## Memo

600 B Street, Suite 300 San Diego, CA 92101 916-444-7301

Date: May 31, 2017 (Revised August 7, 2017 January 3, 2018)

To: Planning and Development Services

From: Honey Walters, Poonam Boparai, and Brenda Hom

Subject: County of San Diego Climate Action Plan - Memorandum: Greenhouse Gas Emissions

Reduction Targets, Measures, and Gap Analysis for the Unincorporated County

#### INTRODUCTION

This technical memorandum summarizes the results of the quantitative "gap analysis" process for the County of San Diego (County) Climate Action Plan (CAP). The purpose of the gap analysis is two-fold: 1) to ensure that all greenhouse gas (GHG)-reducing actions to be incorporated in the CAP set the County on course to meet the unincorporated County's proposed GHG reduction targets; and 2) to ensure that specific measures and associated GHG emissions reduction calculations are defensible and appropriate for the purposes of the California Environmental Quality Act (CEQA) streamlining benefits for proposed projects in the future.

The gap analysis process takes into account several steps in the climate action planning process, which are listed below and addressed in subsequent sections.

- 1. Summary of 2014 baseline community-wide GHG emissions inventory;
- 2. Summary of the community-wide GHG emissions projections for 2020, 20402030, and 2050;
- 3. Identification and evaluation of community-wide GHG emissions reduction targets for 2020 and 2030, and a reduction goal for 2050; and
- 4. Quantification of GHG emissions reductions and evaluation of the calculated gap between the estimated GHG reductions and reduction targets.

#### **GREENHOUSE GAS EMISSIONS INVENTORY**

The baseline GHG emissions inventory for the year 2014 includes community-wide sources in the unincorporated County and emissions resulting from County operations occurring both within and outside the unincorporated County. Both sources are included in the unincorporated County's GHG inventory. The purpose of the baseline inventory is to gain an understanding of the sources and levels of GHG emissions within a jurisdiction, as well as to establish a level against which future GHG emissions can be compared. The 2014 GHG emissions inventory is summarized in Table 1. Total emissions from all sectors in the 2014 Inventory were 3,211,505 metric tons of carbon dioxide equivalent (MTCO<sub>2</sub>e) emissions.

Further details with respect to the 2014 community-wide inventory are discussed in Appendix A and Appendix B of the County's Climate Action Plan.

#### **Greenhouse Gas Emissions Projections**

GHG emissions projections are used to estimate future levels in the absence of climate action measures. Emissions projections were prepared for both an unadjusted "business-as-usual" (BAU) and a legislativeadjusted BAU scenarios for 2020, 2030, and 2050. Projections were also developed for 2040 to provide an interim data point. To calculate the unadjusted BAU emissions, 2014 emissions were scaled based on population, housing, and employment growth anticipated in the unincorporated County as projected by the San Diego Association of Governments (SANDAG), assuming no actions would be taken to reduce emissions by federal, state, or local agencies pursuant to Assembly Bill (AB) 32, Senate Bill (SB) 32 or other legislation. No changes in emission factors were assumed because such changes would be associated with legislative actions. The County population, housing, and job projections are available in Section 2.2 of the County's 2014 Greenhouse Gas Emissions Inventory and Projections. The unadjusted BAU projected emissions are shown in Table 2. Additional detail on scaling factors and breakdown of unadjusted BAU projected emissions can be found in Attachment 1.

The unadjusted BAU projections represent theoretical "worst-case" future conditions that scale current emissions by growth, while the legislative-adjusted BAU projections account for future emissions reductions pursuant to AB 32, SB 32, and other legislation in California from a variety of regulations and programs, including the Renewables Portfolio Standard (RPS), improving vehicle fuel economy standards due to

Advanced Clean Cars, and other state and federal policies. (Note that the projected vehicle-miles traveled [VMT] for both the unadjusted and legislative-adjusted BAU estimates include the influence of SB 375 because VMT estimates for the unincorporated County without the influence of SB 375 are not available from SANDAG.

