Project Name: AUTOZONE

Permit Application Number: PDS2017-LDGRMJ-30144

PREPARER'S CERTIFICATION

I hereby declare that I am the Engineer in Responsible Charge of design of storm water best management practices (BMPs) for this project, and that I have exercised responsible charge over the design of the BMPs as defined in Section 6703 of the Business and Professions Code, and that the design is consistent with the PDP requirements of the County of San Diego BMP Design Manual, which is a design manual for compliance with local County of San Diego Watershed Protection Ordinance (Sections 67.801 et seq.) and regional MS4 Permit (California Regional Water Quality Control Board San Diego Region Order No. R9-2013-0001 as amended by R9-2015-0001 and R9-2015-0100) requirements for storm water management.

I have read and understand that the County of San Diego has adopted minimum requirements for managing urban runoff, including storm water, from land development activities, as described in the BMP Design Manual. I certify that this PDP SWQMP has been completed to the best of my ability and accurately reflects the project being proposed and the applicable BMPs proposed to minimize the potentially negative impacts of this project's land development activities on water quality. I understand and acknowledge that the plan check review of this PDP SWQMP by County staff is confined to a review and does not relieve me, as the Engineer in Responsible Charge of design of storm water BMPs for this project, of my responsibilities for project design.

Final Design

Submittal					
Number		Cummary or Changes			
1	10/26/17	Initial Submittal			
2	04/04/18	Updated Grading Permit Number, revised biofiltration basin configuration and grading, updated total proposed impervious area, updated, updated storm water pollutant worksheet calcs, Form I-8, DMA exhibits and DMA mapbook in Attachment 1, updated Hydromod Compliance report and Hydromod exhibits in Attachment 2, Updated BMP Maintenance Plan and prepared exhibits for the Draft Maintenance Agreement in Attachment 3, included updated plans in Attachment 5, included updated Drainage Study in Attachment 6 and included updated Geotechnical Letter in Attachment 7.			
3	06/28/2018	Updated Step 1 with new Impervious area and WDID No.; updated Step 3.3 with revised project description, updated Land Cover acreages, and updated site drainage patterns; updated Step 3.8 with revised site drainage patterns; updated Step 4.3.8 due to revised landscape			

Template Date: March 16, 2016 Preparation Date: 01/29/2019]

		acreage; updated County BMP worksheets due to revised site grading; updated Attachment 1D exhibit due to revised site grading; updated County of San Diego BMP Verification Form due to new form.
4	01/29/19	Updated Step 1 with revised existing and newly created impervious area and revised total disturbed area. Revised Step 3 to include Existing Development due to having a portion of the two drive access points to the site constructed with the Tractor Supply project (PDS2017-LDGRMJ-30114), updated existing land cover values accordingly and revised wording of existing site drainage patterns as a result of the completed grading and improvements on the adjacent Tractor Supply project. Updated Step 3.3 Project Description to and Change in Land Cover Types due to construction of the adjacent Tractor Supply project. Updated Step 3.4 to account for site impacts from the construction of the adjacent Tractor Supply project.

Step 1: Project type determination (Standard or Priority Development Project)

	Is the project part of another Priority Development Project (PDP)? $(\Box \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \$					
If so, a PDP SWQMP is required. Go to Step 2.						
-	The project is (select one): ⊠ New Development □ Redevelopment ¹					
		•	d newly created or replaced impervious area is:	27,520 ft ²		
			(pre-project) impervious area is:	1,600 ft ²		
The to	otal are	ea dist	turbed by the project is:	42,935 ft ²		
comn must	non pla be obta	n of d ained	sturbed by the project is 1 acre (43,560 sq. ft.) or more OR the project evelopment disturbing 1 acre or more, a Waste Discharger Identification from the State Water Resources Control Board. 3935			
Is the	projec	t in ar	ny of the following categories, (a) through (f)? ²			
Yes ⊠	No	(a)	New development projects that create 10,000 square feet or more 3(collectively over the entire project site). This includes commercial mixed-use, and public development projects on public or private la	al, industrial, residential,		
Yes	No ⊠	(b)	Redevelopment projects that create and/or replace 5,000 square feet or more of impervious surface (collectively over the entire project site on an existing site of 10,000 square feet or more of impervious surfaces). This includes commercial, industrial, residential, mixed-use, and public development projects on public or private land.			
Yes ⊠	No	(c)	New and redevelopment projects that create and/or replace 5,000 impervious surface (collectively over the entire project site), and sith the following uses: (i) Restaurants. This category is defined as a facility that sell drinks for consumption, including stationary lunch counter stands selling prepared foods and drinks for immediate condustrial Classification (SIC) code 5812). (ii) Hillside development projects. This category includes development actual slope that is twenty-five percent or greater. (iii) Parking lots. This category is defined as a land area or far parking or storage of motor vehicles used personally, for commerce. (iv) Streets, roads, highways, freeways, and driveways. This any paved impervious surface used for the transportation motorcycles, and other vehicles.	support one or more of als prepared foods and ars and refreshment consumption (Standard relopment on any acility for the temporary business, or for category is defined as		

Template Date: March 16, 2016 LUEG:SW **PDP SWQMP**

Redevelopment is defined as: The creation and/or replacement of impervious surface on an already developed site. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, and creation or addition of impervious surfaces. Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include routine maintenance activities, such as trenching and resurfacing associated with utility work; pavement grinding; resurfacing existing roadways; new sidewalks construction; pedestrian ramps; or bike lanes on existing roads; and routine replacement of damaged pavement, such as pothole repair.

Applicants should note that any development project that will create and/or replace 10,000 square feet or more of impervious surface (collectively over the entire project site) is considered a new development.

For solar energy farm projects, the area of the solar panels does not count toward the total impervious area of the site.

Project type determination (continued)

Yes	No 🗵	(d)	New or redevelopment projects that create and/or replace 2,500 square feet or more of impervious surface (collectively over the entire project site), and discharging directly to an Environmentally Sensitive Area (ESA). "Discharging directly to" includes flow that is conveyed overland a distance of 200 feet or less from the project to the ESA, or conveyed in a pipe or open channel any distance as an isolated flow from the project to the ESA (i.e. not commingled with flows from adjacent lands). Note: ESAs are areas that include but are not limited to all Clean Water Act Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the State Water Board and San Diego Water Board; State Water Quality Protected Areas; water bodies designated with the RARE beneficial use by the State Water Board and San Diego Water Board; and any other equivalent environmentally sensitive areas which have been identified by the Copermittees. See BMP Design Manual Section 1.4.2 for additional guidance.			
Yes ⊠	No □	(e)	New development projects, or redevelopment projects that create and/or replace 5,000 square feet or more of impervious surface, that support one or more of the following			
<u> </u>			uses:			
			(i) Automotive repair shops. This category is defined as a facility that is categorized			
			in any one of the following SIC codes: 5013, 5014, 5541, 7532-7534, or 7536-			
			7539.			
			(ii) Retail gasoline outlets (RGOs). This category includes RGOs that meet the			
			following criteria: (a) 5,000 square feet or more or (b) a projected Average Daily			
Voc	No	/ f \	Traffic (ADT) of 100 or more vehicles per day. New or redevelopment projects that result in the disturbance of one or more acres of land			
Yes	No ⊠	(f)	and are expected to generate pollutants post construction.			
			Note: See BMP Design Manual Section 1.4.2 for additional guidance.			
			The state of the s			
Does the project meet the definition of one or more of the Priority Development Project categories (a)						
through (f) listed above?						
			ct is <u>not</u> a Priority Development Project (Standard Project).			
⊠ Y€	es – the	e proje	ect is a Priority Development Project (PDP).			
Further guidance may be found in Chapter 1 and Table 1-2 of the BMP Design Manual.						
The following is for redevelopment PDPs only:						
The area of existing (pre-project) impervious area at the project site is: ft² (A)						
The total proposed newly created or replaced impervious area is ft² (B)						
Percent impervious surface created or replaced (B/A)*100: The percent impervious surface created or replaced is (select one based on the above calculation):						
□ less than or equal to fifty percent (50%) – only newly created or replaced impervious areas are						
	uess than or equal to fifty percent (50%) – only newly created or replaced impervious areas are considered a PDP and subject to stormwater requirements					
	OR					
☐ greater than fifty percent (50%) – the entire project site is considered a PDP and subject to						
	stormwater requirements

	Exemption	

Step 1.2: Exemption to PDP definitions

otep 1.2. Exemption to 1 Di definitions	
Is the project exempt from PDP definitions based on either of the following:	If so:
 Projects that are only new or retrofit paved sidewalks, bicycle lanes, or trails that meet the following criteria: Designed and constructed to direct storm water runoff to adjacent vegetated areas, or other non-erodible permeable areas; OR Designed and constructed to be hydraulically disconnected from paved streets or roads [i.e., runoff from the new improvement does not drain directly onto paved streets or roads]; OR Designed and constructed with permeable pavements or surfaces in accordance with County of San Diego Guidance on Green Infrastructure; 	Standard Project requirements apply, AND any additional requirements specific to the type of project. County concurrence with the exemption is required. Provide discussion and list any additional requirements below in this form. Complete Standard Project SWQMP
 Projects that are only retrofitting or redeveloping existing paved alleys, streets or roads that are designed and constructed in accordance with the County of San Diego Guidance on Green 	Complete Green Streets PDP Exempt SWQMP.
Infrastructure. Discussion / justification, and additional requirements for exceptions to PDP	definitions, if applicable:

Template Date: March 16, 2016 Preparation Date: 01/29/2019

Step 2: Construction Storm Water BMP Checklist

Minimum Required Standard Construction Storm Water BMPs If you answer "Yes" to any of the questions below, your project is subject to Table 1 on the following page (Minimum Required Standard Construction Stormwater BMPs). As noted in Table 1, please select at least the minimum number of required BMPs, or as many as are feasible for your project. If no BMP is selected, an explanation must be given in the box provided. The following questions are intended to aid in determining construction BMP requirements for your project. Note: All selected BMPs below must be included on the BMP plan incorporated into the construction plan sets. 1. Will there be soil disturbing activities that will result in exposed soil areas? ⊠Yes □No (This includes minor grading and trenching.) Reference Table 1 Items A, B, D, and E Note: Soil disturbances NOT considered significant include, but are not limited to, change in use, mechanical/electrical/plumbing activities, signs, temporary trailers, interior remodeling, and minor tenant improvement. 2. Will there be asphalt paving, including patching? ⊠Yes □No Reference Table 1 Items D and F 3. Will there be slurries from mortar mixing, coring, or concrete saw cutting? ⊠Yes □No Reference Table 1 Items D and F 4. Will there be solid wastes from concrete demolition and removal, wall ⊠Yes □No construction, or form work? Reference Table 1 Items D and F 5. Will there be stockpiling (soil, compost, asphalt, concrete, solid waste) for over ⊠Yes □No 24 hours? Reference Table 1 Items D and F 6. Will there be dewatering operations? □Yes $\boxtimes No$ Reference Table 1 Items C and D 7. Will there be temporary on-site storage of construction materials, including ⊠Yes □No mortar mix, raw landscaping and soil stabilization materials, treated lumber, rebar, and plated metal fencing materials? Reference Table 1 Items E and F 8. Will trash or solid waste product be generated from this project? ⊠Yes □No Reference Table 1 Item F 9. Will construction equipment be stored on site (e.g.: fuels, oils, trucks, etc.?) ⊠Yes □No Reference Table 1 Item F 10. Will Portable Sanitary Services ("Porta-potty") be used on the site? ⊠Yes \square No Reference Table 1 Item F

Template Date: March 16, 2016 LUEG:SW **PDP SWQMP**

If Vegetation Stabilization (Planting or Hydroseeding) is proposed for erosion control it may be installed between May 1st and August 15th. Slope irrigation is in place and needs to be operable for slopes >3 feet. Vegetation must be watered and established prior to October 1st. The owner must implement a contingency physical BMP by August 15th if vegetation establishment does not occur by that date. If landscaping is proposed, erosion control measures must also be used while landscaping is being established. Established vegetation must have a subsurface mat of intertwined mature roots with a uniform vegetative coverage of 70 percent of the natural vegetative coverage or more on all disturbed areas.

⁶ All slopes over three feet must have established vegetative cover prior to final permit approval.

Description / Additional Information:

Step 3.2: Description of Existing Site Drainage Patterns

How is storm water runoff conveyed from the site? At a minimum, this description should answer:

- (1) Whether existing drainage conveyance is natural or urban;
- (2) Is runoff from offsite conveyed through the site? if yes, quantify all offsite drainage areas, design flows, and locations where offsite flows enter the project site, and summarize how such flows are conveyed through the site;
- (3) Provide details regarding existing project site drainage conveyance network, including any existing storm drains, concrete channels, swales, detention facilities, storm water treatment facilities, natural or constructed channels; and
- (4) Identify all discharge locations from the existing project site along with a summary of conveyance system size and capacity for each of the discharge locations. Provide summary of the pre-project drainage areas and design flows to each of the existing runoff discharge locations.

Template Date: March 16, 2016 Preparation Date: 01/29/2019

Describe existing site drainage patterns:

- (1) Existing drainage sheet flows following natural contours.
- (2) Project accepts offsite run-on from approximately 1.3 acres located south and west of the project site. The offsite run-on was calculated to be 2.51 cfs for the 100-year storm event. The offsite run-on comingles with onsite runoff within the right-of-way for Old Mirar De Valle Road and follows existing contours to an existing catch located near the northeast corner of the project site.
- (3) There is an existing catch basin located near the northeast corner of the site that intercepts runoff from approximately 2.145 acres of offsite and onsite areas. The catch basin is connected to the existing public storm drain in Valley Center Road by an existing 24-inch RCP storm drain. There is a rough graded swale located adjacent to the easterly property line that was created by the road grading for the widening of Valley Center Road.
- (4) As noted in (3) above, the existing catch basin intercepts runoff from approximately 2.145 acres (3.64 cfs for the 100-year storm event). The remainder of the runoff from approximately 0.001 acres (0.01 cfs for the 100-year storm event) sheets flows to the adjacent property to the south (future Tractor Supply site).

Template Date: March 16, 2016 Preparation Date: 01/29/2019

Step 3.3: Description of Proposed Site Development

Project Description / Proposed Land Use and/or Activities:

The project proposes construction of one 7,380 square foot commercial building with hardscape, parking lot and landscaping on a 0.850 acre parcel. The project includes construction of an offsite access drive which would be solely used by delivery and trash trucks and an offsite site wall to shield future residential development from the commercial development. The developed area for AutoZone including the offsite access drive and site walls will be approximately 64.3% impervious (28,814 square feet of building, site walls, hardscape and pavement including the portion of the access drives constructed with the adjacent Tractor Supply project PDS2017-LDGRMJ-30114).

List/describe proposed impervious features of the project (e.g., buildings, roadways, parking lots, courtyards, athletic courts, other impervious features):

The proposed impervious features of the project include one commercial building, hardscape constructed of PCC pavement, parking lot, private access drive and site walls.

List/describe proposed pervious features of the project (e.g., landscape areas):

The proposed pervious features of the project include parking lot landscaped islands, landscaping at the outer edges of the proposed development, tree grates within the hardscape area fronting the building and one proposed biofiltration basin.

Does the project includ	e grading and	changes to s	ite topography?
-------------------------	---------------	--------------	-----------------

⊠Yes

□No

Description / Additional Information:

The project includes construction of a private access drive located immediately west of the project site that includes construction of a bladed swale to intercept and direct offsite run-on away from the property. The proposed parking lot will be graded to drain to a proposed private storm drain system. The majority of the site, including the private access drive, will be designed to direct storm water runoff to a biofiltration basin located just east of the proposed building. The remainder of the project is graded to drain to either Valley Center Road or to Old Mirar De Valle Road.

Insert acreage or square feet for the different land cover types in the table below:

Change in Land Cover Type Summary			
Land Cover Type	Existing	Proposed	Percent
-	(acres or ft ²)	(acres or ft ²)	Change
Vegetation	43,240 s.f.	16,026 s.f.	-63%
Pervious (non-vegetated)	0 s.f.	0 s.f.	0%
Impervious	1,600 s.f.	27,520 s.f.	63%

Template Date: March 16, 2016 Preparation Date: 01/29/2019

Template Date: March 16, 2016 Preparation Date: 01/29/2019 LUEG:SW PDP SWQMP

Step 3.4: Description of Proposed Site Drainage Patterns

Template Date: March 16, 2016 Preparation Date: 01/29/2019 LUEG:SW **PDP SWQMP**

Does the project include changes to site drainage (e.g., installation of new storm water	
conveyance systems)?	
⊠Yes	
□No	
⊠Yes	

If yes, provide details regarding the proposed project site drainage conveyance network, including storm drains, concrete channels, swales, detention facilities, storm water treatment facilities, natural or constructed channels, and the method for conveying offsite flows through or around the proposed project site. Identify all discharge locations from the proposed project site along with a summary of the conveyance system size and capacity for each of the discharge locations. Provide a summary of pre- and post-project drainage areas and design flows to each of the runoff discharge locations. Reference the drainage study for detailed calculations.

Describe proposed site drainage patterns:

The project includes construction of a private access drive located immediately west of the project site that includes construction of a bladed swale to intercept and direct offsite run-on away from the property. The runoff from the private access drive will be directed to either a proposed private curb inlet or to a proposed private Type F catch basin. A portion of the private access drive was constructed with the adjacent Tractor Supply project (PDS2017-LDGRMJ-30114). The runoff from both structures will be conveyed to the proposed biofiltration basin via a proposed private storm drain located adjacent to the north wall of the building. The runoff from the building roof will hard connect to the proposed storm drain located adjacent to the north wall of the building which will outlet into the proposed biofiltration basin. The proposed parking lot will be graded to drain to a proposed private curb inlet which connects to the private onsite storm drain that outlets into the proposed biofiltration basin. A portion of the access drive to the parking lot was constructed with the adjacent Tractor Supply project (PDS2017-LDGRMJ-30114) and the runoff from that pavement will also directed to the proposed biofiltration basin. The runoff from the proposed landscaped areas adjacent to Valley Center Road will sheet flow directly to Valley Center Road and get intercepted by the existing curb inlet located near the north east corner of the site. The remainder of the project is graded to drain to either the adjacent property to the south (future Tractor Supply site) or to Old Mirar De Valle Road where it will follow the natural contours and get intercepted by the existing catch basin located near the northeast corner of the project site.

