

18 CHAIR KRISTIN GASPAR: Next speaker,  
19 please.

20 ANDREW POTTER: As the next speaker is  
21 approaching, I'd like to call forward the next  
22 group of five speakers. Kathy Van Ness, Dan  
23 Silver, Jack Shu, Andrew Yancy and Frank Landis.

24 CHRIS GARRETT: Hi. My name's Chris  
25 Garrett, Latham & Watkins, 12670 High Bluff. I've

1 been writing to the County on climate change  
2 issues for the past three years on behalf of the  
3 Golden Door, which is a resort international  
4 brand grove and agricultural operation.

5 We want to thank the staff for their  
6 strong efforts on this plan, though we oppose it,  
7 in particular, the actions on the agricultural  
8 items. The electric motors and everything else  
9 makes sense.

10 As our General Manager, Kathy Van Ness,  
11 will tell you, we've ordered 15,000 trees, which  
12 are going to be planted in our grove operations.  
13 And if anyone wants our carbon credits, let us  
14 know. So, we're sure happy for that.

15 We've sent a lot of paper to you. I'm  
16 not going to cover that paper. I want to focus on  
17 two practical things that perhaps could resolve  
18 our concerns.

19 First of all, you're here today because  
20 you said you would do a Climate Action Plan in  
21 the 2011 General Plan covering the 2011 General  
22 Plan. We support that. Unfortunately, the staff  
23 made the policy choice to not only cover in the  
24 2011 General Plan, but also possible General Plan  
25 changes that would happen in the future with

1 preapproved mitigation, with a specialized  
2 threshold, and with a checklist.

3           And we were told in the Planning  
4 Commission that future projects, including  
5 General Plan changes, could come in and their  
6 CEQA review would be just going with the  
7 checklist--are you consistent with the plan.  
8 That's a policy choice. We'd urge you to reverse  
9 that policy choice.

10           As your staff said today, yes, these  
11 General Plan Amendments will have to do CEQA and  
12 they will have to mitigate, but they'll be able  
13 to tier off of the Climate Action Plan, follow  
14 the mitigation here. They won't do their own  
15 standalone GHG analysis. Send it back to the  
16 Planning Commission. Ask them to amend these  
17 documents so that there is standalone GHG  
18 analysis for each of these projects. And this  
19 Climate Action Plan only covers the 2011 General  
20 Plan, not all these future General Plan  
21 Amendments.

22           In my 15 seconds left, I would mention  
23 VMT as well. It's important to address VMT in  
24 these documents. Supervisor Roberts has a point  
25 of view, which I understand, about VMT, and we

1 just think the documents need to address it, if  
2 that's what you want to do. If you limit the  
3 General Plan, just the 2011 General Plan, you  
4 won't have to worry about VMT as much because  
5 SANDAG has already done the analysis.

6 CHAIR KRISTIN GASPAR: Thank you.

7 CHRIS GARRETT: The VMT problem comes  
8 when you add in these extra General Plan  
9 amendments. I've run out of time, or I could tell  
10 you what the cliffhanger was.

11 CHAIR KRISTIN GASPAR: [UNINTEL]

12 CHRIS GARRETT: I was at the same  
13 meeting with Mr. Courser. Thank you.

14 CHAIR KRISTIN GASPAR: You never know.  
15 If anyone has any time left that knows the  
16 conclusion, please utilize it wisely.

17 Welcome.

18 KATHY VAN NESS: Hi, Madam Chair,  
19 members of the Board, and staff. I'm Kathy Van  
20 Ness, General Manager and COO of the Golden Door.  
21 And I'm happy to be here today to talk about we  
22 are committed to sustainability in environment.  
23 We work on this every single day at the Golden  
24 Door.

25 The Climate Action Plan represents the

1 County's promise to its residents that we'll do  
2 our fair share to curb the growing threat of  
3 climate change. However, we remain concerned the  
4 proposed plan fall short.

5 In particular, the CAP plan provides a  
6 framework that would allow sprawl development  
7 projects to meet the County's greenhouse gas  
8 requirements simply by paying for credits  
9 anywhere in the world, that allegedly would then  
10 result in emissions reductions.

11 We're concerned the County will not be  
12 able to enforce or even verify these reductions.  
13 Just consider the plausibility of buying  
14 something in a foreign country for our local  
15 community.

16 We are also concerned the residents  
17 will be deprived of important co-benefits and  
18 opportunities of just really seriously building a  
19 green economy. Local efforts to reduce greenhouse  
20 gas emissions can be reduced harmful air  
21 pollutants and traffic congestions that impact  
22 people right here.

23 Also, greenhouse gas reductions are new  
24 investments. They're new jobs. Green technology  
25 and jobs are going to be the fastest growing

1 thing in the industry today. These important co-  
2 benefits should be kept here, right in our  
3 county, not shipped abroad, where we don't even  
4 understand clearly what it means.

5 The Climate Action Plan should align  
6 with smart growth principles and focus on  
7 development near existing populations, and  
8 affordable transit, not far away from urban  
9 populations, where there is actually no structure  
10 or no infrastructure.

11 By doing this, the County can reduce  
12 traffic congestion and support regional  
13 transportation investments that rely on smart  
14 growth planning. Thank you very much.

15 CHAIR KRISTIN GASPAR: Thank you.

16 ANDREW YANCY: Madam Chair, Honorable  
17 Commissioners, counsel and staff, I'm Andrew  
18 Yancy, an attorney with Latham & Watkins. I  
19 represent the Golden Door and also cover  
20 greenhouse gas issues for our firm.

21 I will 'd like to talk about our  
22 concerns with Mitigation Measure GHG-1, which is  
23 this separate program included in the CAP CIR. It  
24 addresses General Plan Amendments. We've  
25 submitted a detailed letter to you, as well as

1 several others to the Planning Commission and  
2 staff.

3 To talk about this more in detail, just  
4 to let you know, the summary of our concerns are  
5 that for General Plan Amendments there is not  
6 enough focus on VMT. There's no requirements for  
7 VMT reduction. There's no requirements for local  
8 offset projects. But instead, General Plan  
9 Amendments developing in the rural areas of the  
10 County would be allowed to purchase unlimited  
11 offsets from foreign countries in order to do  
12 their GHG mitigation.

13 Now, that has some inconsistencies with  
14 CARB's guidance, the State expert agency. That's  
15 going to cause some issues for SANDAG in meeting  
16 its own GHG reduction targets under SummitBridge  
17 375.

18 So, it seems that this is a prudent  
19 time for the County to coordinate with SANDAG and  
20 with CARB. In fact, when the County passed the  
21 General Plan in 2011, it thought the same. Policy  
22 COS-20.3 refers to regional collaboration with  
23 state agencies and SANDAG regarding air quality  
24 planning efforts. Policy LU-4.1 also requires  
25 participation in regional planning, particularly

1 regarding SummitBridge 375.

2 Now, I'm not aware that that's been  
3 done. In fact, I believe my colleague, Mr.  
4 Garrett, and I have done more to coordinate with  
5 SANDAG and CARB than the County has in this  
6 matter. We've written letters talking about this  
7 separate program for GPAs. We've appeared at  
8 public meetings, including the one last night in  
9 Sherman Heights, where CARB staff came down to  
10 San Diego to talk to us about their plans. No  
11 County representation was there.

12 I'd also like to address environmental  
13 justice. This really is an environmental justice  
14 issue. There are communities in San Diego that  
15 could really benefit from VMT reduction, from  
16 local offset programs, from investment and  
17 transit, from programs that help them buy these  
18 electric cars. Instead allowing an unlimited  
19 purchase of offset credits from foreign countries  
20 does a disservice to those local environmental  
21 justice communities here in San Diego. Thank you.

22 CHAIR KRISTIN GASPAR: Thank you.

23 DAN SILVER: Good morning, Chair Gaspar,  
24 Board members. Dan Silver, Endangered Habitats  
25 League. We regretfully ask you to send this item

1 back for additional work. It is in the CAP's  
2 treatment of General Plan Amendments that its  
3 flaws become overwhelming.

4 The County of San Diego absolutely  
5 should not facilitate sprawl development with  
6 this CAP. The County has basic absolute control  
7 over General Plan Amendments. Even so, there is  
8 no measure to reduce vehicle miles traveled in  
9 newly planned residential development.

10 According to the Air Resources Board,  
11 reducing VMTs is "essential". The SANDAG SCS  
12 follows this advice. It is unnecessary under CEQA  
13 to include this optional pathway for GPA  
14 conformance. These GPAs will forever undermine  
15 San Diego's ability to reduce carbon emissions.

16 As you've heard, there are further  
17 problems. GPAs can buy their way out of sprawl  
18 with offsets, including in foreign countries. The  
19 only such limit is "feasibility", but feasibility  
20 is never defined. Certainly, overseas credits are  
21 unenforceable, unless you have a very large  
22 travel budget.

23 If covered at all, newly planned  
24 development should go into smart growth  
25 opportunity areas, as defined by SANDAG, or

1 otherwise make a fair share contribution to SCS  
2 VMT reduction targets. And there should be a  
3 strict percentage on how much emission reductions  
4 can occur offsite as opposed to on-site. Thank  
5 you very much.

6 CHAIR KRISTIN GASPAR: Thank you.  
7 Welcome.

8 JACK SHU: Hi. I'm Jack Shu with the  
9 Cleveland National Forest Foundation, from La  
10 Mesa, California.

11 Let's remember what this is all about.  
12 It's about good science and information. Ninety-  
13 seven percent of scientists says this is  
14 happening and it's human-caused. We know that  
15 greenhouse gas emissions causes temperature rise.  
16 For the past million years, this is going on.  
17 It's gone skyrocketed in terms of greenhouse gas  
18 emissions. We have to control this.

19 Go on, next, next. We have to get it  
20 down below 350. Okay, keep going. And we've got  
21 drought happening. We suffer from drought now. We  
22 know it's going to continue. Next slide.

23 We know about fires. It's affecting us.  
24 Put that into your equation of cost analysis.  
25 Next slide. We're going to get flooded out. Put

1 that into your cost analysis for future  
2 generations. Your districts are all going to  
3 change.

4 Yet after years of litigation and  
5 having some of the best scientists and abilities  
6 and one of the wealthiest communities in the  
7 world, this is our--this is what you come up  
8 with. The green line, or that center little line,  
9 that's what you came up with. The yellow stuff is  
10 this dreamed up offsite stuff.