The unadjusted BAU projections for community-wide GHG emissions are summarized in Table 2. Under the unadjusted BAU scenario, unincorporated County GHG emissions are projected to increase by approximately 6 percent by 2020, 16 percent by 2030, and 31 percent by 2050 from 2014 levels.

| Table 2 Unincorporated San Diego County Emissions Unadjusted BAU Projections (MTCO2e/year) |           |           |           |           |  |  |

The legislative-adjusted BAU projections for community-wide GHG emissions are summarized in Table 3. Under the legislative-adjusted BAU scenario, unincorporated County GHG emissions are projected to decrease by approximately 6 percent by 2020, 12 percent by 2030, and 7 percent by 2050 from 2014 levels.

Further details with respect to the GHG emissions projections are discussed in the County's 2014 Greenhouse Gas Emissions Inventory and Projections document.

#### **GREENHOUSE GAS EMISSIONS REDUCTION TARGETS**

This CAP primarily focuses on reducing emissions by 2020 and 2030, consistent with legislatively-adopted State targets. While it is important to create a long-term emissions reduction goal, it would be speculative to demonstrate achievement of a goal for 2050 with the information known today. This is primarily due to uncertainty around future technological advances and future changes in State and federal law beyond 2030. California's GHG reduction targets have been legislatively adopted for 2020 and 2030, while the 2050 goal is expressed in an executive order. In addition, California Air Resources Board's *TheCalifornia's* 2017 Climate Change Scoping Plan Update (Scoping Plan Update) is focused on meeting the 2030 reduction target, as directed in Senate Bill (SB) 32 and Assembly Bill (AB) 32. Therefore, the County's CAP aligns with the State in setting a 2030 target. As climate change science and policy continues to evolve, the County will be able to apply new reductions toward meeting the long-term 2050 GHG emissions reduction goal in future CAP updates, as outlined in Chapter 5- of the County's CAP. As directed in AB 32, SB 32, and Executive Orders B-30-15 and S-3-05, the State aims to reduce annual statewide GHG emissions to:

- 1990 levels by 2020;
- ▲ 40 percent below 1990 levels by 2030; and
- 80 percent below 1990 levels by 2050.

The Scoping Plan Update pursuant to AB 32 indicates that reducing the State's emissions to 80 percent below 1990 levels by 2050 would be consistent with IPCC's analysis of the global emissions trajectory needed to stabilize atmospheric concentrations at 350 ppm or less, to "reduce the likelihood of catastrophic climate change" (CARB 2014).

Some communities do not have baseline inventories dating back to 1990 and, therefore, must extrapolate from more recent inventories. To determine an overall GHG reduction target at the local level that would be consistent with the state's overall targets, CARB recommends community-wide GHG reduction goals for local climate action plans that would help the stateState achieve its 2030 and 2050 targets (CARB 2017). These goals, presented in the Scoping Plan Update, consist of reducing emissions to 6 MTCO2e per capita and 2 MTCO2e per capita by 2030 and 2050, respectively. Considering the overall statewide emissions in 1990 and 2014 and the projected statewide population in 2030 and 2050, these per-capita goals would be equivalent to reducing 2014 emissions by 40% percent by 2030 and 77% percent by 2050 for the County (CARB 2016, DOF 2014). The per-capita targets were determined to be applicable to the County because a goal of the CAP is to achieve State goals and CARB's per-capita metrics provide the means to accomplish that.

The ultimate framework for setting a local GHG reduction target is based on governing legislation (AB 32 and SB 32). CARB identifies local governments as essential partners in meeting State goals and makes recommendations on setting local targets. The State is on track to meet the 2020 reduction targets; therefore, specific reduction goals for 2020 are not described in the Scoping Plan Update. A target equivalent to reaching 1990 levels by 2020 can be calculated by comparing the State's GHG inventories for 1990 and 2014. Per CARB's estimate of California's GHG inventory, the state emitted approximately 431 million MTCO<sub>2</sub>e (MMTCO<sub>2</sub>e) in 1990 and 441.5 MMTCO<sub>2</sub>e in 2014, a two percent increase. Applying this statewide trend at the county level, the County would also need to reduce emissions to two percent below 2014 levels to match 1990 levels. The County does not have a 1990 GHG inventory with which to develop a County GHG target for 2020 due to data constraints; therefore, the State inventories taken in 1990 and 2014 are relied upon to establish reduction targets, which are then applied to the County's 2014 inventory data. The difference between the state's 1990 and 2014 emissions are used to determine the equivalent reduction from 2014 to achieve 1990 emissions at the local level.

