1. INTRODUCTION

This Preliminary Hydromodification Management Study has been prepared in support of a Tentative Map submittal for the Brightwater Ranch project, which is located in the unincorporated area within the County of San Diego, California near Los Coches Road. The project's name was formerly known as Los Coches during previous entitlement work. This report is a companion report to the following project technical studies:

- CEQA Preliminary Drainage Study, prepared by Project Design Consultants
- Preliminary Storm Water Management Plan, prepared by Project Design Consultants
- Project Downstream Channel SCCWRP Analysis, prepared by Chang Consultants, entitled "Hydromodification Screening for Brightwater Ranch."

The purpose of this report is to document the project's compliance with the County's Final Hydromodification Management Plan (HMP). The stated purpose of the final hydromodification requirements is "...to manage increases in runoff discharge rates and durations from all Priority Development Projects, where such increased rates and durations are likely to cause increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force" (County Final HMP, page ES-1). Flow duration control is the most common form of hydromodification management. Unless a project meets an exemption or is granted prior lawful approval, the County Hydromodification Management Plan (HMP) requires that all priority projects comply with the HMP. Since the project does not qualify for an exemption, the project is required to address the applicability of Final HMP requirements.

2. PROJECT DESCRIPTION

The project is located in the unincorporated area of the County of San Diego (County) and is approximately 0.3 miles west of business route 8, and 0.4 mile south of Los Coches Road. The project is bounded by 1) undeveloped area to the northwest, 2) an existing subdivision to the north, 3) a mobile home park to the south, and 4) a future development named Jackson Ridge to the east. See Vicinity Map, Figure 1, for the project location. Note that at the time of the preparation of this report, the mass grading plans for Jackson Ridge are being processed by Hunsaker and Associates through the County, and therefore it is assumed that Jackson Ridge would be constructed prior to Brightwater Ranch.