11 And lastly, in terms of transportation,  
12 your greatest source of greenhouse gas emissions,  
13 you have the red area, an area that you  
14 completely did not come up with any solutions.  
15 Essentially, you have no plan, you don't have a  
16 CAP. You've done nothing except a green little  
17 sliver going into 2050.

18 You know, a judge said a number of  
19 years ago with regards to greenhouse gas  
20 emissions, don't kick the can down the road.  
21 Here, if you pass this the way it is now, without  
22 major amendments and dealing with urban growth  
23 boundaries--and really addressing VMT, you're  
24 kicking the can off the cliff. Thank you.

25 CHAIR KRISTIN GASPAR: Thank you. Next

1 speaker, please.

2 ANDREW POTTER: As the next speaker is  
3 approaching, I'd like to call forward the  
4 remaining speakers in opposition. Sophie Wolfram,  
5 Joy Frew, Cody Patterson, Michael Bullock, Josh  
6 Chattan-Brown.

7 FRANK LANDIS: Hi, my name is Frank  
8 Landis. I'm a San Diego resident. I'm  
9 representing the California Native Plants  
10 Society. I'm the Conservation Chair and Vice  
11 President of the local chapter.

12 Madam Chairman Gaspar and members of  
13 the Board, thank you for taking my testimony.  
14 CNPS strongly supports the County's having a  
15 Climate Action Plan that works 100 percent.  
16 Unfortunately, this is not the plan, which is why  
17 we oppose the current version before you.

18 The proposal passed by the Planning  
19 Commission achieves about 92 percent of the  
20 inadequate greenhouse gas reduction that the  
21 Planning Development Services brought before  
22 them, and we need a plan that works 100 percent.  
23 And also, I can't really say what the modified  
24 proposal is because I only had an hour and a half  
25 to look at it while I was waiting to testify.

1           As others have said, there's a laundry  
2 list of issues. We've heard about VMTs. We agree.  
3 We've heard about the 1990 baseline. We agree.  
4 We've heard about the General Plan Amendments  
5 tiering off of this, which we agree. General Plan  
6 Amendments are an addition. They shouldn't be  
7 under this CAP.

8           Also, the Planning Commission  
9 eliminated Mitigation Measures E-1.1, E-2.2 and  
10 W-1.2, I believe. These represent at least 8  
11 percent of the County greenhouse gas reductions  
12 alone, so that's where the 92 percent comes from.  
13 And overreliance on direct investment and carbon  
14 offsets won't work because these are hard to do  
15 correctly over the long term in a changing  
16 climate.

17           I'll expand on the last two. The three  
18 mitigation members were lobbied against by the  
19 building industry because they will raise  
20 developers' costs, and this is true. However, if  
21 I remember correctly, one of the Planning  
22 Commissioners who supported them mentioned the  
23 \$10,000 he spent on solar at his home in Hawaii  
24 as reason for supporting their proposal. That's  
25 over four times what I spent on high-end solar

1 panels on my middle-class home.

2 The costs he and the lobbyists  
3 mentioned in supporting this measure are far  
4 higher than I experienced as a middle-class  
5 homeowner, and I would gently suggest that the  
6 building industry protests a little bit too much,  
7 and that removing the mitigation measures will  
8 cost the County more than the building industry  
9 will gain. The measures are good--the mitigations  
10 are a good deal for the County as a whole, and I  
11 think they should be retained.

12 Directed investment and off-site  
13 carbon--and carbon offset off-site would be great  
14 if Planning and Development Services knew the  
15 technical aspects of what they're getting into.  
16 I'm afraid they don't. These things have to work  
17 for 100 years, and keeping a tree growing 100  
18 years, whether it's a street tree, an orange  
19 tree, or a tree up in Cuyamaca is a really hard  
20 thing to do in a changing climate. And that's  
21 what the problem is that they haven't addressed.

22 So, thank you for taking my testimony.

23 CHAIR KRISTIN GASPAR: Thank you. Next  
24 speaker, please.

25 SOPHIE WOLFRAM: Good morning. My name

1 is Sophie Wolfram. I'm with Climate Action  
2 Campaign. The final CAP is currently inadequate  
3 to sufficiently reduce emissions. We offer the  
4 following recommendations to improve it.

5 First, I'll agree with comments  
6 previously made by other speakers in opposition  
7 regarding the need for greater reductions from  
8 built environment and transportation, problems  
9 with offsite offsets, and overreliance on the  
10 direct investment strategy.

11 In addition, we recommend inclusion of  
12 100 percent clean energy, which should be  
13 achieved through Community Choice Energy on the  
14 fastest possible timeline. We are literally being  
15 left behind as L.A. County and Riverside County  
16 both move forward with Community Choice Energy  
17 because of the rate savings for customers.

18 Meanwhile, in San Diego County, we have  
19 the highest rates for electricity in the state,  
20 and the most impacted by rate increases are  
21 customers on CARE. The Office of Ratepayer  
22 Advocates has chastised SDG&E for the huge rate  
23 increases, and the only way to contain costs is  
24 through competition.

25 The County, meanwhile, is shielded from

1 rate increases by direct access, but families are  
2 hurt and that's not fair. They should have the  
3 option to benefit from Community Choice Energy  
4 just as the County benefits from its alternative  
5 to SDG&E.

6 Finally, the CAP needs to include  
7 serious treatments of social equity that  
8 addresses how the County will prioritize high-  
9 scoring communities and CalEnviroScreen, the  
10 State's Environmental Justice screening tool, or  
11 other screening tools for disadvantaged  
12 communities.

13 In its current form, we ask that the  
14 Board reject the CAP for being inadequate to  
15 sufficiently reduce emissions and return it to  
16 staff for significant improvements. Thank you.

17 CHAIR KRISTIN GASPAR: Thank you. Next  
18 speaker, please.

19 JOY FREW: Good morning. My name is Joy  
20 Frew and I represent the Fallbrook Climate Action  
21 Team. And I want to thank you for giving us the  
22 opportunity to speak today.

23 I am, and the people I represent, are  
24 in favor of mass transit. A year ago I came to  
25 speak with the Planning Commission members, or

1 the staff members, about the problem of lack of  
2 public transportation from Fallbrook. And we were  
3 told that it's not anything that County can do  
4 anything about completely, because we don't have  
5 complete purview over it. But yet, Supervisor  
6 Horn has been the Chair of the North County  
7 Transit District. And I know you all are part of  
8 the SANDAG, so it's kind of like you're on a  
9 circular firing squad and, you know, you are the  
10 perpetrator and the victim.

11 But actually, the County and people in  
12 the unincorporated areas are the victim. For  
13 increased greenhouse gases, 45 percent of the  
14 greenhouse gas emissions are from vehicle miles.  
15 And you told us from the beginning you're not  
16 going to do anything to address it in the Climate  
17 Action Plan.

18 So, I'd like to see it go back to the  
19 table. I'm really disappointed that you've wasted  
20 all of our taxpayer money when you're not really  
21 going to address the issue. That's very  
22 disappointing. But I do want to thank Supervisor  
23 Jacob for taking leadership and asking your  
24 fellow Supervisors to support Community Choice  
25 Aggregation. Thank you for that.

1 CHAIR KRISTIN GASPAR: Thank you. Next  
2 speaker, please.

3 CODY PATTERSON: Cody Patterson, 7633  
4 County Camino [UNINTEL PHRASE] California. I also  
5 own and manage 310 acres, half a section in San  
6 Isabel, an unincorporated area.

7 Chairwoman Gaspar, Supervisors, staff,  
8 thank you for the opportunity to speak. First let  
9 me say staff have clearly invested substantial  
10 time and energy in this CAP document and within  
11 the parameters established by their superiors,  
12 done admirable work. But this is not the Climate  
13 Action Plan you would put together if you  
14 actually thought greenhouse gas reduction were  
15 essential to stave off global and regional  
16 calamity.

17 This is the kind of plan you put  
18 together so you can satisfy the letter of  
19 California state law and have cover 20 years from  
20 now, when we've failed to hit our carbon targets  
21 and are suffering the consequences. We did our  
22 best. Well, honestly, this isn't our best. Not  
23 even close.

24 I can tell you right now this plan  
25 isn't going to sufficiently reduce our County's

1 greenhouse gas emissions. This CAP leaves  
2 virtually untouched the primary determinant of  
3 the County's ability to hit its greenhouse gas  
4 targets, which is land use.

5 Staff explicitly stated in the Planning  
6 Commission hearing that the CAP is not a land-use  
7 control document, which they noted is the  
8 exclusive preserve of the General Plan. But the  
9 CAP also doesn't mandate any alterations of the  
10 General Plan.

11 Furthermore, this plan doesn't  
12 establish adequate constraints on General Plan  
13 Amendments, which obviously are the single most  
14 significant threat to GHG reductions in the  
15 unincorporated county.

16 There is absolutely no way to achieve  
17 meaningful reduction of GHGs without constraining  
18 leapfrog development and sprawl, and directing  
19 growth into transit-oriented, mixed use, in-field  
20 development, with on-site affordable units. Far  
21 from mandating the development of mass transit in  
22 collaboration with SANDAG and MTS, the plan only  
23 mentions public transit as a supporting effort of  
24 T-1.3. The plan mandates no change to land use  
25 and no expansion of mass transit.

1 Frankly, the only way the County is  
2 going to dramatically reduce GHG emissions in the  
3 unincorporated areas is to collaborate with  
4 cities to focus in-field development and  
5 population growth in the incorporated areas.

6 This plan is not just woefully  
7 inadequate, it is willfully inadequate. There is  
8 no pain in this plan. You don't finish a  
9 marathon, much less win one, without pain,  
10 without exertion, without exhaustion, without  
11 collapsing at the finish line. This plan is jog  
12 walking.

13 CHAIR KRISTIN GASPAR: Thank you.

14 CODY PATTERSON: Thank you.

15 CHAIR KRISTIN GASPAR: Wow, you had an  
16 extra second. One of you needs to sing. It's like  
17 seventh inning stretch, so hopefully, you have  
18 some time left.

19 MIKE BULLOCK: Hello, Honorable Board.  
20 I'm Mike Bullock. And even though I mention the  
21 Sierra Club, I speak only for myself. The final  
22 published ruling against the County said, "The  
23 Sierra Club also provided specific examples of  
24 feasible greenhouse gas reduction measures that  
25 would actually reduce greenhouse gas emissions

1 and could be adopted without delay." The County  
2 rejected these mitigation measures without  
3 substantial evidence for doing so.