Setting a target with respect to a baseline year, such as 2014, is standard industry practice in climate action planning. The original 2008 Scoping Plan developed by CARB recommended a reduction below baseline levels as a valid reduction target, in recognition of the challenges in developing a 1990 inventory for a local jurisdiction. Data used for developing the 2014 inventory represent the best available data, based on improved inventory methodologies and data collection procedures. The same level of rigor cannot be applied to a 1990 inventory and any attempts to extrapolate activity data (e.g., vehicle miles traveled, energy consumption) for 1990 would introduce a large margin of error and provide an inaccurate accounting of county emissions. Therefore, reliance on State data to determine relative reduction levels that can be applied to local 2014 emissions levels is a valid methodology to determine reduction targets.

Emissions caps pursuant to AB 32, SB 32, EOs B-30-15, and S-3-05 are set at a statewide level; therefore, the relative reductions necessary from 2014 levels for the state are applied to the local inventory. It should be noted that statewide GHG emissions have been declining since the original 2008 Scoping Plan. As State regulations to achieve GHG reductions have been implemented, they also have a positive effect on local emissions, as evidenced in the legislative reductions incorporated into the projections. The original Scoping Plan identified a 15% percent reduction target for local governments developing CAPs. However, that relative reduction was based on then-existing levels (i.e., 2005). Because statewide emissions have declined since 2005, the relative reduction required is now lower to achieve the same absolute emissions level (i.e., 431

MMTCO<sub>2</sub>e by 2020). This does not imply that reduction targets for 2020 have been relaxed; rather, this reflects the decline in statewide emissions since 2005. In addition, 2020 is only the first milestone in the State's long-term GHG reduction strategy. Similarly, while the relative reduction target (the reduction percentage) in the CAP is different from that identified in the 2011 General Plan Update (GPU) Program Environmental Impact Report (PEIR), it is still consistent with the reductions mandated under AB 32 for the reasons discussed above. Inventory methodologies and data collection techniques have evolved since certification of the 2011 GPU PEIR; however, the overall framework of reduction targets is inherently based on State legislation. Thus, consistent with CARB's recommended community targets and recent updates to the State's 2014 GHG emissions inventory, the following 2020 and 2030 adjusted reduction targets and 2050 goal should be achieved in the county:

- 2 percent below 2014 levels by 2020;
- 40 percent below 2014 levels by 2030; and
- 77 percent below 2014 levels by 2050.

Attaining a two percent reduction in GHG emissions would require that annual emissions be reduced to approximately 3,147,275 MTCO<sub>2</sub>e in 2020, which is approximately 64,230 MTCO<sub>2</sub>e lower than 2014 levels. To achieve long-term GHG reductions, the County would need to reduce emissions to 1,926,903 MTCO<sub>2</sub>e by 2030, or approximately 1,284,602 MTCO<sub>2</sub>e (40%) percent) below 2014 GHG emissions levels. To achieve a 77% percent reduction in GHG emissions from 2014 levels by 2050, the County would need to reduce its emissions to approximately 738,646 MTCO<sub>2</sub>e in 2050, which is approximately 2,472,859 MTCO<sub>2</sub>e lower than 2014 levels. A detailed technical analysis of the County's emissions reduction targets and long-term goal can be found in Attachment 1 of this memorandum. Table 4 shows the GHG reduction targets alongside the County's emissions over time without including any measures and actions proposed in this CAP.

Legislative actions will help lower GHG emissions in the county by requiring improvements in energy efficiency in buildings and vehicles, lowering emissions associated with electricity generation, and reducing direct GHG emissions, such as from fuel combustion in off-road vehicles. The resulting legislative GHG reductions, shown in Table 4, will occur without any additional action on the part of the County. The overall decrease in emissions is primarily due to reductions from the electricity sector resulting from cleaner electricity generation, improved energy efficiency in buildings, and more fuel-efficient vehicles.