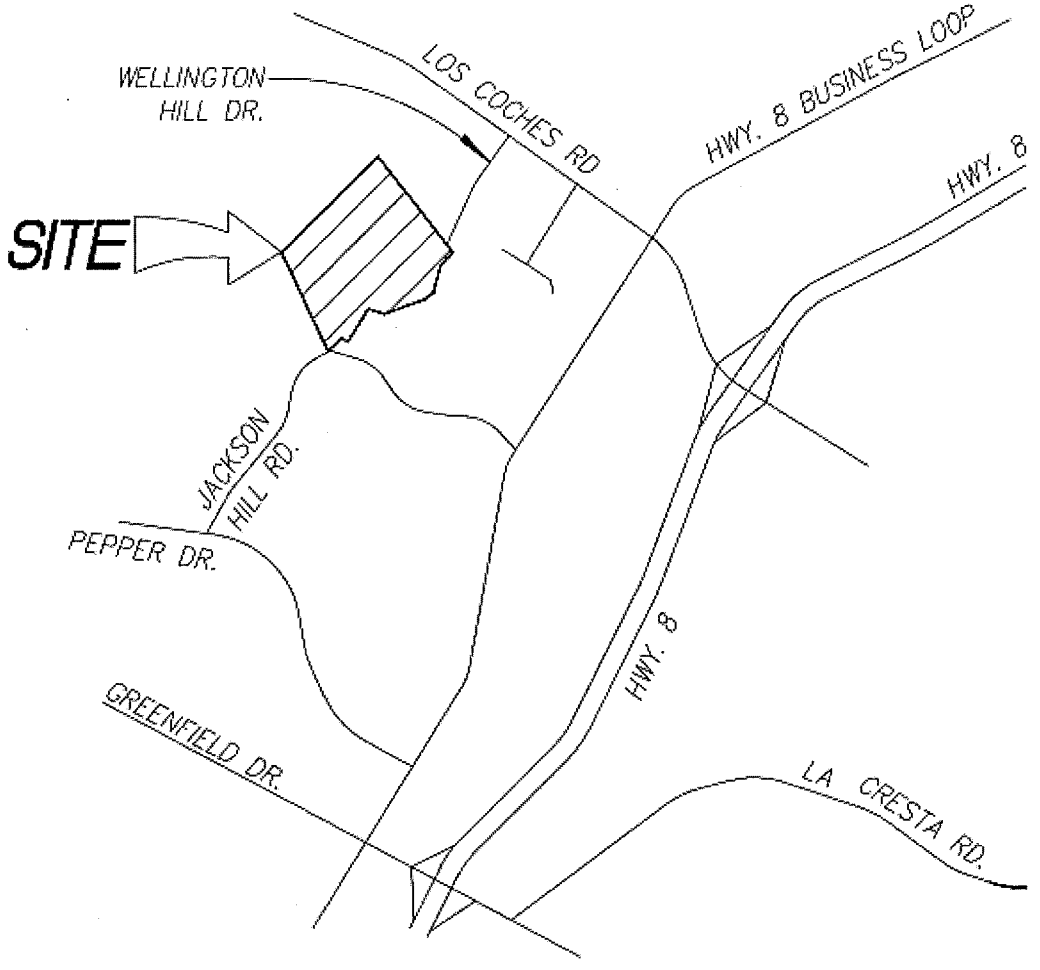

Figure 1: Project Vicinity Map

In general, the project when developed will consist of 66 single-family lots of 10,000 to 36,000 square feet, open space, and public right of way for streets, access easements, and necessary utility easements. The existing drainage pattern of the project flows in a northeasterly direction to two main concentration points at the northeast edge of the project (existing Foxborough Lane and Wellington Hill Drive storm drain systems). The majority of the project's runoff drains to the Wellington Hill Drive storm drain, and a water quality/hydromodification basin is proposed upstream of the connection into the existing Wellington Hill Drive storm drain to mitigate the increased flows and durations from project development.

The project site currently consists of mostly undeveloped land. Offsite areas that contribute runon to the site include a portion of the adjacent mobile home park. Slopes vary from flat to steep and cover is mostly brush with some areas of dense trees. Generally the site consists of steeply sloping terrain. Most of the project drains in an easterly direction towards the existing subdivision to the east.

3. HYDROMODIFICATION MANAGEMENT APPROACH

The project will comply with final hydromodification requirements through flow control management for the portions of the project that require hydromodification mitigation. There are two main points of connection for the storm drain system for the project, and one small minor discharge point in the southwest corner. (A small portion of the southwest corner drains to an existing brow ditch). For the two main discharge points, the northerly pipe is a 30" cast in place concrete pipe within Foxborough Lane and the southerly pipe is a 30" cast in place concrete pipe within Wellington Hill Drive. These two pipes confluence together downstream and discharge into a vegetated channel north of the Burkshire Place cul-de-sac. From there, the regional drainage is conveyed to the upstream end of the improved Los Coches Creek channel approximately 1500 feet downstream. Los Coches Creek eventually drains to the San Diego River. Although the San Diego River is an exempt water body per the County HMP, the project discharge location is not fully lined and/or hardened all the way to the exempt water body, and hence the project is not exempt from hydromodification requirements.

Each of the project discharge locations and their respective drainage areas were reviewed to determine the most appropriate hydromodification management approach on a drainage area by drainage area basis. Because the majority of the site drains to two main outfalls in the existing condition, there were three options to consider for hydromodification management: 1) provide detention at each outfall prior to discharge, 2) provide detention at one outfall and over-detain for the bypass drainage area, or 3) consolidate the outfalls into one outfall. Options 1 and 3 were determined to be undesirable from a site planning perspective, so Option 2 was selected as the hydromodification approach. Because the developed portion of the project draining to the northerly discharge point (Foxborough Lane) was relatively small, it was determined that one hydromodification management facility (basin) would be designed for the southerly discharge location and the northerly basin would be modeled as a bypass basin for the drainage area. Therefore, for this project, there will be one point of compliance (POC) for the hydromodification analysis for the two westerly discharge points (POC #1). POC #2 represents the runoff from the portion of the water easement access road that drains to the existing brown ditch near the southwest corner of the site. Other minor discharge locations surrounding the site are included in the drainage report analysis, but do not require hydromodification analysis because their respective drainage areas do not include any significant proposed impervious areas, and therefore, no hydromodification mitigation is required for those outfalls.

The proposed subdivision is proposed to be located in the flatter areas of the site so that the steeper hillsides upstream of the development are preserved. The storm drain system for the project was designed so that a portion of the hillside areas bypass the proposed hydromodification basin, because they will remain undeveloped and therefore do not need to be commingled for treatment purposes or flow attenuation.