4 This time around, the Sierra Club as  
5 proposed the same demonstration car parking  
6 system. The CAP argues weakly that it is  
7 infeasible. It claims it would not be feasible  
8 because the County has different work locations.  
9 But of course, the pricing and earnings for  
10 employees could easily be site specific.

11 The County also asserts unions would be  
12 opposed. But of course, the unions are much more  
13 concerned about our climate crisis than most  
14 Republicans, for example. And besides, the  
15 proposal includes an add-in payment, so that even  
16 employees that drive every day will break even  
17 under the plan. The result is that every worker  
18 would have a new option to earn more money than  
19 they are earning under the current system.  
20 Something that would not be opposed by the  
21 unions.

22 Finally, instead of mitigating the  
23 approval of additional urban sprawl with carbon  
24 offsets that will most likely be out of County,  
25 please mitigate by not approving such sprawl.

1 Governor Brown has said, "Humanity must  
2 reverse course or face extinction." The County  
3 must reverse course right now at this meeting.  
4 Please put the car parking proposal into the CAP,  
5 adding to your T-2.3. Thank you.

6 CHAIR KRISTIN GASPAR: Thank you, sir.  
7 Welcome.

8 JOSH CHATTAN-BROWN: Good morning,  
9 Honorable members of the Board. My name is Josh  
10 Chattan-Brown. I'm an attorney with Chattan-Brown  
11 & Carstens, here today on behalf of the Sierra  
12 Club.

13 We urge the Board today to correct the  
14 deficiencies we identified along with many  
15 others. Staff has argued, including today, that  
16 the CAP is not a land use document. As a result,  
17 the County continues to process major general  
18 plan amendments [UNINTEL] in Sierra that result  
19 in sprawl and additional vehicle miles traveled,  
20 without considering those impacts through the  
21 CAP. Staff is wrong.

22 The CAP is inextricably connected to  
23 land use planning. I remind the Board that the  
24 CAP was mitigation for the 2011 Gen. Plan Update  
25 GHG impacts. And the Board should not increase

1 VMTs by processing and approving development on  
2 lands that GPU contemplated would be reserved as  
3 green fields, which are rural, agricultural or  
4 open space uses, until the County first shows  
5 that it can meet the GHG emission reduction  
6 commitment in the County that it made in 2011.

7 The CASP is clear. The only way that  
8 the County would be able to approve such new  
9 largescale development on green fields would be  
10 through the use of offsets. The County agreed in  
11 2011 to reduce GHG emissions in the County, and  
12 now the CAP would allow offsets, not only out of  
13 county, but also out of country, raising serious  
14 questions about their enforceability.

15 As Mr. Courser previously alluded to,  
16 despite recognizing that transportation is by far  
17 the largest contributor to GHGs at 45 percent of  
18 the County's total GHG emissions, the CAP only  
19 proposes to implement measures that would produce  
20 a meager 13 percent GHG reduction in this area by  
21 2030.

22 Lastly, the proposed threshold of  
23 significance is inadequate because it would allow  
24 GHG emissions from a project to be considered  
25 below the level of significance if the County

1 find that the project is consistent with the CAP.  
2 The GHG impacts for large projects must be  
3 quantified and mitigated.

4 Looks like I'm out of time, so I'll be  
5 in the back with George and Chris, if you'd like  
6 any more information. Thanks.

7 ANDREW POTTER: Chairwoman Gaspar, that  
8 includes public testimony on this item.

9 CHAIR KRISTIN GASPAR: Well, a big thank  
10 you for all the time that you've dedicated to us  
11 today and the testimony provided. Thank you for  
12 complying with the tight timeframe in which you  
13 had to speak. And really appreciate all of the  
14 input that you've given.

15 First, I'd like to start out by asking  
16 legal counsel a question, because they love when  
17 you do this. But to clarify for the record, what  
18 real flexibility to we have here today? Given the  
19 legal challenge that we're up against, can we  
20 make changes on the spot today to the measures  
21 themselves as outlined in the CAP?

22 CLAUDIA SILVA: The measures that are  
23 presented before you have been fully analyzed,  
24 not only individually to make sure there is  
25 sufficient evidence within the record to support

1 how they were calculated and determined, as well  
2 as the methodology of how they're all  
3 interrelated to achieve the needed reductions.

4 Changes today on the fly to any  
5 particular measure would require a level of  
6 analysis that could not occur without substantial  
7 time and effort to rerun models, to redo the  
8 analysis, and that would require additional time.  
9 And we cannot say with any degree of certainty  
10 whether those changes could even achieve the  
11 total numbers of reductions that are targeted.

12 CHAIR KRISTIN GASPAR: But I appreciate  
13 that, and unfortunately, it is the case that  
14 we're simply out of time. I know several speakers  
15 pointed to that today. They understand the legal  
16 challenge that we're under, and we do have very  
17 narrow options, albeit options, presented before  
18 the Board today.

19 I'm very concerned about the late  
20 letter that was received by the County  
21 threatening additional litigation. It's evident  
22 that if we do not comply with all demands  
23 outlined in that letter, we will find ourselves  
24 back in court. And tragically, it's ironic and  
25 discouraging at the same time that we'll be

1 spending thousands more on attorneys instead of  
2 additional environmental initiatives and work.

3 I want you to know that I've studied  
4 this plan extensively. I thank staff for the time  
5 that you spent with me. We had to separate out  
6 the briefing into two segments. It ran so long,  
7 but the hours of your time was really important  
8 to me.

9 But at the end of the day, I'm  
10 concerned about a number of things, such as  
11 implementation itself, the costs involved,  
12 consumers and residents, and impacts to the CAP  
13 on our housing shortage, which is a crisis.

14 Looking at our regional housing needs  
15 assessment, or some would call the [UNINTEL]  
16 numbers, we are way behind in meeting our  
17 mandated affordable housing for the San Diego  
18 region.

19 In our 10-year housing cycle, which  
20 states 2010 to 2020, we were allocated 22,412  
21 units. We are eight years in and nearing the  
22 conclusion of this housing cycle, and we have  
23 built a total of 4,644 units out of 22,412. And  
24 ladies and gentlemen, these units do not just go  
25 away.

1           To put it into perspective, at the pace  
2 that we're actually building this affordable  
3 housing, I will be 67 years old by the time we  
4 meet this goal. We will fall well short of our  
5 obligation and allocation, and we will have  
6 roughly 16,000 units on the table when the next  
7 [UNINTEL] allocation comes in 2020. Then we will  
8 be responsible for adding the unmet units to the  
9 new units that will be handed by the State.

10           If you look at how well we're doing  
11 building very low-income affordable housing, the  
12 picture gets even weaker. In 2017, there was one  
13 unit built. In 2016, zero. In 2015, one; 2014,  
14 zero. Need I go on? It's not good, and we know  
15 this. All of us as a community, we know this.

16           I have three children at home. I grew  
17 up in this county, and I'm raising my family  
18 here. Will my kids be able to do the same? Will  
19 yours?

20           I also want to briefly discuss the  
21 renewable energy program options. As we move  
22 forward in this implementation planning stage,  
23 it's my expectation that a comparative analysis  
24 is done to study all viable options. It should be  
25 the apples to apples comparison that several

1 speakers brought up today.

2 Last week I had the pleasure of meeting  
3 with the American Society of Landscape  
4 Architects. I applaud these professionals for the  
5 innovative ways they are using landscape project  
6 design to address environmental goals and solve  
7 environmental challenges.

8 It's also my expectation as we move  
9 forward with implementation that professional  
10 associations such as the American Society of  
11 Landscape Architects should be consulted for  
12 their guidance, their innovation, and their best  
13 management practices, that will help us not only  
14 to meet our environmental goals, but to exceed  
15 them.

16 It's important to recognize that all  
17 CAP measures come with a cost. And at the end of  
18 the day, all of these costs are realized either  
19 directly or indirectly by our residents, the many  
20 San Diegan residents who are working hard day in  
21 and day out to make ends meet in expensive San  
22 Diego County. Our residents are relying on us to  
23 meet our environmental goals and to perform a  
24 cost analysis of all aspects of this plan as we  
25 forward in the implementation stage.

1           Having shared my concerns with you, I  
2 believe that the best way to move forward and  
3 move our County forward is with Option 3. As  
4 such, I would like to make a very extensive  
5 motion at this time to, number one, adopt the  
6 California Environmental Quality Act findings  
7 which include the Certification of Findings  
8 regarding significant effects of the project, the  
9 mitigation and monitoring program, the statement  
10 of overriding considerations, and the  
11 recirculation statement prepared pursuant to CEQA  
12 Guidelines, Sections 15088.5, 15090, 15091,  
13 15093, and 15097, and certify the final  
14 supplemental environmental impact report final  
15 SEIR; adopt the guidelines for determining  
16 significance for climate change dated January  
17 2018; adopt the resolution of the County of San  
18 Diego Board of Supervisors; adopting the  
19 Greenhouse Gas Threshold of Significance dated  
20 January 2081; adopt the draft final climate  
21 action plan Option 3, Residential and  
22 Nonresidential development which includes the  
23 final SEIR; increase solid waste diversion  
24 alternative; and 100 percent renewable energy  
25 alternative; and remove five reduction measures

1 with a modification to one reduction measure.

2 To adopt the Climate Action Plan  
3 Consistency Review Checklist dated January 2018;  
4 adopt the report format and content requirement  
5 for climate change dated January 2018; adopt the  
6 resolution of the County of San Diego Board of  
7 Supervisors updating the 2011 General Plan,  
8 update program environmental impact report  
9 mitigation measures CC1.2, CC1.7, and CC1.8.  
10 Adopt the resolution of the County of San Diego  
11 Board of Supervisors adopting the General Plan  
12 Amendment PDS2016GPA16-007 amending the 2011  
13 General Plan Update Goal COS20 and Policy  
14 COS20.1.

15 Adopt the resolution of the County of  
16 San Diego Board of Supervisors to apply for and  
17 accept grant funding to support the Climate  
18 Action Plan and authorize the chief  
19 administrative officer or designee to apply for  
20 and accept grant funds and negotiate contracts to  
21 support implementation of the Climate Action  
22 Plan.

23 That was a lot. Looking for a second.

24 Thank you, supervisor. We'll move  
25 forward with the discussion with our Vice

1 Chairwoman Jacob.

2 VICE CHAIR DIANNE JACOB: Thank you,  
3 Madam Chair. I'd like to thank everyone that came  
4 down to speak on this and thank the staff for  
5 their work and all of the input that has been  
6 received here today, and then as we've gone  
7 through this process. Just a question on the  
8 motion. Is that basically the modified staff  
9 recommendation?