Source: Data compiled by Ascent Environmental in 2017.

Figure 1, depicts the baseline, unadjusted BAU GHG emissions, and legislative-adjusted BAU GHG emissions. The green line indicates the GHG emissions reduction targets for 2020 and 2030 and the goal for 2050. The additional reductions needed to meet the 2030 target and 2050 goal to close the expected "gap" between the legislative-adjusted BAU emissions levels and the targets are also apparent in Figure 1. With respect to emissions beyond 2030, current legislation, such as the Federal Corporate Average Fuel Economy (CAFE) standards, have specific targets and policies that only address activities up to the year 2030. Though advances in new technologies and policy strategies may allow for additional significant reductions in the future, legislative reductions that may occur past 2030 are currently unknown. Thus, past 2030, emission trends assume population growth would continue while legislations no longer improve GHG reductions past 2030. Based on these known current legislations and the County's projected population growth, the County would not be able to meet the 2050 goal at this time; however, with future CAP updates the County will make progress towards the 2050 goal.

Notes:  $MTCO_2e = metric tons$  of carbon dioxide equivalent; BAU = Business as usual Source: Data compiled by Ascent Environmental in 2017.

Figure 1: Baseline Emissions, Unadjusted BAU Projections Emissions, Legislative-Adjusted BAU Projections Emissions, and Emissions Reduction Targets: 2020 through 2050

#### **Greenhouse Gas Emissions Reductions and Estimated Gap**

It is projected that with legislative actions, the County will meet the 2020 target; however, additional GHG reductions are needed to achieve the GHG reduction targetstarget for 2030 and the reduction goal for 2050. As a local government, the County can take action to adopt or update land use plans, enforce or update County ordinances, adjust County operations, encourage or influence County residents and businesses by

partnering with local organizations, and work with local and regional transportation planning or other agencies that provide services or maintain infrastructure that is not directly in the County's control. The County can effectively reduce emissions in some sectors where the County has jurisdictional control (e.g., County operations, land use change), but in some cases the County has limited ability to influence reductions (e.g., on-road transportation). A list of GHG reduction measures was developed based on the County's jurisdictional influence, public input, and other measures based on best practices. The measures have been incorporated into the County's CAP.

GHG reductions associated with these measures were calculated in a step-wise manner for the future years of 2020, 2030, and 2050. In other words, GHG reductions (in MTCO<sub>2</sub>e/year) are assessed during a snapshot in time in years 2020, 2030, and 2050. This is a simplified method of characterizing GHG reductions, which would more realistically occur on a continuous basis. However, a step-wise method is appropriate for a planning-level document for setting the County's GHG reduction targets and monitoring of CAP implementation progress for these future years.

Importantly, GHG emissions reductions were quantified for measures wherever substantial evidence and reasonable assumptions were available to support calculations. The County has identified numerous programs and policies that were not quantifiable at this time due to lack of available data or quantification methods, but would still be expected to reduce GHG emissions. Such programs are characterized as supporting efforts in the CAP document and treated as supporting measures to the strategies and measures that were quantified, and could be tracked for potential quantification in the future if data and/or quantification methods become available in the future.

#### **Summary of Results**

Estimates of GHG emissions reductions, along with an estimated emissions reduction "gap", are summarized in Table 5 and illustrated in Figure 2. Detailed measure descriptions, calculations, and assumptions supporting the GHG reduction estimates are provided in Attachment 1. Measures are organized in the following categories:

- Built Environment and Transportation Focuses on reducing emissions from on-road and off-road transportation through measures that affect land use patterns, travel demand, and low-emission vehicles and fuels.
- Energy Focuses on reducing emissions from the electricity, natural gas, and propane use through reduced energy consumption and greater use of low-emission energy sources.
- Solid Waste Focuses on reducing waste-related emissions through waste diversion efforts.
- Water and Wastewater Focuses on reducing water and wastewater-related emissions through water conservation.
- Agriculture and Conservation Focuses on reducing agriculture-related emissions through conservation, better resource management, and low-emission methods and technologies.

