

California EMF Program

Welcome to the California Electric and Magnetic Fields Program

The California Electric and Magnetic Fields (EMF) Program was a research, education, and technical assistance program concerned with the possible health effects of electric and magnetic fields from powerlines, appliances, and other uses of electricity. Our goal was to find a rational and fair approach to deal with the potential risks, if any, of exposure to EMF. We do this through research, policy analysis, and education. **Please note that funding for the EMF Program ended in the mid-2000s; the Program no longer exists. Materials developed under the auspices of the EMF Program are provided here for historical reference only.**