The proposed biofiltration basin accepts runoff from a 0.852 acre contributing basin that is approximately 76.6% impervious (28,438 square feet of building, hardscape and parking lot and 8,694 square feet of landscaping including the biofiltration basin). The total unmitigated runoff draining to the proposed biofiltration basin was calculated to be 6.42 cfs for the 100-year storm event. The runoff from the biofiltration basin will drain to a proposed underground storage system with flow control orifices and weir walls to reduce the developed outflows to be equal or less than the runoff developed in the existing condition towards the public storm drain system in Valley Center Road. Due to the grades of the un-named private road providing access for Tractor Supply, AutoZone and the existing residences to the west, a portion of the AutoZone site will drain back towards the Tractor Supply site. The basins in question are 0.001acres and 0.00007 acres in size and contribute 0.009 cfs and 0.0004 cfs respectively towards the Tractor Supply site for the 100-year storm event and will have negligible impact to the Tractor Supply storm drain system. The landscaped area fronting Valley Center Road will drain directly to Valley Center Road. The basin in question is 0.083 acres in size and contributes 0.31 cfs for the 100-year storm event. (See Page 18 for continuation)

Template Date: March 16, 2016 Preparation Date: 01/29/2019

Template Date: March 16, 2016 Preparation Date: 01/29/2019 LUEG:SW PDP SWQMP

Step 3.5: Potential Pollutant Source Areas

Identify whether any of the following features, activities, and/or pollutant source areas will be
present (select all that apply). Select "Other" if the project is a phased development and provide
a description:
⊠ On-site storm drain inlets
☐ Interior floor drains and elevator shaft sump pumps
☐ Interior parking garages
□ Need for future indoor & structural pest control
□ Landscape/Outdoor Pesticide Use
☐ Pools, spas, ponds, decorative fountains, and other water features
☐ Food service
⊠ Refuse areas
☐ Industrial processes
☐ Outdoor storage of equipment or materials
☐ Vehicle and Equipment Cleaning
☐ Vehicle/Equipment Repair and Maintenance
☐ Fuel Dispensing Areas
☐ Loading Docks
⊠ Fire Sprinkler Test Water
⊠ Miscellaneous Drain or Wash Water
☐ Other (provide description)
Description / Additional Information:

Template Date: March 16, 2016 Preparation Date: 01/29/2019 LUEG:SW PDP SWQMP

Step 3.6: Identification and Narrative of Receiving Water and Pollutants of Concern

Describe flow path of storm water from the project site discharge location(s), through urban storm conveyance systems as applicable, to receiving creeks, rivers, and lagoons as applicable, and ultimate discharge to the Pacific Ocean (or bay, lagoon, lake or reservoir, as applicable): The public storm drain system in Valley Center Road outlets to Moosa Creek which drains to Turner Lake. Downstream of Turner Lake, Moosa Creek drains to Lower San Luis Rey River which outlets to the Pacific Ocean in Oceanside.

List any 303(d) impaired water bodies¹¹ within the path of storm water from the project site to the Pacific Ocean (or bay, lagoon, lake or reservoir, as applicable), identify the pollutant(s)/stressor(s) causing impairment, and identify any TMDLs and/or Highest Priority Pollutants from the WQIP for the impaired water bodies:

303(d) Impaired Water Body	Pollutant(s)/Stressor(s)	TMDLs / WQIP Highest Priority Pollutant
Pacific Ocean (903.11)	Enterococcus, Total Coliform	
San Luis Rey River (903.11)	Chloride, Enterococcus, Fecal Coliform, Phosphorus, TDS, Total Nitrogen, Toxicity	Bacteria

Identification of Project Site Pollutants*

Identify pollutants expected from the project site based on all proposed use(s) of the site (see BMP Design Manual Appendix B.6):

Pollutant	Not Applicable to the Project Site	Anticipated from the Project Site	Also a Receiving Water Pollutant of Concern
Sediment			
Nutrients			
Heavy Metals			
Organic Compounds			
Trash & Debris			
Oxygen Demanding Substances			
Oil & Grease			
Bacteria & Viruses			

The current list of Section 303(d) impaired water bodies can be found at http://www.waterboards.ca.gov/water_issues/programs/water_quality_assessment/#impaired

Template Date: March 16, 2016 Preparation Date: 01/29/2019 LUEG:SW PDP SWQMP

_

^{*}Identification of project site pollutants below is only required if flow-thru treatment BMPs are implemented onsite in lieu of retention or biofiltration BMPs. Note the project must also participate in an alternative compliance program (unless prior lawful approval to meet earlier PDP requirements is demonstrated).

PRIORITY DEVELOPMENT PROJECT (PDP) SWQMP

17 of 46

Pesticides			
Step 3.7: Hydromodification Management Requirements			
Do hydromodification m Manual)?	nanagement requirements	s apply (see Section 1.6	of the BMP Design
⊠Yes, hydromodificati coarse sediment yiel	 ✓Yes, hydromodification management requirements for flow control and preservation of critical coarse sediment yield areas are applicable. 		
	ischarge runoff directly to age reservoirs, lakes, end	-	
□No, the project will discharge runoff directly to conveyance channels whose bed and bank are concrete-lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean.			
□No, the project will discharge runoff directly to an area identified as appropriate for an exemption by the WMAA ¹² for the watershed in which the project resides.			
Description / Additional	Information (to be provid	led if a 'No' answer has b	een selected above):

Template Date: March 16, 2016 Preparation Date: 01/29/2019

The Watershed Management Area Analysis (WMAA) is an optional element for inclusion in the Water Quality Improvement Plans (WQIPs) described in the 2013 MS4 Permit [Provision B.3.b.(4)]. It is available online at the Project Clean Water website: http://www.projectcleanwater.org/index.php?option=com_content&view=article&id=248

Step 3.7.1: Critical Coarse Sediment Yield Areas*

*This Section only required if hydromodification management requirements apply
Projects must satisfy critical coarse sediment yield area (CCSYA) requirements by
characterizing the project as one of the scenario-types presented below and satisfying
associated criteria. Projects must appropriately satisfy all requirements for identification,
avoidance, and bypass, OR may alternatively elect to demonstrate no net impact.
☐ Scenario 1 : Project is subject to and in compliance with RPO requirements <i>(without</i>
utilization of RPO exemptions 86.604(e)(2)(cc) or 86.604(e)(3) that result in impacts to more than 15% of the project-scale CCSYAs).
☐ Identify: Project has identified both onsite and upstream CCSYAs as areas that are
coarse, ≥25% slope, and ≥50' tall. (Optional refinement methods may be performed per guidance in Section H.1.2). AND,
□ Avoid: Project has avoided <u>onsite</u> CCSYAs per existing RPO steep slope encroachment criteria. AND,
\square Bypass: Project has demonstrated that both <u>onsite and upstream</u> CCSYAs are bypassed
through or around the project site with a 2 year peak storm velocity of 3 feet per second or greater. OR,
\square No Net Impact: Project does not satisfy all Scenario 1 criteria above and must
alternatively demonstrate no net impact to the receiving water.
Scenario 2: Project is entirely exempt/not subject to RPO requirements without utilization of
RPO exemptions 86.604(e)(2)(cc) or 86.604(e)(3).
tall. (Optional refinement methods may be performed per guidance in Section H.1.2). AND,
☑ Avoid: Project is not required to avoid onsite CCSYAs as none were identified in the
previous step. AND,
around the project site with a 2 year peak storm velocity of 3 feet per second or greater. OR,
\square No Net Impact: Project does not satisfy all Scenario 2 criteria above and must
alternatively demonstrate no net impact to the receiving water. (Skip to next row).
☐ Scenario 3: Project utilizes exemption(s) via RPO Section 86.604(e)(2)(cc) or 86.604(e)(3)
and impacts more than 15% of the project-scale CCSYAs.
\square No Net Impact: Project is not eligible for traditional methods of identification, avoidance,
and bypass. Project must demonstrate no net impact to the receiving water.

Template Date: March 16, 2016 Preparation Date: 01/29/2019

Critical Coarse Sediment Yield Areas Continued			
Demonstrate No Net Impact			
If the project elects to satisfy CCSYA criteria through demonstration of no net impact to the			
receiving water. Applicants must identify the methods utilized from the list below and provide			
supporting documentation in Attachment 2c of the SWQMP. Check all that are applicable.			
☑ N/A, the project appropriately identifies, avoids, and bypasses CCSYAs.			
$\hfill\square$ Project has performed additional analysis to demonstrate that impacts to CCSYAs satisfy the			
no net impact standard of Ep/Sp≤1.1.			
☐ Project has provided alternate mapping of CCSYAs.			
$\hfill \square$ Project has implemented additional onsite hydromodification flow control measures.			
\square Project has implemented an offsite stream rehabilitation project to offset impacts.			
\square Project has implemented other applicant-proposed mitigation measures.			

Step 3.7.2: Flow Control for Post-Project Runoff* *This Section only required if hydromodification management requirements apply List and describe point(s) of compliance (POCs) for flow control for hydromodification management (see Section 6.3.1). For each POC, provide a POC identification name or number correlating to the project's HMP Exhibit and a receiving channel identification name or number correlating to the project's HMP Exhibit. The point of compliance for the project is the existing 24-inch RCP stub that was extended to the site with the widening of Valley Center Road. Has a geomorphic assessment been performed for the receiving channel(s)? ☑ No, the low flow threshold is 0.1Q2 (default low flow threshold) \square Yes, the result is the low flow threshold is 0.1Q2 ☐ Yes, the result is the low flow threshold is 0.3Q2 \square Yes, the result is the low flow threshold is 0.5Q2 If a geomorphic assessment has been performed, provide title, date, and preparer: Discussion / Additional Information: (optional)

Template Date: March 16, 2016 Preparation Date: 01/29/2019

Step 3.8: Other Site Requirements and Constraints

When applicable, list other site requirements or constraints that will influence storm water management design, such as zoning requirements including setbacks and open space, or local codes governing minimum street width, sidewalk construction, allowable pavement types, and drainage requirements.

Optional Additional Information or Continuation of Previous Sections As Needed

This space provided for additional information or continuation of information from previous sections as needed.

The offsite run-on from the south and west comingles with the remainder of the onsite runoff and flows to Old Mirar Del Valle Road where it will ultimately get intercepted by the existing catch basin located near the northeast corner of the project. The runoff from this 1.216 acre area was calculated to be 2.41 cfs for the 100-year storm event.

Template Date: March 16, 2016 Preparation Date: 01/29/2019

Step 4: Source Control BMP Checklist

Source Control BMPs

All development projects must implement source control BMPs 4.2.1 through 4.2.6 where applicable and feasible. See Chapter 4.2 and Appendix E of the County BMP Design Manual for information to implement source control BMPs shown in this checklist.

Answer each category below pursuant to the following:

- "Yes" means the project will implement the source control BMP as described in Chapter 4.2 and/or Appendix E of the County BMP Design Manual. Discussion / justification is not required.
- "No" means the BMP is applicable to the project but it is not feasible to implement. Discussion / justification must be provided.
- "N/A" means the BMP is not applicable at the project site because the project does not include the feature that is addressed by the BMP (e.g., the project has no outdoor materials storage areas). Discussion / justification must be provided.

materials storage areas). Discussion / justification must be provided.			
Source Control Requirement	Applied?		
4.2.1 Prevention of Illicit Discharges into the MS4	⊠Yes	□No	□N/A

pollutants are discussed. Justification must be provided for <u>all</u> "No	o" answers	s shown al	bove.

Note: Show all source control measures described above that are included in design capture volume calculations in the plan sheets of Attachment 5.

Template Date: March 16, 2016 Preparation Date: 01/29/2019

Step 5: Site Design BMP Checklist

Site Design BMPs

All development projects must implement site design BMPs SD-A through SD-H where applicable and feasible. See Chapter 4.3 and Appendix E of the County BMP Design Manual for information to implement site design BMPs shown in this checklist.

Answer each category below pursuant to the following:

- "Yes" means the project will implement the site design BMP as described in Chapter 4.3 and/or Appendix E of the County BMP Design Manual. Discussion / justification is not required.
- "No" means the BMP is applicable to the project but it is not feasible to implement. Discussion / justification must be provided.
- "N/A" means the BMP is not applicable at the project site because the project does not include the feature that is addressed by the BMP (e.g., the project site has no existing natural areas to conserve). Discussion / justification must be provided.

natural areas to conserve). Discussion / Justinication must be provided.			
Site Design Requirement	Applied?		
4.3.1 Maintain Natural Drainage Pathways and Hydrologic Features	□Yes	□No	⊠N/A
Discussion / justification if 4.3.1 not implemented:			
The project site has no existing natural drainage pathways or hyd	drologic fe	atures.	
4.3.2 Conserve Natural Areas, Soils, and Vegetation	□Yes	⊠No	□N/A
Discussion / justification if 4.3.2 not implemented: The AutoZone project will disturb the entire area of the project. There are existing street trees, many of which appear to be dead or dying, that will be removed and replaced with other trees. The remainder of the existing native grasses and weeds will be replaced by other native, drought tolerant landscaping. The are no environmentally sensitive areas on site			
4.3.3 Minimize Impervious Area	⊠Yes	□No	□N/A
Discussion / justification if 4.3.3 not implemented:			
4.3.4 Minimize Soil Compaction	⊠Yes	□No	□N/A
Discussion / justification if 4.3.4 not implemented:			
4.3.5 Impervious Area Dispersion	□Yes	⊠No	□N/A
Discussion / justification if 4.3.5 not implemented: In lieu of impervious area dispersion, the runoff from the impervious areas of the project will be directed to a proposed biofiltration basin.			

Template Date: March 16, 2016

Preparation Date: 01/29/2019

PRIORITY DEVELOPMENT PROJECT (PDP) SWQMP

24 of 46

Site Design Requirement		Applied?	•
4.3.6 Runoff Collection	□Yes	⊠No	□N/A
Discussion / justification if 4.3.6 not implemented:			
We are not proposing the use of permeable pavers due to a histo			
(10.1' below existing ground). In addition, in lieu of small collection			
runoff to a proposed biofiltration basin with the exception of the ar			
Valley Center Road that sheet flow directly to Valley Center Road, minor areas that drain back			
towards the adjacent property to the south (Tractor Supply site) and the area that sheet flows			
directly to Old Mirar De Valle Road.			
4.3.7 Landscaping with Native or Drought Tolerant Species	⊠Yes	□No	□N/A
. 0	△ 1 € 3		
Discussion / justification if 4.3.7 not implemented:			
4.3.8 Harvesting and Using Precipitation	□Yes	⊠No	□N/A
Discussion / justification if 4.3.8 not implemented:			
390 gallons/acre * 0.185 acres + 1,470 gallons/acre * 0.185 acres = 344 gallons = 46.0 cubic			
feet. Our calculated DCV for the project is 1,648 cubic feet. Therefore, as the 36 hour demand			
of 46.0 cubic feet is less than 0.25 of the DCV, Harvest and Use is	s consider	ed to be in	ıfeasible.

Note: Show all site design measures described above that are included in design capture volume calculations in the plan sheets of Attachment 5.

Template Date: March 16, 2016 Preparation Date: 01/29/2019 LUEG:SW PDP SWQMP

Step 6: PDP Structural BMPs

All PDPs must implement structural BMPs for storm water pollutant control (see Chapter 5 of the BMP Design Manual). Selection of PDP structural BMPs for storm water pollutant control must be based on the selection process described in Chapter 5. PDPs subject to hydromodification management requirements must also implement structural BMPs for flow control for hydromodification management (see Chapter 6 of the BMP Design Manual). Both storm water pollutant control and flow control for hydromodification management can be achieved within the same structural BMP(s).

PDP structural BMPs must be verified by the County at the completion of construction. This may include requiring the project owner or project owner's representative and engineer of record to certify construction of the structural BMPs (see Section 1.12 of the BMP Design Manual). PDP structural BMPs must be maintained into perpetuity, and the County must confirm the maintenance (see Section 7 of the BMP Design Manual).

Use this section to provide narrative description of the general strategy for structural BMP implementation at the project site in the box below. Then complete the PDP structural BMP summary information sheet (Step 6.2) for each structural BMP within the project (copy the BMP summary information sheet [Step 6.2] as many times as needed to provide summary information for each individual structural BMP).

Step 6.1: Description of structural BMP strategy

Describe the general strategy for structural BMP implementation at the site. This information must describe how the steps for selecting and designing storm water pollutant control BMPs presented in Section 5.1 of the BMP Design Manual were followed, and the results (type of BMPs selected). For projects requiring hydromodification flow control BMPs, indicate whether pollutant control and flow control BMPs are integrated or separate. At the end of this discussion provide a summary of all the structural BMPs within the project including the type and number. We coordinated with the Project Architect to layout the proposed development and at the same time allow sufficient area to construct a biofiltration basin in the best area available to collect, clean and store the runoff from the project site. The next step was to have the a Geotechnical Engineer who is familiar with the area go to the site and perform infiltration/percolation tests as outlined in Appendix C and D of the BMP Design Manual in the location we have chosen for the treatment control BMP. The Geotechnical Engineer determined that the underlying soils could accept partial infiltration based upon the site testing performed within the basin. Therefore, with that knowledge in hand, we utilized PR-1 Biofiltration with Partial Retention from Appendix E of the BMP Design Manual to design the proposed biofiltration basin. We prepared a drainage study to determine the contributing basin limits to the biofiltration basin. We then estimated the design Capture Volume (DCV) for the biofiltration basin using worksheet B.2-1. The next step was to coordinate with the project Architect to determine if the proposed landscaping would be considered Hydrozone-Low, Hydrozone-Medium or Hydrozone- High.

(Continue on following page as necessary.)