10 CHAIR KRISTIN GASPAR: This is actually  
11 the Planning Commission recommendation, Option 3  
12 without the modification by staff. 100 percent  
13 renewable energy option.

14 VICE CHAIR DIANNE JACOB: We do--there's  
15 no doubt we do have a difficult task before us,  
16 and it's a balancing act between trying to  
17 provide affordable housing in this region and  
18 also adding cost to that affordable housing. But  
19 I would submit that there are other conflicting  
20 policies that we've been dealing with over the  
21 years in terms of that conflict in public policy,  
22 and I would name just a couple.

23 If you look at prevailing wage,  
24 prevailing wage has increased the cost of housing  
25 over the years. Project labor agreements have

1 increased housing costs over the years, and  
2 there's probably some others--storm water  
3 requirements and other public policies that are  
4 in conflict with our ability to provide for  
5 affordable housing.

6 I think what we're faced with here is,  
7 how do we balance those two as we look at the  
8 conflicts between trying to provide affordable  
9 housing and then what's the right option here.  
10 What I'm looking at is, what is the best option  
11 in terms of what's best for the people in this  
12 region, particularly our grandchildren and great  
13 grandchildren into the future. What is the best  
14 legal option, and counsel has said all of the  
15 options before us today are legal. Then, what's  
16 realistic and what is practical to achieve, and  
17 it seems like with many of what staff has before  
18 us, it's all going to depend on implementation  
19 and the comparative analysis. And it's that old  
20 saying, the devil is in the details.

21 Having said that, I have a couple of  
22 questions. There was a comment that was made  
23 about--that this is basically going to allow  
24 developers to provide plan amendments that will  
25 buy their way into sprawl. And reference was made

1 to the checklist. And I have the checklist in  
2 front of me and I'd like staff to respond exactly  
3 what does this mean and who would it apply to in  
4 terms of development proposals?

5 MAN 1: Supervisor Jacob, through the  
6 Chair. The checklist would be used by General  
7 Plan consistent projects. Once they provide  
8 substantial evidence that they meet all the  
9 measures in that checklist, their analysis for  
10 greenhouse gas emissions would be assumed to be  
11 consistent with the Climate Action Plan, and  
12 therefore their cumulative impacts to greenhouse  
13 gas emissions would be reduced to a level of less  
14 than significant.

15 That checklist is not used by General  
16 Plan amendments. General Plan amendments do not  
17 tier from the cap or are not afforded any  
18 streamlining benefits from the cap. General Plan  
19 amendments are not in the baseline inventory or  
20 the projections for the cap; they're simply  
21 analyzed as cumulative impacts and the County has  
22 feasible mitigation and we must apply feasible  
23 mitigation when there are cumulative impacts.

24 VICE CHAIR DIANNE JACOB: Okay, I hear  
25 what you're saying. Then, explain to me number

1 one on the checklist, "Is the proposed project  
2 consistent with the existing General Plan  
3 regional category land use designations and  
4 zoning designations?" That's pretty clear.

5 And then it--also, "If yes, proceed to  
6 step two," which is cap measures consistency of  
7 the checklist. But--and it does say, "If no  
8 proceed to question two below," and then question  
9 two below, "Does the project include a land use  
10 element under zoning designation amendment that  
11 would result in an equivalent or less GHG  
12 intensive project when compared to the existing  
13 designations?"

14 That doesn't seem to be consistent, to  
15 me, with what you just said.

16 MAN 1: Supervisor Jacob, that piece of  
17 the checklist--so, what the checklist is meant to  
18 capture is General Plan consistent projects that  
19 are consistent with the density or intensity in  
20 the General Plan. We recognize General Plan  
21 amendments in process excluded that there may be  
22 certain scenarios where a GPA comes in to, for  
23 example, become consistent with--or requires a  
24 rezone to be consistent with land use or vice  
25 versa.

1           That would afford those projects that  
2 aren't increasing any density or intensity an  
3 ability to use the checklist as well, because  
4 they would stay below that density that was  
5 approved in the 2011 General Plan.

6           VICE CHAIR DIANNE JACOB: Thank you for  
7 that. I think the checklist needs to be clearer  
8 then, exactly what it applies to and to make sure  
9 that there's no misunderstanding. Because I heard  
10 some testimony today where at least there are  
11 some individuals that think that this is going to  
12 enhance the ability of General Plan Amendments to  
13 work its way through the process. So, could we  
14 add that to the motion for staff to clarify on  
15 the checklist exactly what this checklist applies  
16 to as was stated?

17           CHAIR KRISTIN GASPAR: You able to  
18 comply with that request? Perfect.

19           MAN 1: Yes.

20           VICE CHAIR DIANNE JACOB: Another--

21           CHAIR KRISTIN GASPAR: Is the seconder  
22 okay with the modification? Thank you.

23           VICE CHAIR DIANNE JACOB: Another  
24 question that I had, T-1.3 Update Community  
25 Plans. We just spent millions of dollars and a

1 lot of years updating our General Plan and our  
2 Community Plans. There are some Community Plans  
3 yet to be done. They're in my district and I  
4 understand that--I think there might be one or  
5 two in Bill's district.

6 What's staff thinking on updating these  
7 community plans? I mean, haven't we spent enough  
8 money on this? What's the goal to be achieved  
9 here?

10 MARK WARDLAW: Through the Chair. The  
11 goal T-1.3 is to secure vehicle mile trip  
12 reductions through more impactful and progressive  
13 community plans, meaning that we actually focus  
14 on achieving what the General Plan actually  
15 states in terms of density and mix of use.

16 So, in order to achieve the densities  
17 that have been established in the General Plan,  
18 each community plan update will focus on the  
19 market conditions, making sure that we understand  
20 what's truly economically viable and then what  
21 barriers exist to achieving the density in the  
22 General Plan, focusing on clear standards and  
23 guidelines that simplify the permitting process  
24 with the idea of reducing permitting time and  
25 costs associated with development, and then

1 identifying the facilities and improvements that  
2 are needed to achieve transit-ready communities.

3 So, the densities in the General Plan  
4 actually--especially in the village districts,  
5 can support transit. Transit won't come if the  
6 density in the population is not there. The  
7 future of transit within the region may not be  
8 heavy rail or light rail, and it might not even  
9 be bus service as the way we see it now. It might  
10 be carshare, rideshare, and autonomous vehicles.  
11 But without the achievement of the density, then  
12 we won't be ready and it will not come. So, it's  
13 a chicken and egg situation for us.

14 By focusing on facilities and achieving  
15 the improvements necessary for that such as  
16 sidewalks and bike facilities, parks and trails,  
17 street and road improvements, and on-street  
18 parking improvements, and then transportation  
19 demand management shared parking programs like  
20 park and ride lots, shared parking, parking and  
21 loading for rideshare and van pool systems,  
22 transit amenities, and car and bike share  
23 programs; those are the impactful types of  
24 studies that we'll include in the community plans  
25 knowing that they haven't been updated

1 substantially since--quite some time.

2           And then finally, identifying the  
3 incentives and the tools of public-private  
4 partnerships that can ease development and make  
5 it happen more timely.

6           VICE CHAIR DIANNE JACOB: Well, Madam  
7 Chair, I think there's a big problem with that  
8 because the unincorporated area is not an urban  
9 area. And two-thirds of the unincorporated area--  
10 the eastern part of the unincorporated area, is  
11 ground water dependent. There's no sewer systems.  
12 There's no imported water, no imported--well,  
13 they're not hooking up to a sewer system, so  
14 you've got some constraints. And when you talk  
15 about improving density to have transit, totally  
16 unrealistic.

17           And vehicles travel--vehicle miles  
18 traveled, we've got 2,000 miles of roads in the  
19 unincorporated area. It's a very different  
20 situation, and I'm not sure in my mind how you're  
21 going to be achieving anything substantial in  
22 terms of what we're dealing with today by  
23 updating and wasting money on community plan  
24 updates. And I can see a real problem and a  
25 conflict there for the future.

1           Those are my comments. Good luck with  
2 that. I don't think it's going to happen. I would  
3 only ask the Chair, in terms of comparative  
4 analysis, if we could include just a couple  
5 directions to staff because I want to make sure  
6 that when they do the comparative analysis that  
7 they hit on these points.

8           One direction to staff would be through  
9 the comparative analysis for the implementation  
10 of the renewable energy, E2.1; to also focus on  
11 the development of local community-based energy  
12 generation such as rooftop solar and microgrids  
13 and off-the-grid systems. I think that should be  
14 included in the analysis.

15           And then also to direct staff to  
16 develop a way for large or small-scale wind or  
17 solar projects that would benefit the local  
18 community they are located in and provide a  
19 benefit to San Diego rate payers. I'd like to see  
20 that analysis and something developed to do that;  
21 although, I would just say as a comment that I'm  
22 not a big fan of these large projects and I know  
23 one that was recently approved by this Board--  
24 Madam Chair, you weren't here--but it doesn't  
25 benefit anybody in the San Diego region because

1 the energy is going up north, and that is not  
2 helpful, I don't think, to meeting our goals.

3 I also--what you mentioned, Madam  
4 Chair, about the landscape. I think that there  
5 should be some special landscape areas  
6 recognized, different ways of doing things. I  
7 know there's been examples presented to me in  
8 terms of storm water requirements that you can  
9 actually do some unique landscaping projects that  
10 would add to the parks or a trail or some other  
11 amenity and still satisfy the storm water, and  
12 there may be some landscape planning that can be  
13 done here. And I think we need to do a lot more  
14 to reduce water reduction in our landscape  
15 planning.

16 And then I would aggressively pursue  
17 the CCA that was mentioned. It is a part of this  
18 plan; although, some have some problems with it,  
19 but I think that that needs to seriously be  
20 looked at as far as a choice. And then finally,  
21 when we look at comparative analysis to include  
22 not just the cost analysis of the projects that  
23 you're looking at, but let's look at the cost to  
24 the consumers, to the rate payers, when we're  
25 looking at this.

1           So, most of my comments are geared  
2 towards doing a very thorough analysis,  
3 comparative analysis, on our energy options, and  
4 I would appreciate that being added to the  
5 motion.

6           CHAIR KRISTIN GASPAR: Sure, I do not  
7 disagree with anything that you've outlined, as  
8 long as the seconder is okay with including those  
9 comments. He looks agreeable. Thank you very  
10 much. Supervisor Roberts.