The following is a summary of the major drainage discharge locations within the project. POC 1 includes the majority of the site drainage and drains to the Wellington Hill Drive storm drain system. The drainage area includes a portion of runon from the adjacent mobile home park located to the south of the project. The developed portion of the Foxborough Lane drainage area is modeled as a "bypass area," meaning that the discharge is not routed through a flow-duration control detention facility. In other words, the minor amount of net increase in impervious

surface at POC 1 is adequately mitigated in the basin upstream such that the combined discharge is in compliance with the hydromodification flow-duration requirements.

3.1 Basin Modeling Assumptions

This study identifies one hydromodification management detention basin needed to mitigate the increased rates and durations of stormwater runoff from the main part of the project (POC #1). A small bioretention area was sized for the portion of the water easement access road that drains to the southwest corner of the site (POC #2). This Preliminary Hydromodification Management Study identifies a conservative estimate for the basin sizes and the report will be revised and updated as the design of the project continues to evolve through final design. The proposed hydromodification management basin (POC #1) has been modeled conservatively with no infiltration into native soils. Note that during final engineering, the model may be updated to reflect more refined geotechnical assessment information if applicable.

3.3 Flow Duration Control

The proposed project will comply with the HMP flow control duration criteria through the construction of one onsite hydromodification management basin (POC #1) and one small bioretention area (POC #2). The Final HMP requires that post-project runoff flows and durations comply with the following flow duration criteria:

- For flow rates between the pre-project low flow threshold and the pre-project 10-year event, the post-project discharge rates and durations may not deviate above the pre-project rates and durations by more than 10% over more than 10% of the length of the flow duration curve.

The low-flow threshold used in the analysis for Brightwater Ranch is the 0.5Q2 low-flow threshold for POC #1, as determined by the project geomorphic channel assessment analysis performed by Chang Consultants. (For POC #2, that area was not included in the project geomorphic channel assessment analysis, and therefore, the default 0.1Q2 threshold was used). The San Diego Hydrology Model (SDHM, dated September 13, 2012) was used for the

continuous simulation modeling to determine the minimum required hydromodification management volumes for each proposed hydromodification management basin.

3.4 Dual Purpose for Water Quality Treatment

It is anticipated that the hydromodification management basin (POC #1) and the bioretention area (POC #2) may also fulfill water quality requirements. Therefore, the basin will be dual purpose to achieve the flow-duration requirements set forth in the County HMP, and will also address the stormwater quality treatment criteria set forth in the MS4 Permit as a regional post-construction treatment BMP for the developed area. For more information on the treatment control aspect of the proposed hydromodification/water quality basins, refer to the project Preliminary Storm Water Management Plan.

4. METHODOLOGY FOR HYDROMODIFICATION ANALYSIS

The hydromodification analysis includes continuous simulation of hourly rainfall, evaporation, infiltration, depression storage, and runoff for the entire continuous rainfall record using SDHM. Note that since the time step of the data is hourly, the calculated rainfall flow rates are extremely low and are not comparable to any sort of synthetic hydrology model such as the Rational Method. The rainfall gauge data selected for this project is the Flinn Springs gauge, which represents the project appropriately based on isopluvial and precipitation zone characteristics and has hourly data for the period of record of 1963 to 2008. The Flinn Springs rain gauge is close to the site, is close to the same elevation, and, after reviewing the Flinn Springs rain gauge data set, Project Design Consultants determined it to be the most appropriate data set to use for the project. County staff confirmed the approval of the rain gauge selection with an email to PDC dated August 12, 2013. SDHM uses the Hydrologic Simulation Program Fortran (HSPF) software as its computational engine to run rainfall-runoff algorithms. Input values into the model include the soil type, slope, land cover, drainage management areas, and rainfall data. Based on the output from the continuous simulation over the entire rainfall record, the program computes a flow duration curve for each point of compliance (POC) and compares the pre-project and post-project flow duration curves to the criteria established in the HMP. The low-

flow and upper-flow thresholds are determined internally by the SDHM program using partial duration statistics. Partial duration statistics are required to estimate the statistics appropriately, since statistics based on peak annual series are inappropriate for estimating values for frequent return intervals such as the 2-year return period. Table 1 below summarizes the input data for the continuous simulation model.

