Hello Ms. Harris, My name is Erin Tuatagaloa, I live in the Jacumba/Boulevard area, specifically Bankhead Springs. I have lived in the back country for 17 years. I am a retired Deputy Sheriff. I have witnessed the development of the power grid that extends in all four directions around my home and community. I have heard my neighbors reports of odd illness. I myself have symptoms I cannot explain.

I26-1

After reading several evidence based articles on the windmills impact on life both human and animal, I am very concerned that the County and State are allowing more windmills to be erected in populated areas.

I have written to Diane Jacobs (who forwarded my concerns to your department, you wrote back July 24, 2019) and other politicians to solicit support for the health and well being of our community. The response if any I received was that there is no proof that the environment or peoples health are being impacted by the Turbines? This confuses me? A letter from the County Planning & Development cited several peer review journals that supported no health impact only annoyances on populations? I did not see the peer review journals I read listed in your research at all? It leads me to believe that if all we want to do is support an issue, we find the articles that support our agenda! Green energy is stream lined, we get that! But slow down and properly measure the costs and toll it has on human and animal life.

I26-2

Were there not studies by NASA that showed a direct impact on humans by Infrasound. Is there not scientific research in oil fields and other areas that use turbines that report negative findings? Read Doctor Pierponts study on "Wind Turbine Syndrome". I have read many peer review articles by epidemiologists, scientists and the medical community that link direct neurological issues, health impacts to Wind Turbines. I am happy to cite all these articles I have read if that would support you and others to reconsider your position on these matters. I understand there is not adequate research on Electro Magnetic Frequencies (EMF) to render a decision. If we use simple common sense, exposing humans and wildlife to toxic dirty electricity, has harmful effects on the environment. Animals will simply migrate to healthier surroundings, are you expecting us humans to do the same thing? Who will compensate the humans for their property loss or devaluation of their property? I suggest do the research!, Don't just simply say it is not proven!

I26-3

I agree with green energy, just not at the cost of human and natures existence. Please consider moving these massive turbines to non populated areas that have minimal impact on those around them. Please do not overlook the research that has been conducted that proves the harmful effects. Be a good neighbor and care for the greater good of all beings not just the agenda of big politics/ big business..

I26-4

Thank you, In Kindness Erin Tuatagaloa