11           SUPERVISOR RON ROBERTS: Thank you,  
12 Madam Chairwoman. First of all, I want to thank  
13 everybody for the testimony, and I want to thank  
14 staff and our legal people for all the work  
15 that's been put into this. In some senses this  
16 sounds like a very complex issue. But others  
17 it's--this is pretty simple, okay.

18           We're talking about greenhouse gas and  
19 we're talking about reducing by some 807,000-plus  
20 tons--metric tons of CO2 equivalent per year, and  
21 we lose sight of that. Okay, I've heard a lot of  
22 testimony that this is--it's absolutely essential  
23 we get that done, and then get diverted into all  
24 sorts of things that really are removing sort of  
25 the priority of getting that done.

1                   And let me also make clear, you know, I  
2 hear about grandkids. I've got three grandkids. I  
3 was reminded when I went to grandparents' day  
4 last week, not just for them for the other  
5 grandkids. I've got a lifetime of working now on  
6 public transit and on air quality issues, and I  
7 will guarantee you there are a few people in this  
8 room that can go back as far as I can, greenhouse  
9 gas, and understand when that first started as a  
10 concern in Scripps Institution of Oceanography  
11 here in San Diego.

12                   Amazing research was really before  
13 there was a public theory that was espoused. They  
14 were sending scientists to the Antarctica, one  
15 who happened to be a close friend of mine. Told  
16 me what he was doing in terms of drilling the  
17 cores and measuring the CO2 and CO2 equivalents  
18 going way, way, way back, way before I was on  
19 this Board.

20                   So, these are things--and I'll also  
21 admit that I believe that there is a problem that  
22 we're faced with, that we have to reduce  
23 greenhouse gas. There's no question of that in my  
24 mind. I'm not a denier. I believe in that  
25 strongly. But I also believe that we don't have

1 to maximize the amount of pain we inflict on  
2 people to get to that goal of 897,145 metric tons  
3 of reduction. We can get that.

4 I'm just about to reach my 23rd  
5 anniversary on the Air Resources Board. We have  
6 an incredible history that we have been able to  
7 reduce, in real terms, in real numbers, in  
8 absolute tons right across the board, of all of  
9 those things that we have deemed to be a concern-  
10 -things that have become a concern that we  
11 couldn't even measure when I started on the Air  
12 Board. We used to talk about PM10. Couldn't  
13 really deal with it, but we talked about.

14 Today we're regulating PM2.5, which we  
15 couldn't begin to do even though we knew there  
16 were health issues, but we didn't know how to get  
17 after it. We didn't have the technology available  
18 to deal with it, and today we are dealing with it  
19 and it's made dramatic difference.

20 And those differences are not just in  
21 communities--undisadvantaged communities, they're  
22 in advantaged communities. In fact, on our 50th  
23 anniversary meeting last week, we were given  
24 charts that the State did--State Air Resources  
25 Board did, that showed how the convergence now,

1 there's not a whole lot of difference between  
2 communities in terms of the impacts. Dramatic  
3 changes. Dramatic changes.

4 Now, the State subscribed to this Cap-  
5 and-Trade Program, and the Cap-and-Trade Program  
6 doesn't require that you stay inside the State of  
7 California to make changes and to mitigate.  
8 Greenhouse gas is not the same as air quality.  
9 Air quality is a localized issue. It's here.  
10 We're putting something in the air here and it's-  
11 -air quality concern. You're affected by it. You  
12 got to clean up your neighborhood.

13 In our case, we have an air district  
14 that this Board's been responsible for, and I'll  
15 share with you--not to be bragging--we've done a  
16 pretty good job. It's not just the State that's  
17 doing a good job; we're doing a good job in San  
18 Diego. We've managed to dramatically decrease air  
19 pollution. But fundamentally, greenhouse gas is  
20 different.

21 If I can reduce greenhouse gas  
22 emissions on the North Pole, then just is good  
23 for the planet. It doesn't make a difference. I  
24 need to be able to verify that I'm actually  
25 getting real reductions. Don't know that there's

1 many emissions on the North Pole, so it's  
2 probably not a good example, but I keep hearing  
3 it's got to be done in San Diego County. The  
4 priority should be get it done, period.

5           If we can go to Imperial County and we  
6 can develop a program with people--the farmers in  
7 Imperial County, do it. As long as it's  
8 verifiable, we can certify, and we can--we know  
9 it's sustainable.

10           It seems to me that that's the key, and  
11 I think that is missed in a big way. All of a  
12 sudden, we're turning this program and concern  
13 with saving the planet--we got to have a job--  
14 jobs in our neighborhoods, okay. The jobs in our  
15 neighborhoods are important, but we need to--you  
16 know, you've got to get these things lined up.  
17 What's most important?

18           And when I look at the charts, you  
19 know, and I see the severity of what is here, I  
20 believe that stuff. What I don't believe is the  
21 manner in which some people want to go about  
22 this.

23           I have a concern about your motion, and  
24 my preference, which I would like to make a  
25 substitute motion for, is that we approve

1 Modified Option 3 as opposed to Option 3, and I  
2 think the points that were made by--early on in  
3 this hearing by the Taxpayers' Association, by  
4 the Chamber of Commerce, and by the United  
5 African American Ministers Alliance are very  
6 valid concerns.

7 Cost-benefit has always been a part of  
8 the work that the California Air Resources Board  
9 has done. It has always been. We have always  
10 looked, okay, there's always a lot of ways to do,  
11 but what's the most cost-effective way of doing  
12 these things? That's why we have a Cap-and-Trade  
13 Program instead of a carbon tax. Yet, what I'm  
14 concerned about is the uncertainties that we're  
15 going to need to deal with when we're talking  
16 about 100 percent. And we may get to 100. We may  
17 find that as a viable strategy.

18 But the fact of the matter, Modified  
19 Option 3 gets us to the 897,154 metric tons, and  
20 it does that and allows us a little bit of  
21 flexibility not knowing exactly the cost impacts  
22 of going that extra 10 percent, which I've found  
23 as we've worked through these things over the  
24 years, that's--that can be a very, very expensive  
25 proposition and I'd like us to be able to deal on

1 a basis of where this Board is continuing to get  
2 updated, understanding what the new technologies  
3 are, what the issues are.

4 What we want to do is make sure we get  
5 to that goal. I'll say it once again, 897,000  
6 metric tons per year. That's the goal. That's  
7 what's really important here.

8 We went through an amazing rezoning  
9 General Plan update here. Madam Chairwoman, you  
10 weren't here to see what we went through, but I  
11 would share with you, we reduced housing capacity  
12 in rural areas. We shrunk the community  
13 footprint, if you will. We decreased the number  
14 of roads by, if I remember, almost 800 miles of  
15 new roads that were going to be needed, okay. We  
16 decreased density on about a half million acres,  
17 if I remember, and we heard from a lot of people.

18 Today, we're facing something quite  
19 different. We're facing a major housing crisis in  
20 San Diego. Now, we're facing a major housing  
21 crisis in California, and there's no question  
22 about it. And when I talk about those grandkids,  
23 that's in my mind, too. I want to meet the  
24 climate goals, but I also want to have economic  
25 opportunity for those youngsters.

1           This climate action plan doesn't add or  
2 remove units. This is--it's not what it's about.  
3 It's about reaching those goals, and projects  
4 that are seeking amendments, they're going to  
5 have to answer to the environmental issues that  
6 involve--whatever issues may be involved with  
7 their projects, so what I want to see us have--  
8 maintain a strong economy as well as a clean  
9 environment and a reduction in greenhouse gas.

10           It's very difficult to predict the  
11 future, and as Mr. Wardlaw was talking about  
12 transportation and other things, you know, people  
13 are talking about--in some rural areas, you know,  
14 need public transit. And yeah, we're not  
15 responsible but some of us have been involved  
16 with that. It's really hard to send today's  
17 technology buses or vans, you know, when a trip  
18 takes almost \$30 of subsidy per trip per  
19 passenger. That's--you know, that's hard to  
20 figure out.

21           Just like when we said, you know, there  
22 are certain parts of the county where there  
23 wasn't water and there wasn't perc-- soils so it  
24 didn't make sense to have as much housing there.  
25 Public transit kind of works that way, and public

1 transit's going to change. And I--in spite of  
2 that fact, I worked many years to get extension  
3 of the light rail and the project that's under  
4 construction right now in the City of San Diego  
5 going.

6 All of this is going to change. It's  
7 going to change pretty substantially. When you  
8 can have driverless vehicles--electric driverless  
9 vehicle, maybe pick you up in your door, pick up  
10 a few other people going in the same general  
11 direction, and drop you off generally where you  
12 want to be; that's got to be something hard to  
13 compete with. And whether it's public transit or  
14 private, I don't know. But these changes are  
15 coming. There's no question about it. Will  
16 vehicle mile travel go up or down?

17 I would argue that I'm not sure that  
18 that's an important issue as long as the  
19 greenhouse gases are going down. Vehicle mile  
20 travel may stay steady, it may go up, it may go  
21 down. I've shared with this Board now--I'll share  
22 with you again, I've got a little chart. I don't  
23 know if I can get it up on the screen, but this  
24 whole notion of tying the planning to that metric  
25 raises major questions in my mind.

1 I was told years ago we couldn't drive  
2 down air pollution unless we reduce vehicle miles  
3 traveled and also reduce the number of houses  
4 that were built and stop the growth of San Diego,  
5 okay. This is our track record over the last 23  
6 years or so. You'll see that vehicle mile travel  
7 has gone up, population has gone up, and that  
8 blue line shows you air pollution has declined  
9 substantially.

10 We don't have the track record yet that  
11 I can show you the greenhouse gas, but there's no  
12 reason to think that we can't cause it to have  
13 the same relationship that we can reduce  
14 greenhouse gas at the same time that vehicle mile  
15 travels and population growth may increase, and I  
16 feel very strongly if you look at what's  
17 happening in transit and you look at--I mean, if  
18 you look at the changes that are coming for cars,  
19 we are becoming increasingly electrified for our  
20 cars.

21 It's not just the trolley that's  
22 electrified, we're looking at cars and buses and  
23 vans and everything else, and it's not that far  
24 down the road. It may be--you know, there may be  
25 a preponderance of hybrids today, and I'm one of

1     them, but in the future it's clear to me while  
2     this--when this range increases happen and I--you  
3     know, program that we were showing new car, you  
4     know, with a 200 mile plus range that are  
5     commonly available now, all electrics, the  
6     dynamic is changing dramatically.