Table 1. Continuous Simulation Model Input Parameters

Total Drainage Area	43.03 acres POC #1 (with 6.16 ac bypass), 2.52 acres POC #2
Pre-project land cover	Soil Type B and C. Slope ranges from Flat to Steep, Grass Cover, with some impervious areas (for example, the existing imperviousness in the runon area of the adjacent mobile home park). For specifics of the pre-project land cover, refer to tabular summary in Appendix 1 and Pre-project land cover exhibit.
Post-project land cover	Soil Type B and C. Slope ranges from Flat to Steep, Grass Cover and impervious areas. Refer to tabular summary in Appendix 1 and Post-project land cover exhibit.
Rainfall Gage	Flinn Springs
Low Flow Threshold	0.5Q2 low-flow threshold for POC #1, based on SCCWRP Analysis & SDHM partial duration statistics. 0.1Q2 low-flow threshold for POC #2, based on default value assumption & SDHM partial duration statistics
Upper Flow Threshold	Q10 based on SDHM partial duration statistics

4.1 Soil Type Analysis

Based on the NRCS soil data maps in Appendix 3, the soils within the entire onsite project area are characterized as Hydrologic Soil Type B and C. The majority of the site's soils are Soil Type B. Type B soils have moderate infiltration rates.

4.2 Land Cover and Slope Analysis

The input values for the SDHM model were developed by breaking the drainage area to the POC into discrete drainage management areas (DMAs). The drainage areas of the model were separated into discrete areas with uniform cover properties for modeling purposes within SDHM. All pervious areas were modeled with grass cover. All pervious areas were categorized into

slope categories of flat (0-5%), moderate (5-10%), or steep (greater than 10%). For the pre-project condition, a slope analysis was performed on the pre-project topography using GIS to separate the drainage areas into the various slope categories. For the post-project condition, the land cover analysis was performed on the post-project topography. The level of imperviousness was estimated based on the imperviousness value used in the hydrologic modeling for each subarea, in order to be consistent with the impervious values used in the Drainage Study. Future refinements of the site plan during final engineering may warrant refinements to the input data used in the SDHM model.

The modeling elements used for this project and available in SDHM include the following options:

- Standard drainage basin: Used to model either impervious or pervious areas that drain directly to a hydromodification management facility or POC.
- Bypass drainage basin: Used to model either impervious or pervious areas that bypass a hydromodification management facility and drain directly to the POC.

Refer to the pre-project and post-project HMP Exhibits in Appendix 5 for the area and location of the DMAs. The DMAs that bypass the hydromodification management basins (those areas draining directly to the stream without detention) were modeled as bypass basins.

4.3 Basin Stage-Volume-Discharge Modeling

For the SDHM model (POC#1), the basin was modeled with a composite outlet structure and the preliminary stage-volume relationship based on the current grading design with no infiltration. The stage/area/volume/discharge relationship was calculated with PondPack and then input into SDHM with an SSD table to model the preliminary design for the outlet structure. This procedure was selected in order to model both the water quality and hydromodification mitigation requirements and to accurately represent the bottom stages of the basin for accurate low-flow orifice sizing. For the SDHM model for POC #2, the SDHM bioretention modeling tool was used.

5. HYDROMODIFICATION ANALYSIS RESULTS

The SDHM models for the basin (POC1-0.5Q2.whm) and the bioretention area (POC2-0.1Q2.whm), represents the proposed site plan for the hydromodification analysis included for this study. Based on the selected basin outlet configurations and basin elevation-volume relationship, the flow-duration requirements are satisfied with the proposed design. During final engineering, further refinements to the design will be required to support the final construction drawings.

Table 2. Summary of Proposed Hydromodification Management BMPs

Hydromodification Control	Location & Description	Modeled Size
Hydromodification/Water Quality Basin (POC #1)	Large basin upstream of Wellington Hill Drive	2.2 AF, modeled based on contours (stage/volume curve from plans)
Hydromodification/Water Quality Bioretention Area (POC #2)	Small bioretention area in southwest corner of project that treats runoff from a portion of the water easement access road.	998 SF

5.1 Drawdown Calculations

Per Section 6.4.6 of the County HMP, the minimum drawdown time to comply with Department of Environmental Health (DEH) guidelines is 96 hours. This standard has been set to minimize mosquito habitat and reduce the public health risk for West Nile Virus. This project complies with the DEH guidelines and, therefore, a separate vector control maintenance plan is not required. The basin drawdown calculations are summarized in the results summary table in Appendix 2, and indicate that each of the drawdown times for the basin is less than the 96 hour time limit.