#### Notes:

 $CO_2e$  = carbon dioxide equivalents

GHG = greenhouse gas

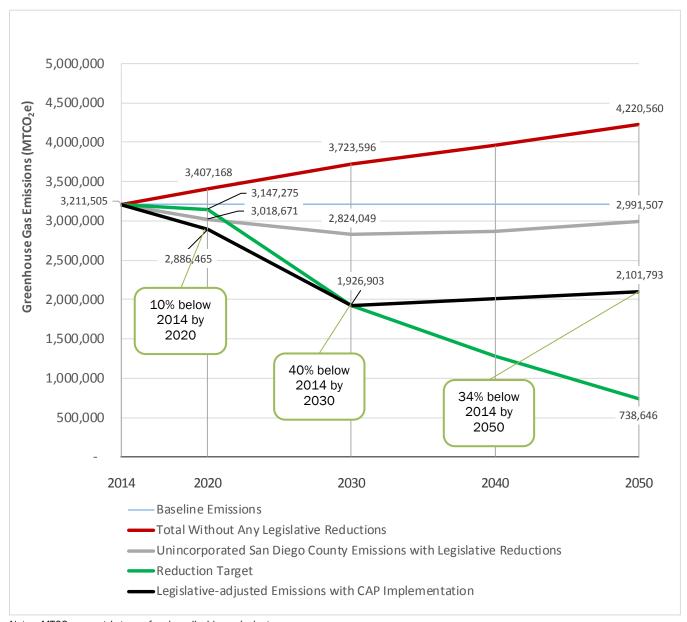

MT = metric tons

TDM = transportation demand management

<sup>a</sup> Full names and descriptions of the measures are available in the main Climate Action Plan document.

Source: Compiled by Ascent Environmental 2017

<sup>&</sup>lt;sup>b</sup> Includes legislative reductions.

Notes:  $MTCO_2e = metric$  tons of carbon dioxide equivalent Source: Data compiled by Ascent Environmental in 2017.

Figure 2: Projections of Greenhouse Gases for the Unincorporated County with Implementation of CAP Measures and Targets: 2020 through 2050

The total estimated GHG emissions reductions from all measures quantified are approximately 132,205 MTCO<sub>2</sub>e in 2020; 897,145 MTCO<sub>2</sub>e in 2030; and 880,943894,170 MTCO<sub>2</sub>e in 2050. The total estimated reductions in 2020 would exceed reductions required to meet the 2020 target. The measure reductions in 2030 would reduce legislative-adjusted BAU emissions to meet the 2030 target. However, the projected GHG reductions from all measures in 2050 would fall short of the long-term goal for 2050. The scale of reductions required to achieve the aggressive longer-term 2050 goal will require significant improvements in

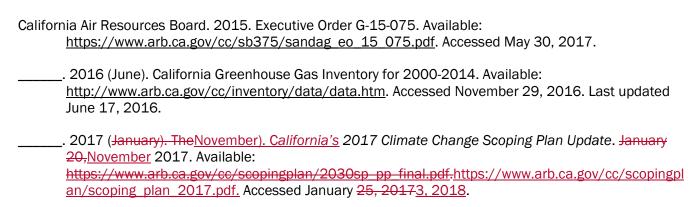

the availability and/or cost of near-zero and zero-emissions technology, as well as potential increased reductions from ongoing state and federal legislative actions that are currently unknown.

This CAP primarily focuses on reducing emissions by 2020 and 2030, consistent with legislatively-adopted state targets. While setting a GHG reduction goal beyond 2030 is important to provide long-term objectives, it is speculative to establish targets beyond 2030 for which defensible reduction assumptions can be made. This is primarily due to uncertainty around future technological advances and future changes in state and federal law beyond 2030. California's GHG reduction targets have been legislatively adopted for 2020 and 2030, while the 2050 goal is expressed in an executive order. In addition, CARB's Scoping Plan is focused on meeting the 2030 reduction target, as directed in SB 32. Therefore, the County's CAP aligns with the state in setting a 2030 target.