Template Date: March 16, 2016 Preparation Date: 01/29/2019 LUEG:SW PDP SWQMP

Description of structural BMP strategy continued (Page reserved for continuation of description of general strategy for structural BMP implementation at the site)

(Continued from previous page)

The Landscape Architect instructed us that it would be appropriate to figure 50% of the proposed landscaping as Hydrozone-Low and 50% of the proposed landscaping as Hydrozone-Medium. We then calculated the anticipated average wet season demand for the site as outlined in Appendix B.3 of the BMP Design Manual. It was determined that the anticipated 36-hour demand would be less than 25% of the DCV for the project. Therefore, Harvest and Use was determined to be infeasible. We then performed the iterative sizing process for the biofiltration basin using Worksheet B.5-1 and determined that the basin would utilize the 3% criteria for basin sizing. The proposed biofiltration basin located adjacent to the proposed building will be sized for both pollutant control and flow control (when combined with the proposed underground storage facility). The next step is to prepare the continuous simulation analysis to determine how the basin and overflow box would need to be modified in order to meet the flow control requirements. Once the basin size and overflow box modifications are determined from the continuous simulation, then next step is to verify that the revised basin will still meet the sizing requirements for cleaning. The overflow box for the basin will tie to underground detention sized to meet the flow control requirements.

Template Date: March 16, 2016 Preparation Date: 01/29/2019

Step 6.2: **Structural BMP Checklist**

(Copy this page as needed to provide information for each individual proposed structural BMP)		
Structural BMP ID No. Biofiltration Basin 1		
Construction Plan Sheet No. Sheets 4, 5, 7, 11	and 13 (PDS2017-LDGRMJ-30144)

Step 6.2: Structural BMP Checklist

(Copy this page as needed to provide information for each individual proposed structural BMP)							
Structural BMP ID No. Underground Storage 1							
Construction Plan Sheet No. Sheets 6, 7, 8, 11 - 13 (PDS2017-LDGRMJ-30144)							
Type of structural BMP: ☐ Retention by harvest and use (HU-1) ☐ Retention by infiltration basin (INF-1) ☐ Retention by bioretention (INF-2) ☐ Retention by permeable pavement (INF-3) ☐ Partial retention by biofiltration with partial retention (PR-1) ☐ Biofiltration (BF-1) ☐ Biofiltration with Nutrient Sensitive Media Design (BF-2) ☐ Proprietary Biofiltration (BF-3) meeting all requirements of Appendix F ☐ Flow-thru treatment control with prior lawful approval to meet earlier PDP requirements (provide BMP type/description in discussion section below) ☐ Flow-thru treatment control included as pre-treatment/forebay for an onsite retention or biofiltration BMP (provide BMP type/description and indicate which onsite retention or biofiltration BMP it serves in discussion section below) ☐ Flow-thru treatment control with alternative compliance (provide BMP type/description in discussion section below) ☐ Detention pond or vault for hydromodification management ☐ Other (describe in discussion section below)							
Purpose: ☐ Pollutant control only ☐ Hydromodification control only ☐ Combined pollutant control and hydromodification ☐ Pre-treatment/forebay for another structural E ☐ Other (describe in discussion section below)							
Who will certify construction of this BMP? Provide name and contact information for the party responsible to sign BMP verification forms (See Section 1.12 of the BMP Design Manual) Brent C. Moore Alidade Engineering 41743 Enterprise Circle North, Suite 209 Temecula, CA 92590 (951) 587-2020							
Who will be the final owner of this BMP?	☐ HOA ☑ Property Owner ☐ County ☐ Other (describe)						
Who will maintain this BMP into perpetuity?	☐ HOA ☑ Property Owner ☐ County ☐ Other (describe)						
What Category (1-4) is the Structural BMP? Refer to the Category definitions in Section 7.3 of the BMP DM. Attach the appropriate maintenance agreement in Attachment 3.	1						

Template Date: March 16, 2016

LUEG:SW PDP SWQMP

Discussion (as needed):

Due to site constraints, the proposed biofiltration basin will be sized for pollutant control and flow control when combined with the proposed underground storage. The underground system will consist of two 48-inch culverts connected to a junction box designed with internal flow control orifices and an overflow weir. One 48-inch culvert working in conjunction with multi-stage flow control orifices and an overflow weir wall will provide the additional capacity not included in the biofiltration basin to meet the hydromodification requirement and the other 48-inch culvert working in conjunction with a single flow control orifice and the overflow weir will provide the capacity to attenuate the increased runoff from the 100-year storm event. The runoff from the underground system will be conveyed via the private storm drain system to the 24-inch diameter stub which serves as the point of discharge for the project. (Continue on subsequent pages as necessary)

Automated Worksheet B.3-1: Project-Scale BMP Feasibility Analysis (V1.3)

Category	#	Description	Value	Units
	0	Design Capture Volume for Entire Project Site	1,651	cubic-feet
C	1	Proposed Development Type	Retail	unitless
Capture & Use Inputs	2	Number of Residents or Employees at Proposed Development	5	#
Inpare	3	Total Planted Area within Development	16,113	sq-ft
	4	Water Use Category for Proposed Planted Areas	Moderate	unitless
	5	Is Average Site Design Infiltration Rate ≤0.500 Inches per Hour?	Yes	yes/no
Infiltration	6	Is Average Site Design Infiltration Rate ≤0.010 Inches per Hour?	No	yes/no
Inputs	7	Is Infiltration of the Full DCV Anticipated to Produce Negative Impacts?	Yes	yes/no
	8	Is Infiltration of Any Volume Anticipated to Produce Negative Impacts?	No	yes/no
	9	36-Hour Toilet Use Per Resident or Employee	1.40	cubic-feet
	10	Subtotal: Anticipated 36 Hour Toilet Use	7	cubic-feet
	11	Anticipated 1 Acre Landscape Use Over 36 Hours	196.52	cubic-feet
	12	Subtotal: Anticipated Landscape Use Over 36 Hours	73	cubic-feet
Calculations	13	Total Anticipated Use Over 36 Hours	80	cubic-feet
	14	Total Anticipated Use / Design Capture Volume	0.05	cubic-feet
	15	Are Full Capture and Use Techniques Feasible for this Project?	No	unitless
	16	Is Full Retention Feasible for this Project?	No	yes/no
	17	Is Partial Retention Feasible for this Project?	Yes	yes/no
Result	18	Feasibility Category	4	1, 2, 3, 4, 5

Worksheet B.3-1 General Notes:

- A. Applicants may use this worksheet to determine the types of structural BMPs that are acceptable for implementation at their project site (as required in Section 5 of the BMPDM). User input should be provided for yellow shaded cells, values for all other cells will be automatically generated. Projects demonstrating feasibility or potential feasibility via this worksheet are encouraged to incorporate capture and use features in their project.
- B. Negative impacts associated with retention may include geotechnical, groundwater, water balance, or other issues identified by a geotechnical engineer and substantiated through completion of Form I-8.
- C. Feasibility Category 1: Applicant must implement capture & use, retention, and/or infiltration elements for the entire DCV.
- D. Feasibility Category 2: Applicant must implement capture & use elements for the entire DCV.
- E. Feasibility Category 3: Applicant must implement retention and/or infiltration elements for all DMAs with Design Infiltration Rates greater than 0.50 in/hr.
- F. Feasibility Category 4: Applicant must implement standard <u>unlined</u> biofiltration BMPs sized at ≥3% of the effective impervious tributary area for all DMAs with Design Infiltration Rates of 0.011 to 0.50 in/hr. Applicants may be permitted to implement lined BMPs, reduced size BMPs, and/or specialized biofiltration BMPs provided additional criteria identified in "Supplemental Retention Criteria for Non-Standard Biofiltration BMPs" are satisfied.
- G. Feasibility Category 5: Applicant must implement standard <u>lined</u> biofiltration BMPs sized at ≥3% of the effective impervious tributary area for all DMAs with Design Infiltration Rates of 0.010 in/hr or less. Applicants may also be permitted to implement reduced size and/or specialized biofiltration BMPs provided additional criteria identified in "Supplemental Retention Criteria for Non-Standard Biofiltration BMPs" are satisfied.
- H. PDPs participating in an offsite alternative compliance program are not held to the feasibility categories presented herein.

Worksheet B.5-1 General Notes:

A. Applicants may use this worksheet to size Lined or Unlined Biofiltration BMPs (BF-1, PR-1) for up to 10 basins. User input must be provided for yellow shaded cells, values for blue cells are automatically populated based on user inputs from previous worksheets, values for all other cells will be automatically generated, errors/notifications will be highlighted in red/orange and summarized below. BMPs fully satisfying the pollutant control performance standards will have a deficit treated volume of zero and be highlighted in green.

Summary Notes:

All fields in this summary worksheet are populated based on previous user inputs. If applicable, drainage basin elements that require revisions and/or supplemental information outside the scope of these worksheets are highlighted in orange and summairzed in the red text below. If all drainage basins achieve full compliance without a need for supplemental information, a green message will appear below.

-Congratulations, all specified drainage basins and BMPs are in compliance with stormwater pollutant control requirements. Include 11x17 color prints of this summary sheet and supporting worksheet calculations as part of the SWQMP submittal package.

Worksheet C.4-1: Categorization of Infiltration Feasibility Condition

Categ	orization of Infiltration Feasibility Condition	Worksh	eet C.4-1					
Part 1 - Full Infiltration Feasibility Screening Criteria Would infiltration of the full design volume be feasible from a physical perspective without any undesirable consequences that cannot be reasonably mitigated? Note that it is not necessary to investigate each and every criterion in the worksheet if infiltration is precluded. Instead a letter of justification from a geotechnical professional familiar with the local conditions substantiating any geotechnical issues will be required.								
Criteria	Screening Question	Yes	No					
1	Is the estimated reliable infiltration rate below proposed facility locations greater than 0.5 inches per hour? The response to this Screening Question must be based on a comprehensive evaluation of the factors presented in Appendix C.2 and Appendix D.							
Provide	basis:							
	ize findings of studies; provide reference to studies, calculations, map on of study/data source applicability.	os, data sources, etc	e. Provide narrative					
2	Can infiltration greater than 0.5 inches per hour be allowed without increasing risk of geotechnical hazards (slope stability, groundwater mounding, utilities, or other factors) that cannot b mitigated to an acceptable level? The response to this Screening Question must be based on a comprehensive evaluation of the factors presented in Appendix C.2.

	e findings of studies; provide reference to studies, calculations, maps, of study/data source applicability and why it was not feasible to mitigate		
Part 2 Result*	If all answers from row 5-8 are yes then partial infiltration design is p. The feasibility screening category is Partial Infiltration . If any answer from row 5-8 is no, then infiltration of any volume is infeasible within the drainage area. The feasibility screening category is	considered to be	

*To be completed using gathered site information and best professional judgment considering the definition of MEP in the MS4 Permit. Additional testing and/or studies may be required by Agency/Jurisdictions to substantiate findings

Use this checklist to ensure the required information has been included on the DMA Exhibit:

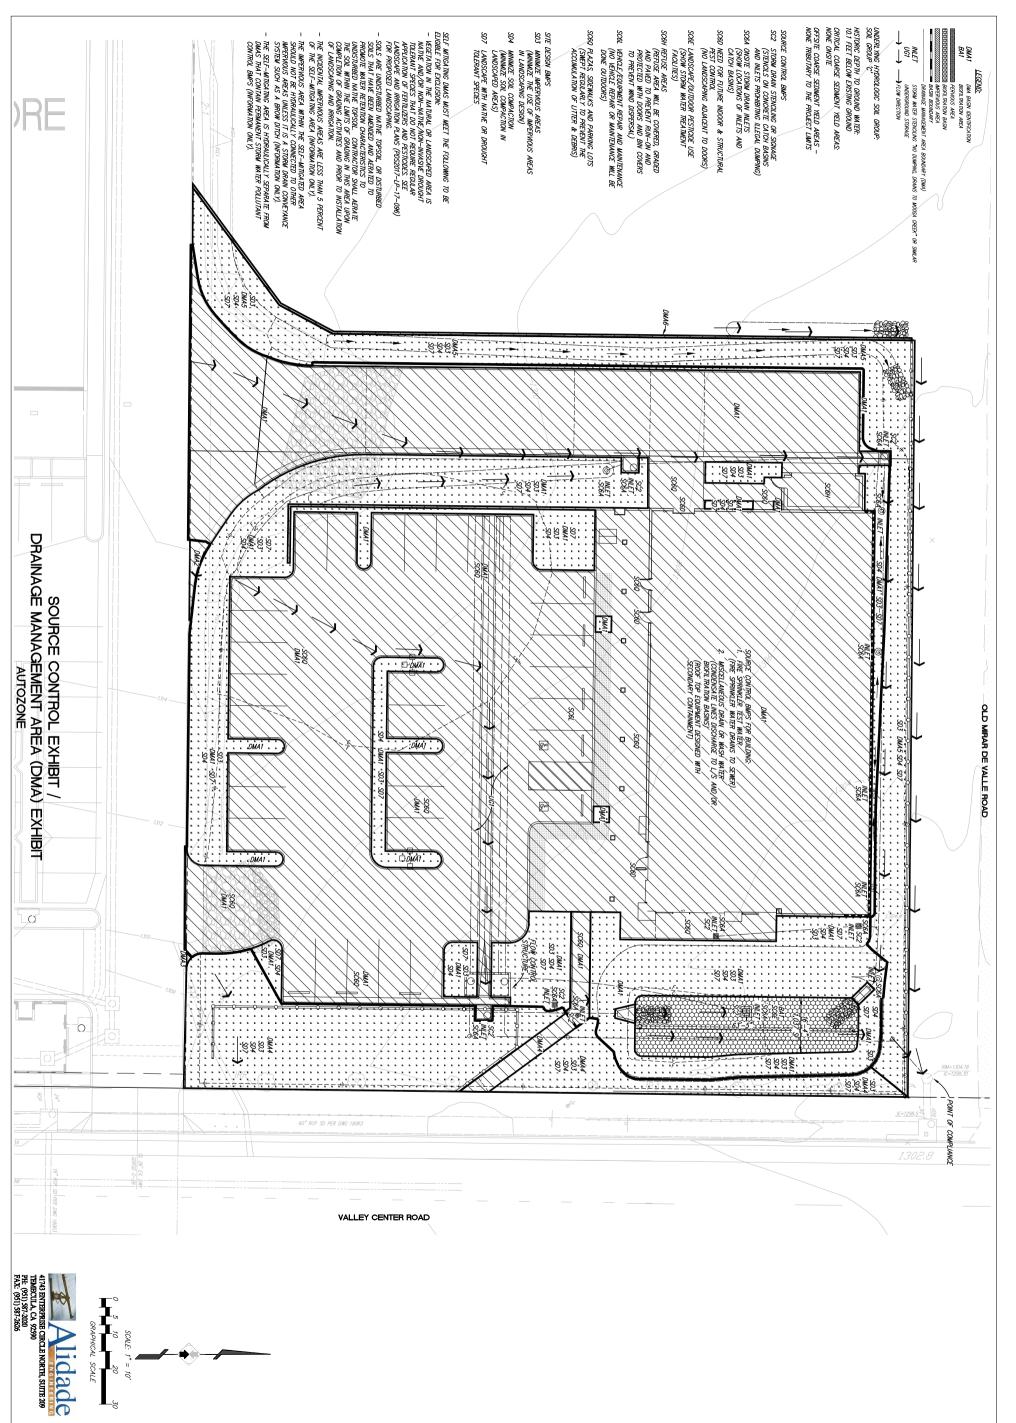

The DMA Exhibit must identify:

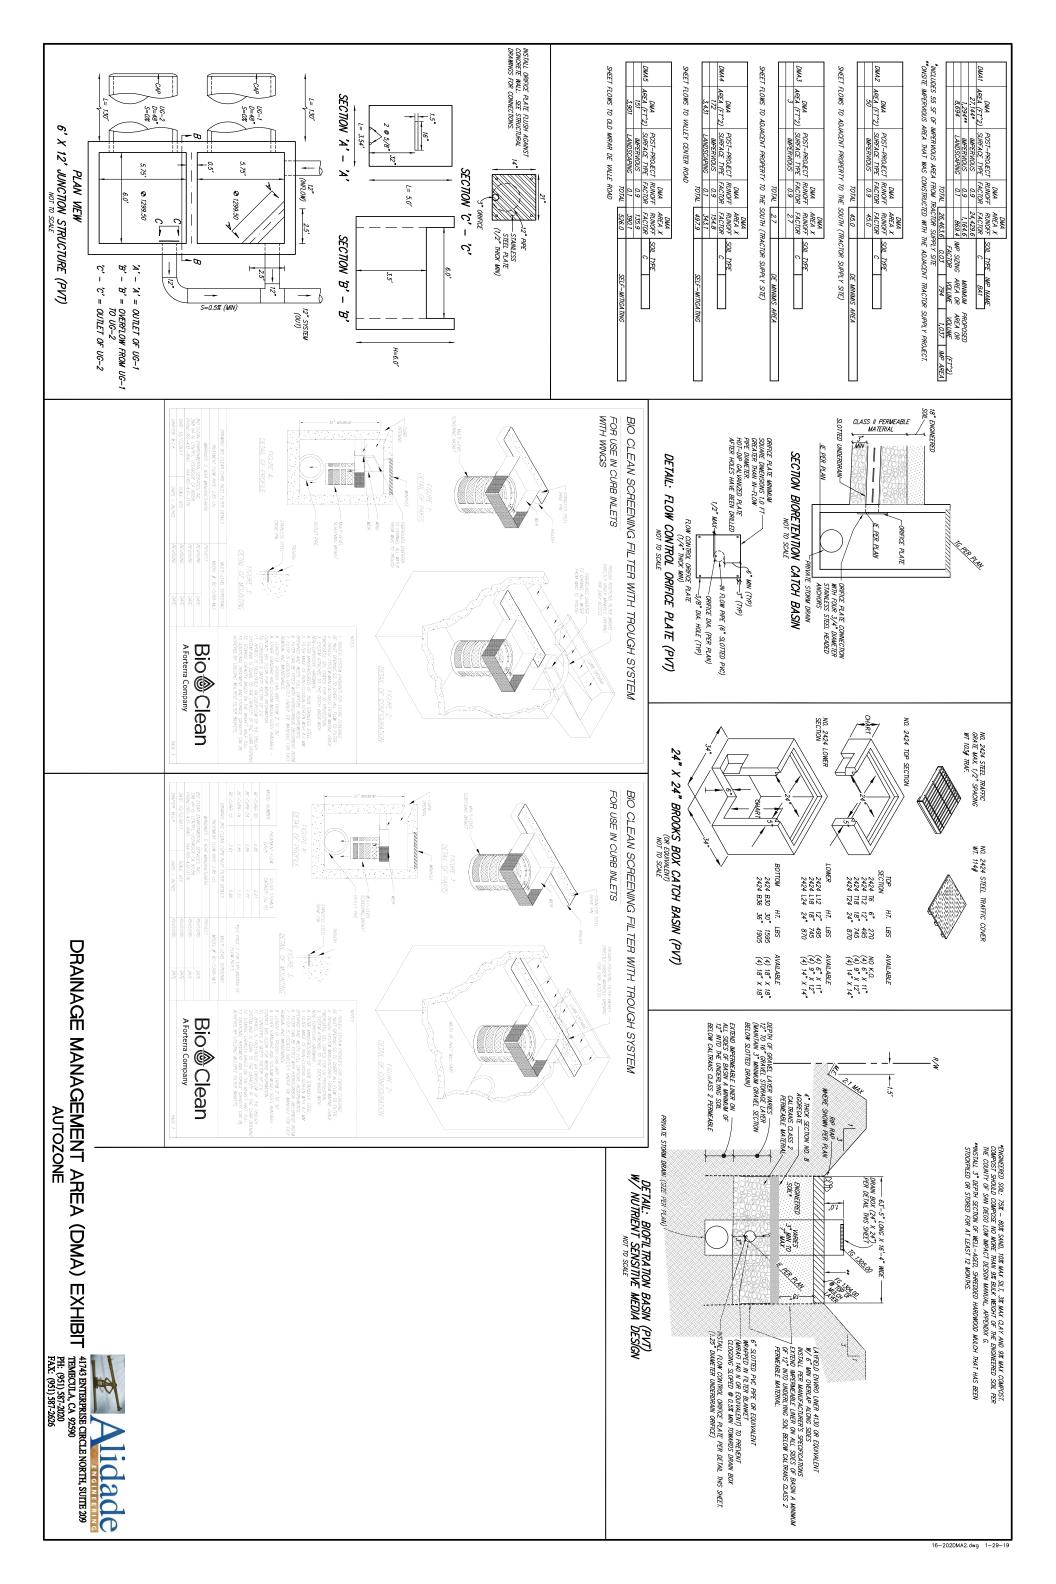

- ☑ Underlying hydrologic soil group
- □ Approximate depth to groundwater
- ☑ Existing natural hydrologic features (watercourses, seeps, springs, wetlands)
- ⊠ Existing topography and impervious areas
- ☑ Existing and proposed site drainage network and connections to drainage offsite

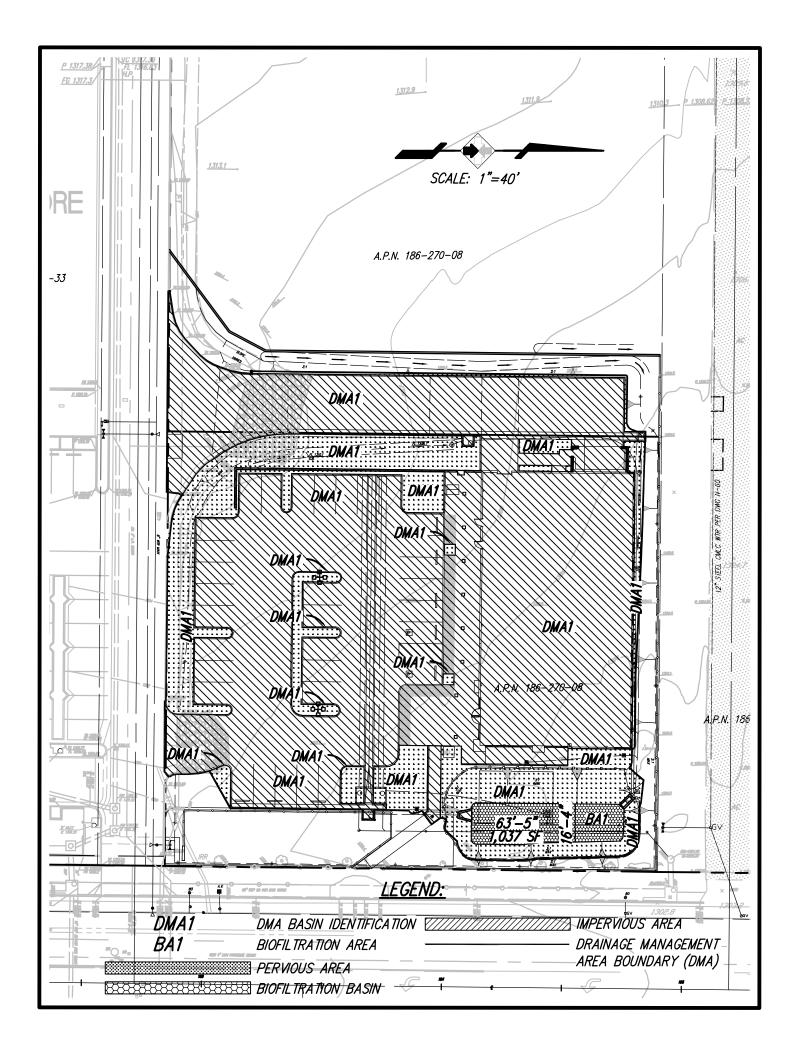

- ☑ Proposed design features and surface treatments used to minimize imperviousness
- ☑ Drainage management area (DMA) boundaries, DMA ID numbers, and DMA areas (square footage or acreage), and DMA type (i.e., drains to BMP, self-retaining, or self-mitigating)
- □ Potential pollutant source areas and corresponding required source controls (see Chapter 4, Appendix E.1, and Step 3.5)
- ⊠ Structural BMPs (identify location, structural BMP ID#, type of BMP, and size/detail)

DATE: April 2, 2018

RE: Summary of SWMM Modeling for Hydromodification Compliance for Autozone, Valley

Center, CA.

INTRODUCTION

This memorandum summarizes the approach used to model the proposed residential development project site in the City of Valley Center using the Environmental Protection Agency (EPA) Storm Water Management Model 5.0 (SWMM). SWMM models were prepared for the pre and post-developed conditions at the site in order to determine if the proposed LID biofiltration facility has sufficient volume to meet Order R9-2013-001 requirements of the California Regional Water Quality Control Board San Diego Region (SDRWQCB), as explained in the Final Hydromodification Management Plan (HMP), dated March 2011, prepared for the County of San Diego by Brown and Caldwell.

SWMM MODEL DEVELOPMENT

The Autozone project comprises of a commercial development along with associated parking lots and two access roads. Two (2) SWMM models were prepared for this study: the first for the predevelopment and the second for the post-developed conditions. The project site drains to one (1) Point of Compliance (POC-1), located to the NE corner of the property on Valley Center Road.

The SWMM model was used since we have found it to be more comparable to San Diego area watersheds than the alternative San Diego Hydrology Model (SDHM) and also because it is a non-proprietary model approved by the HMP document. For both SWMM models, flow duration curves were prepared to determine if the proposed HMP facilities are sufficient to meet the current HMP requirements.

The inputs required to develop SWMM models include rainfall, watershed characteristics, and BMP configurations. The Lake Wohlford gauge from the Project Clean Water website was used for this study, since it is the most representative of the project site precipitation due to elevation and proximity to the project site. Please see gauge location and project location map on Attachment 5.

Per the California Irrigation Management Information System "Reference Evaporation Zones" (CIMIS ETo Zone Map), the project site is located within the Zone 9 Evapotranspiration Area. Thus evapotranspiration values for the site were modeled using Zone 9 average monthly values from Table G.1-1 from the City of San Diego 2016 BMP Design Manual. The site was modeled with Type C hydrologic soil as this is the closest existing soil determined from the NRCS Soil Survey. However, we should point

out that for this particular project a soil type has not been identified in the NRCS soil survey, and we selected C as it is the most conservative approach in this case. In addition, infiltration tests prepared indicate that the tested values for infiltration are about 0.2 in/hr to 0.6 in/hr, which corresponds to the typical Soil Type C range (0.06 in/hr to 0.57 in/hr) according to NRCS definition, that can be found at https://directives.sc.egov.usda.gov/OpenNonWebContent.aspx?content=17757.wba.

Soils have been assumed to be compacted in the existing condition to represent the current natural mass-grade condition of the site. In the post developed conditions the soils have been modeled as fully compacted. Other SWMM inputs for the subareas are discussed in the appendices to this document, where the selection of the parameters is explained in detail.

HMP MODELING

EXISTING CONDITIONS

The current property consists on an undeveloped but mass graded site and has one (1) point of compliance. Runoff from the project drains to POC-1 by sheet flowing in a north easterly direction. Table 1 shows a detailed summary of the areas.

TABLE 1 – SUMMARY OF EXISTING CONDITIONS

DMA	Tributary Area, A (Ac)	Slope (%)	Impervious Percentage, Ip
Existing	0.993	2.65	$0.0\%^{(1)}$

Note:

(1) – Per the 2013 RWQCB permit, existing condition impervious surfaces are not to be accounted for in existing conditions analysis, if the area is part of the project boundary.

DEVELOPED CONDITIONS

Runoff from the proposed project drains to a treatment train as follows: first, one (1) onsite receiving biofiltration with partial infiltration LID-1 collects the runoff. From there, low-flow runoff discharging the French-drain orifice and also the excess runoff that overflows the riser structure are collected and conveyed to an underground system for hydromodification compliance (UG-1), which is a 130 ft horizontal 48" diameter pipe. Excess runoff is overflowed to another underground pipe with the same dimensions, UG-2 (mostly used during the occurrence of very extreme events) and all runoff is then discharged in POC-1. Some small by-pass areas (DMAs 2 to 6) also discharge into POC-1, but they do not drain to the LID system due to topographic constraints. It should be noted that all by-passed areas are either pervious or impervious satisfying the de-minimis requirements of the BMP Manual.

It is assumed all storm water quality requirements for the project will be met by the biofiltration LID-1 BMP. However, detailed water quality requirements are not discussed within this technical memo. For further information in regards to storm water quality requirements for the project, please refer to the site specific Storm Water Quality Management Plan (SWQMP).

2 w.o.7032-05

TABLE 2 – SUMMARY OF DEVELOPED CONDITIONS

DMA	BMP POC	Tributary Area, A (Ac)	Impervious Percentage, Ip
DMA 1	$LID-1 \rightarrow UG-1 \rightarrow POC-1$	0.818	79.95%
LID-1	$LID\text{-}1 \to UG\text{-}1 \to POC\text{-}1$	0.025	0.00%
DMAs_2_to_4	By-pass → POC-1	0.003	37.86%
DMA_5	By-pass → POC-1	0.094	4.87%
DMA_6	By-pass → POC-1	0.053	6.59%
TOTAL	POC-1	0.993	66.8%

One (1) LID biofiltration basin plus one (1) Underground System (UG-1) are located within the project site and are responsible for handling hydromodification requirements for the project. The additional underground system (UG-2) only receives runoff during one hour of the continuous simulation and it is more of an extreme event emergency overflow system. It should be pointed out that in developed conditions, the biofiltration with partial infiltration basin and both underground systems will have a discharge structure with orifices, slots and/or weir as defined in Table 3.

All flows will be either by-passed or discharged from the basins via the outlet structure or infiltrate through the base of the facility to the receiving amended soil and low flow orifice. The riser structure will act as a spillway such that peak flows can be safely discharged to the receiving underground systems and from there to the storm drain system in Valley Center Road, representing POC-1.

In regards to the biofiltration basin with partial infiltration, beneath the basins' invert lays the proposed LID biofiltration portion of the drainage facility. This portion of the basin is comprised of an 18-inch layer of amended soil (a highly sandy, organic rich composite with an infiltration capacity of at least 5 inches/hr) and a layer of gravel. The basins will be unlined to allow partial infiltration, but lateral impervious liners will prevent lateral infiltration (basin is unlined at the bottom, but lined along the walls due to geotechnical safety concerns).

Additionally, an underground horizontal storage pipe (UG-1) will be located in POC-1 to help comply with the hydromodification requirements. The 4 feet diameter pipe will be 130 feet in length. At the downstream end of the pipe a riser structure with slots will control the discharge to meet hydromodification requirements and emergency weir will safely discharge excessive flows into a second underground pipe (UG-2). This second system only discharges via a 3" orifice to control the peak flow during the occurrence of an extreme storm event.

The biofiltration basin with partial infiltration (LID-1) was modeled using the biofiltration LID module within SWMM. The biofiltration module can model the amended soil layer, and a surface storage pond up to the elevation of the invert of the spillway. It should be noted that detailed outlet structure location and elevations will be shown on the construction plans based on the recommendations of this study.

3 W.0.7032-05

BMP MODELING FOR HMP PURPOSES

Modeling of HMP BMPs

One (1) BMP biofiltration with partial infiltration basin (LD-1) and an underground 4 feet horizontal storage pipe (UG-1) are proposed for hydromodification conformance for the project site, in addition to an emergency underground pipe (UG-2) mostly used for extreme storm events. Tables 3 & 4 illustrate the dimensions required for HMP compliance according to the SWMM model that was undertaken for the project.

TABLE 3 – SUMMARY OF BIOFILTRATION / PARTIAL INFILTRATION BMP

		DIMENSIONS								
ВМР	BMP Area ⁽¹⁾ , (ft ²)	Low Flow Orif. on gravel layer (in)	Gravel Depth (in) ⁽²⁾	Depth to Riser Invert (ft) ⁽³⁾	Weir Perimeter Length ⁽³⁾ (ft)	Total Surface Depth ⁽⁴⁾ (ft)				
LID-1	1,089	1.25"	18"	1.00′	8	2.00'				

^{(1):} Area of amended soil = area of gravel layer

TABLE 4 – SUMMARY OF OUTLET STRUCTURE DETAILS AT UNDERGROUND SYSTEMS:

UNDERGROUND PIPE SYSTEM OUTLET STRUCTURE (See Attachment 5 for configuration)									
	Bottom Orifice		Lower Slo	Weir					
Outlet	# of orifices and Diameter (in)	Elev. (ft)	width (in)	height (in)	Invert Elev. (in)	Width (ft)	Elev. (ft)		
UG-1	2 orifices, 5/8" each	0.00 ⁽¹⁾	16	1.5	32	6.00	3.50		
UG-2	1 orifice, 3" ⁽²⁾	0.00	n/a	n/a	n/a	n/a	n/a		

Notes:

FLOW DURATION CURVE COMPARISON

The Flow Duration Curve (FDC) for the site was compared at the POC by exporting the hourly runoff time series results from SWMM to a spreadsheet.

 Q_2 and Q_{10} were determined with a partial duration statistical analysis of the runoff time series in an Excel spreadsheet using the Cunnane plotting position method (which is the preferred plotting methodology in the HMP Permit). As the SWMM Model includes a statistical analysis based on the Weibull Plotting Position Method, the Weibull Method was also used within the spreadsheet to ensure that the results were similar to those obtained by the SWMM Model.

4 W.O.7032-05

^{(2):} Filter layer (3" sand + 3" pea gravel) included here. Also included 3" of gravel below invert of LID orifice.

^{(3):} Riser is at 12" above mulch, which is 3" above amended soil. The equivalent depth of ponding (considering mulch porosity of 0.4 and change in area with elevation) is 18.80", which is the depth to be included in model.

^{(4): 2} ft = 3" of mulch + 12" to reach invert of riser + 9" of free board over riser invert to discharge peak flows.

⁽¹⁾ Slot and orifices on UG-1 will be placed in a wall located at distribution box to control outlet peak to discharge pipe system. Weir will discharge to UG-2.

⁽²⁾ Orifice in UG-2 to be placed in a plate upstream of discharge pipe to control UG-2 discharges

The range between 10% of Q_2 and Q_{10} was divided into 100 equal time intervals; the number of hours that each flow rate was exceeded was counted from the hourly series. Additionally, the intermediate peaks with a return period "i" were obtained (Q_i with i=3 to 9). For the purpose of the plot, the values were presented as percentage of time exceeded for each flow rate. FDC comparison at the POC is illustrated in Figure 1 in both normal and logarithmic scale.

As can be seen in Figure 1, the FDC for the proposed condition with the HMP BMPs is within 110% of the curve for the existing condition in both peak flows and durations. The additional runoff volume generated from developing the site will be released to the existing point of discharge at a flow rate below the 10% Q_2 lower threshold for POC-1. Additionally, the project will also not increase peak flow rates between the Q_2 and the Q_{10} , as shown in the peak flow table in Attachment 1.

Discussion of the Manning's coefficient (Pervious Areas) for Pre and Post-Development Conditions

Typically the Manning's coefficient is selected as n=0.10 for pervious areas and n=0.012 for impervious areas. However, due to the impact that n has in the continuous simulation a more accurate value of the Manning's coefficient has been chosen for pervious areas. Taken into consideration the study prepared by TRWE (Reference [6]) a value of n=0.05 has been selected (see Table 1 of Reference [6] included in Attachment 7). An average n value between average grass plus pasture (0.04) and dense grass (0.06) has been selected per the reference cited, for light rain (<0.8 in/hr) as more than 99% of the rainfall has been measured with this intensity.

DRYING TIMES

Drying time of the LID is based on the assumed low-flow capacity of the LID orifice. For LID-1 Q_{orifice} is approximately 0.042 cfs, and surface volume below riser is 1,706 cu-ft. Therefore, $T_1 = 1,706/(3600\cdot0.042) = 11.3$ hrs. For the underground systems the discharge is a function of the depth; drying times are calculated in Attachment 4 with the following formula:

For UG-1 the drying time is 17.0 hr, and for UG-2 it is 2.44 hrs, in both cases smaller than 24 hours.