7                     And you couple that technology where I  
8     can send a driverless car to pick you up--which  
9     in public transit may just--the largest cost  
10    factor is our drivers. That's the biggest part of  
11    our operational expense, is our employees. You  
12    can't do away with employees, and I'm not saying  
13    that's the goal, but you start transporting  
14    people and you--in driverless vehicles, that's  
15    why Uber and Lyft and Google and everybody else  
16    is putting so much effort into that, because  
17    that's where it's going to be at.

18                    It's going to be a different kind of  
19    ridesharing, perhaps. It's going to be a  
20    different kind of public transit, and I think  
21    maybe Mark in his comments got that right.

22                    We're doing a pretty good job, okay.  
23    Not a pretty good job, we're doing a very good  
24    job, and we're going to keep doing it. I have  
25    just as much confidence that we can do the same

1 for greenhouse gas emissions.

2 Now, if the rest of the world doesn't  
3 follow us, then we're in big trouble; it's not  
4 going to make a whole lot of difference. But I'm  
5 seeing that, and I've spoken on this issue in  
6 China and in other foreign countries. I'll just  
7 tell you, the world is changing dramatically. And  
8 I've seen it going on and we think that it's not,  
9 but it is.

10 I was concerned when I saw some of the  
11 early options with the cost increases for housing  
12 and for commercial development. They weren't just  
13 large, they were extremely large, and while there  
14 is still some in here, I think we're at a more  
15 manageable level and it's a compromise that I'm  
16 willing to make.

17 But I also want staff to keep an eye  
18 and be innovative, because anything we can do to  
19 bring down the cost of housing, I think, is long  
20 overdue. I'm spending a lot of my time working on  
21 homelessness in San Diego, and this Board has  
22 taken the lead on that in committing properties  
23 for affordable housing, in committing a major  
24 investment fund to instill both innovative  
25 projects and other projects and get things going

1 here.

2                   So, you know, I'm very proud of what  
3 this Board has done. I think we have to be  
4 vigilant and we have to--the numbers that you  
5 pointed out, we're way behind. You know, we could  
6 absorb 100,000 units overnight and not even think  
7 about it and give people choices. You know, not  
8 everybody is as fortunate, I think, as I am. I've  
9 heard people testifying who live a long way off  
10 from here, and I live about a mile and a half  
11 from here.

12                   I suspect I've had a lot fewer vehicle  
13 miles traveled than most of you. But not  
14 everybody can make that choice. Yeah, not  
15 everybody has been as fortunate and maybe making  
16 the right decisions. I knew when I finished  
17 school that--and moved back to San Diego, I  
18 wanted to live as close to the center of the city  
19 as I could. And I didn't know about greenhouse  
20 gas then. That was a whole lot of reasons, but  
21 I've committed my own choices to that.

22                   But I want people to have choices. And  
23 when you're out looking for a job, you might not  
24 find a job in your neighborhood. This is this  
25 model that's out there that is so fraudulent,

1 that you're going to work in the same  
2 neighborhood you live and you're going to walk to  
3 work and you're going to have the grocery store  
4 next to you and your barber shop will be there  
5 and your doctors will be there and the hospital  
6 will be around the corner.

7           And you won't have any bad habits like  
8 golf where you have to get on the trolley with  
9 your golf bag and drive--you know, and go  
10 somewhere. You know, it's an image that works for  
11 some people, but it doesn't work for everybody,  
12 and I feel very strongly about this. I want to do  
13 the right thing. I want to get the vehicle mile  
14 travel. It's something we can monitor, but it  
15 doesn't direct policy and we may find out in the  
16 future that, just as reducing air pollution, that  
17 it was largely irrelevant.

18           And we shouldn't say we have to do this  
19 only in the county. We have verifiable programs  
20 outside of the county; we should be able to do  
21 it, if we're sincerely wanting to reduce  
22 greenhouse gas. We don't have to do it in most  
23 expensive--if we can find effective--cost  
24 effective programs that are outside the county  
25 just as the State has, we ought to do it that

1 way.

2                   What we ought to do is keep our eye on  
3 the goal and make sure that we are annually  
4 meeting obligations and getting to that goal, and  
5 someday somebody will pop a bottle of champagne  
6 and say, hey, guess what? We reached that magic  
7 number, but guess what? We've decided that  
8 because there are places on the planet, aren't  
9 doing enough, we're going to do a little more.  
10 But you move that goal way down the road, but  
11 keep your eye focused on that goal now.

12                   Modified Option 3 does all of these  
13 things. I think it gives us a platform for going  
14 forward that is far, far better, gives us the  
15 flexibility that we may need, and gives us  
16 absolutely the opportunity to get to that  
17 reduction in greenhouse gas, and that's why I'm  
18 offering that as a substitute motion. I think  
19 it's the better solution, and I think we're on  
20 the right track and I think we're going to get  
21 there.

22                   CHAIR KRISTIN GASPAR: Okay, we have a  
23 substitute motion on the floor. Is there a second  
24 on the substitute motion?

25                   SUPERVISOR GREG COX: I'll second the

1 motion.

2 CHAIR KRISTIN GASPAR: Okay. I don't  
3 know how the Board likes to handle it. On the  
4 City Council level, we voted immediately on the  
5 substitute motion. Is it the preference of the  
6 Board to do so?

7 SUPERVISOR GREG COX: No.

8 CHAIR KRISTIN GASPAR: Okay. Roberts  
9 Rules of Order affords you the opportunity to do  
10 it otherwise.

11 SUPERVISOR RON ROBERTS: Well, you  
12 should give people a chance to discuss it.

13 CHAIR KRISTIN GASPAR: And you can, but  
14 procedurally when you have a substitute motion  
15 the book says you should vote on it immediately,  
16 but I'm happy to afford that flexibility and hear  
17 from Supervisor Cox. I don't want to stress you  
18 out, but I do have an appointment that's  
19 happening. We were supposed to break today from  
20 12 to 1:30, so hopefully we can do this as  
21 efficiently as possible.

22 SUPERVISOR COX: I--

23 VICE CHAIR DIANNE JACOB: Could I just  
24 ask--I had asked the Chair on her motion to  
25 include certain points in that motion. Would that

1 be acceptable to the maker and the second?

2 SUPERVISOR RON ROBERTS: I'm hesitant to  
3 do that because of the caveats that staff has  
4 given us.

5 VICE CHAIR DIANNE JACOB: Because of the  
6 what?

7 SUPERVISOR RON ROBERTS: The staff has  
8 been concerned about sort of the rippling effect  
9 of making changes, and you know, I--the number of  
10 differences--

11 VICE CHAIR DIANNE JACOB: It's not a  
12 change.

13 SUPERVISOR GREG COX: She didn't--

14 SUPERVISOR RON ROBERTS: Oh, the  
15 additional items?

16 VICE CHAIR DIANNE JACOB: Yes.

17 SUPERVISOR RON ROBERTS: Oh, I would  
18 feel very comfortable with those, Supervisor.

19 VICE CHAIR DIANNE JACOB: Okay.

20 SUPERVISOR RON ROBERTS: Yes, I would.

21 VICE CHAIR DIANNE JACOB: So, the only  
22 difference here is 90 percent or 100 percent.

23 SUPERVISOR RON ROBERTS: That's right.

24 SUPERVISOR GREG COX: And the original  
25 motion stands.

1 SUPERVISOR RON ROBERTS: And I would  
2 feel comfortable with that.

3 SUPERVISOR GREG COX: Madam Chair, thank  
4 you. I would also thank everybody for coming down  
5 to testify today. I appreciate the commitment and  
6 the time and the effort that everybody has put  
7 into this. Regardless of which Climate Action  
8 Plan option the Board chooses today, I think our  
9 staff has laid out a great plan that will allow  
10 us to achieve the State greenhouse gas emission  
11 reduction goals by 2020 and by 2030. I want to  
12 thank the staff again for all the hard work they  
13 put in in creating this--what I consider to be a  
14 very comprehensive plan.

15 After hearing the different  
16 stakeholders, the public, and receiving staff's  
17 report and comments, I'm really strongly in favor  
18 of the Modified Option 3 proposal that Supervisor  
19 Roberts has offered as amendment.

20 This option represents 26 different  
21 measures that we have the ability to track, that  
22 are realistic to achieve, and that are  
23 enforceable and that make an impact locally. When  
24 considering wholesale policies like the Climate  
25 Action Plan, we need to take into account a

1 number of things, and one of those is housing  
2 affordability.

3 So, we've heard people speak today  
4 about their children and their grandchildren and  
5 about wanting to have a clean environment. That  
6 is absolutely important, but it's also, I think,  
7 important that we provide an opportunity for our  
8 kids and grandkids to be able to afford to buy a  
9 house here, and not force them to move to some  
10 other state or some other place across the  
11 country.

12 There was a recent Union-Tribune  
13 article that cited a nationwide study that it  
14 would take a San Diegan with a bachelor's degree  
15 and no debt about 12.4 years to save for a down  
16 payment for a condo that costs \$377,100. Those  
17 are hard to find anywhere in this region. For  
18 someone with a bachelor's degree and student  
19 debt, it would take 16.3 years.

20 And someone with no college degree is  
21 looking at 24.4 years. It's no wonder that  
22 families that are facing the hard choice between  
23 struggling to stay here and moving somewhere else  
24 to achieve a more affordable home, is a reality.

25 Modified Option 3 takes into

1 consideration impacts to housing costs. It brings  
2 the incremental impact on a new home from \$15,381  
3 down to \$1,500. That difference can represent  
4 years of savings for some families.

5 Modified Option 3 also recommends a  
6 target of achieving 90 percent renewable  
7 electricity. To be clear, this Board is not  
8 making the decision today on what model to move  
9 forward with on a renewable energy program. Our  
10 County staff has already indicated that's  
11 something that they're going to be evaluating and  
12 returning to us within the next 18 months to  
13 present their findings from an analysis between  
14 the different renewable energy program models.

15 Today, we're only looking at either a  
16 commitment or 90 percent or 100 percent target  
17 for renewable energy. While I'm a big fan of  
18 renewable energy and its positive impact to our  
19 air quality and environment, I believe that at  
20 this point in time, the 90 percent threshold is  
21 more appropriate and a more realistic target to  
22 have us work towards.

