**MONTHLY GROUNDWATER MONITORING REPORT – SEPTEMBER 2017**  
**TULE WIND CONSTRUCTION PROJECT**  
**EAST SAN DIEGO COUNTY, CALIFORNIA**

---

On behalf of Avangrid Renewables, LLC (Avangrid), Geo-Logic Associates (GLA) is pleased to provide this letter presenting September 2017 daily water level data and weekly flowmeter readings from project construction-related wells (production wells 6, 6a, and 8, and piezometer PZ-1) on Rough Acres Ranch. In accordance with the requirements established in the County of San Diego Planning and Development Services in the Major Use Permit 3300 09-019, weekly groundwater production data must be recorded from wells 6, 6a and 8, and daily water level data measured in the piezometer (PZ-1) and in wells 6 and 8, when project construction is occurring. This report presents a summary of the collected data obtained in September 2017.

Following initial training by GLA on water level and flowmeter protocols for the Tule Wind construction project, daily water levels and weekly flowmeter readings are being obtained by Carol Brady with LG Equipment. Additionally, wells 6, 8, 8a and PZ-1 are each equipped with a pressure transducer to measure and record water level data, which can be uploaded to corroborate the manual measurements throughout the construction program. Well 6a is a non-community public water supply well, supplying water to Rough Acres Ranch, and a pressure transducer cannot be inserted into this well; collection of water levels in this well is not required.

Weekly Flow Meter Readings. Flowmeter readings at each well are recorded on field forms provide in Attachment 1. Well 6b is being used by Rough Acres Ranch for non-construction water for ranch purposes. On September 9 and 20, 2017, the water pipe from well 6b to the Ranch was damaged at two separate locations, which rendered Well 6b inoperable. While the piping was being repaired, Rough Acres Ranch used a total of 48,600 gallons of water from Well 6a for non-construction ranch purposes. The pipe has now been repaired at both locations, and the Ranch is again using non-construction water from Well 6b. The 48,600 gallons of water will be subtracted from this month's and future months Tule Construction water meter readings. Based on the flow meter readings obtained during the September period, some water was pumped from Well 6 to flush out the pipes following the pipe repairs:

### September 2017 Water Production Totals

Well	Gallons Pumped	Acre-Feet Pumped
Well 6	20,700	0.06
Well 6a	0	0
Well 8	0	0
<b>Project Monthly Total</b>		<b>0.06</b>

Note: Total volumes include water pumped to storage (lake or tanks)

Since the start of the project in December 2016, the total volume of water pumped is 51.37 acre-feet; approximately 12.76 acre-feet from Well 8 and the balance (38.62 acre-feet) from wells 6 and 6a (Attachment A – Groundwater Production Summary).

Daily Water Level Data. During the September 2017 period, water levels were measured manually in pumping Wells 6, 8, and piezometer PZ-1 each construction day and recorded on field forms (Attachment A). During prior months, when Well 8 was pumped, the water level dropped below the pressure transducer installed in this well, obstructing access, and a water level could not be measured below the pressure transducer. In lieu of measurements from Well 8, Ms. Brady measured water levels in Well 8a located 286 feet east of Well 8. With pumping discontinued at Well 8, water levels can be measured in Well 8, though water levels in Well 8a continue to be measured and recorded for reference. Table 1 presents a summary of the manual measurements obtained during the month.

Based on the production and water level data presented, the project remains within its required groundwater parameters. Beginning in June 2017, the project began ramping down its draw from the wells. The remaining groundwater as established in the MUP is being held in reserve, in the event that it is needed.

### CLOSING

This monthly report pertains to the Avangrid Tule Wind Project. It may not be appropriate for other projects or for other sites. If you have any questions, please contact me.

Sincerely,  
Geo-Logic Associates

Sarah J. Battelle, CHG 609  
Principal Geologist