SUMMARY

This study has demonstrated that the proposed HMP BMP provided for the Autozone Valley Center site is sufficient to meet the current HMP criteria if the geometry of the LID and underground systems recommended within this technical memorandum, and the respective orifice and outlet structure are incorporated as specified within the proposed project site.

5 W.O.7032-05

KEY ASSUMPTIONS

- 1. Type C Soil is representative of the existing condition site. This is based on the site specific infiltration tests which are representative of soil Type C.
- 2. The LID basin will be unlined at the bottom to provide some partial infiltration at the bottom surface.
- 3. The LID basin will be lined laterally to prevent lateral infiltration.
- 4. Two underground pipes will be added to the drainage system: the first (UG-1) to help hydromodification compliance as the biofiltration with partial infiltration is not large enough, and the second (same dimension, different outlet structure) to help with reduction of Q_{100} peak flow to pre-development levels (which is studied separately in the drainage report).

FLOW DURATION CURVE ANALYSIS

1) Flow duration curve shall not exceed the existing conditions by more than 10%, neither in peak flow nor duration.

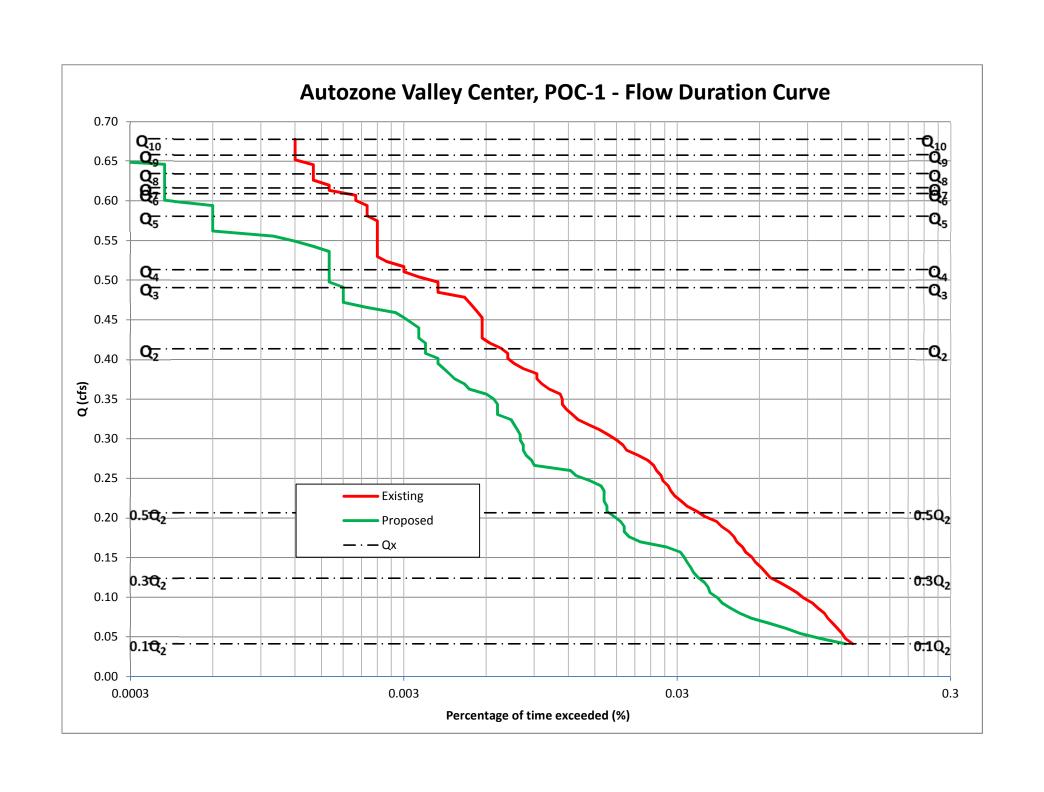

The figures on the following pages illustrate that the flow duration curve in post-development conditions, after the proposed BMP is implemented, is below the existing flow duration curve. The flow duration curve table, following the curve, shows that if the interval $0.10Q_2-Q_{10}$ is divided in 100 sub-intervals, then a) the post development divided by pre-development durations are never larger than 110% (the permit allows up to 110%); and b) there are no more than 10 intervals in the range 101%-110% which would imply an excess over 10% of the length of the curve (the permit allows less than 10% of excesses measured as 101-110%).

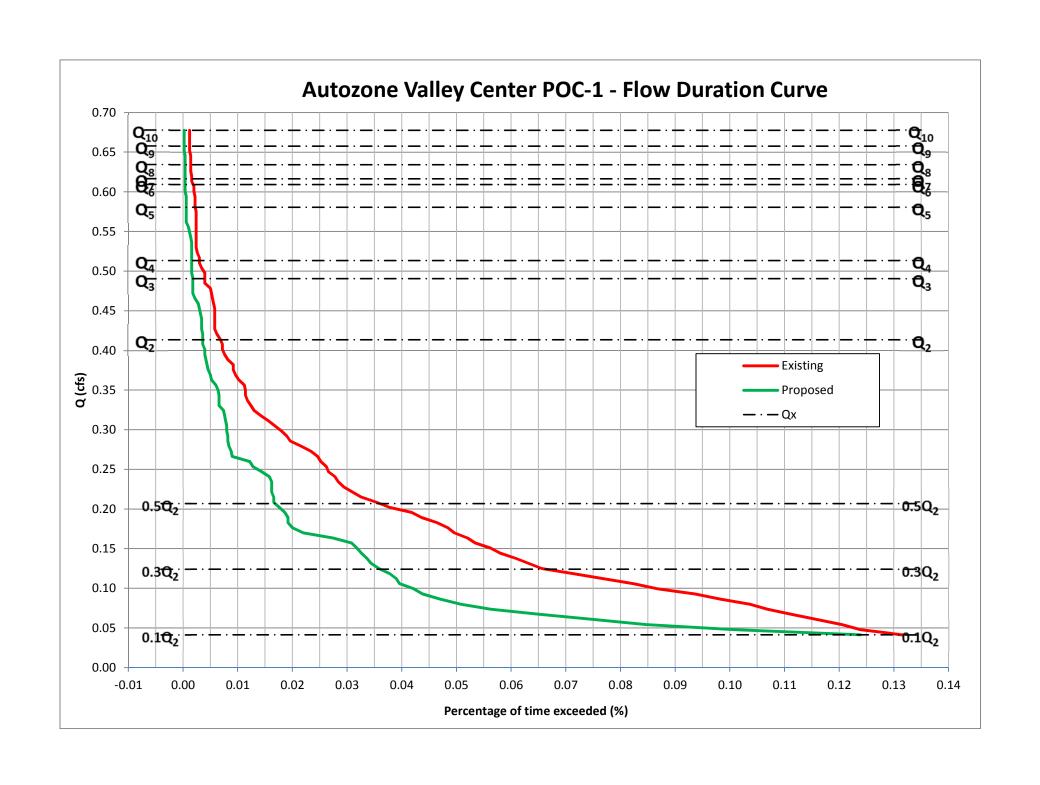

Consequently, the design passes the hydromodification test.

It is important to note that the flow duration curve can be expressed in the "x" axis as percentage of time, hours per year, total number of hours, or any other similar time variable. As those variables only differ by a multiplying constant, their plot in logarithmic scale is going to look exactly the same, and compliance can be observed regardless of the variable selected. However, in order to satisfy the City of Valley Center HMP example, % of time exceeded is the variable of choice in the flow duration curve. The selection of a logarithmic scale in lieu of the normal scale is preferred, as differences between the pre-development and post-development curves can be seen more clearly in the entire range of analysis. Both graphics are presented just to prove the difference.

In terms of the "y" axis, the peak flow value is the variable of choice. As an additional analysis performed by REC, not only the range of analysis is clearly depicted (10% of Q_2 to Q_{10}) but also all intermediate flows are shown (Q_2 , Q_3 , Q_4 , Q_5 , Q_6 , Q_7 , Q_8 and Q_9) in order to demonstrate compliance at any range $Q_x - Q_{x+1}$. It must be pointed out that one of the limitations of both the SWMM and SDHM models is that the intermediate analysis is not performed (to obtain Q_i from i = 2 to 10). REC performed the analysis using the Cunnane Plotting position Method (the preferred method in the HMP permit) from the "n" largest independent peak flows obtained from the continuous time series.

The largest "n" peak flows are attached in this appendix, as well as the values of Q_i with a return period "i", from i=2 to 10. The Q_i values are also added into the flow-duration plot.

ATTACHMENT 3

List of the "n" Largest Peaks: Pre & Post-Developed Conditions

Basic Probabilistic Equation:

R = 1/P

R: Return period (years).

P: Probability of a flow to be equaled or exceeded any given year (dimensionless).

Cunnane Equation:

Weibull Equation:

$$P = \frac{i-0.4}{n+0.2}$$

$$P = \frac{i}{n+1}$$

i: Position of the peak whose probability is desired (sorted from large to small)

n: number of years analyzed.

Explanation of Variables for the Tables in this Attachment

Peak: Refers to the peak flow at the date given, taken from the continuous simulation hourly results of the n year analyzed.

Posit: If all peaks are sorted from large to small, the position of the peak in a sorting analysis is included under the variable Posit.

Date: Date of the occurrence of the peak at the outlet from the continuous simulation

Note: all peaks are not annual maxima; instead they are defined as event maxima, with a threshold to separate peaks of at least 12 hours. In other words, any peak P in a time series is defined as a value where dP/dt = 0, and the peak is the largest value in 25 hours (12 hours before, the hour of occurrence and 12 hours after the occurrence, so it is in essence a daily peak).

List of Peak events and Determination of Q2 and Q10 (Pre-Development)

ATTACHMENT 4

AREA VS ELEVATION

The area vs. elevation curves in the model are calculated in Excel and imported into the model. It should be noted that up to the first surface orifice of the biofiltration basin, the storage is allocated to the LID Module of the SWMM model. Please refer to Attachment 7 for further information. The Excel stage-storage calculations for the underground systems are provided on the following pages.

DISCHARGE VS ELEVATION

The orifice has been selected to maximize its size while still restricting flows to conform to the required 10% of the Q2 event flow as mandated in the Final Hydromodification Management Plan by Brown & Caldwell, dated March 2011. While REC acknowledges that the orifice is small, to increase the size of the outlet would impact the basin's ability to restrict flows beneath the HMP thresholds, thus preventing the BMP from conformance with HMP requirements.

In order to further reduce the risk of blockage of the orifices, regular maintenance of the riser and orifice must be performed to ensure potential blockages are minimized. A detail of the orifice and riser structure is provided in Attachment 5 of this memorandum.

Stage-discharge relationships were developed to represent the outlet structures for the underground pipe systems, and are provided on the following pages.

DISCHARGE EQUATIONS

1) Weir: $Q_W = C_W \cdot L \cdot H^{3/2} \tag{1}$

2) Slot:

As an orifice:
$$Q_s = B_s \cdot h_s \cdot c_g \cdot \sqrt{2g\left(H - \frac{h_s}{2}\right)}$$
 (2.a)

As a weir:
$$Q_S = C_W \cdot B_S \cdot H^{3/2} \tag{2.b}$$

For $H > h_s$ slot works as weir until orifice equation provides a smaller discharge. The elevation such that equation (2.a) = equation (2.b) is the elevation at which the behavior changes from weir to orifice.

3) Vertical Orifices

As an orifice:
$$Q_o = 0.25 \cdot \pi D^2 \cdot c_g \cdot \sqrt{2g\left(H - \frac{D}{2}\right)}$$
 (3.a)

As a weir: Critical depth and geometric family of circular sector must be solved to determined Q as a function of H:

$$\frac{Q_O^2}{g} = \frac{A_{cr}^3}{T_{cr}}; \quad H = y_{cr} + \frac{A_{cr}}{2 \cdot T_{cr}}; \quad T_{cr} = 2\sqrt{y_{cr}(D - y_{cr})}; \quad A_{cr} = \frac{D^2}{8} [\alpha_{cr} - \sin(\alpha_{cr})];$$

$$y_{cr} = \frac{D}{2}[1 - sin(0.5 \cdot \alpha_{cr})]$$
 (3.b.1, 3.b.2, 3.b.3, 3.b.4 and 3.b.5)

There is a value of H (approximately H = 110% D) from which orifices no longer work as weirs as critical depth is not possible at the entrance of the orifice. This value of H is obtained equaling the discharge using critical equations and equations (3.b).

A mathematical model is prepared with the previous equations depending on the type o discharge.

The following are the variables used above:

 Q_W , Q_S , Q_O = Discharge of weir, slot or orifice (cfs)

 C_{W} , c_{g} : Coefficients of discharge of weir (typically 3.1) and orifice (0.61 to 0.62)

L, B_s, D, h_s: Length of weir, width of slot, diameter of orifice and height of slot, respectively; (ft)

H: Level of water in the pond over the invert of slot, weir or orifice (ft)

 A_{cr} , T_{cr} , y_{cr} , α_{cr} : Critical variables for circular sector: area (sq-ft), top width (ft), critical depth (ft), and angle to the center, respectively.

Stage-Area for Biofiltration BMP Basin 1

Elevation (ft)	Area (ft ²)	Volume (ft ³)	
-0.25	1089	0	Bottom of 3" layer of mulch (1)

ATTACHMENT 7

EPA SWMM FIGURES AND EXPLANATIONS

Per the attached, the reader can see the screens associated with the EPA-SWMM Model in both pre-development and post-development conditions. Each portion, i.e., sub-catchments, outfalls, storage units, weir as a discharge, and outfalls (point of compliance), are also shown.

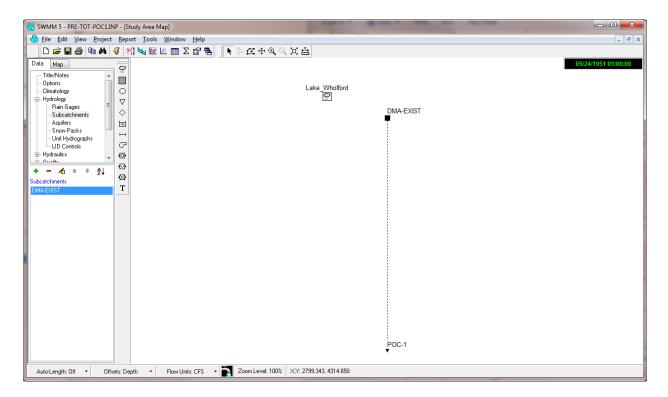

Variables for modeling are associated with typical recommended values by the EPA-SWMM model, typical values found in technical literature (such as Maidment's Handbook of Hydrology). Recommended values for the SWMM model have been attained from the interim Orange County criteria established for their SWMM calibration. Currently, no recommended values have been established by the San Diego County HMP Permit for the SWMM Model.

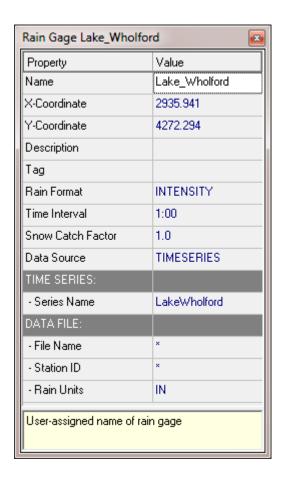

Soil characteristics of the existing soils were determined from the NRCS Web Soil Survey Exhibit (located in Attachment 8 of this report).

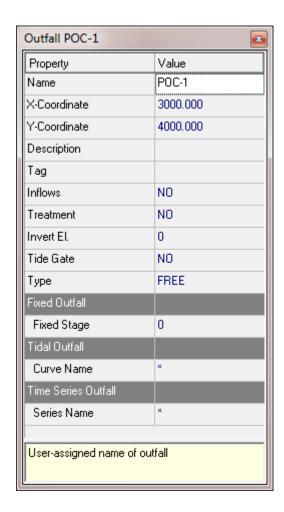

Some values incorporated within the SWMM model have been determined from the professional experience of REC using conservative assumptions that have a tendency to increase the size of the needed BMP and also generate a long-term runoff as a percentage of rainfall similar to those measured in gage stations in Southern California by the USGS.

A Technical document prepared by Tory R Walker Engineering for the Cities of San Marcos, Oceanside and Vista (Reference [1]) can also be consulted for additional information regarding typical values for SWMM parameters.

EXPLANATION OF SELECTED VARIABLES

Sub Catchment Areas:

Please refer to the attached diagrams that indicate the DMA and Bio-Filtration BMP (BMP) sub areas modeled within the project site at both the pre and post developed conditions draining to the POC.

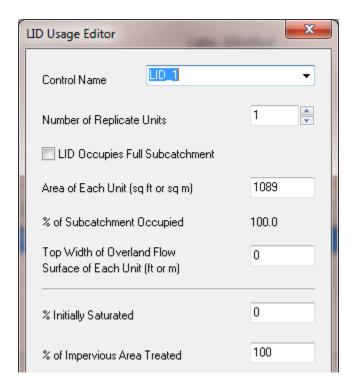

Parameters for the pre -developed models include soil Types C as determined from the site specific Natural Resources Conservation Service (NRCS) We Soil Survey (attached at the end of this appendix) and site specific infiltration results which are representative of Type C soils. Suction head, conductivity and initial deficit corresponds to average values expected for these soils types, according to sources consulted, professional experience, and approximate values obtained by the interim Orange County modeling approach.

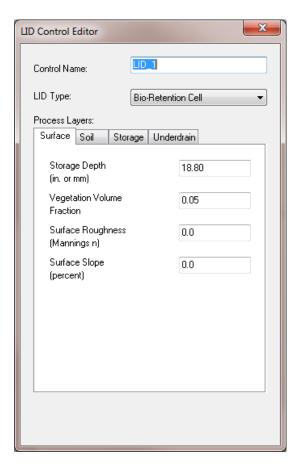

REC selected infiltration values, such that the percentage of total precipitation that becomes runoff, is realistic for the soil types and slightly smaller than measured values for Southern California watersheds.