In the long term, the quantifiable measures in the CAP fall short of meeting the County's 2050 reduction goal; however, over the coming decades new innovations and technologies will likely become available that will enable further GHG reductions. New methods may become available to quantify measures that are currently unquantifiable. Finally, new state and federal regulations may further reduce emissions in sectors currently addressed primarily by local County measures. As climate change science and policy continues to advance, the County will be able to apply new reductions toward meeting the long-term 2050 GHG emissions reduction goal in future CAP updates, as outlined in the CAP.

| Improve Building Energy Efficiency in New Development              | 2014 | 2020  | 2030    | 2050  |

This calculates the reductions in energy usage solely due to the measure's energy efficiency targets and eventual zero net energy standard in 2020 for residential and 2030 for Non-residential. This calculation assumes energy efficiency gains under this measure only apply to commercial/industrial and residential uses. This measure does not apply to agricultural energy uses.

Also, residential propane is not included in this calculation because a larger portion of energy use for propane is used for cooking, as opposed to space and water heating. However, there is currently no data to indentify that portion or an applicable ratio. In addition, the inventory did not include Non-residential propane use.

| seed 10% above the 2016 code, then the revised State requirement would supercede this measure. |

| Electricity  |            | -                    | 24,037               | 88,102     |
| Natural Gas  |            | -                    | 14,671               | 57,114     |

Note: ZNE aims for a net zero usage in energy, which does not necessarily translate to net zero emissions because natural gas and electricity have different emission factors. If roof-top solar is being used to offset overall energy usage, the reductions in emissions would be greater because there are more emissions reductions per unit of energy for electricity than for natural gas, based on estimated SDGE emission factors.

GHG Reductions from E-1.1 (MTCO2e) - 38,708 145,215

| E-1.2  |      |      |      |
|--|------|------|------|
| Use Alternatively-powered Water Heaters in Residential Development | 2020 | 2030 | 2050 |

Note: Only homes not connected to natural gas utilities are allowed to install electric water heaters (See 2016 California Energy Code, Title 24 Part 6). Measure is conservative in that it assumes no water heaters are converted to solar, which would reslut in more GHG reductions.

Percent of natural gas use in homes by end use in California (assumed to apply to propane -only homes also) 2009 Space Heating 25% Water Heating 34% Cooking 25% Other 16% Water heating usage by fuel type 2009 Natural Gas 85% Electric 11% Propane 4%

Source: EIA 2009. http://www.eia.gov/consumption/residential/data/2009/

Note: This is based on most recent data from the US. Energy Information Administration as of May 2017. There was a survey done in 2015, but the breakdown of fuel use by end use will not be available until 2018.

| Improve Building Energy Efficiency in Existing Development | 2020 | 2030 | 2050 |

This calculation assumes participating buildings would have energy efficiency improvements equivalent to the difference between 2008 and 2016 Title 24 standards. This assumption is based on energy efficiency improvement data available from the CEC and CPUC. Energy efficiency gains under this measure only apply to commercial/industrial and residential uses. It does not apply to agricultural energy uses.

Also, residential propane is not included in this calculation because a larger portion of energy use for propane is used for cooking, as opposed to space and water heating. However, there is currently no data to indentify that portion or an applicable ratio. In addition, the inventory did not include Non-residential propane use.

#### **Energy Reduction Measure Quantification (Continued)**

#### E-2.3

#### Install Solar Photovoltaic in Existing Homes

This assumes that buildings with solar would opt out of the Renewable Energy Program (REP). (See measure discounts in E-2.1). Also assumes that permitted solar panels are constructed six months after permits are approved. An assumption of 5.06 kW per home allows the calculated electricity generated by solar per existing home to match the average energy use per existing home in 2020. With additional improvements in energy efficiency from other measures, some homes may still see lower energy use compared to solar electricity generation post-2020.

| Solar permits approved from July 2013 through January 2017 for |          |                          |                      | Number of Residential |