23 It commits the county to a very high  
24 percentage of renewable energy and provides  
25 alternatives to achieving our greenhouse gas

1 reduction targets. I say this understanding that  
2 the cap is a living document that is to be  
3 updated every five years and that there will be  
4 opportunities to revisit these measures as we  
5 move into the implementation of this plan.

6 Now, I know in accepting or offering  
7 Modified Option 3, it does indicate that we would  
8 look at modifying or updating community plans--15  
9 community plans instead of 10 community plans. As  
10 I recall, I think we have about 26 community  
11 plans in the unincorporated area of the county,  
12 and I would just point out that we did the  
13 General Plan update in 2011.

14 That means that over the next 19 years,  
15 we would be updating 15 of those community plans.  
16 I don't think that's unreasonable. In fact, I  
17 think it's something we should be doing. If we  
18 recall, it took us 32 years to do a General Plan  
19 update. I think the community plans are certain  
20 significant building blocks of our General Plan,  
21 and we ought to be taking 15 of those community  
22 plans over the next--now it would be what, 12  
23 years--to update and make sure that they are  
24 consistent and to figure out ways that we can  
25 address vehicle miles traveled. I think that's an

1 appropriate way to deal with that issue.

2 And I guess I would point out that the  
3 Climate Action Plan is not a cap or a ceiling. In  
4 this Climate Action Plan, we're going to be  
5 trying to reduce 897,145 metric tons of CO2. That  
6 is a target that we absolutely have to make, but  
7 it's not a ceiling.

8 To me, it's a floor, and we've got 51  
9 different measures that staff has laid out, not  
10 all of which were going to be addressed in what  
11 is included in Modified Option 3, but are other  
12 measures that could be implemented and should be  
13 implemented where we can realistically do that as  
14 we move forward over the next 12 years in  
15 implementing this Climate Action Plan.

16 No matter which option we choose today,  
17 our county is taking a huge step towards ensuring  
18 a cleaner, greener future for today and for  
19 generations yet to come. We're working to protect  
20 the sunshine, the beaches, and the clean air that  
21 makes this San Diego region so beautiful and  
22 beloved by all. There's something we can--this is  
23 something that we can and we should be very proud  
24 of, and I think Modified Option 3 is the best  
25 roadmap to get to that goal. Thank you.

1 CHAIR KRISTIN GASPAR: Thank you,  
2 Supervisor. Supervisor Horn.

3 SUPERVISOR BILL HORN: Thank you, Madam  
4 Chair. I'll try to get you to your appointment  
5 before 1:30, whatever it is. I won't be a long-  
6 winded as my colleagues here. Now you know why I  
7 voted against the General Plan. I brought up a  
8 lot of these issues when that plan was here and I  
9 voted no, and I was the only one on this Board  
10 who voted no.

11 So, now we're stuck with a cap  
12 mitigation measure on that General Plan, and make  
13 no mistake, the minute we vote on this they're  
14 going to file another lawsuit. That's what they  
15 do. They want you to quit building roads and  
16 everybody to jump on public transit. They  
17 obviously are not like me who has to drive two  
18 hours a day to work, home--two hours here and two  
19 hours back, every day, even when the traffic is  
20 good. If the traffic is not good, it's like  
21 yesterday which took, what, two-and-a-half hours  
22 to get here.

23 And I enjoy the drive. I memorize  
24 things and listen to the radio and what have you,  
25 but the point is, many of us--in Dianne's

1 district and my district I think there's--I don't  
2 know what the current population--last time I  
3 looked it was like 539,000 people--who live in  
4 the unincorporated area, in these outlying areas.  
5 I know you'd like us all to get on public  
6 transit.

7 I've sat on the North County Transit  
8 Board for the last 23 years, both the buses and  
9 the heavy rail, and I'm sure MTS is the same way,  
10 but we have declining ridership at the moment.  
11 We're not sure where that's going to stay, but as  
12 far as the cost of our drivers, Ron, we  
13 outsourced our drivers a few years ago, so that  
14 put us in the black. But that's a problem.

15 And out where I live, if I were to  
16 catch the bus at 7:00 in the morning, I'd be here  
17 about 4 in the afternoon. That's about how long  
18 it would take, and that's even with rapid service  
19 once I got there.

20 So, you're not going to get us out of  
21 our cars. I happen to live on a farm. I've been a  
22 farmer for 40-some-odd years. I enjoy that  
23 lifestyle. I enjoy growing crops. I see [UNINTEL]  
24 in the audience.

25 My electric bills are far too high for

1 pumping water, but the point is, it's a way of  
2 life and we're part of your economy. We're not  
3 the biggest part of it, but we--you know, we're  
4 the fourth largest industry in the county, and  
5 many of you want to keep us green. You want us to  
6 keep those hills green and you want us to  
7 continue to produce that product. But at the same  
8 time, you penalize us with some of these  
9 regulations--horrendous regulations.

10 So, I looked at the plan, I studied  
11 these things. I spent a long time on this.  
12 Frankly, I want to thank Sara and Mark and their  
13 entire [UNINTEL] team, and I usually don't  
14 compliment you guys because I'm usually on the  
15 other side, but I will say, what you've provided  
16 us with options was terrific, and I--the public  
17 is not seeing the size of these notebooks that we  
18 have that we got from [UNINTEL] that we have to  
19 look at and study.

20 But at the same time, I'm interested in  
21 resolving this issue with the Court. That's the  
22 biggest issue to me. And if it's--I think 100  
23 percent will make the judge happy, I want that.  
24 If it's 90 percent, if we can achieve that, I'll  
25 go with that. I prefer 90 percent rather than

1 100. I think 100 is a goal, but at the same time  
2 I don't know that you're ever going to achieve  
3 that goal. I don't know. I'm concerned.

4           You know, Ron mentioned, and I give the  
5 entire Board credit for this, but years ago--and  
6 I've lived here my entire life and I'm 74 years  
7 old. I don't know if you remember the air in the  
8 old days when the wind blew in from L.A. I'm sure  
9 Ron does. It looked like fog, but it was smog.  
10 And as far as clean air goes, I will give the  
11 County of San Diego Boards before us and ours  
12 included, for cleaning up this air. You go  
13 outside, and it's a beautiful day. And the reason  
14 it's a beautiful day is because it's not full of  
15 smog, fog, or whatever you want to call it.

16           So, we've done a good job there. I  
17 think we've done a good job in the other areas.  
18 I'm concerned with the stats that the Chairwoman  
19 gave us, because this is a big issue to me. We  
20 haven't been building the houses; we rejected the  
21 build. We just haven't been doing it. You know, I  
22 was concerned and Ron and I talked about this  
23 earlier.

24           We just approved two projects this year  
25 that declined--I mean, they went from 1,400

1 houses down to, what, 400 or something like that.  
2 I want--I want those extra houses banked  
3 somewhere else. I want--if you--if we have a  
4 developer who can come in here and get that  
5 density bonus and move it into his neighborhood  
6 and can pay for that, I want to sell him those  
7 increases.

8                   And I'm going to provide a Board  
9 [UNINTEL] to make that kind of thing happen,  
10 because I think we ought to meet our target. And  
11 as much as I sit on SANDAG and I hear the same  
12 speakers that come to SANDAG. They want to move  
13 your road money over to buses or trains, and I've  
14 been on buses and trains for a long time, 23  
15 years.

16                   I don't care--even if we tripled the  
17 number of riders in a daily capacity, you're  
18 still not going to get people out of their cars.  
19 I mean, even though more people would be riding  
20 those vehicles, you're still going to have a  
21 problem. You're going to have a clogged I-5 and a  
22 clogged I-15 and a clogged 8, because the transit  
23 doesn't go everywhere.

24                   It's great when you're in the middle of  
25 the City of San Diego and you can go from La Mesa

1 to downtown on a red train, but at the same time  
2 that doesn't happen everywhere and so I will  
3 vote--I could vote on both of these. I seconded  
4 the first motion so we'd have the discussion  
5 because I wanted to have the discussion. I don't  
6 care whether it's 90 or 100. What I care is what  
7 will the judge want, and I've--I just want to get  
8 rid of the lawsuit, is what I'm concerned about.

9 We're not going to get rid of the folks  
10 who want us to save every poll bearer in the  
11 town, but it's not going to happen. So, anyway, I  
12 just want to make progress here, and I will--  
13 depends on how my colleagues vote, I'd like to  
14 know how you're all going to vote, but I don't  
15 care whether it's 90 or 100. I don't care--I  
16 really don't care whether it's 90 or 100, I just  
17 want to resolve the issue.

18 CHAIR KRISTIN GASPAR: Thank you,  
19 Supervisor, and I agree with you that another  
20 goal is to get this out of court and into action,  
21 and that's why I think that the 100 percent helps  
22 us to get there faster, and that's why I  
23 supported that original motion that was on the  
24 table. Supervisor Jacob.

25 VICE CHAIR DIANNE JACOB: Thank you,

1 Madam Chair. I'll try to be brief, but just a  
2 question to counsel. One of the things we're  
3 trying to do is satisfy the judge. You know, it's  
4 not the most important issue that's before us,  
5 obviously, the main issue, but is it--do you  
6 think it's going to make a substantial difference  
7 to the judge whether it's 90 percent or 100  
8 percent?

9 CLAUDIA SILVA: Supervisor Jacob through  
10 the Chair, the--of the staff recommendation and  
11 all options presented to you including the  
12 modified option are all substantiated by  
13 substantial evidence in the record and they have  
14 an environmental impact report that has also  
15 analyzed all those impacts.

16 The judge's requirement is to have a  
17 Climate Action Plan that complies with CEQA. We  
18 believe the Climate Action Plan does comply with  
19 CEQA. The various options that are presented to  
20 you are already analyzed and contain the  
21 appropriate findings to do that. I wouldn't  
22 presume to know what the judge may have a  
23 preference for, whether it's 90 or 100 percent,  
24 but based on the contents of the documents, the  
25 sufficiency of the records, the appendices to the

1 Climate Action Plan, the Environmental Impact  
2 Report and all of its technical reports and  
3 studies, do support the findings that are before  
4 you for consideration on each of those options.

5 VICE CHAIR DIANNE JACOB: So, I guess we  
6 won't know until we get before the judge. When I  
7 started off, I indicated that, you know, where I  
8 sit on this is, you know, what's best for the  
9 people and the future--folks in this county,  
10 what's legal, what's realistic, what's practical.  
11 And when I look at the last two, what's  
12 realistic, what's practical; although I support  
13 the Chair's motion on that, but I could go either  
14 way also.