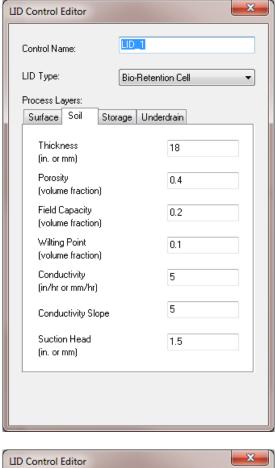

Selection of a Kinematic Approach: As the continuous model is based on hourly rainfall, and the time of concentration for the pre-development and post-development conditions is significantly smaller than 60 minutes, precise routing of the flows through the impervious surfaces, the underdrain pipe system, and the discharge pipe was considered unnecessary. The truncation error of the precipitation into hourly steps is much more significant than the precise routing in a system where the time of concentration is much smaller than 1 hour.

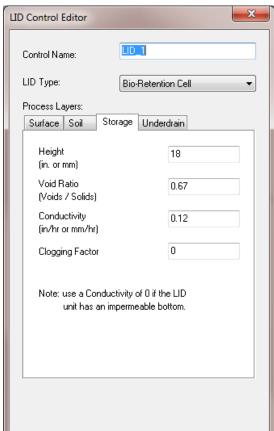

Sub-catchment BMP:

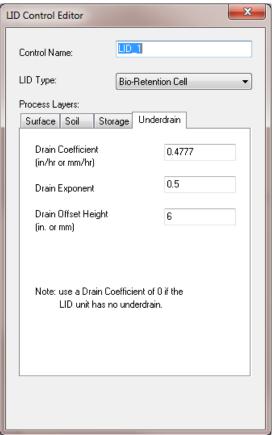

The area of bio-filtration must be equal to the area of the development tributary to the bioretention facility (area that drains into the biofiltration, equal external area plus bio-filtration itself). Five (5) decimal places were given regarding the areas of the bio-filtration to insure that the area used by the program for the LID subroutine corresponds exactly with this tributary.

LID Control Editor: Explanation of Significant Variables

Storage Depth:

The storage depth variable within the SWMM model is representative of the storage volume provided beneath the surface riser outlet and the engineered soil and mulch components of the bioretention facility.

In those cases where the surface storage has a variable area that is also different to the area of the gravel and amended soil, the SWMM model needs to be calibrated as the LID module will use the storage depth multiplied by the BMP area as the amount of volume stored at the surface.

Let A_{BMP} be the area of the BMP (area of amended soil and area of gravel). The proper value of the storage depth S_D to be included in the LID module can be calculated by using geometric properties of the surface volume. Let A_0 be the surface area at the bottom of the surface pond, and let A_i be the surface area at the elevation of the invert of the first row of orifices (or at the invert of the riser if not surface orifices are included). Finally, let h_i be the difference in elevation between A_0 and A_i . By volumetric definition:

$$A_{BMP} \cdot S_D = \frac{(A_0 + A_i)}{2} h_i \tag{1}$$

Equation (1) allows the determination of S_D to be included as Storage Depth in the LID module.

<u>Porosity</u>: A porosity value of 0.4 has been selected for the model. The amended soil is to be highly sandy in content in order to have a saturated hydraulic conductivity of approximately 5 in/hr.

REC considers such a value to be slightly high; however, in order to comply with the HMP Permit, the value recommended by the Copermittees for the porosity of amended soil is 0.4, per Appendix A of the Final Hydromodification Management Plan by Brown & Caldwell, dated March 2011. Such porosity is equal to the porosity of the gravel per the same document.

<u>Void Ratio</u>: The ratio of the void volume divided by the soil volume is directly related to porosity as n/(1-n). As the underdrain layer is composed of gravel, a porosity value of 0.4 has been selected (also per Appendix A of the Final HMP document), which results in a void ratio of 0.4/(1-0.4) = 0.67 for the gravel detention layer.

<u>Conductivity:</u> The conductivity value was set as 0.12 to account for the infiltration value into the underlying soil per the geotechnical report.

<u>Cloquing factor</u>: A clogging factor was not used (0 indicates that there is no clogging assumed within the model). The reason for this is related to the fairness of a comparison with the SDHM model and the HMP sizing tables: a clogging factor was not considered, and instead, a conservative value of infiltration was recommended.

<u>Drain (Flow) coefficient</u>: The flow coefficient C in the SWMM Model is the coefficient needed to transform the orifice equation into a general power law equation of the form:

$$q = C(H - H_D)^n \tag{2}$$

where q is the peak flow in in/hr, n is the exponent (typically 0.5 for orifice equation), H_D is the elevation of the centroid of the orifice in inches (assumed equal to the invert of the orifice for small orifices and in our design equal to 0) and H is the depth of the water in inches.

The general orifice equation can be expressed as:

$$Q = \frac{\pi}{4} c_g \frac{D^2}{144} \sqrt{2g \frac{(H - H_D)}{12}} \tag{3}$$

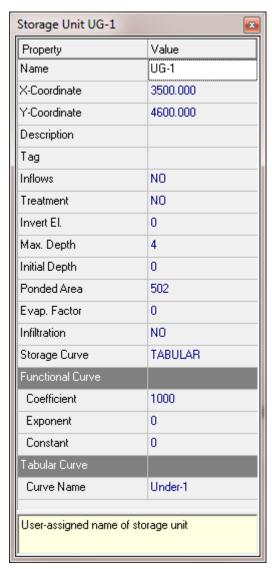

where Q is the peak flow in cfs, D is the diameter in inches, c_g is the typical discharge coefficient for orifices (0.61-0.63 for thin walls and around 0.75-0.8 for thick walls), g is the acceleration of gravity in ft/s², and H and H_D are defined above and are also used in inches in Equation (3).

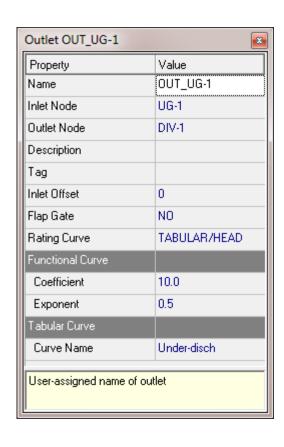

It is clear that:

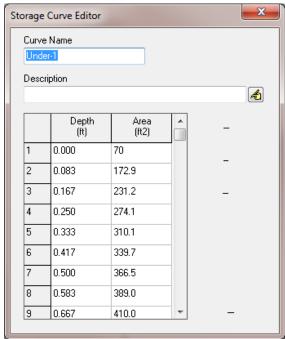

$$q\left(\frac{in}{hr}\right)X\frac{A_{BMP}}{12\ X\ 3600} = Q\ (cfs) \tag{4}$$

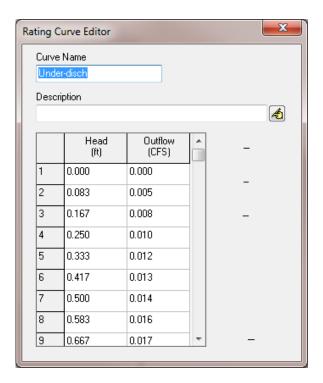

<u>Cut-Off Flow:</u> Q (cfs) and q (in/hr) are also the cutoff flow. For numerical reasons to insure the LID is full, the model uses cut-off = $1.01 \, \text{Q}$.

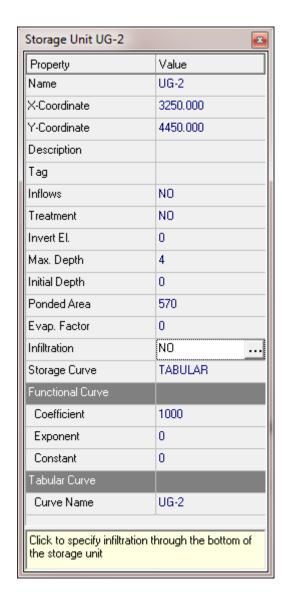

Storage and Discharge Curves

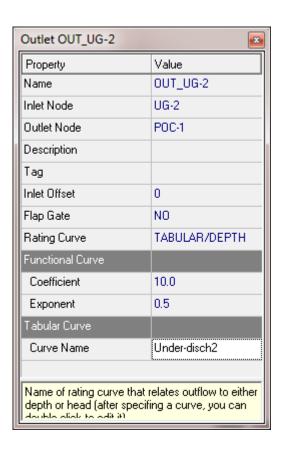

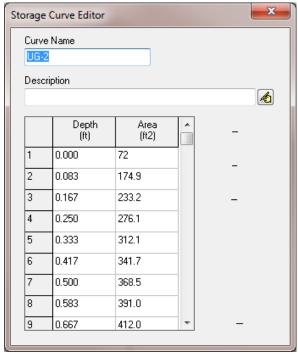

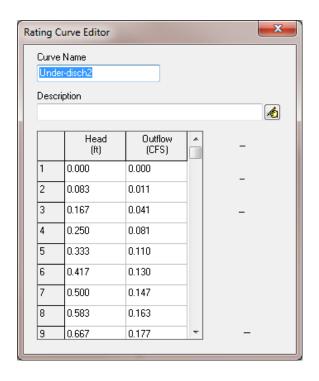

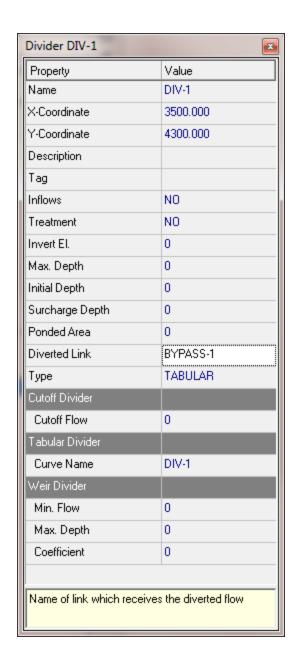

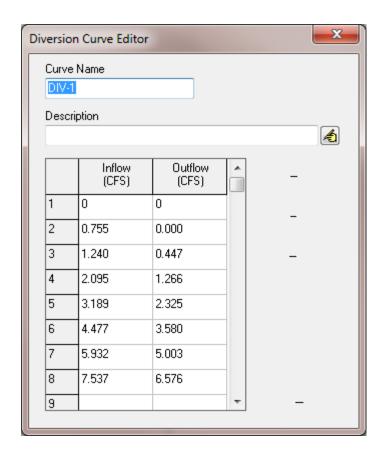

Overland Flow Manning's Coefficient per TRWE (Reference [6])

appeal of a de facto value, we anticipate that jurisdictions will not be inclined to approve land surfaces other than short prairie grass. Therefore, in order to provide SWMM users with a wider range of land surfaces suitable for local application and to provide Copermittees with confidence in the design parameters, we recommend using the values published by Yen and Chow in Table 3-5 of the EPA SWMM Reference Manual Volume I – Hydrology.

SWMM-Endorsed Values Will Improve Model Quality

In January 2016, the EPA released the SWMM Reference Manual Volume I – Hydrology (SWMM Hydrology Reference Manual). The SWMM Hydrology Reference Manual complements the SWMM 5 User's Manual and SWMM 5 Applications Manual by providing an in-depth description of the program's hydrologic components (EPA 2016). Table 3-5 of the SWMM Hydrology Reference Manual expounds upon SWMM 5 User's Manual Table A.6 by providing Manning's *n* values for additional overland flow surfaces³. The values are provided in Table 1:

Table 1: Manning's n Values for Overland Flow (EPA, 2016; Yen 2001; Yen and Chow, 1983).

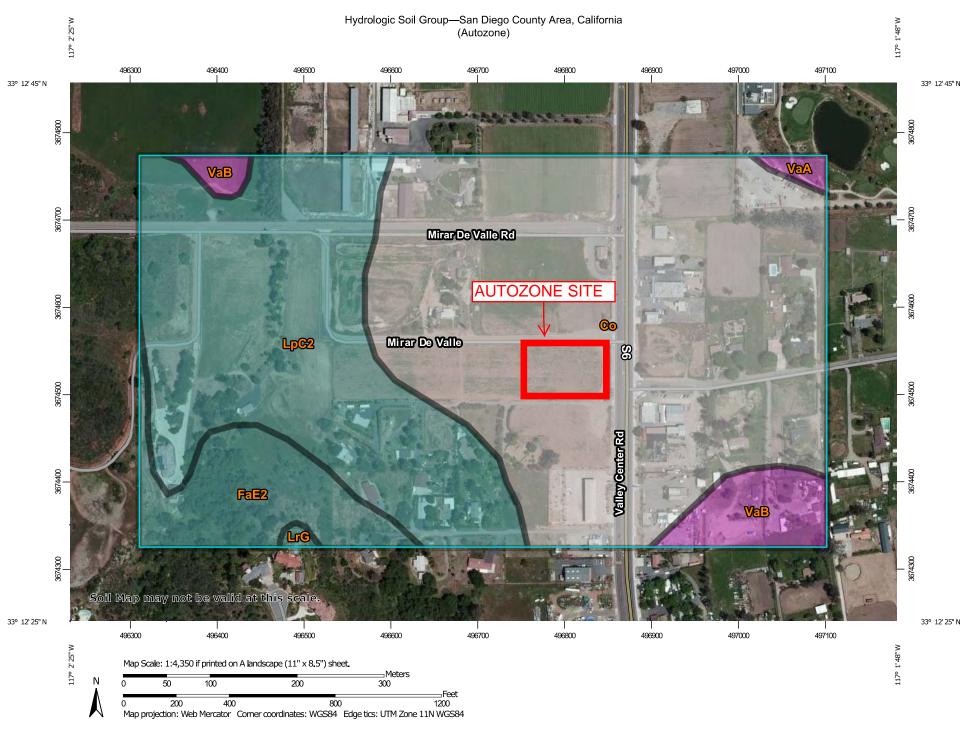

Overland Surface	Light Rain (< 0.8 in/hr)	Moderate Rain (0.8-1.2 in/hr)	Heavy Rain (> 1.2 in/hr)
Smooth asphalt pavement	0.010	0.012	0.015
Smooth impervious surface	0.011	0.013	0.015
Tar and sand pavement	0.012	0.014	0.016
Concrete pavement	0.014	0.017	0.020

Average grass, closely clipped sod	0.040	0.050	0.060
Pasture	0.040	0.055	0.070
Timberland	0.060	0.090	0.120
Dense grass	0.060	0.090	0.120
Shrubs and bushes	0.080	0.120	0.180
Land Use			
Business	0.014	0.022	0.035
Semibusiness	0.022	0.035	0.050
Industrial	0.020	0.035	0.050
Dense residential	0.025	0.040	0.060
Suburban residential	0.030	0.055	0.080
Parks and lawns	0.040	0.075	0.120

For purposes of local hydromodification management BMP design, these Manning's n values are an improvement upon the values presented by Engman (1986) in SWMM 5 User's Manual Table A.6. Values from SWMM 5 User's Manual Table A.6, while completely suitable for the intended application to certain agricultural land covers, comes with the disclaimer that the provided Manning's n values are valid for shallow-depth overland flow that match the conditions in the experimental plots (Engman,

³ Further discussion is provided on page 6 under "Discussion of Differences Between Manning's *n* Values"

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Use this checklist to ensure the required information has been included on the Hydromodification Management Exhibit:

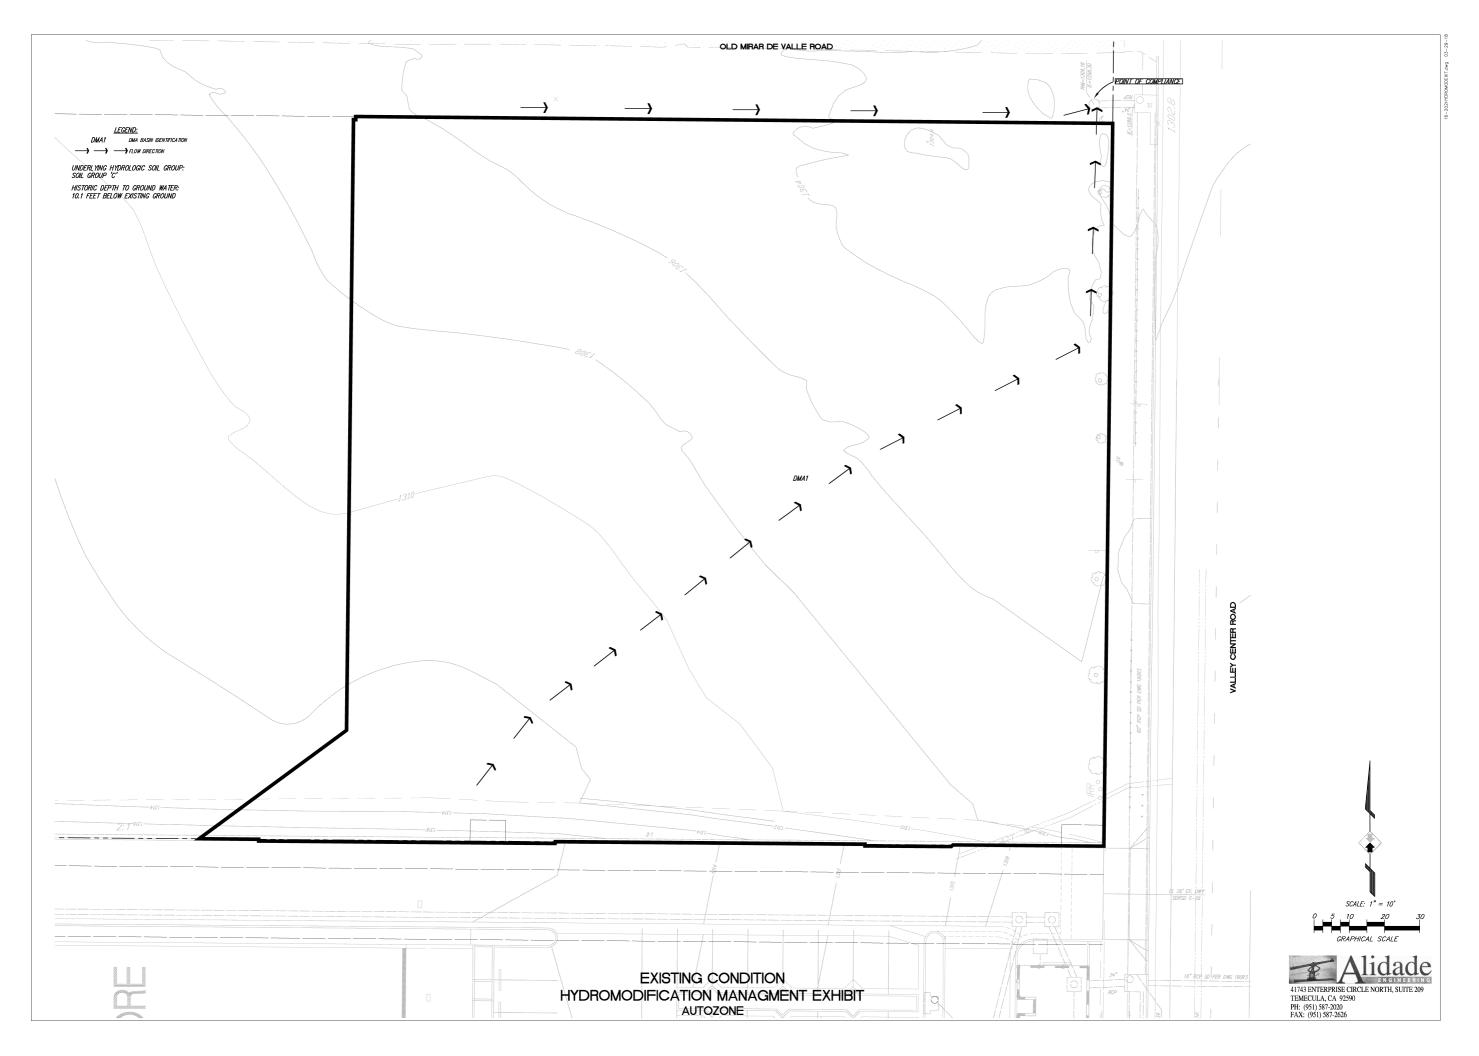

The Hydromodification Management Exhibit must identify:

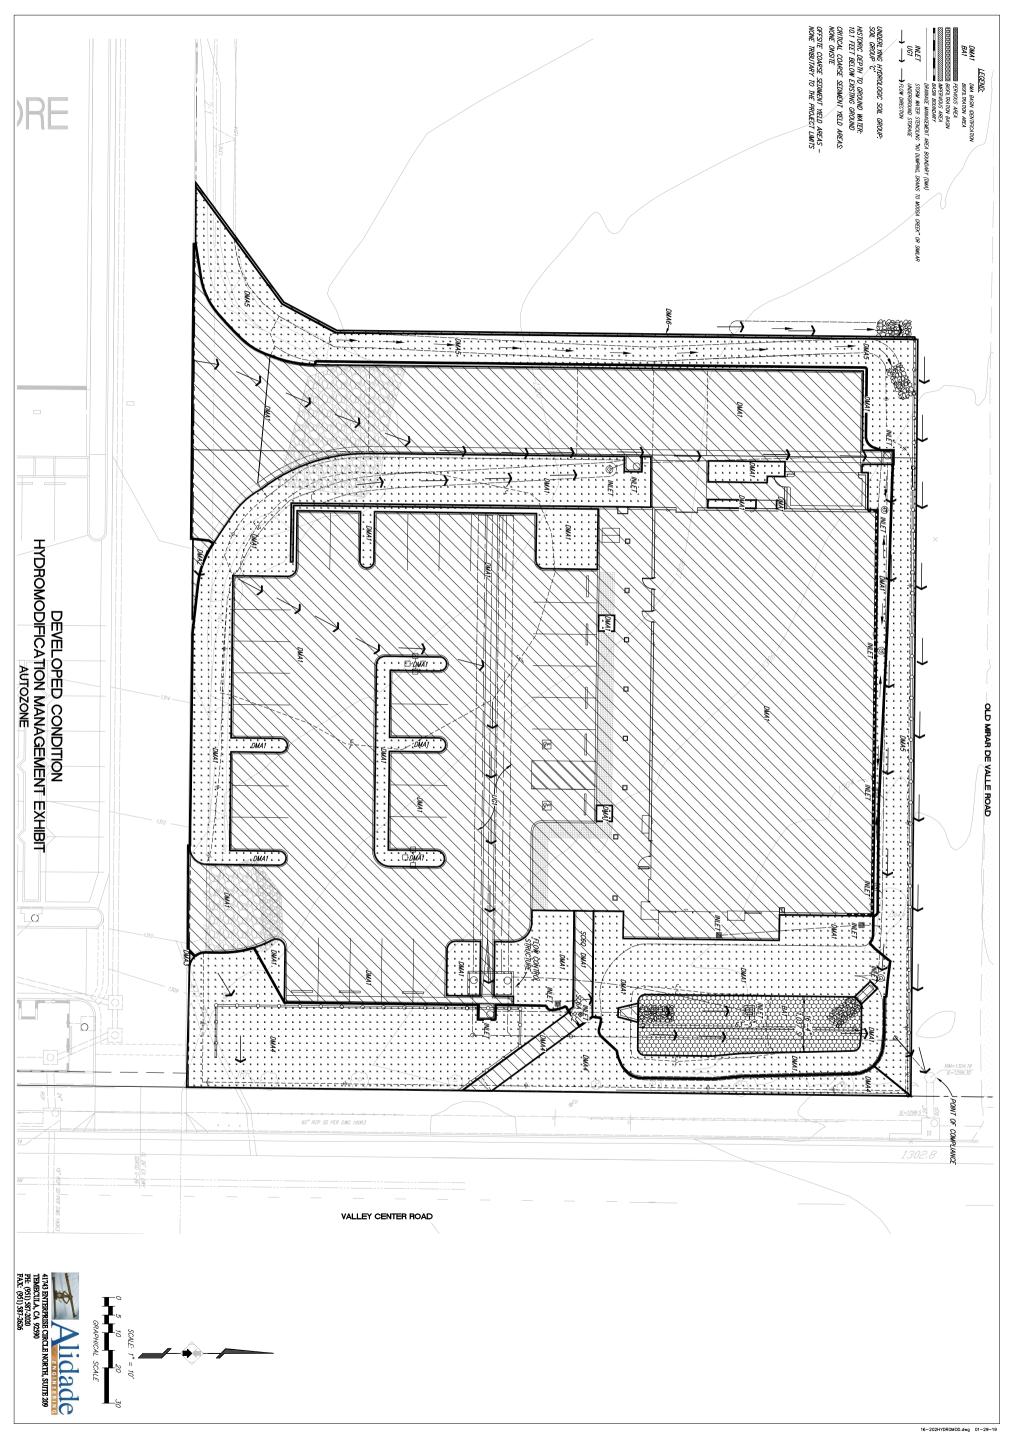

- □ Underlying hydrologic soil group
- □ Approximate depth to groundwater

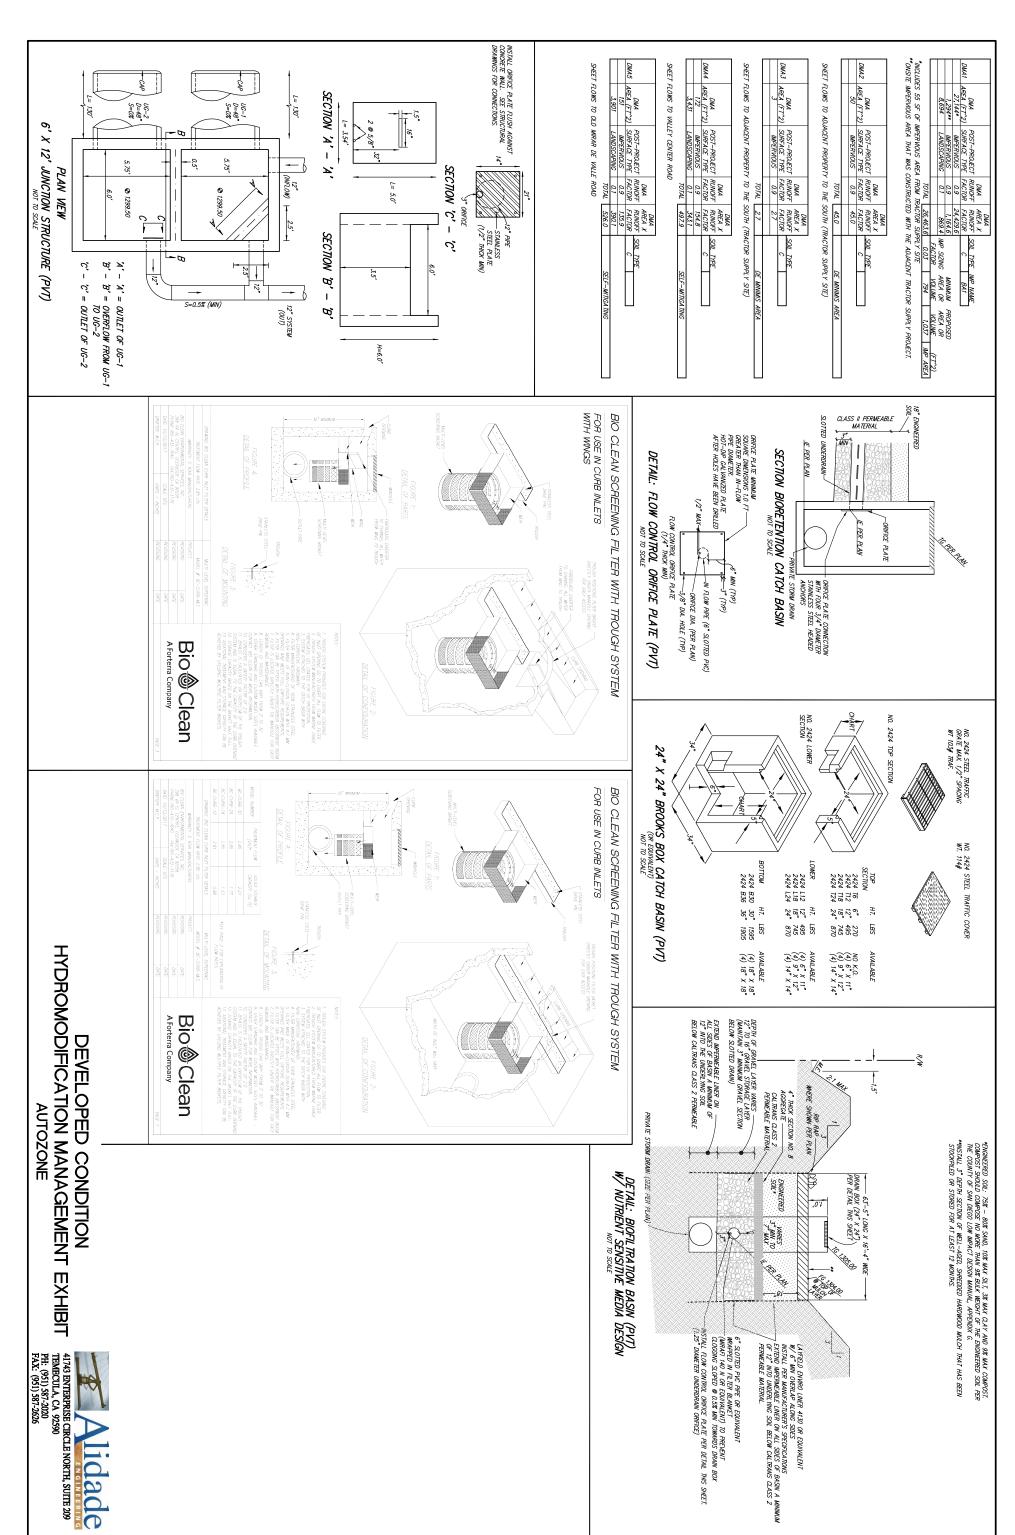

- ⊠ Existing and proposed site drainage network and connections to drainage offsite

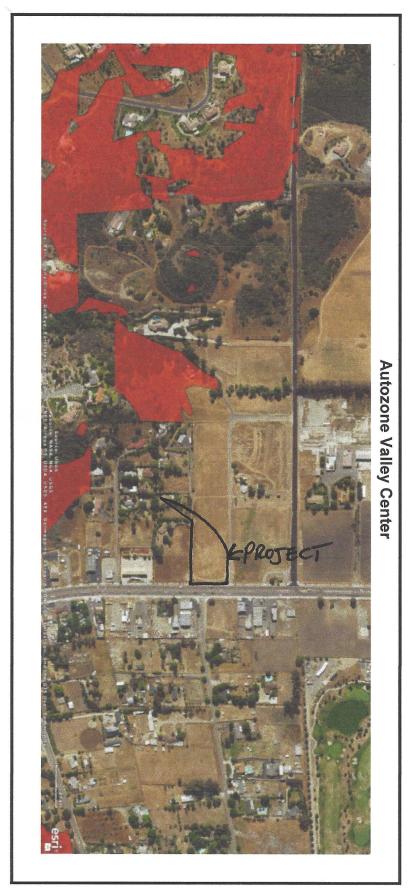

- ☑ Proposed design features and surface treatments used to minimize imperviousness
- □ Point(s) of Compliance (POC) for Hydromodification Management
- ☑ Existing and proposed drainage boundary and drainage area to each POC (when necessary, create separate exhibits for pre-development and post-project conditions)
- ⊠ Structural BMPs for hydromodification management (identify location, type of BMP, and size/detail)

Template Date: March 16, 2016 Preparation Date: [04/04/2018] LUEG:SW PDP SWQMP - Attachments

ATTACHMENT 2C

ATTACHMENT 3

Structural BMP Maintenance Information

This is the cover sheet for Attachment 3.

Indicate which Items are Included behind this cover sheet:

Attachment Sequence	Contents	Checklist
Attachment 3a	Structural BMP Maintenance Plan (Required)	⊠ Included
		See Structural BMP Maintenance Information Checklist on the back of this Attachment cover sheet.
Attachment 3b	Draft Stormwater Maintenance Notification / Agreement (when applicable)	☑ Included☐ Not Applicable

Template Date: March 16, 2016 Preparation Date: [04/04/2018] LUEG:SW **PDP SWQMP - Attachments**

Use this checklist to ensure the required information has been included in the Structural BMP Maintenance Information Attachment:

Attachment 3a must identify:

- ☑ Specific maintenance indicators and actions for proposed structural BMP(s). This must be based on Section 7.7 of the BMP Design Manual and enhanced to reflect actual proposed components of the structural BMP(s)
- ☑ How to access the structural BMP(s) to inspect and perform maintenance
- ☑ Features that are provided to facilitate inspection (e.g., observation ports, cleanouts, silt posts, or other features that allow the inspector to view necessary components of the structural BMP and compare to maintenance thresholds)
- ☑ Manufacturer and part number for proprietary parts of structural BMP(s) when applicable
- Maintenance thresholds specific to the structural BMP(s), with a location-specific frame of reference (e.g., level of accumulated materials that triggers removal of the materials, to be identified based on viewing marks on silt posts or measured with a survey rod with respect to a fixed benchmark within the BMP)
- ⊠ Recommended equipment to perform maintenance

Attachment 3b: For all Structural BMPs, Attachment 3b must include a draft maintenance agreement in the County's standard format depending on the Category (PDP applicant to contact County staff to obtain the current maintenance agreement forms). Refer to Section 7.3 in the BMP Design Manual for a description of the different categories.

Template Date: March 16, 2016 Preparation Date: [04/04/2018]

LUEG:SW PDP SWQMP - Attachments

INTRODUCTION

The Storm Water Operation & Maintenance Plan (O & M) is required under the County of San Diego's BMP Design Manual (Manual). The purpose of this O & M Plan is to describe the designated responsible party to manage the storm water BMPs, employee's training program and duties, operating schedule, maintenance frequency, routine service schedule and specific maintenance activities as called for in the approved Storm Water Quality Management Plan (SWQMP) for the Autozone project in the Township of Valley Center. The O & M Plan is subject to revisions as needed by the County Engineer.

A. DESIGNATED RESPONSIBLE PARTY

Bell Holdings, LLC P.O. Box 642 Ranch Santa Fe, CA 92067 Mr. Steve Flynn (858) 756-3589

B. SUMMARY OF SWOMP

To address water quality for the project, Bell Holdings, LLC shall implement Site Design BMPs, Source Control BMPs and Treatment Control BMPs until such time as the parcel is sold or quit claimed to another individual or entity. After the sale is finalized, the new owner(s) shall implement the Site Design BMPs, Source Control BMPs and Treatment Control BMPs.

(1) Site Design/LID BMPs

The proposed Autozone project minimizes the amount of impervious area as outlined in Site Design Concept 4.3.3 (SD-3) in the Manual by constructing only the minimum required parking areas and by providing the minimum amount of landscaping required by the County. The proposed development minimizes soil compaction on site by providing plenty of pedestrian access paths that should keep pedestrians out of landscaped areas thereby protecting soils in those areas in conjunction with Site Design Concept 4.3.4 (SD-4) in the Manual. Finally, the project includes landscaping with native or drought tolerant species as highlighted in Site Design Concept 4.3.7 (SD-7) of the Manual.

(2) Source Control BMPs

The Autozone project intends to effectively eliminate discharges of non-stormwater into the County's storm drain system as discussed in Source Control Concept 4.2.1 (SC-1) of the Manual. This will be accomplished by use of efficient irrigation systems which will be incorporated into the landscape design for the project. Rain shutoff devises will be employed to prevent irrigation after precipitation. The irrigation system will be designed to meet each landscape area's specific water requirements. Finally, flow reducers or shutoff valves triggered by a pressure drop will be used to control water loss in the event of broken sprinkler heads or lines. In addition, landscaping will be designed to minimize irrigation and runoff, to promote surface infiltration where appropriate and to minimize the use of fertilizers and pesticides that can contribute to storm water pollution.

The Autozone project will identify the storm drain system using stenciling or signage as outlined in Source Control Concept 4.2.2 (SC-2) of the Manual. All concrete catch basins will be stamped or stenciled with prohibitive language (e.g., "No Dumping – I Live in the San Luis Rey River" or "No Dumping – I Live in the Pacific Ocean" or similar and/or graphical icons to discourage illegal dumping satisfactory to the County Engineer. If required, the stamping shall be in Spanish as well.