6. CONCLUSION

This Preliminary Hydromodification Management report documents how the proposed project design complies with the new requirements presented in the County's Final HMP. The report and analysis presented herein supports the preliminary design of the storm drain improvements and hydromodification management facilities for the Tentative Map for the Brightwater Ranch project. The results indicate that the proposed hydromodification management basin (POC #1) and bioretention area (POC #2) mitigates for increased flows and durations per the criteria set forth in the County HMP. In addition, the facilities satisfy the DEH drawdown guidelines for vector control.

PROJECT REPORT

General Model Information

Project Name:	POC2-0.1Q2
Site Name:	Brightwater Ranch
Site Address:	
City:	
Report Date:	01/29/2015
Gage:	FLINN SP
Data Start:	10/01/1963
Data End:	09/30/2004
Timestep:	Hourly
Precip Scale:	1.00
Version:	2014/11/07

POC Thresholds

Low Flow Threshold for POC1:	10 Percent of the 2 Year
High Flow Threshold for POC1:	10 Year

Landuse Basin Data
Predeveloped Land Use

Pre-project

Bypass:	No
GroundWater:	No

Pervious Land Use	Acres
B,Grass,FLAT(0-5%)	0.01
B,Grass,MOD(5-10%)	0.02
B,Grass,STEEP(10-20	2.49
Pervious Total	2.52

Impervious Land Use	Acres
Impervious Total	0
Basin Total	2.52

Element Flows To:

Surface	Interflow	Groundwater

Mitigated Land Use

to basin

Bypass: No

GroundWater: No

Pervious Land Use	Acres
B,Grass,STEEP(10-20	2.36
B,Grass,MOD(5-10%)	0.02
B,Grass,FLAT(0-5%)	0.01
Pervious Total	2.39

Impervious Land Use	Acres
IMPERVIOUS	0.13
Impervious Total	0.13
Basin Total	2.52

Element Flows To:

Surface	Interflow	Groundwater
Surface .5	Surface .5	

Mitigated Routing

.5

Bottom Length:	42.00 ft.
Bottom Width:	11.00 ft.
Material thickness of first layer:	1.5
Material type for first layer:	ASTM 9
Material thickness of second layer:	0.5
Material type for second layer:	GRAVEL
Material thickness of third layer:	0.5
Material type for third layer:	GRAVEL
Infiltration On	
Infiltration rate:	0.2
Infiltration safety factor:	1
Wetted surface area On	
Total Volume Infiltrated (ac-ft):	8.79
Total Volume Through Riser (ac-ft):	4.571
Total Volume Through Facility (ac-ft):	13.361
Percent Infiltrated:	65.79
Total Precip Applied to Facility:	0
Total Evap From Facility:	0
Underdrain not used	
Discharge Structure	
Riser Height:	0.83 ft.
Riser Diameter:	8 in.
Element Flows To:	
Outlet 1	Outlet 2

Pond Volume Equations
* Incremental volume computed by the Conic Method for Reservoir Volumes.

Volume = (1/3) * (EL2 - El1) * (Area1 + Area2 + sqr(Area1 * Area2))

where:	EL1, EL2	Lower and upper elevations of the increment
	Area1, Area2	Areas computed for EL1, EL2, respectively
	Volume	Incremental volume between EL1 and EL2

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Diego County Area, California
Survey Area Data: Version 7, Nov 15, 2013

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: May 2, 2010—May 6, 2010

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Hydrologic Soil Group— Summary by Map Unit — San Diego County Area, California (CA638)				
Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
RaD2	Ramona sandy loam, 9 to 15 percent slopes, eroded	C	12.1	15.8%
VsE	Vista coarse sandy loam, 15 to 30 percent slopes	B	30.7	40.1%
VvG	Vista rocky coarse sandy loam, 30 to 65 percent slopes	B	33.7	44.1%
Totals for Area of Interest			**76.4**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Component Percent Cutoff: *None Specified*

Tie-break Rule: Higher