15 Maybe the 90 percent is more realistic,  
16 more practical in terms of getting there. The--  
17 so, I could go either way. I don't know where  
18 that leaves us, but I just want to make one other  
19 comment. When we talk about updating community  
20 plans because Modified Option is 15, not 10. You  
21 know, it's just about as bad, and maybe Greg's  
22 right that in 19, 20 years they'll need to be  
23 updated.

24 Maybe the whole General Plan will be--  
25 need to be updated again. But I would just say in

1 our back-country areas, particularly that are  
2 ground water dependent, no sewer service, I would  
3 submit to you the best way--you're not going to  
4 reduce vehicle miles traveled. Forget that.  
5 You're not going to have public transit out  
6 there. I mean, it's ridiculous to even think that  
7 you're going to do that.

8           And as Ron mentioned, I'm not sure that  
9 that's related to what we're trying to accomplish  
10 here today anyway. I would submit that as much as  
11 we can have self-sustainable housing and with  
12 electric cars you're going to reduce your GHG.  
13 That would be my vision, my goal, for our back-  
14 country areas and I would also submit to the  
15 board, you're going to have more affordable  
16 housing out there than you can produce in an  
17 urban area because you will not only have just  
18 the initial cost of your house that is self-  
19 sustainable, but you've got your water source,  
20 you've got your sewer source.

21           You're not dependent on outside sources  
22 and energy, that you will have less affording--  
23 more affordable, not just the initial costs but  
24 ongoing costs into the future. So, I would hope  
25 that you would take a look at that. None of us

1 are going to be here in 19 years, at least on  
2 this board when whoever is looking at this, but I  
3 would hope that would put--be put in this  
4 somewhere into our process and what we're doing  
5 today.

6 So, we just need to get off the dime on  
7 this and if the best way to do it is with the  
8 substitute motion, I can vote for that, but Madam  
9 Chair I'd kind of put it in your lap because I  
10 could also go with the 100 percent, so...

11 CHAIR KRISTIN GASPAR: Supervisor Cox,  
12 you had additional comment?

13 SUPERVISOR GREG COX: Just real brief. I  
14 don't think our role here is to try to anticipate  
15 what a judge may decide is the best way to get to  
16 our target. We have a target of 897,145 metric  
17 tons that we have to achieve. How we get there, I  
18 think, give us more flexibility on Modified  
19 Option 3, and I certainly hope we go far beyond  
20 that.

21 That should be something that we strive  
22 for. But I think whatever we do is going to be a  
23 potential target that people are going hold us  
24 to, and that's where I think having a little more  
25 flexibility in how we get to that target and

1 hopefully go beyond it, Modified Option 3 gives  
2 us that opportunity.

3 CHAIR KRISTIN GASPAR: Thank you. With  
4 that, I'll support my colleagues in the Modified  
5 3 Option for my vote today. I think we've  
6 exhausted discussion and we will vote.

7 ANDREW POTTER: Chairwoman Gaspar,  
8 [UNINTEL] counsel has a couple comments to make.

9 CHAIR KRISTIN GASPAR: We will not vote.

10 CLAUDIA SILVA: Thank you. Madam Chair,  
11 the original motion placed had 10 separate listed  
12 items as part of that original motion. Modified  
13 Option 3 is contained in supplemental  
14 information--it's titled Supplemental Information  
15 Modifying Option 3. There's two quick corrections  
16 to two of those line items I'd just like to read  
17 in the record as part of the motion for accuracy.

18 Item one, adopt the California  
19 Environmental Quality Act Findings for Modified  
20 Option 3 which include the certification and  
21 findings regarding significant effects of the  
22 project, the mitigation and monitoring reporting  
23 program, the statement of overriding  
24 considerations and the recirculation statement  
25 prepared pursuant to CEQA Guidelines Sections

1 15088.5, 15090, 15091, 15093, and 15097 and  
2 certify the final supplemental environmental  
3 impact report, final SEIR. The changes to the  
4 modified CEQA findings are attached in  
5 Supplemental Information Modifying Option 3  
6 Attachment D.

7           The other item is item four of the  
8 original motion which is adopt draft climate--  
9 Final Climate Action Plan for Modified Option 3  
10 which included the draft final SEIR. Increased  
11 solid wasted diversion alternative would replace  
12 the components of GHG Reduction Measure SW-1.1,  
13 remove GHG Reduction Measures G-3.1, E-1.1, E-  
14 1.3, E-2.2; accelerate implementation of GHG  
15 Reduction Measure T-1.3 by updating 15 community  
16 plans by 2030 and an additional four community  
17 plans between 2031 and 2040; a local direct  
18 investment program would be implemented to  
19 achieve a total reduction of 176,614 metric tons  
20 and measure E-1.2 would be modified to include a  
21 program for existing homeowners meeting certain  
22 income criteria to reduce the cost to replace  
23 natural gas tank based water heaters with solar,  
24 electric, or tankless gas. All of those are  
25 attached in the Supplemental Information

1 Modifying Option 3 Attachment A.

2 In addition, there were two additional  
3 attachments, B and C, to the Supplemental  
4 Information that should also be incorporated into  
5 that.

6 ANDREW POTTER: And I will also add that  
7 an errata has been distributed with language for  
8 Exhibit A to Attachment F-1 and Exhibit A to  
9 Attachment F-2 that's currently located in the  
10 record as Attachment C of the Board Letter, the  
11 General Plan Amendment for Climate Action Plan.  
12 For clarity purposes, these exhibits were  
13 attached to the errata and added to Attachment F-  
14 1 and Attachment F-2 respectively as part of the  
15 motion.

16 VICE CHAIR DIANNE JACOB: And just to  
17 clarify, the motion also includes the additions  
18 that had mentioned earlier.

19 CHAIR KRISTIN GASPAR: What would we do  
20 without this team. We're going to vote on the  
21 substitute motion.

22 ANDREW POTTER: Chairwoman Gaspar, that  
23 motion passes unanimously with all board members  
24 being present and voting aye.

25 CHAIR KRISTIN GASPAR: Thank you. That

1 was easy. Okay. I'm actually--if our Vice  
2 Chairwoman wouldn't mind handling the  
3 adjournment, I thank you for being here today and  
4 being a part of this important issue for the  
5 County. And I'll turn things over into the  
6 capable hands of our Vice Chair Jacob.

7 VICE CHAIR DIANNE JACOB: Thank you,  
8 Madam Chair. We have two adjournments of the  
9 meeting today. Supervisor Cox and Supervisor Cox.

10 SUPERVISOR GREG COX: thank you, Madam  
11 Chair. Actually, ironically both of these  
12 individuals that I'm going to ask us to adjourn  
13 today's meeting in honor of, suffered what I  
14 think was one of the greatest indignities that  
15 we've had to deal with and that is, during World  
16 War II when a lot of our American citizens that  
17 were of Japanese ancestry were basically forced  
18 into internment camps.

19 The first one is Ben Segawa who is a  
20 Bonita resident, and he was a survivor of the  
21 camp over in Arizona. He was there for, I think,  
22 three years but he went on to come back to his  
23 home community of Chula Vista, became a very  
24 successful and important member of the community.  
25 He passed away on January 26th at the age of 87.

1                   Mr. Segawa was raised in South County  
2 where his family farmed 40 acres of spinach,  
3 string bean, and beets. In 1942, when he was 11  
4 years old, he and his family were forced into an  
5 internment camp in Arizona. Almost 18,000  
6 Japanese Americans were imprisoned there  
7 including more than 100--1,100, I should say,  
8 from San Diego.

9                   Living conditions were harsh, but after  
10 more than two years at the camp, Mr. Segawa and  
11 his family were allowed to return home. He  
12 continued farming, then later sold pesticides and  
13 equipment to other farmers and became a real  
14 estate agent. In his later years, Mr. Segawa  
15 began raising awareness of the plight of  
16 internment camp survivors and helped create the  
17 Japanese American Historical Society of San  
18 Diego.

19                   Mr. Segawa is survived by his wife  
20 Grace, his sons Mike, Randy, and Eric, and a  
21 daughter Debra. Ben Segawa survived one of the  
22 darkest chapters in American history to become an  
23 inspiration for our community and our nation, and  
24 we will dearly miss him.

25                   The second adjournment is in memory of

1 Dr. John K. Yamamoto, a long-time popular Bonita  
2 dentist who was very active in the community. He  
3 passed away on January 5th at the age of 78. Dr.  
4 Yamamoto graduated from Chula Vista high school.  
5 He served in the U.S. Army after high school and  
6 later he attended San Diego State University and  
7 dental school in Ohio before beginning his  
8 medical career in Chula Vista in 1971.

9 Dr. Yamamoto not only was my wife's  
10 dentist, but he was a student in my aunt's class  
11 at Feaster Elementary School when he came back  
12 from being interred up at Santa Anita racetrack.  
13 He and his family, his parents and siblings  
14 basically lived in a horse stall at Santa Anita  
15 racetrack for, I believe, three years.

16 When he came back to Chula Vista, my  
17 aunt as he later related to me was very helpful  
18 in trying to reintegrate him and other Japanese  
19 American students that came back after they were  
20 interred at various locations across California  
21 and the west.

22 He became a very popular dentist,  
23 treating thousands of patients over a 44-year  
24 career, earning the nickname Dr. Painless. Dr.  
25 Yamamoto also found time to serve his community,

1 helping to launch the United Asian American  
2 Council. He became a renowned martial art  
3 instructor. In fact, he had black belts in two  
4 different martial arts and also was involved in  
5 coaching Little League baseball.

6 Dr. Yamamoto is survived by his wife  
7 Amy and his children Lisa and David. Dr. John K.  
8 Yamamoto was one of those trusted figures who are  
9 woven into the fabric of our communities, and he  
10 will be dearly missed by his patients and by many  
11 other people who had the opportunity to know him  
12 over the years.

13 Thank you, Madam Chair.

14 VICE CHAIR DIANNE JACOB: Thank you,  
15 Supervisor, and I'd like to thank all of those  
16 that have stuck with us this afternoon--it is  
17 afternoon already, and for your patience during  
18 this hearing. And with that, our meeting is  
19 adjourned.

20 ANDREW POTTER: The next regular meeting  
21 of the Board will take place on Tuesday, March  
22 13th, 2018. The annual State of the County  
23 address will take place on Tuesday, February 27th  
24 at 6 p.m. at the Scripps Seaside Forum in La  
25 Jolla.