The Autozone project includes a trash storage area that will be constructed per County of San Diego standards and will be protected from rainfall, run-on, runoff and wind dispersal as outlined in Source Control Concept 4.2.5 (SC-5) of the Manual.

Bell Holdings, LLC will employ additional BMPs based upon potential sources of runoff as called for in Source Control Concept 4.2.6 (SC-6) of the Manual. For example, Bell Holdings, LLC will employ Integrated Pest Management (IPM) principles to eliminate and/or reduce the need for pesticide use in the project design by incorporating pest-resistant plants and/or native plants. Bell Holdings, LLC will distribute IPM educational material to all future owners, lessees and operators. The IPM materials will address the following topics: (1) Keeping pests out of buildings and landscaping using banners, screens and caulking; (2) Physical pest elimination techniques, such as weeding, trapping, washing, or pruning out pests; (3) Relying on natural enemies to eat pests; and (4) Proper use of pesticides as a last line of defense. In addition, the design of the proposed building will include facilities in the interior of the building to fire sprinkler test water and direct it to the onsite sewer system.

All hazardous materials with the potential to contaminate urban runoff shall be placed in an enclosure such as, but not limited to, a cabinet, shed or similar structure that prevents contact with rain, runoff or spillage to the storm water conveyance system. In addition, the hazardous materials enclosure shall be protected by secondary containment structure such as berms, dikes, curbs or temporary spill containment systems and have a roof or awning to minimize direct precipitation within the secondary containment area.

An additional Source Control BMP to be used on-site is good housekeeping. Good housekeeping practices that shall be utilized on site include keeping outdoor areas in a neat and orderly condition, picking up garbage left within the pavement and landscape areas. The site shall be visually inspected on a weekly basis to remove all "foreign" items including, but not limited to, landscape debris and common trash. Routine maintenance procedures for good housekeeping include removing all freshly trimmed landscape items and natural deposited items such as annual leaves and dispose off-site per governing codes. Finally, the paved areas shall be swept as necessary using dry methods (manual sweeping, street sweepers, etc.) to remove dust and sediment buildup.

(3) Treatment Control BMPs

As a priority development project, the design of the proposed Autozone project includes treatment control BMPs to remove the pollutants of concern from the storm water runoff generated on-site for the 85th percentile storm. For this project, Bell Holdings, LLC has decided to utilize a biofiltration basin to facilitate pollutant control of the priority pollutants of concern and underground conduits connected to a flow control structure to meet both the hydromodification requirements and to mitigate the increased flows during the 100-year storm event to existing conditions.

(a) Biofiltration Basins

Biofiltration employs a simplistic, site integrated, terrestrial-based design that provides opportunity for runoff infiltration, filtration, storage and for water uptake by vegetation. Biofiltration facilities capture rainwater runoff to be filtered through a prepared soil medium. Once the soil pore space capacity of the medium is exceeded, storm water begins to pool at the surface of the planting soil. The process uses the chemical, biological and physical properties of plants, microbes soils for removal of pollutants from the storm water runoff. Some of the processes that may take place in a biofiltration facility include: sedimentation, adsorption, filtration, volatilization, ion exchange, decomposition, phytoremediation, bioremediation and storage capacity.

Biofiltration basins have a *high* removal efficiency for coarse sediment and trash and pollutants that tend to associate with fine particles during treatment. In addition, biofiltration basins have a *medium* removal efficiency for pollutants that tend to be dissolved after treatment.

The proposed biofiltration basin includes cleanouts/observation ports at the upstream ends of all of the slotted drains as required by the Manual. The rim of the cleanouts will be located 12-inches above the finished grade of the mulched basin and will act as an indicator of the amount of sediment buildup within the basins themselves. The biofiltration basin can be accessed from both the onsite parking lot and from Old Mirar De Valle Road.

The proposed curb inlets will be fitted with BioClean Curb Inlet Filters to act as pre-treatment devices to clean the storm water runoff from the parking lot and from a portion of the private access drive of trash and debris prior to directing the storm water runoff to the biofiltration basin for treatment.

(a) Underground Storm Water Storage System

The project will include dual 48-inch diameter conduits connected to a cast-in-place concrete flow control / cleanout structure. The system will be located beneath the parking lot. The flow control / cleanout structure will be designed with two access ports, two weir walls and multiple flow control orifices. The interior of the structure will be 6-feet in height to allow for easy access for repairs to and/or cleaning of the underground storm water storage system.

C. EMPLOYEE TRAINING PROGRAM

Inspection of the implementation of the SWQMP must be done by trained personnel. In addition, training of employees, contractors and sub-contractors can be an important BMP. To accomplish this, Bell Holdings, LLC shall hold a training seminar for designated owner representatives, lessees, operators, contractors and sub-contractors. The seminar shall cover the following topics at a minimum:

- Background of "pointless Pollution" video on non-point source pollution
- Information on potential fines, citizen lawsuits
- Review of the SWQMP section by section
- Common problem areas in implementation
- Review of monitoring checklists
- Construction details of protective measures

The goal of the storm water management training program is to inform employees, lessees, operators, contractors, and subcontractors of their levels of responsibility for components and goals of the SWQMP. This training program is a preventative maintenance technique, because when properly informed, employees, lessees, operators, contractors, and subcontractors have increased awareness and are more capable of preventing spills, responding safely and effectively to accidents, and recognizing situations that could lead to storm water contamination.

Storm water management training should be provided by Bell Holdings, LLC on an "As Needed" basis. Attendance records should be kept for each training session. Inspection logs and checklists should be distributed to all personnel who will be performing the monitoring and reporting.

D. INSPECTION PROGRAM FOR BMPs

As long as Bell Holdings, LLC owns the parcel, the contact person in charge of the inspection program is Mr. Steve Flynn and he can be reached at (858) 756-3589.

(1) SOURCE CONTROL BMPS

Storm Water Conveyance Stamping and Signage

The private storm drain system shall be inspected and inspection visits shall be completely documented:

• Once a month at a minimum or as directed by the local governing official.

Trash Storage Area

The trash storage area shall be inspected and inspection visits shall be completely documented:

- Routine inspection on a weekly basis to verify all trash is stored in the provided bins.
- The provided bins shall be inspected annually prior to October 1st for any damaged or worn parts and all necessary repairs shall be completed prior to October 15th of each year.

Integrated Pest Management

The project site shall be inspected and inspection visits shall be completely documented:

• Once a month at a minimum or as directed by the local governing official.

Efficient Irrigation System

The landscaped areas shall be inspected and inspection visits shall be completely documented:

• Once a month at a minimum or as directed by the local governing official. All improperly operating apparatus shall be replaced within two working days. Broken sprinkler heads and/or lines shall be repaired or replaced within two working days.

(2) TREATMENT CONTROL BMPS

Biofiltration Basins

The biofiltration basins shall be inspected and inspection visits shall be completely documented:

- Once a month at a minimum.
- After every large storm (after every storm monitored or those storms with more than 0.50 inch of precipitation.)
- On a weekly basis during extended periods of wet weather.

The inspection tasks required for the bioretention basins are as follows:

- The height of the vegetation should be measured once during the wet season and once during the dry season (depending on growth).
- Assess adequate vegetative cover. Assess quantity needed in May each year, late wet season and late dry season.
- Inspect for debris accumulation during routine trash inspection on a weekly basis or as directed by the County of San Diego.

- Inspect for accumulated sediment on a monthly basis during the wet season and prior to and following the wet season (October 1 through April 30).
- Inspect for burrows on an annual basis and after vegetation trimming.
- General maintenance inspection semi-annually late wet season and late dry season to identify signs of significant erosion.

The following inspection tasks are required for the BioClean Curb Inlet Filter that should be done on an ongoing basis including just before annual storm seasons and following rain events are as follows:

- Check for accumulated garbage and debris within the curb inlet filter.
- Look for any out of the ordinary obstructions in the curb inlet, trough, weir, filter basket and outlet pipe.
- Observe the condition and color of the hydrocarbon boom (if installed).

Underground Storm Water Storage System

The underground storm water storage system shall be inspected and inspection visits shall be completely documented:

• Prior to the onset of the rainy season and just after the rainy season. The rainy season begins on October 1 and ends on April 30.

The inspection tasks required for the underground storm water storage system are as follows:

- Manholes: Remove cover. Use a flashlight to detect sediment deposits. If present, measure sediment depth with a stadia rod accounting for depth of sump (if present).
 Inspect pipes connecting to the flow control / cleanout structure. Record results on a maintenance log. Replace cover. Repeat procedure for all manholes.
- If sediment accumulation reaches 6-inch in height within the system, then maintenance is required on the system.

The following inspection tasks are required for the flow control weir walls and orifices of the flow control / cleanout structure that should be done on an ongoing basis just before annual storm seasons and following rain events are as follows:

• Check for accumulated garbage, sediment and debris adjacent to the flow control weir walls and orifices.

E. MAINTENANCE PROGRAM FOR BMPs

The operation and maintenance requirements for each type of BMP are as follows:

(1) SOURCE CONTROL BMPS

Storm Water Conveyance Stamping and Signage

The stamping or stenciling shall be maintained to remain legible. If 25% of a stencil has worn off, all stencils shall be repainted.

Trash Storage Areas

- Lined bins or dumpsters shall be free from leaking of liquid waste.
- Signs on all dumpsters informing users that hazardous materials are not to be disposed of therein shall be legible and clearly visible.
- No trash shall be allowed to collect outside the provided trash bins. If trash accumulates and overflows the provided bins, the schedule for trash pickup shall be increased to account for the amount of trash accumulated.
- The trash enclosure floors shall be washed monthly to ensure no buildup of surface contaminants.
- Hazardous Waste

Suspected hazardous wastes will be analyzed to determine disposal options. Hazardous wastes generated onsite will be handled and disposed of according to applicable local, state, and federal regulations. A solid or liquid waste is considered a hazardous waste if it exceeds the criteria listed in the CCR, Title 22, Article 11.

Integrated Pest Management

Integrated Pest Management (IPM) is an ecosystem-based pollution prevention strategy that focuses on long-term prevention of pests or their damage through a combination of techniques such as:

- Biological control
- Habitat Manipulation
- Modification of cultural practices
- Use of resistant plant varieties

Pesticides are used only after monitoring indicates they are needed according to established guidelines. Pest control materials are selected and applied in a manner that minimizes risks to human health, beneficial and non-target organisms, and the environment.

The operational and maintenance needs of an integrated pest management shall be:

• Plant pest-resistant or well-adapted plant varieties such as native plants to eliminate and/or reduce the need for pesticide use in the project design.

• Discourage pests by modifying the site and landscape design.

Preventive Maintenance

Pollution prevention is the primary "first line of defense" because pollutants that are never used do not have to be controlled or treated. Educational materials shall be distributed to future site residents/tenants with the following topics:

- Keeping pests out of building and landscaping using barriers, screens and caulking.
- Physical pest elimination techniques such as weeding, squashing, trapping, washing, or pruning out pests.
- Relying on natural predators to eat the pests
- Proper use of pesticide as a last line of defense.

Efficient Irrigation System

The operational and maintenance needs of an irrigation system are:

- Preventive maintenance and visual inspection of all sprinkler heads and lines.
- Periodic testing of all irrigation stations to verify if each landscape area is getting the correct amount of water.
- Periodic testing of all flow reducers and/or shutoff valves to verify in good working order.

Aesthetic and Functional Maintenance

Both forms of maintenance will be combined into an overall Stormwater Management System Maintenance.

Aesthetic Maintenance

The following activities will be included in the aesthetic maintenance program:

• Broken sprinkler heads and/or lines will be repaired or replaced in a timely manner.

Functional Maintenance

Functional maintenance has two components:

Preventive maintenance

Corrective maintenance

Preventive Maintenance

Preventive maintenance activities to be instituted for an irrigation system include:

- Preventive maintenance and visual inspection of all sprinkler heads and lines.
- Periodic testing of all irrigation stations to verify if each landscape area is getting the correct amount of water.
- Periodic testing of all flow reducers and/or shutoff valves to verify in good working order.

Corrective Maintenance

Corrective maintenance is required on an emergency or non-routine basis to correct problems and to restore the intended operation and safe function of an irrigation system. Corrective maintenance activities include:

- Broken sprinkler heads and/or lines will be repaired or replaced in a timely manner.
- General Facility Maintenance. In addition to the above elements of corrective maintenance, general corrective maintenance will address the overall irrigation system and its associated components. If corrective maintenance is being done to one component, other components will be inspected to see if maintenance is needed.

Good Housekeeping

The operational and maintenance needs associated with good housekeeping are:

- Keep outdoor areas in a neat and orderly condition.
- Pick up garbage left within the pavement and landscape areas.
- Periodic sweeping of the paved areas.
- Removal of all freshly trimmed landscape items and natural deposited items such as annual leaves and disposal off-site per governing codes.
- Apply all fertilizer, herbicide or pesticide in the amount and application as provided by the manufacturer.

Aesthetic and Functional Maintenance

Both forms of maintenance will be combined into an overall Stormwater Management System Maintenance.

Aesthetic Maintenance

The following activities will be included in the aesthetic maintenance program:

- Keep outdoor areas in a neat and orderly condition.
- Pick up garbage left within the pavement and landscape areas.
- Periodic sweeping of the paved areas.
- Removal of all freshly trimmed landscape items and natural deposited items such as annual leaves and disposal off-site per governing codes.
- Weed Control. Weeds will be removed through mechanical means. Herbicide will not be used because these chemicals may impact the water quality monitoring.

Functional Maintenance

Functional maintenance has two components:

Preventive maintenance

Corrective maintenance

Preventive Maintenance

Preventive maintenance activities to be instituted with good housekeeping are:

• Apply all fertilizer, herbicide or pesticide in the amount and application as provided by the manufacturer.

Corrective Maintenance

Corrective maintenance is required on an emergency or non-routine basis. Corrective maintenance activities include:

• General Facility Maintenance. General corrective maintenance will address the overall facility and its associated components. If corrective maintenance is being done to one component, other components will be inspected to see if maintenance is needed.

Hazardous Waste

Suspected hazardous wastes will be analyzed to determine disposal options. Hazardous wastes generated onsite will be handled and disposed of according to applicable local, state, and federal regulations. A solid or liquid waste is considered a hazardous waste if it exceeds the criteria listed in the CCR, Title 22, Article 11.

(2) STRUCTURAL BMPS

Biofiltration Basin

The maintenance indicators of a biofiltration basin are:

- 1. Accumulation of sediment, litter or debris.
- 2. Poor vegetation establishment.
- 3. Erosion due to concentrated irrigation flow.
- 4. Erosion due to concentrated storm water runoff flow.
- 5. Standing water in biofiltration basin for longer than 96 hours following a storm event.
- 6. Obstructed inlet or outlet structures.
- 7. Damage to structural components such as inlet and outlet structures.

The maintenance actions associated with the maintenance indicators noted above are as follows:

- 1. Remove and properly dispose of accumulated materials, without damage to vegetation. As engineered soil section is intended to be installed and maintained with minimal compaction, the removal of accumulated material will need to be done by hand and with shovels.
- 2. Re-seed, re-plant or re-establish vegetation per original plans.
- 3. Repair/re-seed/re-plant eroded areas and adjust the irrigation system.
- 4. Repair/re-seed/re-plant eroded areas, and make appropriate corrective measures such as adding erosion control blankets, adding stone at flow entry points, or minor re-grading to restore proper drainage according to the original plan. If the issue is not corrected by restoring the BMP to the original plan and grade, the City Engineer shall be contacted prior to any additional repairs or reconstruction.
- 5. Make appropriate corrective measures such as adjusting irrigation system, removing obstructions of debris or invasive vegetation, clearing underdrains, or repairing/replacing clogged or compacted soils. The surface blockage problem may be corrected by removing the mulch layer and raking the surface. The mulch layer should then be replaced with new mulch installed 3-inch thick continuous throughout the entire area repaired.
- 6. Clear obstructions.
- 7. Repair or replace as applicable.

The maintenance actions for the BioClean Curb Inlet Filters are as follows:

- 1. Remove trash and debris buildup within the curb inlets either manually, with a vacuum device or with a vactor truck. A pressure wash is recommended and will assist in spraying of any debris stuck on the side or bottom of the filter basket.
- 2. Power wash off the trough, weir, debris screen and filter basket sides and bottom.
- 3. Remove the hydrocarbon boom (if installed) and assess the color and condition of the boom. Replace as necessary by ordering directly from the manufacturer.
- 4. Replace any damaged parts by ordering directly from the manufacturer.

Hazardous Waste

Suspected hazardous wastes will be analyzed to determine disposal options. Hazardous wastes generated onsite will be handled and disposed of according to applicable local, state, and federal regulations. A solid or liquid waste is considered a hazardous waste if it exceeds the criteria listed in the CCR, Title 22, Article 11.

Underground Storm Water Storage System

The maintenance actions for the underground storm water storage system are as follows:

- 1. Remove trash, sediment and debris buildup within the flow control structure and dual 48-inch diameter conduits either manually, with a vacuum device or with a vactor truck.
- 2. Verify that the weir walls and low flow orifice(s) are clear of all impediments and able to function as originally designed.

Hazardous Waste

Suspected hazardous wastes will be analyzed to determine disposal options. Hazardous wastes generated onsite will be handled and disposed of according to applicable local, state, and federal regulations. A solid or liquid waste is considered a hazardous waste if it exceeds the criteria listed in the CCR, Title 22, Article 11.

F. RECORD KEEPING

The project records for monitoring and reporting in accordance with the SWQMP will be maintained on-site and shall be retained for a minimum of 5 years. Monitoring, preparation of inspection reports and record keeping shall be the responsibility of Bell Holdings, LLC until such time that the parcel get sold or quit claimed to another person or entity. Bell Holdings, LLC may decide to hire out the maintenance and inspections of the SWQMP, however, the filing and reports of the monitoring and inspection shall remain the responsibility of Bell Holdings, LLC.
